

SIMATIC PXO photoelectric proximity switches

Introduction

Photoelectric proximity switches – fast and accurate sensing with light and laser

Pure photoelectric astuteness – this is what distinguishes these extremely precise, quick-acting and accurately pin-pointing photoelectric proximity switches. This is supplemented by first-class ease of adjustment using a teach-in function or potentiometer and easiest possible handling during operation. With the wide range of different designs, from cubic to cylindrical right down to miniature designs and different types, e.g. as diffuse sensors with or without background suppression, retroreflective or thru-beam sensors, they master any task with a range of up to 50 m superbly.

Highlights

- Extremely precise and quick-acting with pin-point locating ability
- Maximum performance even over large distances
- Small, compact enclosure
- Degree of protection up to IP68
- Adjustable ranges
- Easy commissioning (teach-in)
- Suitable for global use (UL/CSA)

Configurator

A configurator for photoelectric proximity switches is available in the Mall. Based on the technical features required, the desired product can be quickly and easily selected, placed in the shopping cart and ordered.

The configurator can be reached by the following link:
www.siemens.com/simatic-sensors/px

PXO series

The photoelectric proximity switches are organized in different product families in accordance with their technical version and design:

SIMATIC sensors	Version	Design
PXO100	Cylindrical version, mini	D4, M5, M12
PXO200	Cylindrical versions	M18, M18S, L18
PXO300	Cubic version, mini	K21, K21R, K20, L20, C20
PXO400	Cubic version, small	K31, K30
PXO500	Cubic version	C40, L50, L50HF, L50HF adv., C50
PXO600	Cubic version, large	K80, L80HF, L90L
PXO800	Special device amplifiers	GL, LV70

Application

The various versions of the photoelectric proximity switches are predominantly used in the following applications:

- In conveyor systems
- In packaging machines
- In mechanical engineering
- In paper, textile and plastics processing
- In printing machines
- For access control.

These photoelectric sensors detect all objects regardless of their composition, whether metal, wood or plastic.

Special versions of the K20 form in miniature enclosure and the C40 are available for detecting transparent objects. Special devices such as the color sensor or color mark reader can be used to detect differences in color or contrast. The analog laser supports extremely precise distance measurements and position monitoring.

Sensors for Ex Zone 2/22

The K80 ATEX photoelectric proximity switch is approved according to EU Guideline 94/9/EG (ATEX) Appendix VIII

The approval is for:

- Gas EX II 3G EEx nA II T6x and
- Dust EX II 3D IP65 T 80 °C x

The functionality of the photoelectric proximity switches with ATEX approval is identical to that of the standard proximity switches.

Safety-related applications

The use of the sensors is not permissible for applications in which the safety of persons is dependent on the function of the proximity switch.

NSDO_00801

Design

The devices can be mounted in any position. They should be installed in such a manner as to prevent dirt deposits as far as possible. The available accessories enable the devices to be mounted easily and correctly.

Alignment

Diffuse sensor

The sensor must be aligned with the object to be sensed to ensure reliable switching. In devices that have a surplus light function, the relevant LED must be active.

Reflex sensors

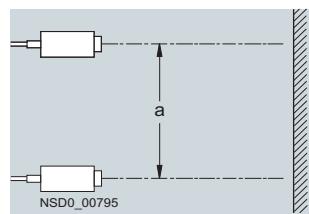

- Place the reflector at the required location and secure it firmly.
- Cover the reflector with adhesive tape so that only the center (approximately 25 % of the surface) remains free.
- Install the reflex sensor so that it switches reliably.
- Finally remove the adhesive tape from the reflector.

Thru-beam sensors

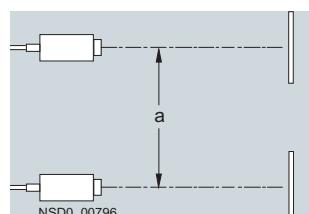

- Place the receiver in the required position and secure it firmly.
- Align the emitter with the receiver as accurately as possible.

Minimum clearance

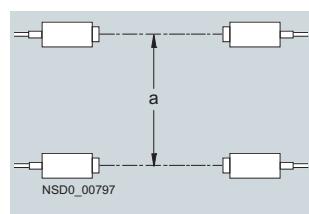

The proximity switches must not interfere with each other. Therefore a minimum distance *a* must be observed between two sensors. The following distances are recommended values only. The values given are for maximum sensitivity.

Diffuse sensor

Reflex sensor

Thru-beam sensor.

Photoelectric proximity switches Dimension *a*

	Dimension <i>a</i>
D4/M5	50 mm
M12	250 mm
M18	250 mm
K31	250 mm
K30	750 mm
K80	500 mm
L18 (laser light barrier)	150 mm ¹⁾
L50 (laser light scanner)	30 mm
L50 (laser light barrier)	80 mm
C50 (color sensor)	500 mm

1) Focusing at 50 m.

Setting the operating distance

Sensitivity is either adjusted using a built-in potentiometer or taught by means of a teach-in function. When a potentiometer is used, turning clockwise increases sensitivity and thus the achievable operating distance.

Diffuse sensor and diffuse sensor with background suppression

The object is positioned in front of the sensor inside its sensing range. Set the sensitivity, or distance, in such a way that the object to be scanned is sure to be sensed. If necessary, the surplus light display (green LED) must be active. The object must then be removed. If the output remains on, sensitivity must be reduced.

In devices with teach-in function, sensitivity is adjusted automatically. During this process, the sensor is taught the two states "Object there" and "Object not there" by pressing the keys.

Reflex sensors and thru-beam sensors

In normal cases, the sensor is always operated with sensitivity at maximum. This produces the maximum surplus light. It is usually only necessary to reduce sensitivity for sensing very small or transparent objects. The procedure is the same as for diffuse sensors.

Cable length

Long cables between the devices result in:

- Additional capacitive loading (short-circuit protection)
- Increased injection of interference.

For this reason the specified maximum cable length must not be exceeded.

SIMATIC PXO photoelectric proximity switches

Introduction

2

Function

Diffuse sensor (energetic sensor)

The light from the emitter falls on an object and is reflected in a diffuse pattern. Part of this reflected light reaches the receiver located in the same device. If the intensity of the received light is sufficient, the output is switched.

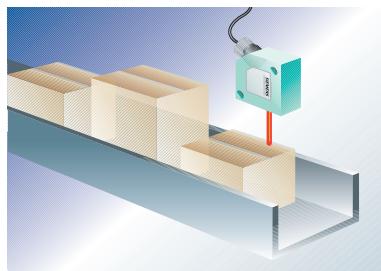

The sensing range depends on the size and color of the object involved as well as its surface texture. The sensing range can be varied within a wide range by means of the built-in potentiometer. The energetic sensor can therefore also be used to detect different colors.

Diffuse sensor with background suppression

Diffuse sensors with background suppression can detect objects up to a specific sensing range. All objects beyond this range are suppressed. The focus level can be adjusted. The background is suppressed due to the geometric constellation between the emitter and the receiver.

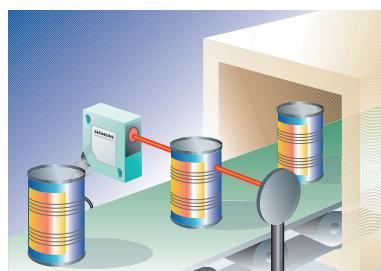

Reflex sensors

The light from the emitter diode is focused through a lens and directed via a polarization filter to a reflector (principle of a 3-way mirror). Part of the reflected light passes through another polarization filter and reaches the receiver. The filters are selected and aligned in such a way that only the light reflected from the reflector reaches the receiver and not the light reflected from other objects within the beam range.

An object that interrupts the light beam from the emitter through the reflector to the receiver causes the output to switch.

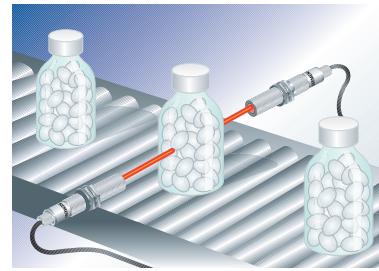

Thru-beam sensors

Thru-beam sensors comprise an emitter and a receiver. The emitter is aligned in such a way that the greatest possible amount of pulsed light from the emitter diode reaches the receiver. The receiver evaluates the incoming light to clearly separate it from the ambient light and other light sources.

Any interruption of the light beam between emitter and receiver causes the output to switch.

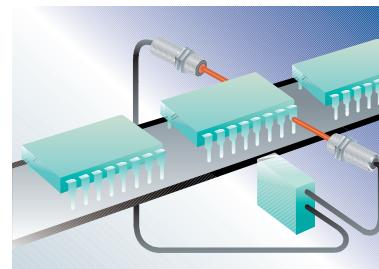

Devices for fiber-optic wires

Optical fibers are fitted in front of the emitter and receiver. They represent the "extended eye" of the photoelectric proximity switch.

As optical fibers are very small and flexible, they provide a practical solution to the problem of sensing at points that are not easily accessible. Furthermore no electrical potential is transferred.

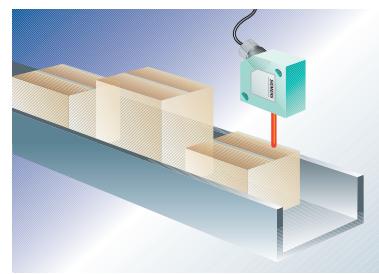

Laser diffuse sensor with analog output

The analog laser proximity switch can measure the exact distance of an object within its sensing range. Due to the use of visible laser light, the measurement is highly accurate and the output is extremely linear.

All laser proximity switches belong to safety class 2, i.e. they are harmless and can be used without any risk to health (e.g. to the eyes).

Color sensors

The color sensor functions with an incandescent LED, which illuminates the object.

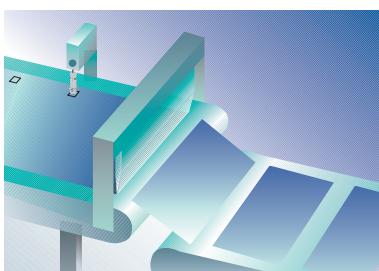

During sensor adjustment, the light reflected from the object is measured and assigned to the appropriate output. The recognized color is stored in the device in a non-volatile memory, and is immediately available even when the sensor has been switched off and on again. Either three independent colors or one color scale can be saved and evaluated.

The measured color value (RGB) is not available.

Color mark sensor

The color mark sensor uses green or red emitted light. The color is selected automatically depending on the contrast. The mark color and the background color can be set separately by means of two keys.

Technical specifications

The table lists data which are independent of the design

Type	Solid-state output		Relay output (K80)	Devices with laser
Voltage drop at 200 mA	V	Max. 2.0	–	Max. 2.4
Operating capacity	mA	Max. 200	2000	Max. 200
Reverse current of outputs	mA	Max. 0.1	–	Max. 0.1

Overview

Diffuse sensor with background suppression

- Sensing range 1 to 12 cm (adjustable via potentiometer)

Technical specifications

Operating mode		Diffuse sensor with background suppression	
Sensing range	cm	1 ... 12 (adjustable)	
Standard target	mm	50 × 50 (white)	
Operating voltage range (DC)	V	10 ... 36 (max. 20 % residual ripple)	
No-load current I_0 (typ.)	mA	25	
Rated operational current I_e	mA	200	
Switching frequency	Hz	500	
Switching time	ms	1	
Wavelength (illuminant)	nm	660 (red)	
Indicators			
• Switching status		Yellow LED	
• Surplus light		Green LED	
Enclosure material		Brass, nickel-plated	
Degree of protection		IP67	
Ambient temperature	°C	-25 ... +55	
Temperature coefficient	%/K	0.3	
Type		3RG71 34-...00

Overview

Diffuse sensor; energetic sensor

- Sensing range 1.2 m (adjustable via potentiometer)

Reflex sensor

- Sensing range 4 m (adjustable via potentiometer)
- Supplied without reflector

Thru-beam sensor

- Sensing range 12 m (adjustable via potentiometer)

Sensor for plastic fiber-optic wires

- Sensing range depends on type of optical fiber
(see page 2/263)

Supplied without mounting material

Technical specifications

Operating mode	Diffuse sensor	Reflex sensor with polarization filter
Sensing range	cm	120 (adjustable)
Standard target	mm	200 × 200 (white)
Operating voltage range (DC)	V	10 ... 36 (max. 20 % residual ripple)
No-load current I_0 , max.	mA	15
Rated operational current I_e	mA	200

SIMATIC PXO photoelectric proximity switches

SIMATIC PXO500

C40 design

Overview

Diffuse sensor; energetic sensor

- Sensing range 70 cm (adjustable via "teach-in")

Diffuse sensor with background suppression

- Sensing range 5 to 25 cm (adjustable via "teach-in")

Reflex sensor

- Sensing range 6 m (adjustable via "teach-in")

Reflex sensor for transparent objects

- Sensing range 1 m (adjustable via "teach-in")

External "teach-in"

Supplied with mounting bracket, without reflector.

C50 design

Overview

Color sensor with three individually adjustable switch outputs

- 3 color ranges can be learned
- Long-term stable and neutral color white-light transmitter LEDs
- 5 tolerance levels selectable

- Sensing range 12 to 32 mm
 - Transparent objects with reflection film detectable
 - Trigger function via activation input
 - External Teach-in
- Supplied without mounting material and without reflector

2

Technical specifications

Operating mode	Color sensor
Operating voltage	DC 12 ... 28 V
Max. residual ripple	10%
Reverse polarity protection, short-circuit protection	yes
Current consumption during no-load operation	≤ 40 mA at 24 V DC
Switching outputs	Q1 ... Q3, PNP NO contact
Max. output current	100 mA
Max. voltage drop at the switching output	< 2.4 V
Power-up delay	< 300 ms
Switching frequency	500 Hz
Switching status indicator CH1 ... CH3	3 x Yellow LED
Operating voltage indicator	Green LED
Tolerance level indicator Tol1 ... Tol5	3 x Red LED

Response time	10 ms
Pulse stretching/dropout delay	50 ms
Sensing range for light spot ø4 mm	12 ... 32 mm
Sensing range tolerance for light spot ø 4 mm	± 6 mm for mean tolerance
Color resolution tolerance	Adjustable in 5 stages
Illuminant	White light, pulsed
Light spot diameter at a distance of 22 mm	4 mm
Ambient light limit	EN 60947-5-2
Enclosure material	ABS
Degree of protection	IP67
Ambient temperature range	-10 ... +55 °C
Storage temperature range	-20 ... +80 °C
Type of connection	M12 connector, 8-pole
Max. permissible lead length	100 m
Weight	40 g

SIMATIC PXO photoelectric proximity switches

SIMATIC PXO600

K80 design

Overview

Versions for use in potentially explosive environments acc. to 94/9/EG (ATEX exists):

- Zone 2 (gases, vapors, mist) according to classification II 3G
- Zone 22 (dust atmosphere, non-conductive dust) according to classification II 3D

Diffuse sensor (energetic sensor)

- Sensing range 2 m (adjustable via potentiometer)

Diffuse sensor with background suppression

- Sensing range 0.2 to 1 m (adjustable via potentiometer)

Reflex sensor

- Sensing range 6 m (adjustable via potentiometer)

- Supplied without reflector

- "Advanced" version 1 to 12 m

Thru-beam sensor

- Sensing range 50 m (adjustable via potentiometer)

Rated operating voltage 24 V DC or 240 V AC/DC

Inputs and outputs

- Electronics output pnp or npn
 - Programmable as light-ON or dark-ON
 - Light-ON and dark-ON (antivalent)
- Relay output 20 to 320 V AC/DC
- Timing function (delayed pick-up or drop-out, pulse shaping)
- Enabling input for test purposes

Supplied without mounting material

Technical specifications

Overview

Visible laser light (red),
laser protection class 2 according to EN 60947-5-2
Diffuse sensor with analog output,
parameterizable using teach-in buttons
Resolution < 0.1% of full-scale value

Two digital channels, adjustable as 2 switching outputs or 1 switching output and 1 trigger input
Analog output 4 to 20 mA (scaling can be set)
Supplied without mounting material

Technical specifications

Overview

Measuring laser sensor based on the principle of optical running-time measurement

- Measuring laser with IR light; laser class 1
- Pilot laser for adjustment with visible red light; laser class 2
- Wired via M12 4-pole or 5-pole connector
- Range 6 m; range with reflector 30 m

- Rated operating voltage 24 V DC
- 1 or 2 solid-state outputs pnp
- NO or NC contact, adjustable via "teach-in"
- Analog output 4 to 20 mA
- Timer function

Overview

PXO830 GL fork sensor for detecting small objects.

- Molded plastic enclosure with screw-on or dovetail fastening.
- Wired with 3 or 4-pole M8 connector.
- 4 different fork widths:
 - GL30 = 30 mm
 - GL50 = 50 mm
 - GL80 = 80 mm
 - GL120 = 120 mm

- NO or NC contact, adjustable via "teach-in".
- Versions with external "teach-in".

SIMATIC PXO photoelectric proximity switches

Glossary for photoelectric proximity switches

More information

Terms associated with the technology of photoelectric proximity switches are explained below. Some of the terms are defined in IEC 60947-5-2.

Anti-interference function

This function prevents mutual interference between photoelectric proximity switches. The specified clearances between the devices does not have to be observed for devices with an anti-interference function. It is therefore possible to align two reflex sensors, for example, with a common reflector.

Function of the outputs

Dark-ON

The "dark-ON" function means that this output is conducting (current-carrying) when **no** light reaches the receiver.

Light-ON

The "light-ON" function means that this output is conducting (current-carrying) when light reaches the receiver.

Antivalent

The devices with antivalent output have 2 outputs. One output is **dark-ON**, and the other is **light-ON**.

Surplus light

As an alternative, some devices can be supplied with a different configuration of outputs, one output light-ON and the other for signaling the surplus light.

Output current

The devices are designed for a maximum output current (rated operating current, see Technical specifications). If this current is exceeded, even briefly, the built-in overload and short-circuit protection will be activated. Destruction of the device is effectively prevented.

Incandescent lamps, capacitors and other strongly capacitive loads (e.g. long leads) have a similar effect to an overload.

A minimum load current (smallest operating current) is not required. A built-in pull-up resistor ensures that an output signal is always available.

Auto-collimation

With these devices, the optical axes of the emitter and receiver are identical. The device only has one optical axis. This means that there is no blind zone range in front of the proximity switch and the accuracy of the switching point is higher.

Spurious signal suppression

The devices feature spurious signal suppression. It prevents the occurrence of spurious signals from the moment of application of the operating voltage until the moment when the device is ready for operation (approximately 5 ms).

Sensing range

The sensing range is the range within which the operating distance can be set. This term replaces any other previously used terms (sensing range/transmission range).

Correction factors

The specified sensing ranges of diffuse sensors are achieved with the specified surfaces by using matte white standard paper. The following correction factors (approximate values) apply to other surfaces:

Test card	100%	Black neoprene	20%
White paper	80%	Automobile tires	15%
Light-colored wood	73%	Sheet aluminum	
White plastic	70%	• raw	200%
Cork	65%	• black, anodized	150%
Printed newspaper	60%	• matte (brushed)	120%
PVC, gray	57%	Stainless steel, polished	230%
Black plastic	22%		

Enabling input

With photoelectric proximity switches with a test input, the emitter can be switched on or off. Function monitoring can be implemented with appropriate evaluation of the output signal (light barrier: no obstruction of light beam / diffuse sensors: reflecting object exists).

To disable the proximity switch, the enabling input must be connected to 0 V. The enabling input does not have to be used for operation.

Ambient light limit

Ambient light is the light produced by external light sources. The luminescence level is measured on the light incidence surface. Thanks to the use of modulated light, the devices are insensitive to ambient light.

There is, however, an upper limit for the intensity of any external light which is referred to as the ambient light limit. It is specified for sunlight (unmodulated light) and halogen light (light modulated at twice the frequency of the electricity supply). Reliable operation is not possible above the relevant ambient light limit.
