Description

The BSP75GQ-13 is a self-protected low-side IntelliFET[®] MOSFET. It features monolithic overtemperature, overcurrent, overvoltage (active clamp) and ESD protected logic-level functionality. It is intended as a general-purpose switch.

Applications

- Especially suited for loads with a high inrush current such as lamps and motors
- All types of resistive, inductive and capacitive loads in switching applications
- μC compatible power switches for 12V and 24V DC applications
- Automotive rated
- Replaces electromechanical relays and discrete circuits
- Linear mode capabilities - the current-limiting protection circuitry is designed to de-activate at low V_{DS} in order not to compromise the load current during normal operation. The maximum DC operating current is therefore determined by the thermal capability of the package/board combination, rather than by the protection circuitry.

- Notes:
- Protection features may operate outside spec for V_{IN} < 4.5V.
 - The drain current is limited to a reduced value when V_{DS} exceeds a safe level.
 - Integrated protection functions are designed to prevent IC destruction under fault conditions described in the datasheet. Fault conditions are considered as "outside" normal operating range. Protection functions are not designed for continuous, repetitive operation.
