# CAPACITOR SERIES TABLE, CONTENTS

## ■ CONDUCTIVE POLYMER ALUMINUM SOLID CAPACITORS

| Series             |                | Features                                                     | Standard Type | Miniaturization Low profile type | Low Z | Long life | High temperature | AEC-Q200 | Terminal type | Endurance (+R=With ripple)   | Rated voltage range (Vdc) |
|--------------------|----------------|--------------------------------------------------------------|---------------|----------------------------------|-------|-----------|------------------|----------|---------------|------------------------------|---------------------------|
| Surface Mount Type | PXN            | Super low ESR, high ripple current, high moisture resistance |               | ●                                | ●     | ●         |                  | ●        | SMD           | 105°C 5,000 hours            | 2.5 to 16                 |
|                    | PXT            | Super low ESR, high ripple current, high moisture resistance |               | ●                                | ●     | ●         |                  |          | SMD           | 105°C 15,000 hours           | 2.5 to 16                 |
|                    | PXJ            | Super low ESR, high ripple current, downsizing               |               | ●                                | ●     | ●         |                  |          | SMD           | 105°C 15,000 hours           | 2.5 to 25                 |
|                    | PXG (Upgrade!) | Super low ESR, high ripple current, downsizing               | ●             | ●                                | ●     | ●         |                  |          | SMD           | 105°C 3,000 to 15,000 hours  | 16 to 25                  |
|                    | PXK            | Super low ESR, high ripple current, downsizing               | ●             | ●                                | ●     | ●         |                  |          | SMD           | 105°C 3,000 to 15,000 hours  | 2.5 to 16                 |
|                    | PXS            | Super low ESR, high ripple current                           |               | ●                                | ●     | ●         |                  |          | SMD           | 105°C 20,000 hours           | 4 to 16                   |
|                    | PXF            | Super low ESR, high ripple current                           | ●             | ●                                | ●     | ●         |                  |          | SMD           | 105°C 3,000 to 15,000 hours  | 2 to 10                   |
|                    | PXE            | Super low ESR, high ripple current                           |               | ●                                | ●     | ●         |                  |          | SMD           | 105°C 15,000 hours           | 2.5 to 16                 |
|                    | PXA            | Super low ESR, high ripple current                           |               | ●                                | ●     | ●         |                  |          | SMD           | 105°C 3,000 to 15,000 hours  | 2.5 to 25                 |
|                    | PXD            | 125°C, super low ESR, high ripple current                    |               | ●                                | ●     |           | ●                | ●        | SMD           | 125°C 2,000 hours            | 2.5 to 10                 |
| Radial Lead Type   | PXH (Upgrade!) | 125°C, super low ESR, high ripple current                    |               | ●                                | ●     |           | ●                |          | SMD           | 125°C 1,000 to 3,000 hours   | 2.5 to 20                 |
|                    | PSW            | Super low ESR, high ripple current, downsizing               |               | ●                                | ●     |           |                  |          | Radial        | 105°C 5,000 hours            | 25                        |
|                    | PSJ            | Super low ESR, high ripple current, downsizing               |               | ●                                | ●     |           |                  |          | Radial        | 105°C 2,000 to 5,000 hours   | 2.5                       |
|                    | PSG            | Super low ESR, high ripple current                           | ●             | ●                                | ●     | ●         |                  |          | Radial        | 105°C 15,000 to 20,000 hours | 16 to 35                  |
|                    | PSK            | Super low ESR, high ripple current                           | ●             | ●                                | ●     | ●         |                  |          | Radial        | 105°C 20,000 hours           | 2.5 to 6.3                |
|                    | PSF            | Super low ESR, high ripple current                           | ●             | ●                                | ●     | ●         |                  |          | Radial        | 105°C 20,000 hours           | 2 to 16                   |
|                    | PSE            | Super low ESR, high ripple current                           |               | ●                                | ●     | ●         |                  |          | Radial        | 105°C 20,000 hours           | 2.5 to 6.3                |
|                    | PSC            | Super low ESR, high ripple current                           |               | ●                                | ●     | ●         |                  |          | Radial        | 105°C 15,000 hours           | 2.5 to 16                 |

## ■ CONDUCTIVE POLYMER HYBRID ALUMINUM ELECTROLYTIC CAPACITORS

| Series             |            | Features                                  | Standard Type | Miniaturization Low profile type | Low Z | Long life | High temperature | AEC-Q200 | Terminal type | Endurance (+R=With ripple)     | Rated voltage range (Vdc) |
|--------------------|------------|-------------------------------------------|---------------|----------------------------------|-------|-----------|------------------|----------|---------------|--------------------------------|---------------------------|
| Surface Mount Type | HXF        | 135°C, super low ESR, high ripple current |               |                                  | ●     | ●         | ●                | ●        | SMD           | 135°C 4,000 hours +R           | 25 to 63                  |
|                    | HXE        | 135°C, super low ESR, high ripple current |               |                                  | ●     | ●         | ●                | ●        | SMD           | 135°C 2,000 to 4,000 hours +R  | 16 to 63                  |
|                    | HXK (New!) | 125°C, super low ESR, high ripple current |               |                                  | ●     | ●         | ●                | ●        | SMD           | 125°C 4,000 hours +R           | 16 to 35                  |
|                    | HXJ        | 125°C, super low ESR, high ripple current |               |                                  | ●     | ●         | ●                | ●        | SMD           | 125°C 4,000 hours +R           | 16 to 63                  |
|                    | HXC        | 125°C, super low ESR, high ripple current | ●             |                                  | ●     | ●         | ●                | ●        | SMD           | 125°C 4,000 hours +R           | 16 to 80                  |
|                    | HXD        | 105°C, super low ESR, standard            | ●             |                                  | ●     |           |                  | ●        | SMD           | 105°C 5,000 to 10,000 hours +R | 16 to 80                  |
| Radial Lead Type   | HSE        | 135°C, super low ESR, high ripple current |               |                                  | ●     | ●         | ●                | ●        | Radial        | 135°C 4,000 hours +R           | 25 to 63                  |
|                    | HSC        | 125°C, super low ESR, high ripple current | ●             |                                  | ●     | ●         | ●                | ●        | Radial        | 125°C 4,000 hours +R           | 25 to 80                  |
|                    | HSD        | 105°C, super low ESR, standard            | ●             |                                  | ●     |           |                  | ●        | Radial        | 105°C 10,000 hours +R          | 25 to 80                  |

## ■ ALUMINUM ELECTROLYTIC CAPACITORS

| Series             |                     | Features       | Standard Type | Miniaturization Low profile type | Low Z | Long life | High temperature | AEC-Q200 | Terminal type | Endurance (+R=With ripple) | Rated voltage range (Vdc) |

AEC-Q200 : AEC-Q200 compliant. Please contact your local Chemi-Con office for more details, test data, information and also non indicated products.

# PART NUMBERING SYSTEM

## Part numbering system

Our part numbering system is common to all of Nippon Chemi-Con's subsidiaries worldwide, and has been switching the conventional part numbering system. The part number uses 18-digit codes to express information of principal product specifications such as product category, series name, rated voltage, capacitance, case size and RoHS compliance.

### ●Example

| Product type              | Part number (Example) | Conventional part number (Ref.) |
|---------------------------|-----------------------|---------------------------------|
| Surface mount type        | EMVE160ADA100MD55G    | MVE16VC10MD55E0                 |
| Radial lead type          | EKMQR3ETC102MHB5D     | TC04RKMQR6.3VB1000MF50E0        |
| Snap-in type              | EKMQR201VSN471MP30S   | KMQ200VSSN470M22BE0             |
| Screw mount terminal type | ERWE551LGC821MCD0U    | RWE550LGSN820MCC13EA            |

## Environment friendly capacitors

Nippon Chemi-Con has been taking proactive approaches toward developing and marketing less environmentally-load products in response to the international efforts for reducing hazardous substances and to the regulations. Nippon Chemi-Con had already abolished 4 additional substances, which will be prohibited from July 2019 in accordance with revised RoHS directive (2011/65/EU), by innovating alternative materials of the outer tube.

RoHS2 Compliant : Compliant to the 2011/65/EU and the revisions (2015/863/EU)

ELV Compliant : Compliant to the 2000/53/EC and the revisions (2016/774/EU)

Please contact us for more information about "Halogen-free specification".

### ◆Pb-free and Non-PVC Products

|                                                               | Screw-Mount | PVC                       |

\*Please consult with us when you need "Non-PVC parts" other than the above mentioned outer sleeve materials.

The colors of a PET sleeve are "Black", "Brown", and "Dark blue".

Standard designs of "Pb-free" Snap-in type are not equipped with a plastic disc.

Please consult with us when you need nonflammable grade for outer sleeve material.

Identification of friendly parts is given by a supplement code (18th digit) of the part number.

For details, please refer to "Product code guide" for each type.

◆ RECOMMENDED SOLDER LAND

⊗ Solder land on PC board

The vibration resistant model supports the vibration condition of 30G.  
Since vibration is affected by solder thickness and other characteristics and conditions, please contact us for details.

\* 1 : Each product family has different value. Please refer to each page.

\* 2 : The taping for size  $\phi 16$  and  $\phi 18$  is available as a custom design.

\* 3 : For the Taping code TD products with case diameter  $\geq 12.5$ mm, you can also select an option (Taping code: TS) that enhanced taping packaging.

### TAPING CODE

#### Example

### QUANTITY PER AMMO PACK

#### Ammo pack box

#### Typical example

| Case size<br>$\phi D \times L$ (mm)                   | A<br>(mm)         | B<br>(mm)      | Quantity<br>(pcs.) |
|-------------------------------------------------------|-------------------|----------------|--------------------|
| $\phi 5$<br>L=11 to 15mm<br>L=17mm                    | 232<br>235        | 51<br>60       | 2,000              |
| $\phi 6.3$<br>L=11 to 15mm<br>L=17mm                  | 284<br>284        | 51<br>55       | 2,000              |

## RADIAL LEAD TYPE (CUT/FORMED LEAD)

The following lead configurations are available. When ordering, please indicate the type of lead configurations by using the appropriate supplement code, such as C3, FC, MC or RC in the product part number.

| Terminal type                                                                                                                                                                                                                                                                                                                                                                                                             | Size        | Terminal type                                                                                                                                                                                                                                                                                                           | Size        |   |            |         |     |         |            |         |     |         |             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |  |

\*1 The GVA, GPD, GVD and GQB series are not compatible with bagging. They are packaged in a box.

\*2 The standard bagged quantity may differ depending on the terminal type or packing style. Please contact us for details.

\*3 Minimum order quantity for conductive polymer aluminum solid capacitors and conductive polymer hybrid aluminum electrolytic capacitors.

## AVAILABLE TERMINALS FOR SNAP-IN AND SCREW-MOUNT TYPE

- We can make the following terminal type on custom design.
- There is a restriction for specification of product, please consult with us when the product is required.
- Please consult with us about terminal type other than those following listed.

### Snap-in type

\*1 Negative terminal : Mesh marking

\*2 Use the dummy terminals for mechanical support only.

The dummy terminals must not be connected to any circuit trace on PC board, be sure to electrically isolate from the negative and the positive terminals.

## Conductive Polymer Aluminum Solid Capacitors

## PRECAUTIONS AND GUIDELINES (Conductive Polymer)

The NPCAP™ is a Conductive Polymer Solid Aluminum Capacitor that uses highly conductive polymer electrolytic material. Please read the following in order to get the most out of your NPCAP™ capacitor.

The circuits described as examples in this catalog and the "delivery specifications" are featured in order to show the operations and usage of our products, however, this fact does not guarantee that the circuits are available to function in your equipment systems.

We are not in any case responsible for any failures or damage caused by the use of information contained herein.

You should examine our products, of which the characteristics are described in the "delivery specifications" and other documents, and determine whether or not our products suit your requirements according to the specifications of your equipment systems. Therefore, you bear final responsibility regarding the use of our products.

Please make sure that you take appropriate safety measures such as use of redundant design and malfunction prevention measures in order to prevent fatal accidents and/or fires in the event any of our products malfunction.

For Conductive Polymer Hybrid Aluminum Electrolytic Capacitors, see Precautions and Guidelines (Conductive Polymer Hybrid). For Aluminum Electrolytic Capacitors, see Precautions and Guidelines (Aluminum Electrolytic Capacitors).

### 1 Designing Device Circuits

#### 1) Types of Circuits Where NPCAP™ Capacitors are Not to be Used

The leakage current in conductive polymer solid aluminum capacitors (hereafter called capacitors) may vary depending on thermal stresses during soldering. Avoid the use of capacitors in the following types of circuits:

- ① High-impedance circuits that are to sustain voltages.
- ② Coupling circuits
- ③ Time constant circuits

Because the capacitance varies depending on the environment the capacitors are used in, there is a possibility that the capacitor can affect a time constant circuit where sensitivity to variation in capacitance is required.

- ④ Other circuits that are significantly affected by leakage current

#### 2) Circuit Design

Verify the following before designing the circuit:

- ① The electrical characteristics of the capacitor will vary depending on differences in temperature and frequency. You had better design after verifying the scope of these factors.
- ② When connecting two or more capacitors in parallel, ensure that the design takes current balancing into account.
- ③ When two or more capacitors are connected in series, variability in applied voltage may cause over-voltage conditions. Contact Nippon Chemi-Con before using capacitors connected in series.
- ④ Avoid putting heat generating parts either around the capacitor or on the reverse of the circuit board.

#### 3) Use in High Reliable and Critical Applications

Consult with us in advance of usage of our products in the following listed applications. ① Aerospace equipment ② Power generation equipment such as thermal power, nuclear power etc. ③ Medical equipment ④ Transport equipment (automobiles, trains, ships, etc.) ⑤ Transportation control equipment ⑥ Disaster prevention / crime prevention equipment ⑦ Highly publicized information processing equipment ⑧ Submarine equipment ⑨ Other applications that are not considered general-purpose applications.

#### 4) Polarity

The NPCAP™ is a polarized solid aluminum electrolytic capacitor. Do not apply either reverse voltages or AC voltages to the polarized capacitors, using reversed polarity may cause a short circuit. Refer to the catalog, product specifications or capacitor body to confirm the polarity prior to use.

#### 5) Operating Voltage

Do not apply a greater than rated voltage, if a voltage greater than the rated voltage is suddenly applied the leakage current increases causing shorting. The peak voltage of superimposed AC voltages (ripple voltages) on DC voltages must not exceed

the full rated voltage. Capacitors do not require voltage derating within the category temperature. While there are specifications for surge voltages exceeding the rated voltage, usage conditions apply, and continued operation for extended periods of time under such conditions cannot be guaranteed.

#### 6) Ripple Current

Do not apply currents in excess of the rated ripple current. The superimposition of a large ripple current increases the rate of heating within the capacitor. When excessive ripple current is imposed the internal temperature increases which can shorten life and shorting may occur.

#### 7) Operating Temperature

Use within the stated category temperature range, if used outside this range, characteristics can deteriorate potentially leading to problems.

#### 8) Charging and Discharging the Capacitor

Do not use the NPCAP™ capacitor in circuits where the capacitor is repetitively charged and discharged rapidly. Repetitive charging and discharging the capacitor rapidly may reduce the capacitance or may cause damage due to internal heating. Use of a protective circuit to ensure reliability is recommended when rush currents exceed 20A.

#### 9) Leakage current

The leakage current may increase. After that, however, the leakage current will gradually decrease by self-healing action of the dielectric oxide layer when the capacitors are applied with a voltage less than the rated voltage within the Category Temperature range. As the voltage is closer to the rated voltage and the temperature is closer to the upper limit of Category Temperature range, the leakage current decreases faster.

The leakage current will increase by the following factors,

- ① Soldering
- ② Testing of high temperature exposure with no voltage applied, high temperature/humidity storage, temperature cycles, etc.

#### 10) Failures and Service Life

The failure rate at the rated voltage application of NPCAP™ and the upper limit of the category temperature is based on 0.5%/1,000 hours (reliability level 60%) compliant with JIS C 5003. The possibility of failures is not zero, however, the actual failure mode is as follows.

## (1) Failure Modes

- The principal failure mode is wear-out failure caused by a decrease in capacitance as a result of an increase in temperature in the product, and an increase in ESR, both of which eventually cause the capacitors to experience open circuit failure. In addition, a short circuit failure may occur due to excessive voltage, excessive current, excessive heat stress, or excessive physical stress applied to the capacitors.
- The failure rate would be reduced by reducing ambient temperatures, ripple current and applying voltage.
- If the short-circuited capacitor, which may be caused by over-voltages higher than the rated voltage or other conditions, has a large amount of current passed through, the aluminum can of the capacitor bulges and might be expelled with odor gas emitted.
- The product contains flammable materials. If the short causes a spark it may ignite.  
Please be careful when installing the product, its position and the layout design.
  - Increase safety by using in conjunction with a protective circuit or protective equipment.
  - Install measures such as redundant circuits so that the failure of a part of the equipment will not cause unstable operation.

Failure modes depend on the application conditions that lead to fail.

## (2) Service Life

SMD (Chip type) and radial lead type use rubber as the sealing material, so the service life depends on the thermal integrity of this rubber.

When long life performance is required in actual use, please use the capacitor at lower temperature within the category temperature.

capacitor. The trace must pass 1 to 2mm to the side of the capacitor.

- Do not pass any via holes underneath a capacitor on double-sided PC board
- In designing double-sided PC boards, do not locate any copper trace under the seal side of a capacitor

## 11) Capacitor Insulation

Insulation of the capacitor's case is not guaranteed. Ensure electrical insulation between the capacitor case, negative electrode, positive electrode and circuit pattern.

## 12) Capacitor Usage Environment

Do not use/expose capacitors to the following conditions.

- Oil, water, salty water, take care to avoid storage in damp locations.
- Direct sunlight
- Toxic gases such as hydrogen, sulfide, sulfurous acids, nitrous acids, chlorine and chlorine compounds, bromine and bromine compounds, ammonia, etc.
- Ozone, ultraviolet rays and radiation.
- Severe vibration or mechanical shock conditions beyond the limits advised in the product specification section of the catalog. The standard vibration condition is applicable to JIS C 5101-4.

## 13) Capacitor mounting

- For the surface mount capacitor, design the solder land on the PC board in accordance with the catalog or the product specification.
- For radial capacitors, design the terminal holes on the PC board to fit the terminal dimension of the capacitor.
- Do not pass any circuit traces beneath the seal side of a

## 2) Installing Capacitors

## 1) Installing

- Do not reuse capacitors already assembled in equipment that have been exposed to power.
- The capacitor may have self charge. If this happens, discharge the capacitor through a resistor of approximately 1kΩ before use.
- If capacitors are stored at a temperature of 35°C or more and more than 75%RH, the leakage current may increase. This may also occur if the capacitors are stored for a longer period than the period which is specified in the catalog or the product specification. In this case, they can be reformed by the voltage treatment through a resistor of approximately 1kΩ.
- Verify the rated capacitance and voltage of the capacitors when installing.
- Verify the polarity of the capacitors.
- Do not use the capacitors if they have been dropped on the floor.
- Do not deform the case of the capacitors.
- Verify that the lead spacing of the capacitor fits the hole spacing in the PC board before installing the capacitors.
- Do not apply any mechanical force in excess of the limits prescribed in the catalog or the product specification of the capacitors. Avoid subjecting the capacitor to strong forces,

## PRECAUTIONS AND GUIDELINES (Conductive Polymer)

as this may break the electrode terminals, bend or deform the capacitor, or damage the packaging, and may also cause short/open circuits, increased leakage current, or damage the appearance. Also, note the capacitors may be damaged by mechanical shocks caused by cut the lead wire, the vacuum/insertion head, component checker or centering operation of an automatic mounting or insertion machine.

### 2) Heat Resistance during Soldering

Ensure that the soldering conditions meet the specifications recommended by Nippon Chemi-Con. Note that the leakage current may increase or capacitance may decrease due to thermal stresses that occur during soldering, etc. Furthermore, the leakage current which rose gradually decreases, when voltage is applied at below the category upper limit temperature. Additionally the self repairing action is faster when voltage near the rated voltage rather than at a higher voltage is applied at below the category's upper temperature limit.

① Verify the following before using a soldering iron:

- That the soldering conditions (temperature and time) are within the ranges specified in the catalog or product specifications.
- That the tip of the soldering iron does not come into contact with the capacitor itself.

② Verify the following when flow soldering:

- Do not dip the body of a capacitor into the solder bath only dip the terminals in. The soldering must be done on the reverse side of PC board.
- Soldering conditions (preheat, solder temperature and dipping time) should be within the limits prescribed in the catalog or the product specifications.
- Do not apply flux to any part of capacitors other than their terminals.
- Make sure the capacitors do not come into contact with any other components while soldering.
- Flow soldering must not be used for the SMD(Chip type) capacitors.

③ Verify the following when reflow soldering:

- Soldering conditions (preheat, solder temperature and soldering time) should be within the limits prescribed in the catalogs or the product specification.
- The heat level should be appropriate. (Note that the thermal stress on the capacitor varies depending on the type and position of the heater in the reflow oven, and the color and material of the capacitor.)
- Please consult us about Vapor phase soldering (VPS).
- Except for the surface mount type, reflow soldering must not be used for the capacitors.

④ Do not reuse a capacitor that has already been soldered to PC board and then removed. When using a new capacitor in the same location, remove the flux, etc. first, and then use a soldering iron to solder on the new capacitor in accordance with the specifications.

### 3) Handling After Soldering

Do not apply any mechanical stress to the capacitor after soldering onto the PC board.

- ① Do not lean or twist the body of the capacitor after soldering the capacitors onto the PC board.
- ② Do not use the capacitors for lifting or carrying the assembly board.
- ③ Do not hit or poke the capacitor after soldering to PC board. When stacking the assembly board, be careful that other components do not touch the aluminum electrolytic capacitors.
- ④ Do not drop the assembled board.

### 4) Cleaning PC boards

- ① Do not wash capacitors by using the following cleaning agents. Solvent resistant capacitors are only suitable for washing using the cleaning conditions prescribed in the

catalog or the product specification. In particular, ultrasonic cleaning will accelerate damage to capacitors.

- Halogenated solvents; cause capacitors to fail due to corrosion.
- Alkali system solvents; corrode (dissolve) an aluminum case.
- Petroleum system solvents; cause the rubber seal material to deteriorate.
- Xylene and toluene; causes the rubber seal material to deteriorate.
- Acetone; erases the markings.

CFC alternatives or the other cleaners above; please consult with us.

② Verify the following points when washing capacitors.

- Monitor conductivity, pH, specific gravity and the water content of cleaning agents. Contamination adversely affects these characteristics.
- Be sure not to expose the capacitors under solvent rich conditions or keep capacitors inside a closed container. In addition, please dry the solvent sufficiently on the PC board and the capacitor with an air knife (temperature should be less than the maximum rated category temperature of the capacitor) for 10 minutes. Aluminum electrolytic capacitors can be characteristically and catastrophically damaged by halogen ions, particularly by chlorine ions, though the degree of the damage mainly depends upon the characteristics of the electrolyte and rubber seal material. When halogen ions come into contact with the capacitors, the foil corrodes when a voltage is applied. This corrosion causes an extremely high leakage current which results venting and an open circuit.

If the new types of cleaning agents mentioned below are used, the following are recommended as cleaning conditions for some of new cleaning agents.

#### -Higher alcohol cleaning agents

Pine Alpha ST-100S (Arakawa Chemical)

Clean Through 750H, 750HS and 750J (Kao)

Cleaning Conditions:

Using these cleaning agents, capacitors are capable of withstanding immersion or ultrasonic cleaning for 10 minutes at a maximum liquid temperature of 60°C. Find optimum condition for washing, rinsing, and drying. Be sure not to rub the marking off the capacitor which can be caused by contact with other components or the PC board. Note that shower cleaning adversely affects the markings on the sleeve.

#### -Non-Halogenated Solvent Cleaning

AK225AES (Asahi Glass)

Cleaning Conditions:

Immersion, ultrasonic or vapor cleaning for 5 minutes. However, from an environmental point of view, these types of solvent will be banned in near future. We would recommend not using them if at all possible.

#### -Isopropyl Alcohol (IPA)

IPA (Isopropyl Alcohol) is one of the most acceptable cleaning agents; it is necessary to maintain a flux content in the cleaning liquid at a maximum limit of 2 Wt.%.

### 5) Precautions for using adhesives and coating materials

- ① Do not use any adhesive and coating materials containing halogenated solvent.
- ② Verify the following before using adhesive and coating material.
  - Remove flux and dust left over between the rubber seal and the PC board before applying adhesive or coating materials to the capacitor.
  - Dry and remove any residual cleaning agents before applying adhesive and coating materials to the capacitors. Do not cover over the whole surface of the rubber seal with the

adhesive or coating materials.

- For permissible heat conditions for curing adhesives or coating materials, please consult with us.
- Covering over the whole surface of the capacitor rubber seal with resin may result in a hazardous condition because the inside pressure cannot be completely released. Also, a large amount of halogen ions in resins will cause the capacitors to fail because the halogen ions penetrate into the rubber seal and the inside of the capacitor.
- Some coating materials, it cannot be implemented to the capacitor.

Please note change on the surface might be caused according to the kind of solvents used for mounting adhesives and coating agents.

## 6) Fumigation

In exporting or importing electronic devices, they may be exposed to fumigation with halide such as methyl bromide. Where aluminum electrolytic capacitors are exposed to halide such as methyl bromide, the capacitors will be damaged with the corrosion reaction with halogen ions in the same way as cleaning agents. For the export and import, Nippon Chemi-Con considers using some packaging method and so forth so that fumigation is not required. For customers to export or import electronic devices, semi-assembly products or capacitor components, confirm if they will be exposed to fumigation and also consider final condition of packaging. (Note that either cardboard or vinyl package has a risk of fumigation gas penetration.)

## 3 The Operation of Devices

- 1) Do not touch the capacitor terminals directly.
- 2) Do not short-circuit the terminal of a capacitor by letting it come into contact with any conductive object. Also, do not spill electric-conductive liquid such as acid or alkaline solution over the capacitor.
- 3) Do not use capacitors in circumstances where they would be subject to exposure to the following materials
  - Oil, water, salty water or damp location.
  - Direct sunlight.
  - Ozone, ultraviolet rays or radiation.
  - Toxic gases such as hydrogen sulfide, sulfurous acid, nitrous acid, chlorine or its compounds, and ammonium.
  - Severe vibration or mechanical shock conditions beyond the limits prescribed in the catalog or product specification.

The standard vibration condition is applicable to JIS C 5101-4.

## 4 Maintenance Inspection

- 1) Make periodic inspections of capacitors that have been used in industrial applications. Before inspection, turn off the power supply and carefully discharge the electricity in the capacitors. Verify the polarity when measuring the capacitors with a volt-ohm meter. Do not apply any mechanical stress to the terminals of the capacitors.
- 2) The following items should be checked during the periodic inspections.
  - ① Significant damage in appearance
  - ② Electrical characteristics: Leakage current, capacitance,  $\tan \delta$  and other characteristics prescribed in the catalog or product specification.

We recommend replacing the capacitors if the parts are out of specification.

## 5 Contingencies

- 1) If gas has vented from the capacitor during use, there is a short circuit and burning, or the capacitor discharges an odor or smoke, turn off the main power supply to the equipment or unplug the power cord.
- 2) If there is a problem with the capacitor or a fire breaks out, the capacitor may produce a burning gas or reactive gas

from the outer resin, etc. If this happens, keep your hands and face away from the gas. If vented gas is inhaled or comes into contact with your eyes, flush your eyes immediately with water and/or gargle. If vented gas comes into contact with the skin, wash the affected area thoroughly with soap and water.

## 6 Storage

We recommend the following conditions for storage.

- 1) Store capacitors in a cool, dry place. Store at a temperature between 5 and 35°C, with a humidity of 75% or less. (table-1 Maximum storage term)

|                 | Before the bag is opened           | After the bag is opened                 |
|-----------------|------------------------------------|-----------------------------------------|
| SMD (Chip type) | Within 3 years after manufacturing | Within 6 months after the bag is opened |
| Radial          | Within 3 years after manufacturing | —                                       |

SMD products are sealed in a special laminated aluminum bag. Use all capacitors once the bag is opened. Return unused capacitors to the bag, and seal it with a zipper. Please refer to (Table -1 maximum storage term) for storage conditions. Be sure to follow our recommendations for reflow soldering.

- 2) Store the capacitors in a location free from direct contact with water, salt water, and oil.
- 3) Store in a location where the capacitor is not exposed to toxic gas, such as hydrogen sulfide, sulfurous acid, nitrous acid, chlorine or chlorine compounds, bromine or other halogen gases, methyl bromide or other halogen compounds, ammonia, or similar.
- 4) Store in a location where the capacitor is not exposed to ozone, ultraviolet radiation, or other radiation.
- 5) It is recommended to store capacitors in their original packaging wherever possible.
- 6) The JEDEC J-STD-020 standard does not apply.

## 7 Disposal

Please consult with a local industrial waste disposal specialist when disposing of aluminum electrolytic capacitors.

## 8 About AEC-Q200

The Automotive Electronics Council (AEC) was originally established by major American automotive related manufactures. Today, the committees are composed of representatives from the sustaining Members of manufacturing companies in automotive electrical components. It has standardized the criteria for "stress test qualification" and "reliability tests" for electronic components.

AEC-Q200 is the reliability test standard for approval of passive components in Automotive applications. It specifies the test type, parameters and quantity, etc. for each component. The criteria of the reliability tests such as for our main products, "Aluminum Electrolytic Capacitors" are described in this standard.

Pursuant to the customer's specific testing requirements, Chemi-Con submits the test results according to AEC-Q200 for Aluminum Electrolytic Capacitors used in automotive applications on request.

An electronic component manufacturer cannot simply claim that their product is "AEC-Q200 Qualified". It can be claimed "Compliant", "Capable", "Available", etc., however each component must be tested per each users "Qualification Test Plan" in order to claim AEC-Q200 status.

Please contact us for more information.

## 9 Response to the Substances of Concern

- 1) Nippon Chemi-Con aims for developing products that meet laws and regulations concerning substances of concern. (Some products may contain regulated substances for ex-

## PRECAUTIONS AND GUIDELINES (Conductive Polymer)

empted application)

Please contact us for more information about law-compliance status.

- 2) According to the content of REACH handbook (Guidance on requirements for substances in articles which is published on May 2008), our electronic components are “articles without any intended release”. Therefore they are not applicable for “Registration” for EU REACH Regulation Article 7 (1).

“Study of REACH Regulation in EU about Electrolytic Capacitor”

(publicized on 13 March 2008)

### 10 Catalogs

Specifications in the catalogs are subject to change without notice. Test data shown in the catalogs are not assured as the whole performance values, but typical values.

For more details, refer to JEITA RCR-2367D (March 2019) with the title of “Safety Application Guide for fixed aluminum electrolytic capacitors for use in electronic equipment”.

# RECOMMENDED SOLDERING CONDITIONS FOR NPCAP™

## ◆SURFACE MOUNT TYPE

The following conditions are recommended for air or infrared reflow soldering PXN/PXT/PXJ/PXG/PXK/PXS/PXF/PXE/PXA/PXD/PXH series onto a glass epoxy circuit board of 90×50×0.8mm (with resist) by cream solder. The temperatures shown are the surface temperature values on the top of the can and temperature of capacitor terminal.

Reflow should be performed twice or less.

Please ensure that the capacitor became cold enough to the room temperature (5 to 35°C) before the second reflow.

### ● Recommended soldering heat conditions

| Series                                                     | Voltage range (Vdc) | Preheat       | Time maintained above 217°C | Time maintained above 230°C | Peak temp. | Reflow number    |
|------------------------------------------------------------|---------------------|---------------|-----------------------------|-----------------------------|------------|------------------|
| PXN/PXT<br>PXJ/PXG<br>PXK/PXS<br>PXF/PXE<br>PXA/PXD<br>PXH | 2.5 to 16V          | 150 to 180°C  | 50 sec. max.                | 40 sec. max.                | 260°C max. | 1-cycle only     |
|                                                            |                     |               |                             |                             | 250°C max. | 2-cycles allowed |

|                                                            |                     |               | 40 sec. max.                | 30 sec. max.                |            | 2-cycles allowed |

### ● Recommended Solder Land on PC Board

| Size code          | a   | b   | c   |
|--------------------|-----|-----|-----|
| E40, E46, E61      | 1.4 | 3.0 | 1.6 |
| F46, F61, F80, FA0 | 1.9 | 3.5 | 1.6 |
| H70, H80, HA0, HC0 | 3.1 | 4.2 | 2.2 |
| J80, JA0, JC0      | 4.5 | 4.4 | 2.2 |

## ◆RADIAL LEAD TYPE

### ● Recommended soldering heat conditions

Preheat : 150°C 120 seconds max.

Flow soldering : 260±5°C max. 10+1 seconds max. (Or 380±10°C max. 3±0.5 seconds max.: hand soldering)

### ◆PRECAUTIONS FOR USERS

#### Soldering method

SMD (Chip type) have no capability to withstand such dip or flow soldering as totally immersing components into a solder bath.

#### Reflow soldering

Reflow the capacitors within Recommended Reflow Soldering Conditions. Verify there is no temperature stress to the capacitors because the following differences might degrade capacitors electrically and mechanically. Please consult with us if other reflow conditions are employed.

1. Location of components : Temperature increases at the edge of PC board more than the center.
2. Population of PC board : The lower the component population is, the more temperature rises.
3. Material of PC board : A ceramic-made board needs more heat than a glass epoxy-made board. The heat increase may cause damage to the capacitors.
4. Thickness of PC board : A thicker board needs more heat than a thinner board. The heat may damage the capacitors.
5. Size of PC board : A larger board needs more heat than a smaller board. The heat may damage the capacitors.
6. Solder thickness  
If very thin cream solder paste is to be used for SMD types, please consult with us.
7. Location of infrared ray lamps : IR reflow as well as hot plate reflow heats only on the reverse side of the PC board to lessen heat stress to the capacitors.
8. Case leakage current will increase (~mA) after the reflow process, the leakage current which rose gradually decreases when voltage is applied.
9. Please consult us about vapor phase soldering (VPS).

#### Rework of soldering

Use a soldering iron for rework. Do not exceed an iron tip temperature of 380±10°C and an exposure time of 3±0.5 seconds.

#### Mechanical stress

Do not grab the capacitors to lift the PC board and give stress to the capacitor. Avoid bending the PC board. This may damage the capacitors.

#### Cleaning assembly board

Immediately after solvent cleaning, remove residual solvent with an air knife for at least 10 minutes. If the solvent is insufficiently dry, the capacitors may corrode.

#### Coating on assembly board

1. Before curing coating material, remove the cleaning solvents from the assembly board.
2. Before conformal coating, a chloride free pre-coat material is recommended to decrease the stress on the capacitors.

#### Molding with resin

Internal chemical reaction gradually produces gas in the capacitor; increasing internal pressure. If the end seal of the capacitor is completely covered by resin the gas will be unable to escape causing a potentially dangerous situation. The chlorine in resin will penetrate the end seal, reach the element, and damage of the capacitor.

#### Glue

The followings are requirements for glue.

1. A low curing temperature over a short period of time
2. Strong adhesion and heat resistance after curing
3. Long shelf life
4. No corrosion

#### Others

Refer to PRECAUTIONS AND GUIDELINES (Conductive Polymer).

## Lifetime Estimation of Conductive Polymer Aluminum Solid Capacitors

Subject series : PXN, PXT, PXJ, PXG, PKX, PXS, PXF, PXE, PXA, PXD, PXH, PSW, PSJ, PSG, PSK, PSF, PSE, PSC

Conductive polymer aluminum solid capacitors are finite life electronic components like aluminum electrolytic capacitors.

The lifetime is affected by ambient temperature, humidity, ripple current and surge voltage.

The lifetime of aluminum electrolytic capacitors is affected mainly by the loss of electrolyte as the result of the liquid electrolyte evaporating through the rubber seal materials, resulting in capacitance drop and  $\tan \delta$  rise.

On the other hand, the lifetime of conductive polymer aluminum solid capacitors is affected mainly by oxidation degradation of the conductive polymer caused by osmose of oxygen or the thermal degradation of the conductive polymer by ambient temperature or self-heating, resulting in ESR rise and  $\tan \delta$  rise.

The infiltration rate of the oxygen is depend on the temperature as the liquid electrolyte evaporation and the relationship follows the Arrhenius's Law, too. Similarly, thermal degradation of the conductive polymer by self-heating follows the Arrhenius's Law, too.

Therefore, the lifetime estimation has been using the theory of lifetime reducing by half at every 10°C rise of the ambient temperature.

### 1. Lifetime Estimation

Equation (1) can be used for estimating the lifetime of the conductive polymer aluminum solid capacitors based on the ambient temperature and the rise of internal temperature due to ripple current.

$$L_x = L_o \times 2^{\frac{T_o - T_x}{10}} \times 2^{\frac{-\Delta T}{10}} \dots\dots\dots(1)$$

$L_x$  : Estimation of actual lifetime (hour)

$L_o$  : Specified lifetime with the rated voltage at the upper limit of the category temperature (hour)

$T_o$  : Maximum category temperature (°C)

$T_x$  : Actual ambient temperature of the capacitor (°C)

Use 40°C if the actual ambient temperature is below it.

$\Delta T$  : Rise of internal temperature due to the rated ripple current (°C)

Longer lifetime is expected by lowering the ripple current and the ambient temperature.

An approximate value of ripple current-caused  $\Delta T$  can be calculated using Equation (2)

$$\Delta T = \Delta T_o \times \left( \frac{I_x}{I_o} \right)^2 \dots\dots\dots(2)$$

$\Delta T_o$  : Rise in internal temperature due to the rated ripple current

| Maximum category temperature | $\Delta T_o$                 |                                                  |
|------------------------------|------------------------------|--------------------------------------------------|
|                              | $T_x \leq 105^\circ\text{C}$ | $105^\circ\text{C} < T_x \leq 125^\circ\text{C}$ |
| 105°C                        | 20°C                         | -                                                |
| 125°C                        | 20°C                         | 3°C                                              |

\*Please consult us about  $\Delta T_o$  for F80 size of PXH series.

$I_x$  : Operating ripple current (Arms) actually flowing in the capacitor

$I_o$  : Rated ripple current (Arms), frequency compensated, at the upper limit of the category temperature range

To determine more accurate values of  $\Delta T$ , they can be actually measured using a thermocouple.

### 2. Rated Ripple Current Frequency Multipliers

Self-heat rise is generated by the ripple current even though the conductive polymer aluminum solid capacitors have low ESR compared to liquid based electrolyte aluminum electrolytic capacitor. The ESR value differs depending on the frequency, thus the degree of self-heat rise differs depending on the ripple current frequency. Therefore, if the actual ripple current frequency differs from the specifications stated in the standard ratings, use the value obtained by multiplying the rated ripple current multiplier to convert the rated current.

Conductive polymer aluminum solid capacitors have super low ESR characteristic in high-frequency range. On the whole, ESR in low-frequency range relatively rises. Therefore, they can use only small ripple current in low-frequency range.

Please ensure that excessive ripple current is not applied to the capacitors in all frequency range.

### 3. Restriction of estimated lifetime calculation

The result calculated by the estimated lifetime formula, it is not guaranteed lifetime by Nippon Chemi-Con Corporation.

When designer calculate the lifetime of apparatus, please include an ample margin in consideration to the estimated lifetime of a capacitor.

When calculated lifetime result are over 15 years by using the estimated lifetime formula, please consider 15 years to be a maximum in considering that the sealing rubber characteristics vary during the lifetime.

If 15 years or more may be required as an expected lifetime, please consult us.

# CONDUCTIVE POLYMER ALUMINUM SOLID CAPACITORS

## Product List

### ◆RADIAL LEAD TYPE (2 to 10V<sub>dc</sub>)

\*1 ESR(mΩ max.)20°C, 100k to 300kHz(PSJ series : 300kHz) \*2 Rated ripple current(mArms)105°C, 100kHz

| Cap<br>(μF) | 2V <sub>dc</sub> |                                |                   |                                 | 2.5V <sub>dc</sub> |                                |                   |                                 | 4V <sub>dc</sub> |                                |                   |                                 | 6.3V <sub>dc</sub> |                                |                   |                                 | 10V <sub>dc</sub> |                                |                   |                                 |

## NPCAP™-PXN Series

- Super low ESR, impedance and high heat resistance have been obtained by using conductive polymer as electrolyte.
- High moisture resistance, Bias Humidity: 1,000 hours at 85°C, 85%RH
- Rated voltage range: 2.5 to 16V<sub>dc</sub>, Capacitance range: 56~1,200μF
- Suitable for DC-DC converters, voltage regulators and decoupling applications used on computer motherboards etc.
- Solvent resistant type (see PRECAUTIONS AND GUIDELINES)
- RoHS2 Compliant
- Halogen Free
- AEC-Q200 compliant : Please contact Chemi-Con for more details, test data, information.

## ◆MARKING

EX) 6.3V220μF

PXN series is a conductive polymer aluminum solid capacitor. All conductive polymer aluminum solid capacitors, including the PXN series may temporarily exhibit increased leakage current due to heat stress during the reflow soldering process. However, applying stepped voltage under the category temperature range gradually decreases the increased leakage current to normal levels. The speed or recovery time that leakage current decreases by self-healing depends on the temperature and voltage: (The closer to category upper limit temperature and rated voltage, the more rapid the leakage current decrease). Conductive polymer aluminum solid capacitors do not utilize liquid electrolyte. Therefore it takes a longer period of time to accomplish self-healing than aluminum electrolytic capacitors that have liquid electrolyte impregnation.

PXN series is a conductive polymer aluminum solid capacitor. All conductive polymer aluminum solid capacitors, including the PXN series may temporarily exhibit increased leakage current due to heat stress during the reflow soldering process. However, applying stepped voltage under the category temperature range gradually decreases the increased leakage current to normal levels. The speed or recovery time that leakage current decreases by self-healing depends on the temperature and voltage: (The closer to category upper limit temperature and rated voltage, the more rapid the leakage current decrease). Conductive polymer aluminum solid capacitors do not utilize liquid electrolyte. Therefore it takes a longer period of time to accomplish self-healing than aluminum electrolytic capacitors that have liquid electrolyte impregnation.

## NPCAP™-PXT Series

- Super low ESR, impedance and high heat resistance have been obtained by using conductive polymer as electrolyte.
- High moisture resistance, Bias Humidity: 1,000 hours at 85°C, 85%RH
- Rated voltage range: 2.5 to 16V<sub>dc</sub>, Capacitance range: 100 to 820μF
- Case size range : φ5×5.8L to φ6.3×7.7L
- Suitable for DC-DC converters, voltage regulators and decoupling applications used on computer motherboards etc.
- Solvent resistant type (see PRECAUTIONS AND GUIDELINES)
- RoHS2 Compliant
- Halogen Free

|                                                              |                                                                                                                                                                                                                   |  |  |  |  |  |
|                                                              |                                                                                                                                                                                                                   |  |  |  |  |  |
| Soldering Heat                                               | The following specifications shall be satisfied when the solder temperature is reduced back to 20°C after soldering has been performed under the recommended soldering conditions.                                |  |  |  |  |  |
|                                                              |                                                                                                                                                                                                                   |  |  |  |  |  |
|                                                              |                                                                                                                                                                                                                   |  |  |  |  |  |
|                                                              |                                                                                                                                                                                                                   |  |  |  |  |  |
|                                                              |                                                                                                                                                                                                                   |  |  |  |  |  |
|                                                              |                                                                                                                                                                                                                   |  |  |  |  |  |

\*Note : If any doubt arises, measure the leakage current after the following voltage treatment.  
Voltage treatment : DC rated voltage is applied to the capacitors for 120 minutes at 105°C.

## ◆DIMENSIONS [mm]

- Terminal Code : A

| Size Code | φD  | L   | A   | B   | C   | W          | P   |
|-----------|-----|-----|-----|-----|-----|------------|-----|
| E61       | 5   | 5.8 | 5.3 | 5.3 | 5.9 | 0.5 to 0.8 | 1.4 |
| F61       | 6.3 | 5.8 | 6.6 | 6.6 | 7.2 | 0.5 to 0.8 | 1.9 |
| F80       | 6.3 | 7.7 | 6.6 | 6.6 | 7.2 | 0.5 to 0.8 | 1.9 |

## NPCAP™-PXJ Series

- Super low ESR, impedance and high heat resistance have been obtained by using conductive polymer as electrolyte.
- Rated voltage range : 2.5 to 25V<sub>dc</sub>, Capacitance range : 56 to 1,200μF
- Case size range : φ6.3×5.8L to φ8×6.7L
- Suitable for DC-DC converters, voltage regulators and decoupling applications used on computer motherboards etc.
- Solvent resistant type (see PRECAUTIONS AND GUIDELINES)
- RoHS2 Compliant
- Halogen Free

\*Note : If any doubt arises, measure the leakage current after the following voltage treatment.  
Voltage treatment : DC rated voltage is applied to the capacitors for 120 minutes at 105°C.

## ◆DIMENSIONS [mm]

- Terminal Code : A

| Size Code | φD  | L   | A   | B   | C   | W          | P   |
|-----------|-----|-----|-----|-----|-----|------------|-----|
| F61       | 6.3 | 5.8 | 6.6 | 6.6 | 7.2 | 0.5 to 0.8 | 1.9 |
| F80       | 6.3 | 7.7 | 6.6 | 6.6 | 7.2 | 0.5 to 0.8 | 1.9 |
| FA0       | 6.3 | 9.7 | 6.6 | 6.6 | 7.2 | 0.5 to 0.8 | 1.9 |
| H70       | 8   | 6.7 | 8.3 | 8.3 | 9.0 | 0.7 to 1.1 | 3.1 |

## ◆MARKING

EX) 2.5V820μF

## NPCAP™-PXJ Series

### ◆PART NUMBERING SYSTEM

Please refer to "Product code guide (conductive polymer type)"

(Note1) :PXJ series, 16V270  $\mu$ F (Rated ripple current 5,080mArms) have supplement code "J". Terminal and terminal plating are the same as all other in PXJ series.

Production of the products shown in   is scheduled to be discontinued.

### ◆RATED RIPPLE CURRENT MULTIPLIERS

#### ●Frequency Multipliers

| Frequency(Hz) | 120  | 1k   | 10k  | 50k  | 100k to 500k |
|---------------|------|------|------|------|--------------|
| SMD type      | 0.05 | 0.30 | 0.55 | 0.70 | 1.00         |

## NPCAP™-PXG Series Upgrade!

- Super low ESR, high ripple current capability
- Rated voltage range : 16 to 25V<sub>dc</sub>, Capacitance range : 10 to 1,000μF
- Case size : φ5×4.5L to φ10×12.2L
- Solvent resistant type (see PRECAUTIONS AND GUIDELINES)
- RoHS2 Compliant
- Halogen Free

\*Note : If any doubt arises, measure the leakage current after the following voltage treatment.  
Voltage treatment : DC rated voltage is applied to the capacitors for 120 minutes at 105°C.

Production of the products shown in [ ] is scheduled to be discontinued.

## ◆RATED RIPPLE CURRENT MULTIPLIERS

## ● Frequency Multipliers

| Frequency (Hz) | 120  | 1k   | 10k  | 50k  | 100k to 500k |
|----------------|------|------|------|------|--------------|
| SMD type       | 0.05 | 0.30 | 0.55 | 0.70 | 1.00         |

Product specifications in this catalog are subject to change without notice. Request our product specifications before purchase and/or use. Please use our products based on the information contained in this catalog and product specifications.

## NPCAP™-P XK Series

- Super low ESR, impedance and high heat resistance have been obtained by using conductive polymer as electrolyte.
- Rated voltage range : 2.5 to 16V<sub>dc</sub>, Capacitance range : 100 to 560μF
- Suitable for DC-DC converters, voltage regulators and decoupling applications used to computer motherboards etc.
- Solvent resistant type (see PRECAUTIONS AND GUIDELINES)
- RoHS2 Compliant
- Halogen Free

## ◆RATED RIPPLE CURRENT MULTIPLIERS

## ● Frequency Multipliers

| Frequency (Hz) | 120  | 1k   | 10k  | 50k  | 100k to 500k |
|----------------|------|------|------|------|--------------|
| SMD type       | 0.05 | 0.30 | 0.55 | 0.70 | 1.00         |

## NPCAP™-PXS Series

- Super low ESR, high ripple current capability
- Longer life (20,000 hours at 105°C)
- Rated voltage range : 4 to 16V<sub>dc</sub>, Capacitance range : 39 to 560μF
- Suitable for DC-DC converters, voltage regulators and decoupling applications for computer motherboards etc.
- Solvent resistant type (see PRECAUTIONS AND GUIDELINES)
- RoHS2 Compliant
- Halogen Free

### SPECIFICATIONS

| Items                                                  | Characteristics                                                                                                                                                                                                 |                                                                                                                                                                                   |     |    |    |

## NPCAP™-PXF Series

- Super low ESR, impedance and high heat resistance have been obtained by using conductive polymer as electrolyte.
- Rated voltage range : 2 to 10V<sub>dc</sub>, Capacitance range : 120 to 1,000μF
- Case size range : φ5×3.9L to φ8×7.7L
- Suitable for DC-DC converters, voltage regulators and decoupling applications used on computer motherboards etc.
- Solvent resistant type (see PRECAUTIONS AND GUIDELINES)
- RoHS2 Compliant
- Halogen Free

PXF

Lower ESR

PXE

## ◆SPECIFICATIONS

Production of the products shown in [ ] is scheduled to be discontinued.

## ◆RATED RIPPLE CURRENT MULTIPLIERS

## ● Frequency Multipliers

| Frequency(Hz) | 120  | 1k   | 10k  | 50k  | 100k to 500k |
|---------------|------|------|------|------|--------------|
| SMD type      | 0.05 | 0.30 | 0.55 | 0.70 | 1.00         |

## NPCAP™-PXE Series

- Super low ESR, impedance and high heat resistance have been obtained by using conductive polymer as electrolyte.  
(ESR and rated ripple current values are improved from PXA series.)
- Rated voltage range : 2.5 to 16V<sub>dc</sub>, Capacitance range : 33 to 2,700μF
- Suitable for DC-DC converters, voltage regulators and decoupling applications used on computer motherboards etc.
- Solvent resistant type (see PRECAUTIONS AND GUIDELINES)
- RoHS2 Compliant
- Halogen Free

### SPECIFICATIONS

Production of the products shown in  is scheduled to be discontinued.

◆RATED RIPPLE CURRENT MULTIPLIERS

Frequency Multipliers

| Frequency(Hz) | 120  | 1k   | 10k  | 50k  | 100k to 500k |
|---------------|------|------|------|------|--------------|
| SMD type      | 0.05 | 0.30 | 0.55 | 0.70 | 1.00         |

## NPCAP™-PXA Series

- Super low ESR, impedance and high heat resistance have been obtained by using conductive polymer as electrolyte
- Rated voltage range : 2.5 to 25V<sub>dc</sub>, case size range :  $\phi 5 \times 5.8L$  to  $\phi 10 \times 12.2L$
- Suitable for DC-DC converters, voltage regulators and decoupling applications used on computer motherboards etc.
- Solvent resistant type (see PRECAUTIONS AND GUIDELINES)
- RoHS2 Compliant
- Halogen Free

### SPECIFICATIONS

## NPCAP™-PXD Series

- Super low ESR, impedance and high heat resistance have been obtained by using conductive polymer as electrolyte.
- For automobile modules and other high temperature applications
- Endurance : 125°C 2,000 hours
- Rated voltage range : 2.5 to 10V<sub>dc</sub>, Capacitance range : 47 to 470μF
- Solvent resistant type (see PRECAUTIONS AND GUIDELINES)
- RoHS2 Compliant
- Halogen Free
- AEC-Q200 compliant : Please contact Chemi-Con for more details, test data, information.

PXD

Longer life

PXH

# NPCAP™-PXH Series

Upgrade!

- Super low ESR, impedance and high heat resistance have been obtained by using conductive polymer as electrolyte.
- For AI servers, GPU computing, and other high temperature applications.
- Suitable for DC-DC converters, voltage regulators and decoupling applications.
- Endurance : 125°C 1,000 to 3,000 hours
- Rated voltage range : 2.5 to 20V<sub>dc</sub>, Capacitance range : 22 to 1,000μF
- Case size range : φ 6.3×5.8L to φ 10×7.7L
- Solvent resistant type (see PRECAUTIONS AND GUIDELINES)
- RoHS2 Compliant
- Halogen Free

## ◆RATED RIPPLE CURRENT MULTIPLIERS

### ● Frequency Multipliers

| Frequency(Hz)             | 120  | 1k   | 10k  | 50k  | 100k to 500k |
|---------------------------|------|------|------|------|--------------|
| 2.5 to 6.3V <sub>dc</sub> | 0.05 | 0.30 | 0.55 | 0.70 | 1.00         |
| 10 to 20V <sub>dc</sub>   | 0.05 | 0.25 | 0.55 | 0.55 | 1.00         |

## NPCAP™-PSW Series

- Super low ESR, high ripple current capability
- Endurance: 5,000 hours at 105°C
- Rated voltage : 25V<sub>dc</sub>, Capacitance range : 180 to 820μF
- RoHS2 Compliant
- Halogen Free

# NPCAP™-PSJ Series

- Super low ESR, high ripple current capability
- ESR 4mΩ max. lineup
- Endurance : 2,000 to 5,000 hours at 105°C
- Solvent resistant type (see PRECAUTIONS AND GUIDELINES)
- RoHS2 Compliant
- Halogen Free

## SPECIFICATIONS

## MARKING

EX) 2.5V560μF

## NPCAP™-PSJ Series

## ◆PART NUMBERING SYSTEM

(Note1) : PSJ series, 2.5V560μF (ESR 4mΩ max.) has supplement code "J".  
Terminal and terminal plating are the same as all other in PSJ series.

Please refer to "Product code guide (conductive polymer type)"

## NPCAP™-PSG Series

- High capacitance model has been introduced to the product range.
- Super low ESR, high ripple current capability
- Endurance: 15,000 to 20,000 hours at 105°C
- Rated voltage : 16 to 35V<sub>dc</sub>
- RoHS2 Compliant
- Halogen Free

## ◆ SPECIFICATIONS

\*Note : If any doubt arises, measure the leakage current after the following voltage treatment.  
Voltage treatment : DC rated voltage is applied to the capacitors for 120 minutes at 105°C.

## ◆ DIMENSIONS [mm]

● Terminal Code : E

F05, F08, H08

HB5, H16, H20, JB5, J16, J20

| Size code | F05               | F08 | H08 | HB5 | H16        | H20 | JB5 | J16  | J20 |
|-----------|-------------------|-----|-----|-----|------------|-----|-----|------|-----|
| φD        | 6.3               |     |     |     | 8.0        |     |     | 10.0 |     |
| φd        | 0.45              |     |     |     | 0.6        |     |     |      |     |
| F         | 2.5               |     |     |     | 3.5        |     |     | 5.0  |     |
| φD'       |                   |     |     |     | φD+0.5max. |     |     |      |     |
| L'        | L+1.0max. (Note1) |     |     |     | L+1.5max.  |     |     |      |     |

Note1: L+1.2 max. for 16V270 μF (Rated ripple current 5,080mArms), for 16V330 μF (Rated ripple current 5,080mArms).

## ◆ MARKING

EX) 16V150μF

## NPCAP™-PSG Series

## ◆PART NUMBERING SYSTEM

Please refer to "Product code guide (conductive polymer type)"

(Note2) : PSG series, 16V270μF (Rated ripple current 5,080mArms), 16V330μF (Rated ripple current 5,080mArms), 16V470μF (Rated ripple current 5,400mArms), 16V560μF (Rated ripple current 5,400mArms), 16V560μF (Rated ripple current 6,100mArms), and 16V680μF (Rated ripple current 6,100mArms) have supplement code "J". Terminal and terminal plating are the same as all others in the PSG series.

## ◆RATED RIPPLE CURRENT MULTIPLIERS

## ●Frequency Multipliers

| Frequency(Hz)    | 120  | 1k   | 10k  | 50k  | 100k to 500k |
|------------------|------|------|------|------|--------------|
| Radial lead type | 0.10 | 0.35 | 0.60 | 0.80 | 1.00         |

## NPCAP™-PSK Series

- Super low ESR, high ripple current capability
- Downsized from PSE series ( $\phi 6.3 \times 8L$  to  $\phi 5 \times 8L$ )
- Long life (20,000 hours at 105°C)
- Solvent resistant type (see PRECAUTIONS AND GUIDELINES)
- RoHS2 Compliant
- Halogen Free

## ◆RATED RIPPLE CURRENT MULTIPLIERS

## ● Frequency Multipliers

| Frequency(Hz)    | 120  | 1k   | 10k  | 50k  | 100k to 500k |
|------------------|------|------|------|------|--------------|
| Radial lead type | 0.10 | 0.35 | 0.60 | 0.80 | 1.00         |

## NPCAP™-PSF Series

- Super low ESR, high ripple current capability
- ESR 5mΩmax. (2 to 4V<sub>dc</sub>)
- Longer life (20,000 hours at 105°C)
- Rated voltage range : 2 to 16V<sub>dc</sub>
- Solvent resistant type (see PRECAUTIONS AND GUIDELINES)
- RoHS2 Compliant
- Halogen Free

| Radial lead type | 0.10 | 0.35 | 0.60 | 0.80 | 1.00         |

## NPCAP™-PSE Series

- Super low ESR, high ripple current capability
- Endurance : 20,000 hours at 105°C
- Rated voltage range : 2.5 to 6.3V<sub>dc</sub>
- Solvent resistant type (see PRECAUTIONS AND GUIDELINES)
- RoHS2 Compliant
- Halogen Free

## NPCAP™-PSC Series

- Super low ESR, high ripple current capability
- Rated voltage range : 2.5 to 16V<sub>dc</sub>
- Nominal capacitance range : 270 to 2,700μF
- Endurance : 15,000 hours at 105°C
- Suitable for DC-DC converters, voltage regulators and decoupling applications for computer motherboards
- Added 2.5V 820μF (ESR 5mΩ max.)
- Solvent resistant type (see PRECAUTIONS AND GUIDELINES)
- RoHS2 Compliant
- Halogen Free

|                                                       |                                                                                                                                                                                                                  |  |                                      |     |     |    |    |

\*Note : If any doubt arises, measure the leakage current after the following voltage treatment.  
Voltage treatment : DC rated voltage is applied to the capacitors for 120 minutes at 105°C.

## ◆ DIMENSIONS [mm]

## ● Terminal Code : E

| Size code | H08        | HB5        | JB5        | JC5  |
|-----------|------------|------------|------------|------|
| φD        | 8.0        | 8.0        | 10.0       | 10.0 |
| φd        | 0.6        | 0.8(Note1) | 0.8(Note1) | 0.6  |
| F         | 3.5        | 3.5        | 5.0        | 5.0  |
| φD'       | φD+0.5max. |            |            |      |
| L'        | L+1.0max.  | L+1.5max.  |            |      |

Note1 : 0.6 for rated volt 16V.

## ◆ MARKING

EX) 2.5V820μF

## NPCAP™-PSC Series

## ◆PART NUMBERING SYSTEM

(Note2) PSC series, 2.5V820μF(ESR 5mΩ max.) has supplement code "J".  
Can case, terminal and terminal plating are the same as all others in PSC series.

Please refer to "Product code guide (conductive polymer type)"

## Conductive Polymer Hybrid Aluminum Electrolytic Capacitors

## PRECAUTIONS AND GUIDELINES (Conductive Polymer Hybrid)

Conductive Polymer Hybrid Aluminum Electrolytic Capacitors (Hereinafter called capacitor) that uses highly conductive polymer electrolytic materials and electrolyte. Please read the following in order to get the most out of your capacitor. The circuits described as examples in this catalog and the "delivery specifications" are featured in order to show the operations and usage of our products, however, this fact does not guarantee that the circuits are available to function in your equipment systems.

We are not in any case responsible for any failures or damage caused by the use of information contained herein.

You should examine our products, of which the characteristics are described in the "delivery specifications" and other documents, and determine whether or not our products suit your requirements according to the specifications of your equipment systems. Therefore, you bear final responsibility regarding the use of our products.

Please make sure that you take appropriate safety measures such as use of redundant design and malfunction prevention measures in order to prevent fatal accidents and/or fires in the event any of our products malfunction.

For Conductive Polymer Aluminum Solid Capacitors, see Precautions and Guidelines (Conductive Polymer).

For Aluminum Electrolytic Capacitors, see Precautions and Guidelines (Aluminum Electrolytic Capacitors).

### 1) Device circuits design considerations

1) Confirm installation and operating requirements for the capacitors, then use them within the performance limits prescribed in this catalog or product specifications.

#### 2) Polarity

Capacitors are polarized.

Never apply a reverse voltage or AC voltage. Connecting with wrong polarity will short-circuit or damage the capacitor with the pressure relief vent opening early on. To identify the polarity of a capacitor, see the relevant diagram in the catalogs or product specifications, or the polarity marking on the body of the capacitors.

#### 3) Operating voltage

Do not apply an over-voltage that exceeds a rated voltage specified for the capacitors.

The total peak value of the ripple voltage plus the DC voltage must not exceed the rated voltage of the capacitors. Capacitors do not require voltage derating within the category temperature. Although capacitors specify a surge voltage that exceeds the full rated voltage, it does not assure long-term use but limited use under specific conditions.

#### 4) Ripple current

Do not apply an over current that exceeds the rated ripple current specified for the capacitors. Excessive ripple current will increase heat production within the capacitors, causing the capacitors to be damaged as follows:

- Shorten lifetime
- Open pressure relief vent
- Short circuit

At the time of low DC bias voltage, reverse voltage may be applied if uses with less than rated ripple current. Please use it as far as the reverse voltage is not applied. The rated ripple current is specified along with a specific ripple frequency. Where using the capacitors at any ripple frequency other than the specified frequency, calculate the allowable ripple current by multiplying the rated ripple current by a frequency compensation factor (Frequency Multiplier) specified for each product series.

#### 5) Operating temperature (Category temperature)

Do not apply high temperatures that exceed the upper limit of the category temperature range specified for the capacitors.

Using the capacitors at temperatures higher than the upper limit will considerably shorten the lifetime of the capacitors and make the pressure relief vent open. The temperature, please confirm the temperature of the capacitors which included the ambient temperature of the device, not only the temperature in the device but also radiant heat of the heating element (power transistor, resistance) in the apparatus, self heating caused by the ripple current. Additionally, please do not place heating ele-

ment on the back side of the capacitors. In addition, please use the capacitors within category temperature range because the life of the capacitors are affected by the operating temperature. In other words, lowering ambient temperatures will extend the expected lifetime of the capacitors.

#### 6) Lifetime

Select the capacitors to meet the service life requirements of device.

#### 7) Charging and discharging

Do not use capacitors in circuits intended for rapid charge and discharge cycle operations.

If capacitors are used in the circuits that repeat a charge and discharge with a large voltage drop or a rapid charge and discharge at short interval cycle, capacitance will decrease and/or the capacitors will be damaged by internal heat generation.

Please consult us the capacitors to use for the circuit where rapid charge and discharge is repeated.

Please be careful about rush currents. Recommend to install protective circuit.

#### 8) Leakage current

The leakage current may increase due to thermal stress such as reflow soldering. After that, however, the leakage current will gradually decrease by self-healing action of the dielectric oxide layer when the capacitors are applied with a voltage less than the rated voltage within the Category Temperature range. As the voltage is closer to the rated voltage and the temperature is closer to the upper limit of Category Temperature range, the leakage current decreases faster.

The leakage current will increase by the following factors,

- ① Soldering
- ② Testing of high temperature exposure with no voltage applied, high temperature/humidity storage, temperature cycles, etc.

#### 9) Failure mode of capacitors

Non-solid aluminum electrolytic capacitors have a limited lifetime which ends in an open circuit failure mode, in general.

Depending on the product type and operating conditions, the failure mode may involve in opening of the pressure relief vent.

But it may lead to shot circuit mode failure when capacitor is used in the overload more than the guarantee ranges including over voltage and the over current.

Failure modes depend on the application conditions that lead to fail.

### 10) Capacitor insulation

The can case of capacitor does not assure electrical insulation. The outer coating on can case is aimed for indication and does not assure function of the electrical insulation. Electrically isolate the outer can case of a capacitor from the negative terminal, the positive terminal and circuit patterns.

### 11) Operating conditions

Do not use/expose capacitors to the following conditions:

- ① Direct contact with water, salt water or oil, or high condensation environment.
- ② Direct sunlight
- ③ Toxic gases such as hydrogen sulfide, sulfurous acid, nitrous acid, chlorine and its compounds, bromine and its compounds and ammonium.
- ④ Ozone, ultraviolet rays or radiation.
- ⑤ Extreme vibration or mechanical shock that exceeds limits in the catalogs or product specifications.

The standard vibration condition is applicable to JIS C 5101-4.

### 12) Mounting

Capacitors contain paper separators and electric-conductive electrolyte that contains organic solvent as main solvent material, both of which are flammable. If the electrolyte leaks onto a printed circuit board, it can erode the device circuit pattern, may short-circuit the copper traces, smoke and burn. Make sure of designing a PC board as follows:

- ① Provide clearance space (2mm minimum) over the pressure relief vent of a capacitor to avoid blocking the correct opening of the pressure relief vent for 10mm case diameter of capacitor.
- ② Do not locate any wire or circuit pattern over the pressure relief vent of a capacitor.
- ③ Avoid locating any heat source components near capacitors or on the opposite side of the PC board under capacitors.
- ④ Design the solder land on the PC board in accordance with the catalog or the product specification.
- ⑤ For radial capacitors, design the terminal holes on the PC board to fit the terminal dimension of the capacitor.
- ⑥ Do not print any copper trace under the seal (terminal) side of a capacitor. When the electrolyte leaks out, it may occur circuit pattern short-circuit, and tracking or migration. Copper traces should be 1 mm (preferably 2mm or more) spaced apart from the side of the capacitor body.
- ⑦ In designing a double-sided PC board, do not locate any through-hole via or unnecessary hole underneath a capacitor.

- ⑧ In designing a double-sided PC board, do not print any circuit pattern underneath a capacitor.

### 13) Using capacitors for significantly safety-oriented applications

Consult with us in advance of usage of our products in the following listed applications. ① Aerospace equipment ② Power generation equipment such as thermal power, nuclear power etc. ③ Medical equipment ④ Transport equipment (automobiles, trains, ships, etc.) ⑤ Transportation control equipment ⑥ Disaster prevention / crime prevention equipment ⑦ Highly publicized information processing equipment ⑧ Submarine equipment ⑨ Other applications that are not considered general-purpose applications.

### 14) Others

Design device circuits taking into consideration the following conditions:

- ① Electrical characteristics of a capacitor depend on the temperature and frequency. In designing the device circuits, consider the change in the characteristics.
- ② If using more than one capacitor connected in parallel, design the device circuits to balance the current flow in individual capacitors.
- ③ If using more than one capacitor connected in series, connect shunting resistors in parallel with the individual capacitors to balance the voltage.

## 2) Installation

### 1) Assembling

- ① Do not try to reuse the capacitors once assembled and electrified
- ② Capacitors may have been spontaneously recharged with time by a recovery voltage phenomenon. Capacitors may produce recovery voltage higher than aluminum electrolytic capacitors and conductive polymer aluminum solid capacitors. In this case, discharge electricity through approximately 1kΩ before use.
- ③ If capacitors have been stored at any conditions more than 35°C and 75%RH for long storage periods of time more than the limits specified in the catalogs or product specifications, they may have high leakage current. In this case, make pre-conditioning by applying the rated voltage through a resistor of approximately 1kΩ.
- ④ Confirm the rated capacitance and voltage of capacitors

before installation.

- ⑤ Confirm the polarity of capacitors before installation.
- ⑥ Do not try to use the capacitors that were dropped to the floor and so forth.
- ⑦ Do not deform the can case of a capacitor.
- ⑧ Verify that the lead spacing of the capacitor fits the hole spacing in the PC board before installing the capacitors.
- ⑨ Do not apply excessive mechanical force to capacitors more than the limits prescribed in the catalogs or product specifications. Avoid excessive mechanical force while the capacitors are in the process of vacuum-picking, placing and positioning by automatic mounting machines or cutting the lead wires by automatic insertion machines.

## 2) Soldering and heat resistance

- ① For soldering using a soldering iron, consider the following conditions:  
Soldering conditions (temperature and time) should be ( $380 \pm 10^{\circ}\text{C}$ ,  $3 \pm 0.5\text{second}$ ).  
Do not touch the body of a capacitor with the hot tip of the soldering iron.
- ② Verify the following when flow soldering:
  - Do not dip the body of a capacitor into the solder bath only dip the terminals in. The soldering must be done on the reverse side of PC board.
  - Soldering conditions (preheat, solder temperature and dipping time) should be within the limits prescribed in the catalog or the product specifications.
  - Do not apply flux to any part of capacitors other than their terminals.
  - Make sure the capacitors do not come into contact with any other components while soldering.
- ③ For reflow soldering, consider the following conditions:  
Soldering conditions (preheat, reflow temperature and time) should be within the limits prescribed in the catalogs or product specifications.
  - When using the infrared heater and setting its temperatures, adjust the heating levels taking into consideration that the color and materials of a capacitor vary in their infrared absorbance.
  - The allowable number of reflow passes is specified in the catalogs or product specifications.
  - Please consult us about vapor phase soldering (VPS).
- ④ Do not try to reuse the capacitors once assembled.
- ⑤ Only use radial lead type capacitors for flow soldering. The other type capacitors are not designed for the flow soldering.
- ⑥ Only use chip type capacitors for reflow soldering. The other type capacitors are not designed for the reflow soldering.

## 3) Handling after soldering

After soldering the PC board, do not apply the following mechanical stress to the capacitor:

- ① Do not tilt, push down or twist the body of the capacitor.
- ② Do not grab the body of the capacitor to carry the assembly board.
- ③ Do not hit anything against the capacitor. When stacking the assembled boards, do not put any of the PC boards or other components against the capacitor.
- ④ Do not drop the assembled board.

## 4) Cleaning assembly boards

- ① Do not clean capacitors with the following cleaning agents:
  - Halogenated solvents: cause capacitor failures due to corrosion.
  - Alkali system solvents: corrode (dissolve) the aluminum can case.
  - Terpene and petroleum system solvents: deteriorate the rubber seal materials.
  - Xylene and toluene: deteriorates the rubber seal materials as well.
  - Acetone: erases the markings printed on a capacitor.

Where cleaning is necessary, use only solvent resistant type capacitors that have been assured for the cleaning within the specific cleaning conditions prescriber in the catalogs or product specifications. In particular, carefully set up the conditions for ultrasonic cleaning system. Consult us regarding alternative

CFCs or other cleaners before use.

- ② Where cleaning the capacitors, confirm the following conditions:

- Control the contamination (the conductivity, pH, specific gravity, water content, etc.) of the cleaning agents.
- After the cleaning, do not leave the capacitors (assembly boards) in an environment of cleaning agent-rich or in a closed container. Sufficiently evaporate the residual cleaning agent from the assembly boards and the capacitors by forced hot air at temperatures less than the upper limit of category temperature range for more than 10 minutes.

In general, aluminum electrolytic capacitors are sensitive to contamination of halogen ions (particularly to chlorine ions). Depending on the properties of the electrolyte and rubber seal materials used in a capacitor, the halogen ions lead up to catastrophic failures on the capacitor. Where the inside of a capacitor has been contaminated with more than a certain amount of halogen ions and the capacitor is in use, the corrosion reaction of aluminum occurs. The corrosion causes the capacitor to have a significant increase in leakage current with heat produced, open the pressure relief vent and become open circuit mode failure.

Due to global environmental issues (greenhouse effects and other environmental destruction by depletion of the ozone layer), the conventional cleaning solvents of CFC 113, Trichloroethylene and 1,1,1-trichloroethylene were replaced by substitutes. The following are some substitute cleaning agents and allowable cleaning conditions:

### a) Fatty-alcohol cleaning agents

Pine Alpha ST-100S (Arakawa Chemical)  
Clean Through 750H, 750HS and 750J (Kao)

[Cleaning conditions]

Either of immersion or ultrasonic cleaning, for a maximum of 10 minutes and at a maximum liquid temperature of  $60^{\circ}\text{C}$  is acceptable. Make sure that the markings on the capacitor are not rubbed against any other component or the PC board during cleaning. Note that shower cleaning affects the markings on the capacitor.

### b) Alternative CFCs

AK225AES (Asahi Glass)

[Cleaning conditions]

Solvent resistant type capacitors, which were originally developed to intend to resist Freon TE or Freon TES, are also capable of withstanding any one of immersion, ultrasonic or vapor cleaning, for a maximum of 5 minutes.

However, this type of cleaning agent is not recommended to use, as the cleaning materials may be banned in near future in view of global environmental issues

### c) IPA (Isopropyl Alcohol)

Immersion cleaning with a maximum flux concentration of 2 wt% is acceptable.

## 5) Adhesives and coating materials

- ① Do not use any adhesive or coating materials containing halogenated solvents.
- ② Make sure of the following conditions before applying adhesive or coating materials to a capacitor,
  - No flux residue nor stain is left between the rubber seal of a capacitor and PC board.
  - Dry the capacitor to remove residual cleaning agents before applying adhesive and coating materials. Do not cover up the entire surface of the rubber seal of the capacitor with adhesives or coating materials.
  - Consult us Heating and curing conditions for adhesives and coating materials.
  - Covering up the entire surface of the rubber seal with resin mold materials will obstruct the normal diffusion of internal

hydrogen gas from a capacitor and result in serious failures. Also, where the adhesive and coating materials contain a large amount of halogen ions, the halogen ions will contaminate the inside of the capacitor through the rubber seal materials, causing the capacitor to become a failure.

- Depending on solvent materials that the adhesive or coating materials contains, note that the surface of a capacitor may change in appearance.

## 6) Fumigation

In exporting or importing electronic devices, they may be exposed to fumigation with halide such as methyl bromide. Where the capacitors are exposed to halide such as methyl bromide, the capacitors will be damaged with the corrosion reaction with halogen ions in the same way as cleaning agents. For the export and import, Nippon Chemi-Con considers using some packaging method and so forth so that fumigation is not required. For customers to export or import electronic devices, semi-assembly products or capacitor components, confirm if they will be exposed to fumigation and also consider final condition of packaging. (Note that either cardboard or vinyl package has a risk of fumigation gas penetration.)

## 3) Precautions during operation of devices

- Never touch the terminals of a capacitor directly with bare hands.
- Do not short-circuit between the capacitor terminals with anything conductive. Also, do not spill any conductive liquid such as acid or alkaline solution over a capacitor.
- Confirm environmental conditions where the device will be placed. Do not use the device in the following environmental conditions:
  - Water or oil spatters, or high condensation environment.
  - Direct sunlight.
  - Ozone, ultraviolet rays or radiation.
  - Toxic gases such as hydrogen sulfide, sulfuric acid, nitrous acid, chlorine and its compounds, bromine and its compounds and ammonium.
  - Severe vibration or mechanical shock conditions beyond the limits prescribed in the catalog or product specification. The standard vibration condition is applicable to JIS C 5101-4.

## 4) Maintenance inspections

- For industrial use capacitors, make periodic inspections of the capacitors. Before the inspections, turn off the power supply of the device and discharge the electricity of the capacitors. When checking it by a volt-ohm meter, confirm the polarity beforehand. Do not apply mechanical stress to the terminals of the capacitors during inspection.
- Characteristics to be inspected
  - Significant damage in appearance: vent opening, electrolyte leakage, etc.
  - Electrical characteristics: Leakage current, capacitance,  $\tan \delta$  and other characteristics prescribed in the catalogs or product specifications. If finding anything abnormal on the characteristics above, check the specifications of the capacitor and take appropriate actions such as replacement.

## 5) Contingencies

- A capacitor with more than a certain case size has the pressure relief vent functioning to escape abnormal gas pressure increase. If gas expels from a venting capacitor, disconnect the power supply of the device or unplug the power supply cord. If not disconnecting the power supply, the device circuit may be damaged due to the short circuit failure of the capacitor or short-circuited with the liquid that the gas was condensed to. It may cause secondary damages

such as device burnout in the worst case scenario. The gas that comes out of the open vent is vaporized electrolyte not smoke.

- The gas expelled from a venting capacitor is more than 100°C. Never expose your face to the capacitor. If your eyes are exposed to the gas or you inhale it, immediately flush your eyes and/or gargle with water. If the electrolyte comes in contact with the skin, wash with soap and water.

## 6) Storage

- Do not store capacitors at high temperature or high humidity. Store the capacitors indoors at temperatures of 5 to 35°C and humidities of less than 75%RH. In principle, conductive polymer hybrid aluminum electrolytic capacitors should be used within 2 years after production.
- Keep capacitors packed in the original packaging material whenever possible.
- Avoid the following storage environmental conditions:
  - Water spattering, high temperatures, high humidity or condensation environment.
  - Oil spattering or oil mist filled.
  - Salt water spattering or salt filled.
  - Acidic toxic gases such as hydrogen sulfide, sulfuric acid, nitrous acid, chlorine, bromine and methyl bromide filled.
  - Alkaline toxic gases such as ammonium filled.
  - Acid or alkaline solutions spattering.
  - Direct sunlight, ozone, ultraviolet rays or radiation.
  - Extreme vibration or shock loading.
- JEDEC J-STD-020 is not applicable.

## 7) Capacitor disposal

Please consult with a local organization for the proper disposal of industrial waste. For incinerating capacitors, apply a high temperature incineration (over 800°C). Incinerating them at temperatures lower than that may produce toxic gases such as chlorine. To prevent capacitors from explosion, punch holes in or sufficiently crush the can cases of the capacitors, then incinerate.

## 8) About AEC-Q200

The Automotive Electronics Council (AEC) was originally established by major American automotive related manufactures. Today, the committees are composed of representatives from the sustaining Members of manufacturing companies in automotive electrical components. It has standardized the criteria for "stress test qualification" and "reliability tests" for electronic components.

AEC-Q200 is the reliability test standard for approval of passive components in Automotive applications. It specifies the test type, parameters and quantity, etc. for each component. The criteria of the reliability tests such as for our main products, "Aluminum Electrolytic Capacitors" are described in this standard.

Pursuant to the customer's specific testing requirements, Chemi-Con submits the test results according to AEC-Q200 for Aluminum Electrolytic Capacitors used in automotive applications on request.

An electronic component manufacturer cannot simply claim that their product is "AEC-Q200 Qualified". It can be claimed "Compliant", "Capable", "Available", etc., however each component must be tested per each users "Qualification Test Plan" in order to claim AEC-Q200 status.

Please contact us for more information.

## 9) Response to the Substances of Concern

- Nippon Chemi-Con aims for developing products that meet laws and regulations concerning substances of concern. (Some products may contain regulated substances for ex-

## PRECAUTIONS AND GUIDELINES (Conductive Polymer Hybrid)

empted application)

Please contact us for more information about law-compliance status.

- 2 ) According to the content of REACH handbook (Guidance on requirements for substances in articles which is published on May 2008), our electronic components are “articles without any intended release”. Therefore they are not applicable for “Registration” for EU REACH Regulation Article 7 (1). Reference: Electrolytic Condenser Investigation Society Study of REACH Regulation in EU about Electrolytic Capacitor (publicized on 13 March 2008)

### 10 Catalogs

Specifications in the catalogs are subject to change without notice. Test data shown in the catalogs are not assured as the whole performance values, but typical values. For more details, refer to JEITA RCR-2367D (March 2019) with the title of “Safety Application Guide for fixed aluminum electrolytic capacitors for use in electronic equipment”.

## RECOMMENDED SOLDERING CONDITIONS

### ◆SURFACE MOUNT TYPE

The following conditions are recommended for air or infrared reflow soldering on the SMD products onto a glass epoxy circuit board of 90×50×0.8mm (with resist) by cream solder. The temperatures shown are the surface temperature values on the top of the can and temperature of capacitor terminal.

Reflow should be performed twice or less.

Please ensure that the capacitor became cold enough to the room temperature (5 to 35°C) before the second reflow.

#### ● Recommended soldering heat conditions

| Size Code     | Preheat       | Time maintained above 217°C | Time maintained above 230°C | Peak temp.               | Reflow number                    |
|---------------|---------------|-----------------------------|-----------------------------|--------------------------|----------------------------------|
| E61, F61, F80 | 150 to 180°C  | 50 sec. max.                | 40 sec. max.                | 260°C max.               | 2-cycles allowed                 |
| HA0 to JH0    | 120 sec. max. | 50 sec. max.                | 40 sec. max.                | 260°C max.<br>245°C max. | 1-cycle only<br>2-cycles allowed |

#### ● Recommended Solder Land on PC Board

| Size code | Terminal code : A |     |     | Terminal code : G |     |     |
|-----------|-------------------|-----|-----|-------------------|-----|-----|
|           | a                 | b   | c   | a                 | b   | c   |
| E61       | 1.4               | 3.0 | 1.6 |                   |     |     |
| F61, F80  | 1.9               | 3.5 | 1.6 | 1.9               | 3.5 | 3.3 |
| HA0       | 3.1               | 4.2 | 2.2 | 3.1               | 4.2 | 3.5 |
| JA0       | 4.5               | 4.4 | 2.2 | 4.5               | 4.4 | 3.5 |
| JC5       | 4.5               | 4.4 | 2.2 | 4.5               | 4.4 | 3.5 |
| JH0       | 4.0               | 4.7 | 2.5 | 4.0               | 4.7 | 3.8 |

### ◆RADIAL LEAD TYPE

#### ● Recommended soldering heat conditions

Preheat : 150°C 120 seconds max.

Flow soldering : 260±5°C max. 10+1 seconds max. (Or 380±10°C max. 3±0.5 seconds max.: hand soldering)

#### ◆PRECAUTIONS FOR USERS

##### Soldering method

SMD type have no capability to withstand such dip or wave soldering as totally immersing components into a solder bath.

##### Reflow soldering

Reflow the capacitors within Recommended Reflow Soldering Conditions. Verify there is no temperature stress to the capacitors because the following differences might degrade capacitors electrically and mechanically. Please consult with us if other reflow conditions are employed.

1. Location of components : Temperature increases at the edge of PC board more than the center.
2. Population of PC board : The lower the component population is, the more temperature rises.
3. Material of PC board : A ceramic-made board needs more heat than a glass epoxy-made board. The heat increase may cause damage to the capacitors.
4. Thickness of PC board : A thicker board needs more heat than a thinner board. The heat may damage the capacitors.
5. Size of PC board : A larger board needs more heat than a smaller board. The heat may damage the capacitors.
6. Solder thickness  
If very thin cream solder paste is to be used for SMD types, please consult with us.
7. Location of infrared ray lamps : IR reflow as well as hot plate reflow heats only on the reverse side of the PC board to lessen heat stress to the capacitors.
8. Case leakage current will increase (~mA) after the reflow process, the leakage current which rose gradually decreases when voltage is applied.
9. Please consult us about vapor phase soldering (VPS).

##### Rework of soldering

Use a soldering iron for rework. Do not exceed an iron tip temperature of 380±10°C and an exposure time of 3±0.5 seconds.

##### Mechanical stress

Do not grab the capacitors to lift the PC board and give stress to the capacitor. Avoid bending the PC board. This may damage the capacitors.

##### Cleaning assembly board

Immediately after solvent cleaning, remove residual solvent with an air knife for at least 10 minutes. If the solvent is insufficiently dry, the capacitors may corrode.

##### Coating on assembly board

1. Before curing coating material, remove the cleaning solvents from the assembly board.
2. Before conformal coating, a chloride free pre-coat material is recommended to decrease the stress on the capacitors.

##### Molding with resin

Internal chemical reaction gradually produces gas in the capacitor; increasing internal pressure. If the end seal of the capacitor is completely covered by resin the gas will be unable to escape causing a potentially dangerous situation. The chlorine in resin will penetrate the end seal, reach the element, and damage of the capacitor.

##### Glue

The followings are requirements for glue.

1. A low curing temperature over a short period of time
2. Strong adhesion and heat resistance after curing
3. Long shelf life
4. No corrosion

##### Others

Refer to PRECAUTIONS AND GUIDELINES (Conductive Polymer Hybrid).

## Lifetime Estimation of Conductive Polymer Hybrid Aluminum Electrolytic Capacitors

Subject series : HXC/HXD/HXJ/HXK/HXE/HSC/HSD/HSE

Please consult us about lifetime equations for HXF series.

Conductive polymer hybrid aluminum electrolytic capacitors, in common with other aluminum electrolytic capacitors, are electronic components with a finite lifespan. The lifetime of these capacitors is influenced by ambient temperatures, environmental conditions such as humidity, and operating conditions such as the level of ripple current and surge voltage, all of which can reduce capacitance and increase ESR as a result.

### 1. Lifetime Estimation

Estimation of lifetime can be expressed by the following equations (1) to (3), which take the effects of ambient temperatures and self-heat rise resulting from ripple current into account.

Subject series : HXC/HXD/HXJ/HXK/HSC/HSD

$$Lx=Lr \times Bt^{\frac{Kt(To-Tx)}{10}} \times Bt^{\frac{\Delta To-\Delta T}{10}} \dots\dots\dots(1)$$

Subject series : HXE/HSE

125 °C<Tx≤135 °C

$$Lx=Lr \times Bt^{\frac{To-Tx}{10}} \times Bt^{\frac{\Delta To-\Delta T}{10}} \dots\dots\dots(2)$$

Tx≤125 °C

$$Lx=Lr \times Bt^{\frac{Kt(125-Tx)}{10}} \times Bt^{\frac{\Delta To-\Delta T}{10}} \dots\dots\dots(3)$$

Lx : Estimation of actual lifetime (hour)

Lr : Stated lifetime under the rated ripple current superimposition at the upper limit of the category temperature (hours)

Bt : Temperature acceleration factor ..... (Table-1)

Kt : Correction factor of ambient temperature acceleration factor..... (Table-2)

To : Maximum category temperature (°C)

Tx : Actual ambient temperature of the capacitor (°C)

Use 40°C if the actual ambient temperature is below it.

ΔTo : Rise of internal temperature due to the rated ripple current (°C) ..... (Table-3)

ΔT : Rise of internal temperature due to actual ripple current (°C)

Table-1 Bt : Temperature acceleration factor

| Subject series          |                      | φ 5, 6.3 | φ 8, 10 |
|-------------------------|----------------------|----------|---------|
| HXC/HXD/HXJ/HXK/HSC/HSD |                      | 1.7      | 2       |
| HXE/HSE                 | Tx ≤ 125 °C          | 1.7      | 2       |
|                         | 125 °C < Tx ≤ 135 °C | 1.7      | 1.7     |

Table-2 Kt : Correction factor of ambient temperature acceleration factor

| Actual ambient temperature of the capacitor | Tx ≤ 65 °C | 65 °C < Tx ≤ 105 °C | 105 °C < Tx ≤ 125 °C |
|---------------------------------------------|------------|---------------------|----------------------|
| Bt=1.7                                      | 1.06       | 1.03                | 1                    |
| Bt=2                                        | 1          |                     |                      |

Table-3 ΔTo : Rise in internal temperature due to the rated ripple current (°C)

| Subject series | HXC                   |            | HSC | HXD/HSD/HXK | HXJ        |            |                   |            |
|----------------|-----------------------|------------|-----|-------------|------------|------------|-------------------|------------|
| Case size      | φ 6.3×5.8 to φ 10×10L | φ 10×12.5L | —   | —           | φ 6.3×5.8L | φ 6.3×7.7L | φ 8×10L, φ 10×10L | φ 10×12.5L |
| ΔTo            | 5°C                   |            | 5°C | 15°C        | 5°C        | 8°C        | 10°C              | 11°C       |

| Subject series | HXE                                        |  | HSE                                        |
|----------------|--------------------------------------------|--|--------------------------------------------|
| Case size      | φ 6.3×5.8L to φ 10×10L, φ 10×16.5L         |  | φ 10×12.5L                                 |
| ΔTo            | 15°C (Tx≤125 °C)<br>5°C (125 °C<Tx≤135 °C) |  | 16°C (Tx≤125 °C)<br>6°C (125 °C<Tx≤135 °C) |

An approximate value of ripple current-caused ΔT can be calculated using Equation (4)

$$\Delta T=\Delta To \times \left( \frac{Ix}{Io} \right)^2 \dots\dots\dots(4)$$

ΔTo : Rise in internal temperature due to the rated ripple current ..... (Table-3)

Ix : Operating ripple current (Arms) actually flowing in the capacitor

Io : Rated ripple current (Arms), frequency compensated, at the upper limit of the category temperature range

To determine more accurate values of ΔT, they can be actually measured using a thermocouple.

### 2. Rated Ripple Current Frequency Multipliers

Self-heat rise is generated by the ripple current even though the conductive polymer hybrid aluminum electrolytic capacitors have low ESR compared to liquid based electrolyte aluminum electrolytic capacitor. The ESR value differs depending on the frequency, thus the degree of self-heat rise differs depending on the ripple current frequency. Therefore, if the actual ripple current frequency differs from the specifications stated in the standard ratings, use the value obtained by multiplying the rated ripple current multiplier to convert the rated current.

Conductive polymer hybrid aluminum electrolytic capacitors have super low ESR characteristic in high-frequency range. On the whole, ESR in low-frequency range relatively rises. Therefore, they can use only small ripple current in low-frequency range. Please ensure that excessive ripple current is not applied to the capacitors in all frequency range.

### 3. Restriction of estimated lifetime calculation

The result calculated by the estimated lifetime formula, it is not guaranteed lifetime by Nippon Chemi-Con Corporation.

When designer calculate the lifetime of apparatus, please include an ample margin in consideration to the estimated lifetime of a capacitor.

When calculated lifetime result are over 15 years by using the estimated lifetime formula, please consider 15 years to be a maximum in considering that the sealing rubber characteristics vary during the lifetime.

If 15 years or more may be required as an expected lifetime, please consult us.

## Product code guide (Conductive polymer hybrid Surface mount type)

(Example : HXC series, 16V-82μF, φ6.3×5.8L)

Please refer to the following table

\*Refer to the appendix (Part number) for codes not listed here.

## Product code guide (Conductive polymer hybrid Radial lead type)

(Example : HSC series, 25V-330μF, φ10×12.5L, Long Lead with bulk)

Please refer to the following table

\*Refer to the appendix (Part number) for codes not listed here.

# HXF Series

- Guaranteed short time operating temperature at 150°C
- High reliability is realized by hybrid electrolyte
- Endurance with ripple current : 4,000 hours at 135°C
- Rated voltage range : 25 to 63V<sub>dc</sub>, Capacitance range : 33 to 560μF
- For high temperature and high reliability applications.  
(Automotive equipment, Base station equipment, etc.)
- RoHS2 Compliant
- Halogen Free
- AEC-Q200 compliant : Please contact Chemi-Con for more details, test data, information.

# HXE Series

- High ripple current model is now available for JC5 size.
- High reliability is realized by hybrid electrolyte
- Endurance with ripple current : 2,000 to 4,000 hours at 135°C
- Rated voltage range : 16 to 63V<sub>dc</sub>, Capacitance range : 22 to 560μF
- For high temperature and high reliability applications.  
(Automotive equipment, Base station equipment, etc.)
- RoHS2 Compliant
- Halogen Free
- AEC-Q200 compliant : Please contact Chemi-Con for more details, test data, information.

# HXK Series

- High reliability is realized by hybrid electrolyte
- Endurance with ripple current : 4,000 hours at 125°C
- Rated voltage range : 16 to 35V<sub>dc</sub>, Capacitance range : 270 to 1,200μF
- For high temperature and high reliability applications.  
(Automotive equipment, etc.)
- RoHS2 Compliant
- Halogen Free
- AEC-Q200 compliant : Please contact Chemi-Con for more details, test data, information.

# HXJ Series

- High reliability is realized by hybrid electrolyte
- Endurance with ripple current : 4,000 hours at 125°C
- Rated voltage range : 16 to 63V<sub>dc</sub>, Capacitance range : 56 to 820μF
- For high temperature and high reliability applications.  
(Automotive equipment, Base station equipment, etc.)
- RoHS2 Compliant
- Halogen Free
- AEC-Q200 compliant : Please contact Chemi-Con for more details, test data, information.

## ◆RATED RIPPLE CURRENT MULTIPLIERS

## ● Frequency Multipliers

| Capacitance( $\mu$ F) | Frequency(Hz) | 120  | 1k   | 5k   | 10k  | 20k  | 30k  | 100k to 500k |
|-----------------------|---------------|------|------|------|------|------|------|--------------|
| 56 to 82              |               | 0.15 | 0.50 | 0.70 | 0.75 | 0.80 | 0.80 | 1.00         |
| 100 to 820            |               | 0.15 | 0.50 | 0.70 | 0.75 | 0.85 | 0.85 | 1.00         |

# HXC Series

● 80VV model has been introduced to the product range. High ripple current model is now available for JC5 size.

● High reliability and high voltage are realized by hybrid electrolyte

● Endurance with ripple current : 4,000 hours at 125°C

● Rated voltage range : 16 to 80V<sub>dc</sub>, Capacitance range : 6.8 to 560μF

● For high temperature and high reliability applications.

(Automotive equipment, Base station equipment, etc.)

● RoHS2 Compliant

● Halogen Free

● AEC-Q200 compliant : Please contact Chemi-Con for more details, test data, information.

## SPECIFICATIONS

| Items                                                  | Characteristics                                                                                                                                                                                                                                                                       |                                       |      |      |      |      |      |                 |

# HXD Series

- High reliability and high voltage are realized by hybrid electrolyte
- Endurance with ripple current : 5,000 to 10,000 hours at 105°C
- Rated voltage range : 16 to 80V<sub>dc</sub>, Capacitance range : 6.8 to 560μF
- For high reliability applications.  
(Automotive equipment, Base station equipment, etc.)
- RoHS2 Compliant
- Halogen Free
- AEC-Q200 compliant : Please contact Chemi-Con for more details, test data, information.

## ◆RATED RIPPLE CURRENT MULTIPLIERS

## ●Frequency Multipliers

| Capacitance(μF) | Frequency(Hz) | 120  | 1k   | 5k   | 10k  | 20k  | 30k  | 100k to 500k |
|-----------------|---------------|------|------|------|------|------|------|--------------|
| to 10           |               | 0.03 | 0.30 | 0.50 | 0.60 | 0.70 | 0.75 | 1.00         |
|                 | 15 to 33      | 0.07 | 0.30 | 0.50 | 0.60 | 0.70 | 0.75 | 1.00         |
| 47 to 180       |               | 0.10 | 0.40 | 0.60 | 0.70 | 0.80 | 0.80 | 1.00         |
|                 | 220 to 560    | 0.13 | 0.45 | 0.65 | 0.75 | 0.85 | 0.85 | 1.00         |

# HSE Series

- High reliability and high voltage are realized by hybrid electrolyte
- Endurance with ripple current : 4,000 hours at 135°C
- Rated voltage range : 25 to 63V<sub>dc</sub>, Capacitance range : 100 to 330μF
- For high temperature and high reliability applications.  
(Automotive equipment, Base station equipment, etc.)
- RoHS2 Compliant
- Halogen Free
- AEC-Q200 compliant : Please contact Chemi-Con for more details, test data, information.

# HSC Series

- High reliability and high voltage are realized by hybrid electrolyte
- Endurance with ripple current : 4,000 hours at 125°C
- Rated voltage range : 25 to 80V<sub>dc</sub>, Capacitance range : 56 to 330μF
- For high temperature and high reliability applications.  
(Automotive equipment, Base station equipment, etc.)
- RoHS2 Compliant
- Halogen Free
- AEC-Q200 compliant : Please contact Chemi-Con for more details, test data, information.

## SPECIFICATIONS

# HSD Series

- High reliability and high voltage are realized by hybrid electrolyte
- Endurance with ripple current : 10,000 hours at 105°C
- Rated voltage range : 25 to 80V<sub>dc</sub>, Capacitance range : 68 to 470μF
- For high reliability applications.  
(Automotive equipment, Base station equipment, etc.)
- RoHS2 Compliant
- Halogen Free
- AEC-Q200 compliant : Please contact Chemi-Con for more details, test data, information.

# Aluminum Electrolytic Capacitors

## Precautions and Guidelines (Aluminum Electrolytic Capacitors)

The circuits described as examples in this catalog and the "delivery specifications" are featured in order to show the operations and usage of our products, however, this fact does not guarantee that the circuits are available to function in your equipment systems.

We are not in any case responsible for any failures or damage caused by the use of information contained herein.

You should examine our products, of which the characteristics are described in the "delivery specifications" and other documents, and determine whether or not our products suit your requirements according to the specifications of your equipment systems. Therefore, you bear final responsibility regarding the use of our products.

Please make sure that you take appropriate safety measures such as use of redundant design and malfunction prevention measures in order to prevent fatal accidents and/or fires in the event any of our products malfunction.

For Conductive Polymer Aluminum Solid Capacitors, see Precautions and Guidelines (Conductive Polymer).

For Conductive Polymer Hybrid Aluminum Electrolytic Capacitors, see Precautions and Guidelines (Conductive Polymer Hybrid).

### 1 Device circuits design considerations

#### 1) Confirm installation and operating requirements for capacitors, then use them within the performance limits prescribed in this catalog or product specifications.

#### 2) Polarity

Aluminum electrolytic capacitors are polarized.

Never apply a reverse voltage or AC voltage. Connecting with wrong polarity will short-circuit or damage the capacitor with the pressure relief vent opening early on. To identify the polarity of a capacitor, see the relevant diagram in the catalogs or product specifications, or the polarity marking on the body of the capacitor. Incidentally, the rubber end seal bungs of the radial lead type capacitors have a solder-flux gas escaping configuration, which is nothing to do with the polarity of the capacitors. For circuits where the polarity is occasionally reversed, use a bi-polar type of aluminum electrolytic capacitor. However, note that even bi-polar type capacitors must not be used for AC circuits.

#### 3) Operating voltage

Do not apply an over-voltage that exceeds a rated voltage specified for the capacitors. The total peak value of the ripple voltage plus the DC voltage must not exceed the rated voltage of the capacitors. Although capacitors specify a surge voltage that exceeds the full rated voltage, it does not assure long-term use but limited use under specific conditions.

#### 4) Ripple current

Do not apply an overcurrent that exceeds the rated ripple current specified for the capacitors. Excessive ripple current will increase heat production within the capacitors, causing the capacitors to be damaged as follows:

- Shorten lifetime
- Open pressure relief vent
- Short circuit

The rated ripple current is specified along with a specific ripple frequency.

Where using the capacitors at any other ripple frequency other than the specified frequency, calculate the allowable ripple current by multiplying the rated ripple current by a frequency compensation factor (Frequency Multiplier) specified for each product series.

#### 5) Operating temperature (Category temperature)

Do not apply high temperatures that exceed the upper limit of the category temperature range specified for the capacitors.

Using the capacitor at temperatures higher than the upper limit will considerably shorten the lifetime of the capacitor and make the pressure relief vent open.

In other words, lowering ambient temperatures will extend the expected lifetime of the capacitors.

#### 6) Lifetime

Select the capacitors to meet the service life requirements of a device.

#### 7) Charging and discharging

Do not use capacitors in circuits intended for rapid charge and discharge cycle operations.

If capacitors are used in the circuits that repeat a charge and discharge with a large voltage drop or a rapid charge and discharge at a short interval cycle, capacitance will decrease and/or the capacitors will be damaged by internal heat generation.

Consult us for a heavy charge and discharge type of capacitor so that the capacitor will be designed in accordance with requirements of duty cycle of charge and discharge, the number of cycles, discharging resistance and operating temperatures.

#### 8) Failure mode of capacitors

Non-solid aluminum electrolytic capacitors have a limited lifetime which ends in an open circuit failure mode, in general. Depending on the product type and operating conditions, the failure mode may involve in opening of the pressure relief vent.

#### 9) Capacitor insulation

Electrically isolate the following sections of a capacitor from the negative terminal, the positive terminal and the circuit patterns.

- The outer can case of a non-solid aluminum capacitor.
- The dummy terminal of a snap-in type non-solid aluminum capacitor, which is designed for mounting stability.

#### 10) Outer sleeve

The outer sleeve of a capacitor does not assure electrical insulation (except for screw-terminal type capacitors). It should not be used where electrical insulation is required.

#### 11) Operating conditions

Do not use/expose capacitors to the following conditions:

- ① Direct contact with water, salt water or oil, or high condensation environment.
- ② Direct sunlight.
- ③ Toxic gases such as hydrogen sulfide, sulfurous acid, nitrous acid, chlorine and its compounds, bromine and its compounds and ammonium.
- ④ Ozone, ultraviolet rays or radiation.
- ⑤ Extreme vibration or mechanical shock that exceeds limits in the catalogs or product specifications.

The standard vibration condition is applicable to JIS C 5101-4.

#### 12) Mounting

① Non-solid aluminum electrolytic capacitors contain paper separators and electric-conductive electrolyte that contains organic solvent as main solvent material, both of which are flammable. If the electrolyte leaks onto a printed circuit board, it can erode the device circuit pattern, may short-circuit the copper traces, smoke and burn. Make sure of designing a PC board as follows:

- Provide the appropriate hole spacing on the PC board to match the terminal spacing of a capacitor.
- Provide the following adequate clearance space over the pressure relief vent of a capacitor to avoid blocking the correct opening of the pressure relief vent.

| Case diameter       | Clearance   |
|---------------------|-------------|
| φ 8(6.3) to φ 16mm: | 2mm minimum |
| φ 18 to φ 35mm:     | 3mm minimum |
| φ 40 mm and above:  | 5mm minimum |

- Do not locate any wire or circuit pattern over the pressure relief vent of a capacitor.
  - If a capacitor is mounted with its pressure relief vent facing down on the PC board, provide a ventilation hole in the board beneath it to let gas escape when the vent opens.
  - Do not print any copper trace under the seal (terminal) side of a capacitor. Copper traces should be 1 mm (preferably 2mm or more) spaced apart from the side of the capacitor body.
  - Avoid locating any heat source components near capacitors or on the opposite side of the PC board under capacitors.
  - In designing a double-sided PC board, do not locate any through-hole via or unnecessary hole underneath a capacitor.
  - In designing a double-sided PC board, do not print any circuit pattern underneath a capacitor.
- ② For a screw terminal type capacitor, tightening the terminal screws and the mounting clamp should be within the maximum torque specified in the catalogs or product specifications. Do not mount a screw terminal type capacitor with the terminals facing downward. Also, if the body of a capacitor is installed horizontally such as being laid on its side, do not position the pressure relief vent downward.
  - ③ For a chip type capacitor, design the land patterns of the PC board in accordance with the recommended footprint dimensions described in the catalogs or product specifications.

### 13) Using capacitors for significantly safety-oriented applications

Consult with us in advance of usage of our products in the following listed applications. ① Aerospace equipment ② Power generation equipment such as thermal power, nuclear power etc. ③ Medical equipment ④ Transport equipment (automobiles, trains, ships, etc.) ⑤ Transportation control equipment ⑥ Disaster prevention / crime prevention equipment ⑦ Highly publicized information processing equipment ⑧ Submarine equipment ⑨ Other applications that are not considered general-purpose applications.

Note that some products such as photoflash use capacitors which have been designed for specific applications cannot be used for any other application.

### 14) Others

Design device circuits taking into consideration the following conditions:

- ① Electrical characteristics of a capacitor depend on the temperature and frequency. In designing the device circuits, consider the change in the characteristics.
- ② If using more than one capacitor connected in parallel, design the device circuits to balance the current flow in individual capacitors.
- ③ If using more than one capacitor connected in series, connect shunting resistors in parallel with the individual capacitors to balance the voltage.

## 2) Installation

### 1) Assembling

- ① Do not try to reuse the capacitors once assembled and electrified, except only capacitors that are taken from a device for periodic inspection to measure their electrical characteristics.
- ② Capacitors may have been spontaneously recharged with time by a recovery voltage phenomenon. In this case, discharge the capacitors through a resistor of approximately 1kΩ before use.
- ③ If non-solid aluminum electrolytic capacitors have been stored at any conditions more than 35°C and 75%RH for long storage periods of time more than the limits specified in the catalogs or product specifications, they may have high leakage current. In this case, make pre-conditioning by applying the rated voltage through a resistor of approximately 1kΩ.

- ④ Confirm the rated capacitance and voltage of capacitors before installation.
- ⑤ Confirm the polarity of capacitors before installation.
- ⑥ Do not try to use the capacitors that were dropped to the floor and so forth.
- ⑦ Do not deform the can case of a capacitor.
- ⑧ Make sure that the terminal spacing of a capacitor equals the holes spacing on the PC board before installing the capacitor. For radial lead type capacitors, some standard pre-formed lead types are also available.
- ⑨ When installing a snap-in type capacitor on the PC board, insert the terminals into the holes and press the capacitor down until the body is settled flush on the surface of the PC board (without the body standing off).
- ⑩ Do not apply excessive mechanical force to capacitors more than the limits prescribed in the catalogs or product specifications. Avoid excessive mechanical force while the capacitors are in the process of vacuum-picking, placing and positioning by automatic mounting machines or cutting the lead wires by automatic insertion machines.

### 2) Soldering and heat resistance

- ① For soldering using a soldering iron, consider the following conditions:
  - Soldering conditions (temperature and time) should be within the limits prescribed in the catalogs or product specifications.
  - If it is necessary to pre-form the terminal spacing of a capacitor to match the hole spacing on the PC board before assembly and soldering, do not make mechanical stress reach into the body of the capacitor but only the lead wires.
  - Do not touch the body of a capacitor with the hot tip of the soldering iron.
- ② For flow soldering, consider the following conditions:
  - Do not dip the body of a capacitor into a solder bath. Expose only the terminals to the melt solder with the PC board interposing between the solder and the body of the capacitor. Solder only the reverse side of the PC board where the body of the capacitor is not located.
  - Soldering conditions should be within the limits prescribed in the catalogs or product specifications.
  - Do not apply flux to any part of a capacitor other than the terminals.
  - Do not let any other component lean against nor come into contact with the capacitor while soldering.
- ③ For reflow soldering, consider the following conditions:
  - Soldering conditions (preheat, reflow temperature and time) should be within the limits prescribed in the catalogs or product specifications.
  - When using the infrared heater and setting its temperatures, adjust the heating levels taking into consideration that the color and materials of a capacitor vary in their infrared absorbance.
  - The allowable number of reflow passes is specified in the catalogs or product specifications.
  - When mounting a capacitor on the double-sided PC board, do not place any wiring pattern underneath the capacitor.
  - Please consult us about vapor phase soldering (VPS).
- ④ Do not try to reuse the capacitor that was removed from the PC board after soldering.
- ⑤ Only use chip type capacitors for reflow soldering. The other type capacitors are not designed for the reflow.

### 3) Handling after soldering

After soldering the PC board, do not apply the following mechanical stress to the capacitor:

- ① Do not tilt, push down or twist the body of the capacitor.
- ② Do not grab the body of the capacitor to carry the assembly board.
- ③ Do not hit anything against the capacitor. When stacking the assembled boards, do not put any of the PC boards or other

components against the capacitor.

- ④ Do not drop the assembled board.

#### 4) Cleaning assembly boards

- ① Do not clean capacitors with the following cleaning agents:

- Halogenated solvents: cause capacitor failures due to corrosion.
- Alkali system solvents: corrode (dissolve) the aluminum can case.
- Terpene and petroleum system solvents: deteriorate the rubber seal materials.
- Xylene and toluene: deteriorates the rubber seal materials as well.
- Acetone: erases the markings printed on a capacitor.

Where cleaning is necessary, use only solvent resistant type capacitors that have been assured for the cleaning within the specific cleaning conditions prescriber in the catalogs or product specifications. In particular, carefully set up the conditions for ultrasonic cleaning system.

- ② Where cleaning the solvent resistance type of aluminum electrolytic capacitors, confirm the following conditions:

- Control the contamination (the conductivity, pH, specific gravity, water content, etc.) of the cleaning agents.
- After the cleaning, do not leave the capacitors (assembly boards) in an environment of cleaning agent-rich or in a closed container. Sufficiently evaporate the residual cleaning agent from the assembly boards and the capacitors by forced hot air at temperatures less than the upper limit of category temperature range for more than 10 minutes.

In general, aluminum electrolytic capacitors are sensitive to contamination of halogen ions (particularly to chlorine ions). Depending on the properties of the electrolyte and rubber seal materials used in a capacitor, the halogen ions lead up to catastrophic failures on the capacitor. Where the inside of a capacitor has been contaminated with more than a certain amount of halogen ions and the capacitor is in use, the corrosion reaction of aluminum occurs. The corrosion causes the capacitor to have a significant increase in leakage current with heat produced, open the pressure relief vent and become open circuit mode failure.

Due to global environmental issues (greenhouse effects and other environmental destruction by depletion of the ozone layer), the conventional cleaning solvents of CFC 113, Trichloroethylene and 1,1,1-trichloroethylene were replaced by substitutes.

The following are some substitute cleaning agents and allowable cleaning conditions:

- a) Fatty-alcohol cleaning agents  
Pine Alpha ST-100S (Arakawa Chemical)  
Clean Through 750H, 750HS and 750J (Kao)

#### [Compatible capacitor products]

| Terminal Shape     | Subject Series                     |
|--------------------|------------------------------------|
| Surface Mount Type | All Series                         |
| Radial Lead Type   | All Series                         |
| Snap-in Type       | All Series (Less and equal 100Vdc) |

#### [Cleaning conditions]

Either of immersion or ultrasonic cleaning, for a maximum of 10 minutes and at a maximum liquid temperature of 60°C is acceptable. Make sure that the markings on the capacitor are not rubbed against any other component or the PC board during cleaning. Note that shower cleaning affects the markings on the capacitor.

- b) HCFC (Freon 225) as Alternative CFCs  
AK225AES (Asahi Glass)

#### [Cleaning conditions]

Solvent resistant type capacitors, which were originally developed to intend to resist Freon TE or Freon TES, are also capable of withstanding any one of immersion, ultrasonic or vapor cleaning, for a maximum of 5 minutes (or 2 minutes for

KRE series capacitors or 3 minutes for SRM series).

However, this type of cleaning agent is not recommended to use, as the cleaning materials may be banned in near future in view of global environmental issues.

- c) IPA (Isopropyl Alcohol)

Immersion cleaning with a maximum flux concentration of 2 wt% is acceptable.

#### 5) Adhesives and coating materials

- ① Do not use any adhesive or coating materials containing halogenated solvents.
- ② Make sure of the following conditions before applying adhesive or coating materials to a capacitor,
  - No flux residue nor stain is left between the rubber seal of a capacitor and PC board.
  - Dry the capacitor to remove residual cleaning agents before applying adhesive and coating materials. Do not cover up the entire surface of the rubber seal of the capacitor with adhesives or coating materials.
  - Heating and curing conditions for adhesives and coating materials should be followed as prescribed in the catalogs or product specifications.
  - Covering up the entire surface of the rubber seal with resin mold materials will obstruct the normal diffusion of internal hydrogen gas from a capacitor and result in serious failures. Also, where the adhesive and coating materials contain a large amount of halogen ions, the halogen ions will contaminate the inside of the capacitor through the rubber seal materials, causing the capacitor to become a failure.
  - Depending on solvent materials that the adhesive or coating materials contains, note that the outer sleeve of a capacitor may lose a gloss or whiten in appearance.

#### 6) Fumigation

In exporting or importing electronic devices, they may be exposed to fumigation with halide such as methyl bromide. Where aluminum electrolytic capacitors are exposed to halide such as methyl bromide, the capacitors will be damaged with the corrosion reaction with halogen ions in the same way as cleaning agents. For the export and import, Nippon Chemi-Con considers using some packaging method and so forth so that fumigation is not required. For customers to export or import electronic devices, semi-assembly products or capacitor components, confirm if they will be exposed to fumigation and also consider final condition of packaging. (Note that either cardboard or vinyl package has a risk of fumigation gas penetration.)

### 3) Precautions during operation of devices

- 1) Never touch the terminals of a capacitor directly with bare hands.
- 2) Do not short-circuit between the capacitor terminals with anything conductive.  
Also, do not spill any conductive liquid such as acid or alkaline solution over a capacitor.
- 3) Confirm environmental conditions where the device will be placed. Do not use the device in the following environmental conditions:
  - ① Water or oil spatters, or high condensation environment.
  - ② Direct sunlight.
  - ③ Ozone, ultraviolet rays or radiation.
  - ④ Toxic gases such as hydrogen sulfide, sulfuric acid, nitrous acid, chlorine and its compounds, bromine and its compounds and ammonium.
  - ⑤ Severe vibration or mechanical shock conditions beyond the limits prescribed in the catalog or product specification. The standard vibration condition is applicable to JIS C 5101-4.

**4 Maintenance inspections**

- 1) For industrial use capacitors, make periodic inspections of the capacitors. Before the inspections, turn off the power supply of the device and discharge the electricity of the capacitors. When checking it by a volt-ohm meter, confirm the polarity beforehand. Do not apply mechanical stress to the terminals of the capacitors during inspection.
- 2) Characteristics to be inspected
  - ① Significant damage in appearance: vent opening, electrolyte leakage, etc.
  - ② Electrical characteristics: Leakage current, capacitance,  $\tan \delta$  and other characteristics prescribed in the catalogs or product specifications.

If finding anything abnormal on the characteristics above, check the specifications of the capacitor and take appropriate actions such as replacement.

**5 Capacitor venting**

- 1) A capacitor with more than a certain case size has the pressure relief vent functioning to escape abnormal gas pressure increase.  
If gas expels from a venting capacitor, disconnect the power supply of the device or unplug the power supply cord. If not disconnecting the power supply, the device circuit may be damaged due to the short circuit failure of the capacitor or short-circuited with the liquid that the gas was condensed to. It may cause secondary damages such as device burnout in the worst case scenario.  
The gas that comes out of the open vent is vaporized electrolyte, not smoke.
- 2) The gas expelled from a venting capacitor is more than 100°C. Never expose your face to the capacitor. If your eyes are exposed to the gas or you inhale it, immediately flush your eyes and/or gargle with water. If the electrolyte comes in contact with the skin, wash with soap and water.

**6 Storage**

- 1) Do not store capacitors at high temperature or high humidity. Store the capacitors indoors at temperatures of 5 to 35°C and humidities of less than 75%RH.  
In principle, aluminum electrolytic capacitors should be used within three years after production.
- 2) Keep capacitors packed in the original packaging material wherever possible.
- 3) Avoid the following storage environmental conditions:
  - ① Water spattering, high temperatures, high humidity or condensation environment.
  - ② Oil spattering or oil mist filled.
  - ③ Salt water spattering or salt filled.
  - ④ Acidic toxic gases such as hydrogen sulfide, sulfuric acid, nitrous acid, chlorine, bromine and methyl bromide filled.
  - ⑤ Alkaline toxic gases such as ammonium filled.
  - ⑥ Acid or alkaline solutions spattering.
  - ⑦ Direct sunlight, ozone, ultraviolet rays or radiation.
  - ⑧ Extreme vibration or shock loading.
- 4) JEDEC J-STD-020 is not applicable.

**7 Capacitor disposal**

Please consult with a local organization for the proper disposal of industrial waste. For incinerating capacitors, apply a high-temperature incineration (over 800°C). Incinerating them at temperatures lower than that may produce toxic gases such as chlorine. To prevent capacitors from explosion, punch holes in or sufficiently crush the can cases of the capacitors, then incinerate.

**8 About AEC-Q200**

The Automotive Electronics Council (AEC) was originally established by major American automotive related manufactures. Today, the committees are composed of representatives from the sustaining Members of manufacturing companies in automotive electrical components. It has standardized the criteria for "stress test qualification" and "reliability tests" for electronic components.

AEC-Q200 is the reliability test standard for approval of passive components in Automotive applications. It specifies the test type, parameters and quantity, etc. for each component. The criteria of the reliability tests such as for our main products, "Aluminum Electrolytic Capacitors" are described in this standard.

Pursuant to the customer's specific testing requirements, Chemi-Con submits the test results according to AEC-Q200 for Aluminum Electrolytic Capacitors used in automotive applications on request.

An electronic component manufacturer cannot simply claim that their product is "AEC-Q200 Qualified". It can be claimed "Compliant", "Capable", "Available", etc., however each component must be tested per each users "Qualification Test Plan" in order to claim AEC-Q200 status.

Please contact us for more information.

**9 Response to the Substances of Concern**

- 1) Nippon Chemi-Con aims for developing products that meet laws and regulations concerning substances of concern.  
(Some products may contain regulated substances for exempted application)  
Please contact us for more information about law-compliance status.
- 2) According to the content of REACH handbook (Guidance on requirements for substances in articles which is published on May 2008), our electronic components are "articles without any intended release". Therefore they are not applicable for "Registration" for EU REACH Regulation Article 7 (1).  
Reference: Electrolytic Condenser Investigation Society  
"Study of REACH Regulation in EU about Electrolytic Capacitor"  
(publicized on 13 March 2008)

**10 Catalogs**

Specifications in the catalogs are subject to change without notice. Test data shown in the catalogs are not assured as the whole performance values, but typical values.

For more details, refer to JEITA RCR-2367D (March 2019) with the title of "Safety Application Guide for fixed aluminum electrolytic capacitors for use in electronic equipment".

## RECOMMENDED SOLDERING CONDITIONS

## ◆SURFACE MOUNT TYPE

Alchip™ MVE/MZT/MZS/MZL/MZR/MZJ/MZA/MVY/MZF/MZE/MZK/MLA/MLF/MLK/MVL/MVJ/MXB/MHS/MVH/MHL/MHB/MHJ/MHK

The following conditions are recommended for air convection and infrared reflow soldering on the SMD products onto a glass epoxy circuit boards by cream solder. The dimensions of the glass epoxy boards with resist are 90×50×0.8mm for D55 to KG5 case code SMD capacitors and 180×90×0.8mm for LH0 to MN0 case codes SMD capacitors.

The temperatures shown are the surface temperature values on the top of the can and on the capacitor terminals.

Reflow should be performed twice or less. (Only some products: 3 times)

Please ensure that the capacitor became cold enough to the room temperature (5 to 35°C) before the second reflow and the third reflow (Only some products). Consult with us when performing reflow profile in IPC / JEDEC (J-STD-020)

## ●Recommended soldering heat conditions (Except for Conductive Polymer Aluminum Solid Capacitors)

| Series                                                                                                            | Size code  | Voltage range (Vdc)           | Preheat                      | Time maintained above 217°C | Time maintained above 230°C | Peak temp. | Reflow number   |

## ●Recommended Solder Land on PC Board

▨ : Solder land on PC board

## ◆RADIAL LEAD AND SNAP-IN TYPE

## ●Recommended soldering heat conditions

Preheat : 150°C 120 seconds max. (Radial lead type)

Flow : 260±5°C max. 10±1 seconds max.

(Or 380±10°C max. 3±0.5 seconds max.: hand soldering)

## ◆PRECAUTIONS FOR USERS

## Soldering method

The capacitors of Alchip-series have no capability to withstand such dip or wave soldering as totally immerses components into a solder bath.

## Reflow soldering

Reflow the capacitors within recommended reflow soldering conditions. Verify there is no temperature stress to the capacitors because the following differences might degrade capacitors electrically and mechanically. Please consult us if other reflow conditions are employed.

1. Location of components : Temperature increases at the edge of PC board more than the center.
2. Population of PC board : The lower the component population is, the more temperature rises.
3. Material of PC board : A ceramic made board needs more heat than a glass epoxy made board. The heat increase may cause damage to the capacitors.
4. Thickness of PC board : A thicker board needs more heat than a thinner board. The heat increase may damage the capacitors.
5. Size of PC board : A larger board needs more heat than a smaller board. The heat increase may damage the capacitors.
6. Solder thickness  
If very thin cream solder paste is to be used for SMD types, please consult with us.
7. Location of infrared ray lamps : IR reflow as well as hot plate reflow heats only on the reverse side of the PC board to lessen heat stress to the capacitors.
8. Please consult us about vapor phase soldering (VPS).

## Rework of soldering

Use a soldering iron for rework. Do not exceed an iron tip temperature of 380±10°C and an exposure time of 3±0.5 seconds.

## Mechanical stress

Do not use the capacitors for lifting the PC board and give stress to the capacitor. Avoid bending the PC board. This may damage the capacitors.

## Cleaning assembly board

Immediately after solvent cleaning, remove residual solvent with an air knife for at least 10 minutes. If the solvent is insufficiently dry, the capacitors may corrode.

## Coating on assembly board

1. Before curing coating material, remove the cleaning solvents from the assembly board.
2. Before conformal coating, a chloride free pre-coat material is recommended to decrease the stress on the capacitors.

## Molding with resin

Internal chemical reaction gradually produces gas in the capacitor; then, increasing internal pressure. If the end seal of the capacitor is completely covered by resin the gas will be unable to escape causing a potentially dangerous situation. The chlorine contained resin will penetrate into the end seal, reach the inside element, and cause damage of the capacitor.

## Others

Refer to PRECAUTIONS AND GUIDELINES.

## Product code guide (Surface mount type)

(Example : MVE series, 25V-47 $\mu$ F,  $\phi$ 6.3 $\times$ 5.2L)

Please refer to the following table

\*Refer to the appendix (Part number) for codes not listed here.

## Alchip™-MVE Series

- Endurance : 1,000 to 2,000 hours at 105°C
- Case size range :  $\phi 4 \times 5.2\text{L}$  to  $\phi 18 \times 21.5\text{L}$
- Solvent resistant type except 100V<sub>dc</sub> (see PRECAUTIONS AND GUIDELINES)
- RoHS2 Compliant
- AEC-Q200 compliant : Please contact Chemi-Con for more details, test data, information.

MVE → Longer life → MVL

● Frequency Multipliers

| Size code  | Capacitance(μF) | Frequency(Hz) |      |      |      |
|------------|-----------------|---------------|------|------|------|
|            |                 | 120           | 1k   | 10k  | 100k |
| D55 to JA0 | 1.0             | 1.00          | 1.50 | 1.75 | 1.80 |
|            | 2.2 to 10       | 1.00          | 1.30 | 1.40 | 1.50 |
|            | 22 to 1,500     | 1.00          | 1.05 | 1.08 | 1.08 |
| KE0 to MN0 | 47, 68          | 1.00          | 1.50 | 1.75 | 1.80 |
|            | 100 to 1,000    | 1.00          | 1.30 | 1.40 | 1.50 |
|            | 2,200 to 6,800  | 1.00          | 1.05 | 1.08 | 1.08 |

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.

Please refer to "Product code guide (surface mount type)"

□ : Enter the appropriate terminal code.

Production of the products shown in   is scheduled to be discontinued.

\*1: Assembly boards with the designated products attached cannot be cleaned.

# Alchip™.MZT Series

Upgrade!

- Downsizing and Lower ESR, 2,000hours at 105°C
- Rated voltage range : 16 to 35V, Nominal capacitance range : 220 to 1,500μF
- Solvent resistant type(see PRECAUTIONS AND GUIDELINES)
- Vibration resistance structure
- RoHS2 Compliant
- AEC-Q200 compliant : Please contact Chemi-Con for more details, test data, information.

| JA0       | 10  | 10.0 | 10.3 | 10.3 | 11.0 | 0.7 to 1.1 | 4.5 |

## MARKING

EX) 25V1,200μF

- Rated voltage symbol

| Rated voltage (V <sub>dc</sub> ) | 16 | 25 | 35 |
|----------------------------------|----|----|----|
| Symbol                           | C  | E  | V  |

Applying voltage over the rated voltages causes the capacitors to have short lifetime.  
 Besides, applying voltage over the specified surge voltages may cause to have short circuit failure. A protection circuit should be used if applied voltage will exceed the rated voltages.

## ◆RATED RIPPLE CURRENT MULTIPLIERS

## ●Frequency Multipliers

| Capacitance(μF) \ Frequency(Hz) | 120  | 1k   | 10k  | 100k |
|---------------------------------|------|------|------|------|
| 220 to 510                      | 0.50 | 0.85 | 0.94 | 1.00 |
| 680 to 1,500                    | 0.60 | 0.87 | 0.95 | 1.00 |

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.

## Alchip™-MZS Series

- Downsizing and Lower ESR, 2,000hours at 105°C
- Rated voltage range : 25, 35V, Nominal capacitance range : 330 to 1,000μF
- Solvent resistant type(see PRECAUTIONS AND GUIDELINES)
- Vibration resistance structure
- RoHS2 Compliant
- AEC-Q200 compliant : Please contact Chemi-Con for more details, test data, information.

## ◆ MARKING

EX) 25V1,000μF

- Rated voltage symbol

| Rated voltage (V <sub>dc</sub> ) | 25 | 35 |
|----------------------------------|----|----|
| Symbol                           | E  | V  |

Applying voltage over the rated voltages causes the capacitors to have short lifetime.  
Besides, applying voltage over the specified surge voltages may cause to have short circuit failure. A protection circuit should be used if applied voltage will exceed the rated voltages.

## ◆RATED RIPPLE CURRENT MULTIPLIERS

## ●Frequency Multipliers

| Capacitance(μF) \ Frequency(Hz) | 120  | 1k   | 10k  | 100k |
|---------------------------------|------|------|------|------|
| 330 to 560                      | 0.50 | 0.85 | 0.94 | 1.00 |
| 680 to 1,000                    | 0.60 | 0.87 | 0.95 | 1.00 |

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.

## Alchip™-MZL Series

- Low ESR, 5,000hours at 105°C
- Rated voltage range : 6.3 to 50V, Nominal capacitance range : 100 to 1,500μF
- Solvent resistant type(see PRECAUTIONS AND GUIDELINES)
- Vibration resistance structure
- RoHS2 Compliant
- AEC-Q200 compliant : Please contact Chemi-Con for more details, test data, information.

## ◆SPECIFICATIONS

## ◆MARKING

EX) 35V560μF

● Rated voltage symbol

| Rated voltage (V <sub>dc</sub> ) | 6.3 | 10 | 16 | 25 | 35 | 50 |
|----------------------------------|-----|----|----|----|----|----|
| Symbol                           | j   | A  | C  | E  | V  | H  |

Applying voltage over the rated voltages causes the capacitors to have short lifetime.  
Besides, applying voltage over the specified surge voltages may cause to have short circuit failure. A protection circuit should be used if applied voltage will exceed the rated voltages.

## ◆RATED RIPPLE CURRENT MULTIPLIERS

## ●Frequency Multipliers

| Capacitance(µF) \ Frequency(Hz) | 120  | 1k   | 10k  | 100k |
|---------------------------------|------|------|------|------|
| 100                             | 0.40 | 0.75 | 0.90 | 1.00 |
| 220 to 560                      | 0.50 | 0.85 | 0.94 | 1.00 |
| 680 to 1,500                    | 0.60 | 0.87 | 0.95 | 1.00 |

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.

## Alchip™-MZR Series

- Downsizing and Lower ESR, 2,000hours at 105°C
- Rated voltage range : 6.3 to 50V, Nominal capacitance range : 22 to 2,200μF
- Solvent resistant type(see PRECAUTIONS AND GUIDELINES)
- Vibration resistance structure
- RoHS2 Compliant
- AEC-Q200 compliant : Please contact Chemi-Con for more details, test data, information.

## ◆ SPECIFICATIONS

## ◆ MARKING

EX) 35V330μF

- Rated voltage symbol

| Rated voltage (V <sub>dc</sub> ) | 6.3 | 10 | 16 | 25 | 35 | 50 |
|----------------------------------|-----|----|----|----|----|----|
| Symbol                           | j   | A  | C  | E  | V  | H  |

Applying voltage over the rated voltages causes the capacitors to have short lifetime.  
Besides, applying voltage over the specified surge voltages may cause to have short circuit failure. A protection circuit should be used if applied voltage will exceed the rated voltages.

## ◆RATED RIPPLE CURRENT MULTIPLIERS

## ●Frequency Multipliers

| Capacitance(μF) | Frequency(Hz) |      |      |      |
|-----------------|---------------|------|------|------|
|                 | 120           | 1k   | 10k  | 100k |
| 22 to 150       | 0.40          | 0.75 | 0.90 | 1.00 |
| 220 to 560      | 0.50          | 0.85 | 0.94 | 1.00 |
| 680 to 2,200    | 0.60          | 0.87 | 0.95 | 1.00 |

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.

## Alchip™-MZJ Series

- Lower ESR, 2,000 to 5,000 hours at 105°C
- Rated voltage range : 6.3 to 50V
- Nominal capacitance range : 22 to 10,000μF
- Solvent resistant type (see PRECAUTIONS AND GUIDELINES)
- Vibration resistant structure
- RoHS2 Compliant
- AEC-Q200 compliant : Please contact Chemi-Con for more details, test data, information.

## ◆ SPECIFICATIONS

## ◆ MARKING

EX) 35V220μF

- Rated voltage symbol (E61 to JA0)

| Rated voltage (V <sub>dc</sub> ) | 6.3 | 10 | 16 | 25 | 35 |
|----------------------------------|-----|----|----|----|----|
| Symbol                           | j   | A  | C  | E  | V  |

KE0 to LN0

EX) 16V1,800μF

Applying voltage over the rated voltages causes the capacitors to have short lifetime.  
Besides, applying voltage over the specified surge voltages may cause to have short circuit failure. A protection circuit should be used if applied voltage will exceed the rated voltages.

## Alchip™-MZJ Series

## ◆PART NUMBERING SYSTEM

## ◆RATED RIPPLE CURRENT MULTIPLIERS

## ●Frequency Multipliers

| Size code  | Capacitance(μF) | Frequency(Hz) | 120  | 1k   | 10k  | 100k |
|------------|-----------------|---------------|------|------|------|------|
| E61 to JA0 | 22 to 150       |               | 0.40 | 0.75 | 0.90 | 1.00 |
|            | 220 to 560      |               | 0.50 | 0.85 | 0.94 | 1.00 |
|            | 680 to 1,800    |               | 0.60 | 0.87 | 0.95 | 1.00 |
| KE0 to LN0 | 390 to 470      |               | 0.50 | 0.85 | 0.94 | 1.00 |
|            | 680 to 1,800    |               | 0.60 | 0.87 | 0.95 | 1.00 |
|            | 2,200 to 3,300  |               | 0.75 | 0.90 | 0.95 | 1.00 |
|            | 3,900 to 10,000 |               | 0.85 | 0.95 | 0.98 | 1.00 |

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.

## Alchip™-MZA Series

- Endurance : 2,000 to 5,000 hours at 105°C
- Low impedance
- Solvent resistant type(see PRECAUTIONS AND GUIDELINES)
- Vibration resistant structure
- RoHS2 Compliant
- AEC-Q200 compliant : Please contact Chemi-Con for more details, test data, information.

## ◆SPECIFICATIONS

## ◆RATED RIPPLE CURRENT MULTIPLIERS

●Frequency Multipliers

| Size code  | Capacitance(μF) | Frequency(Hz) |      |      |      |
|------------|-----------------|---------------|------|------|------|
|            |                 | 120           | 1k   | 10k  | 100k |
| D61 to JA0 | 3.3 to 4.7      | 0.35          | 0.70 | 0.90 | 1.00 |
|            | 10 to 100       | 0.40          | 0.75 | 0.90 | 1.00 |
|            | 220 to 470      | 0.50          | 0.85 | 0.94 | 1.00 |
|            | 680 to 1,500    | 0.60          | 0.87 | 0.95 | 1.00 |
| KE0 to MNO | 110 to 200      | 0.40          | 0.75 | 0.90 | 1.00 |
|            | 220 to 620      | 0.50          | 0.85 | 0.94 | 1.00 |
|            | 680 to 1,800    | 0.60          | 0.87 | 0.95 | 1.00 |
|            | 2,400 to 3,000  | 0.75          | 0.90 | 0.95 | 1.00 |
|            | 3,900           | 0.85          | 0.95 | 0.98 | 1.00 |

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.

Product specifications in this catalog are subject to change without notice. Request our product specifications before purchase and/or use. Please use our products based on the information contained in this catalog and product specifications.

# Alchip™-MVY Series

- Endurance : 1,000 to 5,000 hours at 105°C
- Low impedance
- For digital equipment, especially DC-DC converters
- Solvent resistant type except 80 & 100V<sub>dc</sub> (see PRECAUTIONS AND GUIDELINES)
- Vibration resistant structure
- RoHS2 Compliant
- AEC-Q200 compliant : Please contact Chemi-Con for more details, test data, information.

## ◆RATED RIPPLE CURRENT MULTIPLIERS

## ●Frequency Multipliers

| Size code  | Capacitance(μF) | Frequency(Hz) | 120  | 1k   | 10k  | 100k |
|------------|-----------------|---------------|------|------|------|------|
| D55 to JA0 | 1.0 to 4.7      |               | 0.35 | 0.70 | 0.90 | 1.00 |
|            | 10 to 100       |               | 0.40 | 0.75 | 0.90 | 1.00 |
|            | 220 to 470      |               | 0.50 | 0.85 | 0.94 | 1.00 |
|            | 680 to 1,500    |               | 0.60 | 0.87 | 0.95 | 1.00 |
| KE0 to MN0 | 47 to 100       |               | 0.40 | 0.75 | 0.90 | 1.00 |
|            | 220 to 470      |               | 0.50 | 0.85 | 0.94 | 1.00 |
|            | 1,000           |               | 0.60 | 0.87 | 0.95 | 1.00 |
|            | 2,200 to 3,300  |               | 0.75 | 0.90 | 0.95 | 1.00 |
|            | 4,700 to 8,200  |               | 0.85 | 0.95 | 0.98 | 1.00 |

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.

Product specifications in this catalog are subject to change without notice. Request our product specifications before purchase and/or use. Please use our products based on the information contained in this catalog and product specifications.

## Alchip™-MZF Series

- Endurance : 10,000 hours at 105°C
- Low impedance
- Rated voltage range : 6.3 to 50V
- Nominal capacitance range : 10 to 470μF
- Suitable for long life and low profile products
- Solvent resistant type (see PRECAUTIONS AND GUIDELINES)
- RoHS2 Compliant

Production of the products shown in   is scheduled to be discontinued.

## ◆RATED RIPLE CURRENT MULTIPLIERS

## ●Frequency Multipliers

| Capacitance(μF) | Frequency(Hz) | 120  | 1k   | 10k  | 100k |
|-----------------|---------------|------|------|------|------|
| 10 to 150       |               | 0.40 | 0.75 | 0.90 | 1.00 |
| 220 to 470      |               | 0.50 | 0.85 | 0.94 | 1.00 |

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.

# SURFACE MOUNT ALUMINUM ELECTROLYTIC CAPACITORS

Low impedance, 7000 to 8000-hours-life, 105°C

## Alchip™-MZE Series

- Endurance : 7,000 to 8,000 hours at 105°C
- Low impedance
- Rated voltage range : 6.3 to 50V
- Nominal capacitance range : 10 to 470μF
- Suitable for long life and low profile products
- Solvent resistant type (see PRECAUTIONS AND GUIDELINES)
- RoHS2 Compliant

| 220 to 470      |               | 0.50 | 0.85 | 0.94 | 1.00 |

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.

## Alchip™-MZK Series

- Endurance : 5,000 hours at 105°C
- Low impedance
- Rated voltage range : 6.3 to 35V
- Nominal capacitance range : 10 to 150μF
- Suitable for low profile products
- Solvent resistant type (see PRECAUTIONS AND GUIDELINES)
- RoHS2 Compliant

MVY → Longer life → **MZK**

## ◆RATED RIPPLE CURRENT MULTIPLIERS

## ●Frequency Multipliers

| Frequency(Hz)            | 120  | 1k   | 10k  | 100k |
|--------------------------|------|------|------|------|
| 6.3 to 35V <sub>dc</sub> | 0.40 | 0.75 | 0.90 | 1.00 |

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.

## Alchip™-MLA Series

- Low impedance, long life
- Rated voltage 6.3 to 50V, Capacitance 10 to 1,000μF
- Case size  $\phi 5 \times 5.8\text{L}$  to  $\phi 10 \times 10\text{L}$
- Suitable for applications requiring long life and low impedance such as equipment in continuous operation, industrial applications, etc.
- Solvent resistant type (see PRECAUTIONS AND GUIDELINES)
- RoHS2 Compliant

MVY → Longer life

MLA

## ◆ SPECIFICATIONS

## ◆RATED RIPPLE CURRENT MULTIPLIERS

## ● Frequency Multipliers

| Capacitance(μF) | Frequency(Hz) | 120  | 1k   | 10k  | 100k |
|-----------------|---------------|------|------|------|------|
| 10 to 150       |               | 0.40 | 0.75 | 0.90 | 1.00 |
| 220 to 470      |               | 0.50 | 0.85 | 0.94 | 1.00 |
| 1,000           |               | 0.60 | 0.87 | 0.95 | 1.00 |

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.

## Alchip™-MLF Series

- Endurance : 10,000 hours at 105°C
- Rated voltage range : 6.3 to 50V
- Nominal capacitance range : 1.0 to 1,000μF
- Suitable for long life and low profile products
- Solvent resistant type (see PRECAUTIONS AND GUIDELINES)
- RoHS2 Compliant

MVL  $\xrightarrow{\text{Longer life}}$  MLE  $\xrightarrow{\text{Longer life}}$  **MLF**

Production of the products shown in   is scheduled to be discontinued.

## ◆RATED RIPPLE CURRENT MULTIPLIERS

## ⊙Frequency Multipliers

| Capacitance(μF) \ Frequency(Hz) | 120  | 1k   | 10k  | 100k |
|---------------------------------|------|------|------|------|
| 1.0                             | 1.00 | 1.50 | 1.75 | 1.80 |
| 2.2 to 10                       | 1.00 | 1.30 | 1.40 | 1.50 |
| 22 to 1,000                     | 1.00 | 1.05 | 1.08 | 1.08 |

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.

## Alchip™-MLE Series

- Endurance : 7,000 to 8,000 hours at 105°C
- Rated voltage range : 6.3 to 50V
- Nominal capacitance range : 1.0 to 1,000μF
- Suitable for long life and low profile products
- Solvent resistant type (see PRECAUTIONS AND GUIDELINES)
- RoHS2 Compliant

### SPECIFICATIONS

Production of the products shown in   is scheduled to be discontinued.

## ◆RATED RIPPLE CURRENT MULTIPLIERS

## ●Frequency Multipliers

| Capacitance(μF) \ Frequency(Hz) | 120  | 1k   | 10k  | 100k |
|---------------------------------|------|------|------|------|
| 1.0                             | 1.00 | 1.50 | 1.75 | 1.80 |
| 2.2 to 10                       | 1.00 | 1.30 | 1.40 | 1.50 |
| 22 to 1,000                     | 1.00 | 1.05 | 1.08 | 1.08 |

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.

## Alchip™-MLK Series

- 6.1mm height
- Endurance : 5,000 hours at 105°C
- Rated voltage range : 6.3 to 35V
- Nominal capacitance range : 4.7 to 100μF
- Suitable to fit for downsized equipment
- Solvent resistant type (see PRECAUTIONS AND GUIDELINES)
- RoHS2 Compliant

MVL

Longer life

MLK

## ◆ RATED RIPPLE CURRENT MULTIPLIERS

- Frequency Multipliers

| Frequency (Hz)           | 120  | 1k   | 10k  | 100k |
|--------------------------|------|------|------|------|
| 6.3 to 35V <sub>dc</sub> | 1.00 | 1.05 | 1.08 | 1.08 |

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.

## Alchip™-MVL Series

- Endurance : 3,000 to 5,000 hours at 105°C
- Suitable for applications requiring long life such as continuously operating equipment, industrial applications, etc
- Solvent resistant type (see PRECAUTIONS AND GUIDELINES)
- RoHS2 Compliant

MVL

Longer life  
MVJ

Production of the products shown in   is scheduled to be discontinued.

## ◆ RATED RIPPLE CURRENT MULTIPLIERS

## ● Frequency Multipliers

| Capacitance(μF) \ Frequency(Hz) | 120  | 1k   | 10k  | 100k |
|---------------------------------|------|------|------|------|
| 1.0                             | 1.00 | 1.50 | 1.75 | 1.80 |
| 2.2 to 10                       | 1.00 | 1.30 | 1.40 | 1.50 |
| 22 to 1,000                     | 1.00 | 1.05 | 1.08 | 1.08 |

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.

## Alchip™-MVJ Series

- Endurance : 2,000 hours at 105°C
- Solvent resistant type (see PRECAUTIONS AND GUIDELINES)
- RoHS2 Compliant

Production of the products shown in [ ] is scheduled to be discontinued.

## ◆ RATED RIPPLE CURRENT MULTIPLIERS

● Frequency Multipliers

| Capacitance(μF) | Frequency(Hz) | 120  | 1k   | 10k  | 100k |
|-----------------|---------------|------|------|------|------|
| 1.0             |               | 1.00 | 1.50 | 1.75 | 1.80 |
| 2.2 to 10       |               | 1.00 | 1.30 | 1.40 | 1.50 |
| 22 to 100       |               | 1.00 | 1.05 | 1.08 | 1.08 |

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.

Product specifications in this catalog are subject to change without notice. Request our product specifications before purchase and/or use. Please use our products based on the information contained in this catalog and product specifications.

# Alchip™-MHS Series

Upgrade!

- Downsizing, High capacitance
- Endurance : 2,000 to 5,000 hours at 125°C
- For high temperature and high reliability applications (Base station equipment, etc)
- High temperature reflow soldering
- Solvent resistant type(see PRECAUTIONS AND GUIDELINES)
- Vibration resistant structure
- RoHS2 Compliant
- AEC-Q200 compliant : Please contact Chemi-Con for more details, test data, information.

## SPECIFICATIONS

## ◆RATED RIPPLE CURRENT MULTIPLIERS

## ●Frequency Multipliers

| Size code  | Capacitance(μF) | Frequency(Hz) | 120  | 1k   | 10k  | 100k |
|------------|-----------------|---------------|------|------|------|------|
| HA0, JA0   | 47 to 180       |               | 0.40 | 0.75 | 0.90 | 1.00 |
|            | 220 to 470      |               | 0.50 | 0.85 | 0.94 | 1.00 |
|            | 680 to 1,000    |               | 0.60 | 0.87 | 0.95 | 1.00 |
| KE0 to MN0 | 110 to 200      |               | 0.40 | 0.75 | 0.90 | 1.00 |
|            | 220 to 620      |               | 0.50 | 0.85 | 0.94 | 1.00 |
|            | 680 to 2,000    |               | 0.60 | 0.87 | 0.95 | 1.00 |
|            | 2,400 to 4,300  |               | 0.75 | 0.90 | 0.95 | 1.00 |
|            | 4,700 to 6,200  |               | 0.85 | 0.95 | 0.98 | 1.00 |
|            |                 |               |      |      |      |      |

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.

## Alchip™-MVH Series

- Lower ESR, Higher ripple current
- Endurance : 1,000 to 5,000 hours at 125°C
- Suitable to fit for automotive equipment
- Solvent resistant type except 63 to 100V<sub>dc</sub> (see PRECAUTIONS AND GUIDELINES)
- Vibration resistant structure
- RoHS2 Compliant
- AEC-Q200 compliant : Please contact Chemi-Con for more details, test data, information.

MVH

125°C  
MVE

## ◆ SPECIFICATIONS

## ◆RATED RIPPLE CURRENT MULTIPLIERS

## ●Frequency Multipliers

| Size code  | Capacitance(μF) | Frequency(Hz) | 120  | 1k   | 10k  | 100k |
|------------|-----------------|---------------|------|------|------|------|
| F60 to JA0 | 10              |               | 0.66 | 0.86 | 0.93 | 1.00 |
|            | 22 to 470       |               | 0.93 | 0.97 | 1.00 | 1.00 |
|            | 47 to 100       |               | 0.40 | 0.75 | 0.90 | 1.00 |
| KE0 to MN0 | 220 to 470      |               | 0.50 | 0.85 | 0.94 | 1.00 |
|            | 680 to 1,000    |               | 0.60 | 0.87 | 0.95 | 1.00 |
|            | 2,200 to 3,300  |               | 0.75 | 0.90 | 0.95 | 1.00 |
|            | 4,700           |               | 0.85 | 0.95 | 0.98 | 1.00 |
|            |                 |               |      |      |      |      |

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.

## Alchip™-MHL Series

- Downsized and Longer life from current MVH series
- Endurance : 2,000 to 4,000 hours at 125°C
- Rated voltage range : 10 to 35V. Nominal capacitance range : 47 to 680μF
- For automobile modules and other high temperature applications
- Solvent resistant type (see PRECAUTIONS AND GUIDELINES)
- Vibration resistant structure
- RoHS2 Compliant
- AEC-Q200 compliant : Please contact Chemi-Con for more details, test data, information.

## ◆RATED RIPPLE CURRENT MULTIPLIERS

## ●Frequency Multipliers

| Capacitance(μF) | Frequency(Hz) |      |      |      |
|-----------------|---------------|------|------|------|
|                 | 120           | 1k   | 10k  | 100k |
| 47 to 680       | 0.93          | 0.97 | 1.00 | 1.00 |

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.

## Alchip™-MHB Series

- ESR : Less than MVH
- Endurance : 1,500 to 3,000 hours at 125°C
- Rated voltage range : 10 to 100V
- Solvent resistant type (see PRECAUTIONS AND GUIDELINES)
- Vibration resistant structure
- RoHS2 Compliant
- AEC-Q200 compliant : Please contact Chemi-Con for more details, test data, information.

## ◆RATED RIPPLE CURRENT MULTIPLIERS

## ● Frequency Multipliers

| Size code  | Capacitance(μF) | Frequency(Hz) | 120  | 1k   | 10k  | 100k |
|------------|-----------------|---------------|------|------|------|------|
| HA0 to JA0 | 47 to 470       |               | 0.93 | 0.97 | 1.00 | 1.00 |
|            | 75 to 200       |               | 0.40 | 0.75 | 0.90 | 1.00 |
| KE0 to MN0 | 220 to 560      |               | 0.50 | 0.85 | 0.94 | 1.00 |
|            | 680 to 1,600    |               | 0.60 | 0.87 | 0.95 | 1.00 |
|            | 2,200 to 3,300  |               | 0.75 | 0.90 | 0.95 | 1.00 |

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.

Product specifications in this catalog are subject to change without notice. Request our product specifications before purchase and/or use. Please use our products based on the information contained in this catalog and product specifications.

## Alchip™-MHJ Series

- Endurance : 2,000 to 3,000 hours at 125°C
- Rated voltage range : 10 to 35V
- Nominal capacitance range : 47 to 470μF
- Solvent resistant type (see PRECAUTIONS AND GUIDELINES)
- Vibration resistant structure
- RoHS2 Compliant
- AEC-Q200 compliant : Please contact Chemi-Con for more details, test data, information.

## ◆RATED RIPPLE CURRENT MULTIPLIERS

## ●Frequency Multipliers

| Capacitance(μF) \ Frequency(Hz) | 120  | 1k   | 10k  | 100k |
|---------------------------------|------|------|------|------|
| 47 to 100                       | 0.40 | 0.75 | 0.90 | 1.00 |
| 220 to 470                      | 0.50 | 0.85 | 0.94 | 1.00 |

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.

# Alchip™-MHK Series

- Endurance : 2,000 hours at 125°C
- Specified ESR after endurance
- For automobile modules and other high temperature applications
- Solvent resistant type (see PRECAUTIONS AND GUIDELINES)
- RoHS2 Compliant
- AEC-Q200 compliant : Please contact Chemi-Con for more details, test data, information.

## ◆RATED RIPPLE CURRENT MULTIPLIERS

## ●Frequency Multipliers

| Capacitance(μF) \ Frequency(Hz) | 120  | 1k   | 10k  | 100k |
|---------------------------------|------|------|------|------|
| 47 to 100                       | 0.40 | 0.75 | 0.90 | 1.00 |
| 220                             | 0.50 | 0.85 | 0.94 | 1.00 |

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.

## Alchip™-MXB Series

- Endurance : 1,000 hours at 150°C
- Rated voltage range : 25 & 35V, Nominal capacitance range : 330 to 2,400μF
- For automobile modules and other high temperature applications.
- Solvent resistant type (see PRECAUTIONS AND GUIDELINES).
- Vibration resistant structure.
- RoHS2 Compliant
- AEC-Q200 compliant : Please contact Chemi-Con for more details, test data, information.

## ◆RATED RIPPLE CURRENT MULTIPLIERS

## ● Frequency Multipliers

| Capacitance(μF) \ Frequency(Hz) | 120  | 1k   | 10k  | 100k |
|---------------------------------|------|------|------|------|
| 330 to 560                      | 0.50 | 0.85 | 0.94 | 1.00 |
| 750 to 1,800                    | 0.60 | 0.87 | 0.95 | 1.00 |
| 2,400                           | 0.75 | 0.90 | 0.95 | 1.00 |

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.

Please contact us for lifetime estimation.

## Product code guide (Radial lead type)

(Example : KMQ series, 100V-100 $\mu$ F,  $\phi$ 10 $\times$ 16L, Long lead with bulk)

# SRG Series

- Low profile :  $\phi 10 \times 12.5\text{mm}$  to  $\phi 18 \times 25\text{mm}$
- Endurance : 2,000 hours at 85°C
- Solvent resistant type (see PRECAUTIONS AND GUIDELINES)
- RoHS2 Compliant

## SPECIFICATIONS

### ◆RATED RIPPLE CURRENT MULTIPLIERS

#### ● Frequency Multipliers

| Capacitance(μF) \ Frequency(Hz) | 50   | 120  | 300  | 1k   | 10k  | 100k |
|---------------------------------|------|------|------|------|------|------|
| 220 to 1,000                    | 0.80 | 1.00 | 1.15 | 1.30 | 1.40 | 1.50 |
| 2,200 to                        | 0.85 | 1.00 | 1.03 | 1.05 | 1.08 | 1.08 |

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.

## KRG Series

- Low profile :  $\phi 10 \times 12.5\text{mm}$  to  $\phi 18 \times 25\text{mm}$
- Endurance : 1,000 hours at 105°C
- Solvent resistant type (see PRECAUTIONS AND GUIDELINES)
- RoHS2 Compliant

## ◆RATED RIPPLE CURRENT MULTIPLIERS

## ●Frequency Multipliers

| Capacitance(μF) \ Frequency(Hz) | 50   | 120  | 300  | 1k   | 10k  | 100k |
|---------------------------------|------|------|------|------|------|------|
| 220 to 1,000                    | 0.80 | 1.00 | 1.15 | 1.30 | 1.40 | 1.50 |
| 2,200 to                        | 0.85 | 1.00 | 1.03 | 1.05 | 1.08 | 1.08 |

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.

# KMQ Series

- Downsized from current standard KMG series
- Solvent resistant type except 160 to 450V<sub>dc</sub>  
(see PRECAUTIONS AND GUIDELINES)
- RoHS2 Compliant

## SPECIFICATIONS

| Items                                                        | Characteristics                                                                                                                                                                                                                                                                         |                                      |      |      |      |      |                            |                                      |             |             |             |      |      |   |

**KMQ**Series◆**RATED RIPPLE CURRENT MULTIPLIERS**

## ● Frequency Multipliers

| Capacitance(μF) \ Frequency(Hz) | 50   | 120  | 300  | 1k   | 10k  | 100k |
|---------------------------------|------|------|------|------|------|------|
| 1.0 to 4.7                      | 0.65 | 1.00 | 1.35 | 1.75 | 2.30 | 2.50 |
| 10 to 68                        | 0.75 | 1.00 | 1.25 | 1.50 | 1.75 | 1.80 |
| 100 to 1,000                    | 0.80 | 1.00 | 1.15 | 1.30 | 1.40 | 1.50 |
| 2,200 to                        | 0.85 | 1.00 | 1.03 | 1.05 | 1.08 | 1.08 |

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.

# KZN Series

- Adoption of innovative high stability electrolyte
- High ripple current and long endurance
- Rated voltage range : 6.3 to 100V<sub>dc</sub>, Capacitance range : 8.2 to 22,000μF
- Endurance with ripple current : 6,000 to 10,000 hours at 105°C
- Non solvent resistant type
- RoHS2 Compliant

## SPECIFICATIONS

**KZN**Series◆**RATED RIPPLE CURRENT MULTIPLIERS**

## ● Frequency Multipliers

| Capacitance(μF) \ Frequency(Hz) | 120  | 1k   | 10k  | 100k |
|---------------------------------|------|------|------|------|
| 8.2 to 180                      | 0.40 | 0.75 | 0.90 | 1.00 |
| 220 to 560                      | 0.50 | 0.85 | 0.94 | 1.00 |
| 680 to 1,800                    | 0.60 | 0.87 | 0.95 | 1.00 |
| 2,200 to 3,900                  | 0.75 | 0.90 | 0.95 | 1.00 |
| 4,700 to 22,000                 | 0.85 | 0.95 | 0.98 | 1.00 |

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.

# KZM Series

- Long-Life version of KZH series
- Endurance with ripple current : 6,000 to 10,000 hours at 105°C
- Newly innovative electrolyte is employed to minimize ESR
- Rated voltage range : 6.3 to 50V<sub>dc</sub>, Nominal capacitance range : 27 to 10,000μF
- Non solvent resistant type
- RoHS2 Compliant

## SPECIFICATIONS

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.

Production of the products shown in □□□□ is scheduled to be discontinued.

# KZH Series

- Newly innovative electrolyte is employed to minimize impedance
- Endurance with ripple current: 5,000 to 6,000 hours at 105°C
- Non solvent resistant type
- RoHS2 Compliant

## ◆RATED RIPLE CURRENT MULTIPLIERS

## ●Frequency Multipliers

| Capacitance(μF) | Frequency(kHz) |      |      |      |
|-----------------|----------------|------|------|------|
|                 | 120            | 1k   | 10k  | 100k |
| 0.47 to 150     | 0.40           | 0.75 | 0.90 | 1.00 |
| 220 to 560      | 0.50           | 0.85 | 0.94 | 1.00 |
| 680 to 1,800    | 0.60           | 0.87 | 0.95 | 1.00 |
| 2,200 to 3,900  | 0.75           | 0.90 | 0.95 | 1.00 |
| 4,700 to 8,200  | 0.85           | 0.95 | 0.98 | 1.00 |

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.

## KZE Series

- Newly innovative electrolyte is employed to minimize impedance
- Endurance with ripple current: 2,000 to 5,000 hours at 105°C
- Non solvent resistant type
- RoHS2 Compliant

### SPECIFICATIONS

## ◆RATED RIPPLE CURRENT MULTIPLIERS

## ●Frequency Multipliers

| Capacitance(μF) | Frequency(Hz) |      |      |      |
|-----------------|---------------|------|------|------|
|                 | 120           | 1k   | 10k  | 100k |
| 6.8 to 180      | 0.40          | 0.75 | 0.90 | 1.00 |
| 220 to 560      | 0.50          | 0.85 | 0.94 | 1.00 |
| 680 to 1,800    | 0.60          | 0.87 | 0.95 | 1.00 |
| 2,200 to 3,900  | 0.75          | 0.90 | 0.95 | 1.00 |
| 4,700 to        | 0.85          | 0.95 | 0.98 | 1.00 |

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.

# KYC Series

Upgrade!

- New highly reliable electrolyte is employed to minimize ESR and maximize ripple current.
- For motorcycle ACG starter.
- Endurance with ripple current : 3,000 to 5,000 hours at 105°C
- Rated voltage range : 16 to 100V, Capacitance range : 68 to 12,000μF
- Non solvent resistant type
- RoHS2 Compliant
- AEC-Q200 compliant : Please contact Chemi-Con for more details, test data, information.

## PART NUMBERING SYSTEM

Please refer to "Product code guide (radial lead type)"

KYC series is the product, based on AEC-Q200 standard, for specific applications or market such as compact mobility.  
Please contact us when selecting KYC series for the important applications related to automotive or its safety.

## ◆RATED RIPPLE CURRENT MULTIPLIERS

## ●Frequency Multipliers

| Capacitance(μF) | Frequency(Hz) | 120  | 1k   | 10k  | 100k |
|-----------------|---------------|------|------|------|------|
| 68 to 150       |               | 0.40 | 0.75 | 0.90 | 1.00 |
| 180 to 220      |               | 0.40 | 0.82 | 0.93 | 1.00 |
| 300 to 560      |               | 0.50 | 0.85 | 0.94 | 1.00 |
| 620 to 2,000    |               | 0.60 | 0.87 | 0.95 | 1.00 |
| 2,200 to 4,300  |               | 0.75 | 0.90 | 0.95 | 1.00 |
| 4,700 to 12,000 |               | 0.85 | 0.95 | 0.98 | 1.00 |

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.

KYC series is the product, based on AEC-Q200 standard, for specific applications or market such as compact mobility. Please contact us when selecting KYC series for the important applications related to automotive or its safety.

# KYB Series

- Low impedance, high ripple and long life from KYA series
- Newly innovative electrolyte is employed to minimize impedance
- Endurance with ripple current : 4,000 to 10,000 hours at 105°C
- Non solvent resistant type
- RoHS2 Compliant

## SPECIFICATIONS

## ◆RATED RIPPLE CURRENT MULTIPLIERS

## ● Frequency Multipliers

| Capacitance(μF) | Frequency(Hz) |      |      |      |
|-----------------|---------------|------|------|------|
|                 | 120           | 1k   | 10k  | 100k |
| 6.8 to 180      | 0.40          | 0.75 | 0.90 | 1.00 |
| 220 to 560      | 0.50          | 0.85 | 0.94 | 1.00 |
| 680 to 1,800    | 0.60          | 0.87 | 0.95 | 1.00 |
| 2,200 to 3,900  | 0.75          | 0.90 | 0.95 | 1.00 |
| 4,700 to        | 0.85          | 0.95 | 0.98 | 1.00 |

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.

# KYA Series

- Downsized from KY series
- Newly innovative electrolyte is employed to minimize impedance
- Endurance with ripple current : 4,000 to 10,000 hours at 105°C
- Non solvent resistant type
- RoHS2 Compliant

### ◆RATED RIPPLE CURRENT MULTIPLIERS

#### ● Frequency Multipliers

| Capacitance(μF) | Frequency(Hz) |      |      |      |
|-----------------|---------------|------|------|------|
|                 | 120           | 1k   | 10k  | 100k |
| 1.0 to 180      | 0.40          | 0.75 | 0.90 | 1.00 |
| 220 to 560      | 0.50          | 0.85 | 0.94 | 1.00 |
| 680 to 1,800    | 0.60          | 0.87 | 0.95 | 1.00 |
| 2,200 to 3,900  | 0.75          | 0.90 | 0.95 | 1.00 |
| 4,700 to        | 0.85          | 0.95 | 0.98 | 1.00 |

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.

# KY Series

- Newly innovative electrolyte is employed to minimize ESR
- Endurance with ripple current : 6,000 to 10,000 hours at 105°C
- Non solvent resistant type
- RoHS2 Compliant

## SPECIFICATIONS

## ◆RATED RIPLE CURRENT MULTIPLIERS

### ●Frequency Multipliers

| Capacitance(μF) | Frequency(Hz) | 120  | 1k   | 10k  | 100k |
|-----------------|---------------|------|------|------|------|
| 47 to 180       |               | 0.40 | 0.75 | 0.90 | 1.00 |
| 220 to 560      |               | 0.50 | 0.85 | 0.94 | 1.00 |
| 680 to 1,800    |               | 0.60 | 0.87 | 0.95 | 1.00 |
| 2,200 to 3,900  |               | 0.75 | 0.90 | 0.95 | 1.00 |
| 4,700 to        |               | 0.85 | 0.95 | 0.98 | 1.00 |

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.

## LZA Series

- Adoption of innovative electrolyte and new technologies
- Very low impedance at high frequency
- Endurance with ripple current: 4,000 to 7,000 hours at 105°C
- Solvent resistant type (see PRECAUTIONS AND GUIDELINES)
- RoHS2 Compliant
- AEC-Q200 compliant : Please contact Chemi-Con for more details, test data, information.

### ◆RATED RIPPLE CURRENT MULTIPLIERS

#### ● Frequency Multipliers

| Capacitance(μF) | Frequency(Hz) |      |      |      |
|-----------------|---------------|------|------|------|
|                 | 120           | 1k   | 10k  | 100k |
| 330 to 470      | 0.50          | 0.85 | 0.94 | 1.00 |
| 680 to 1,800    | 0.60          | 0.87 | 0.95 | 1.00 |
| 2,200 to 3,900  | 0.75          | 0.90 | 0.95 | 1.00 |
| 4,700 to 12,000 | 0.85          | 0.95 | 0.98 | 1.00 |

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.

## LXZ Series Upgrade!

- Adoption of innovative electrolyte and new technologies
- Very low impedance at high frequency
- Endurance with ripple current: 2,000 to 8,000 hours at 105°C
- Solvent resistant type (see PRECAUTIONS AND GUIDELINES)
- RoHS2 Compliant
- AEC-Q200 compliant : Please contact Chemi-Con for more details, test data, information.

## ◆RATED RIPLE CURRENT MULTIPLIERS

## ●Frequency Multipliers

| Capacitance(μF) | Frequency(Hz) |      |      |      |
|-----------------|---------------|------|------|------|
|                 | 120           | 1k   | 10k  | 100k |
| 12 to 180       | 0.40          | 0.75 | 0.90 | 1.00 |
| 220 to 560      | 0.50          | 0.85 | 0.94 | 1.00 |
| 680 to 1,800    | 0.60          | 0.87 | 0.95 | 1.00 |
| 2,200 to 3,900  | 0.75          | 0.90 | 0.95 | 1.00 |
| 4,700 to 18,000 | 0.85          | 0.95 | 0.98 | 1.00 |

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.

# LXY Series

- Adoption of innovative electrolyte and new technologies
- Endurance with ripple current : 2,000 to 8,000 hours at 105°C
- Solvent resistant type (see PRECAUTIONS AND GUIDELINES)
- RoHS2 Compliant
- AEC-Q200 compliant : Please contact Chemi-Con for more details, test data, information.

## SPECIFICATIONS

The deterioration of aluminum electrolytic capacitors accelerates their life due to the internal heating produced by ripple current. For details, refer to Section "5-3 Ripple Current Effect on Lifetime" in the catalog, Technical Note.
