

Features

- Precision low voltage monitoring
- 200 ms (typical) reset timeout
- Manual reset input
- Reset output stage
- Push-pull Active-low output (TPV811)
- Push-pull Active-high output (TPV812)
- Low power consumption: 2.2 μ A
- Guaranteed reset output valid to VCC = 1 V
- Power supply glitch immunity
- Specified from -40°C to +125°C
- 5-lead SOT-23-5 package and 4-lead SOT-143 package

Applications

- Microprocessor systems
- Computers
- Controllers
- Intelligent instruments
- Portable equipment

Description

The TPV811/812 is a supervisory circuit that monitors power supply voltage levels and provides a power-on reset signal.

A reset signal can also be asserted by an external manual reset input.

The reset periods are fixed at 200 ms (typical).

The TPV811/812 is available in a 5-lead SOT-23-5 package and 4-lead SOT-143 package. And typically consumes only 2.2 μ A, suitable for use in low power, portable applications.

Pin Configuration and Functions

Name	PIN NO (SOT-23-5)	PIN NO (SOT-143)	Description
GND	1	1	Ground.
NC	2	NA	Not connected.
RESET	3	2	TPV811: Active-Low Reset Push-Pull Output Stage. Asserted whenever VCC is below the reset threshold, VTH.
RESET	3	2	TPV812: Active-High Reset Push-Pull Output Stage. Asserted whenever VCC is below the reset threshold, VTH.
MR	4	3	Manual Reset Input. This is an active-low input, which, when forced low for at least 1 µs, generates a reset. It features a 50 kΩ internal pull-up.
VCC	5	5	Power Supply Voltage Being Monitored.

Theory of Operation

The TPV811/812 provides supply voltage supervision as well as manual reset function.

A reset signal is asserted when the supply voltage is below a preset threshold. In addition, the TPV811/812 allows supply voltage stabilization with a fixed timeout before the reset de-asserts after the supply voltage rises above the threshold.

A manual reset input is available to reset the microprocessor, for example, by using an external push-button.

RESET OUTPUT

The TPV811/812 features an active-low or active-high push-pull output. For active-low output, the reset signal is guaranteed to be logic low for VCC down to 1 V. The reset output is asserted when VCC is below the reset threshold (V_{TH}), when MR is driven low. Reset remains asserted for the duration of the reset active timeout period (t_{RP}) after VCC rises above the reset threshold, after MR transitions from low to high. Figure 10 shows the reset (active low) outputs.

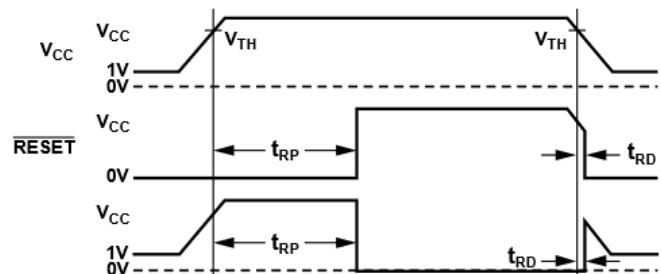

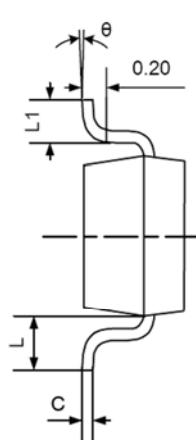

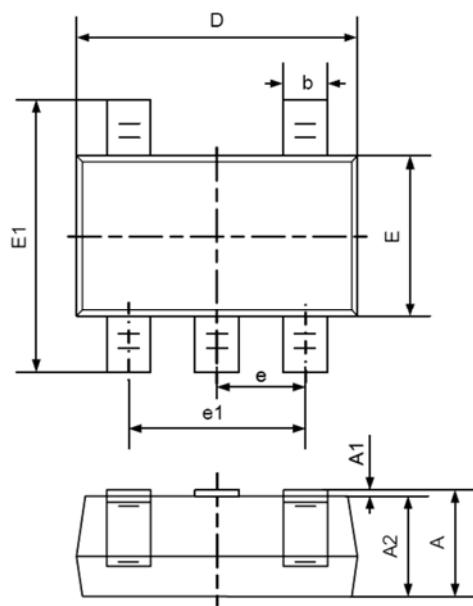

Figure 10. Reset Timing Diagram

MANUAL RESET INPUT

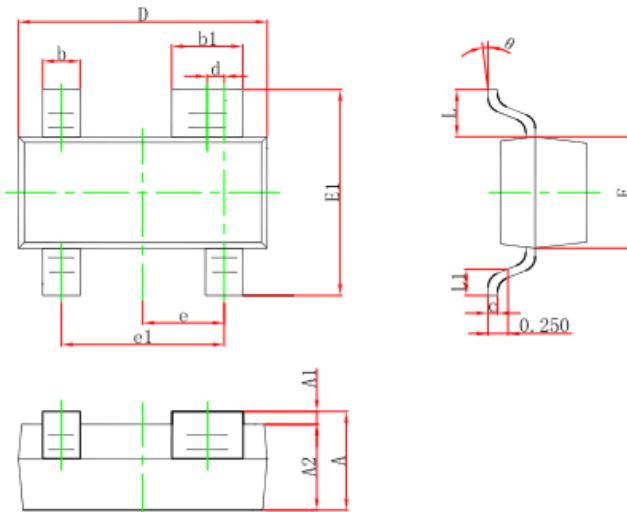

The TPV811/812 features a manual reset input (MR), which, when driven low, asserts the reset output. When MR transitions from low to high, reset remains asserted for the duration of the reset active timeout period before de-asserting.

The MR input has an internal pull-up resistor so that the input is always high when unconnected. Noise immunity is provided on the MR input, and fast, negative-going transients are ignored. A 0.1 μ F capacitor between MR and ground provides additional noise immunity.
