

Eaton is dedicated to ensuring that reliable, efficient and safe power is available when it's needed most. With unparalleled knowledge of electrical power management across industries, experts at Eaton deliver customized, integrated solutions to solve our customers' most critical challenges.

Our focus is on delivering the right solution for the application. But, decision makers demand more than just innovative products. They turn to Eaton for an unwavering commitment to personal support that makes customer success a top priority. For more information, visit www.eaton.eu.

To contact an Eaton salesperson or local distributor/agent, please visit www.eaton.eu/electrical/customersupport

Changes to the products, to the information contained in this document, and to prices are reserved; so are errors and omissions. Only order confirmations and technical documentation by Eaton is binding. Photos and pictures also do not warrant a specific layout or functionality. Their use in whatever form is subject to prior approval by Eaton. The same applies to Trademarks (especially Eaton, Moeller, Cutler-Hammer). The Terms and Conditions of Eaton apply, as referenced on Eaton internet pages and Eaton order confirmations.

The power of fusion.

There's a certain energy at Eaton. It's the power of uniting some of the world's most respected names to build a brand you can trust to meet your every power management need.

Eaton is dedicated to ensuring that reliable, efficient and safe power is available when it's needed most. Building on over 100 years of experience in electrical power management, the experts at Eaton deliver customized, integrated solutions to solve your most critical challenges. To learn more visit www.eaton.eu/electrical.

Energizing a world that demands more.

Discover today's Eaton.

Powering business worldwide

As a global diversified power management company, we help customers worldwide manage the power needed for buildings, aircraft, trucks, cars, machinery and businesses.

Eaton's innovative technologies help customers manage electrical, hydraulic and mechanical power more reliably, efficiently, safely and sustainably.

Powering Business Worldwide

We deliver:

- **Electrical solutions** that use less energy, improve power reliability and make the places we live and work safer and more comfortable
- **Hydraulic and electrical solutions** that enable machines to deliver more productivity without wasting power
- **Aerospace solutions** that make aircraft lighter, safer and less costly to operate, and help airports operate more efficiently
- **Vehicle drivetrain and powertrain solutions** that deliver more power to cars, trucks and buses, while reducing fuel consumption and emissions

We provide integrated solutions that help make energy, in all its forms, more practical and accessible.

With 2012 sales of \$16.3 billion, Eaton has approximately 103,000 employees around the world and sells products in more than 175 countries.

Eaton's electrical business

Eaton is a global leader with expertise in:

- Power distribution and circuit protection
- Backup power protection
- Solutions for harsh and hazardous environments
- Lighting and security
- Structural solutions and wiring devices
- Control and automation
- Engineering services

Eaton is positioned through its global solutions to answer today's most critical electrical power management challenges. With 100 years of electrical experience behind us, we're energized by the challenge of powering up a world that demands twice as much energy as today. We're anticipating needs, engineering products, and creating solutions to energize our markets today and in the future.

We are dedicated to ensuring that reliable, efficient and safe power is available when it's needed most.

www.eaton.eu

PowerXL™ DC1, DA1 variable frequency drives

Variable frequency drives make it possible to use infinitely variable speed control with three-phase asynchronous motors and AC motors. To do so, they convert a single-phase or three-phase alternating voltage with a specific frequency and amplitudes into a single-phase or three-phase alternating voltage with a variable frequency and a variable amplitude. With its DC1 and DA1 device series, Eaton has just the right variable frequency drive for any machine building application or standard electric drive system application, regardless of whether your needs are extremely simple or extremely complex.

DC1 variable frequency drives

Output voltage with sinusoidal pulse-width modulation (PWM) when using Volts-per-Hertz control (V/Hz control) with slip compensation and start voltage boost.

DC1-12...: U_{IN} 1~230 V/ U_{OUT} 3~230 V, allocated motor output 0.37 – 4 kW

DC1-32...: U_{IN} 3~230 V/ U_{OUT} 3~230 V, allocated motor output 0.37 – 4 kW

DC1-34...: U_{IN} 3~400 V/ U_{OUT} 3~400 V, allocated motor output 0.75 – 11 kW

DC1-S2...: U_{IN} 1~230 V/ U_{OUT} 1~230 V, allocated motor output 0.37 – 1.1 kW (Single-phase motor)

DC1-S1...: U_{IN} 1~115 V/ U_{OUT} 1~115 V, allocated motor output 0.37 – 0.55 kW

DC1-1D...: U_{IN} 1~115 V/ U_{OUT} 3~230 V, allocated motor output 0.37 – 1.1 kW (voltage doubler)

DA1 variable frequency drives

Output voltage with sinusoidal pulse-width modulation (PWM) when using Volts-per-Hertz control (V/Hz control), sensorless (SLVC) and sensored vector control

DA1-12...: U_{IN} 1~230 V/ U_{OUT} 3~230 V, allocated motor output 0.75 – 2.2 kW

DA1-32...: U_{IN} 3~230 V/ U_{OUT} 3~230 V, allocated motor output 0.75 – 75 kW

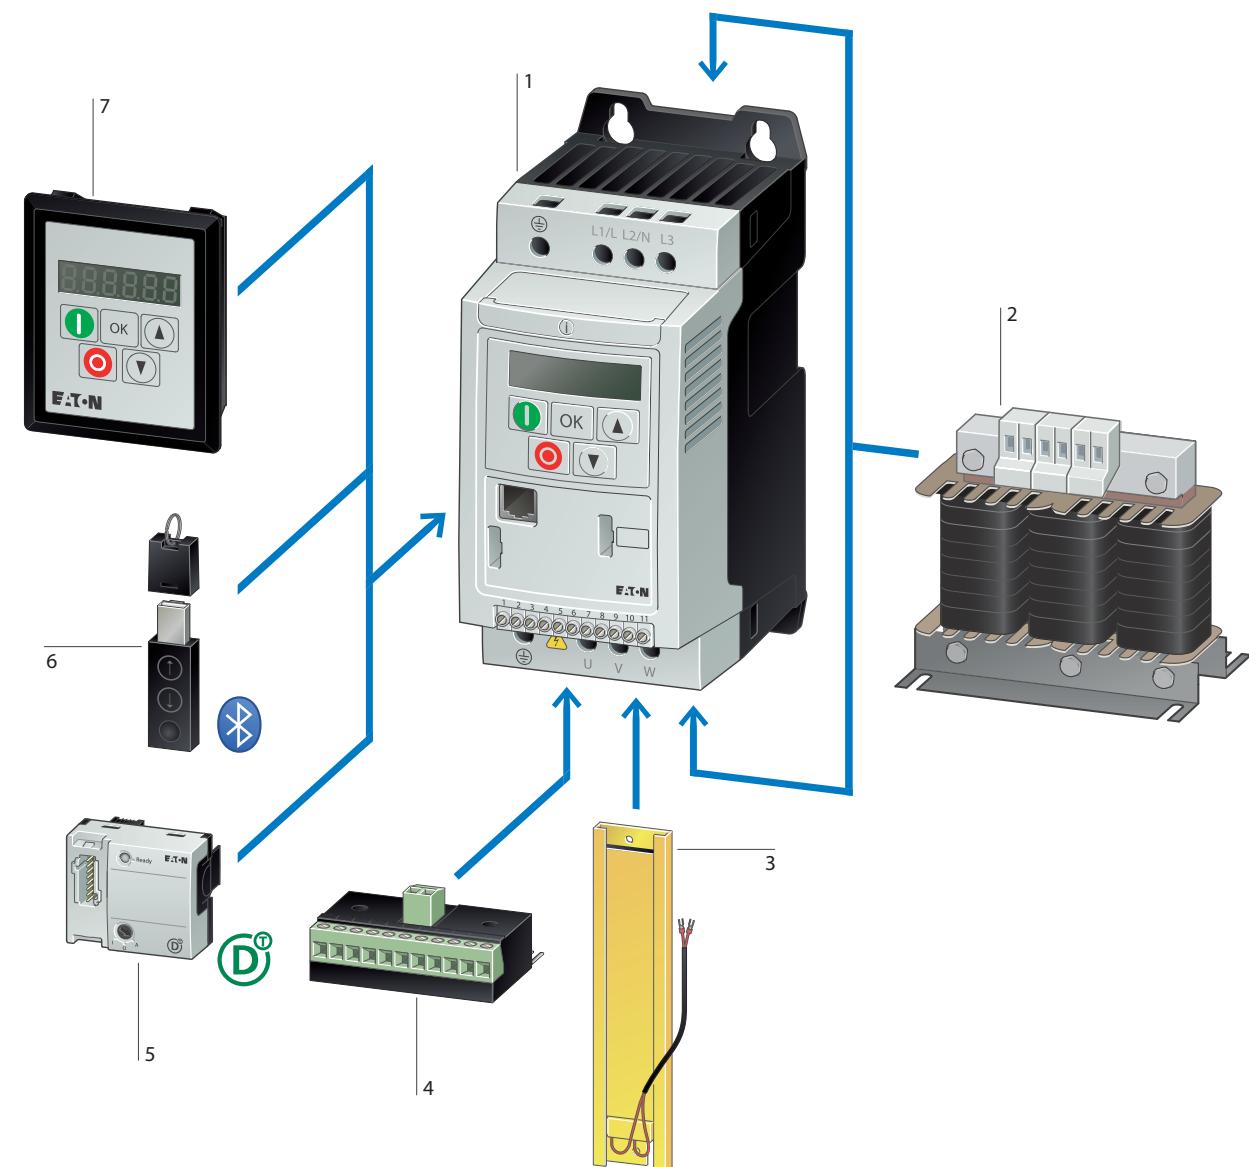

DA1-34...: U_{IN} 3~400 V/ U_{OUT} 3~400 V, allocated motor output 0.75 – 250 kW

Description

The DC1 is Eaton's compact variable frequency drive. It has been specifically designed for simple applications. With only 14 basic parameters and outstanding ease of mounting and installation, the DC1 is perfect for quick commissioning. This makes these compact variable frequency drive ideal for series production applications in the field of machine building.

Typical applications for this series include fans, pumps, and conveyor systems. In addition, additional parameters and functionalities can be flexibly enabled in order to allow the DC1 to handle more demanding applications as well.

When configured with an IP66 degree of protection, DC1 variable frequency drives can be installed in humid and wet locations as well.

In addition, these variable frequency drives can also be used as stand-alone units directly on site if they are equipped with a setpoint potentiometer, a selector switch, and a mains transfer switch and are configured with an IP66 degree of protection.

Essential features

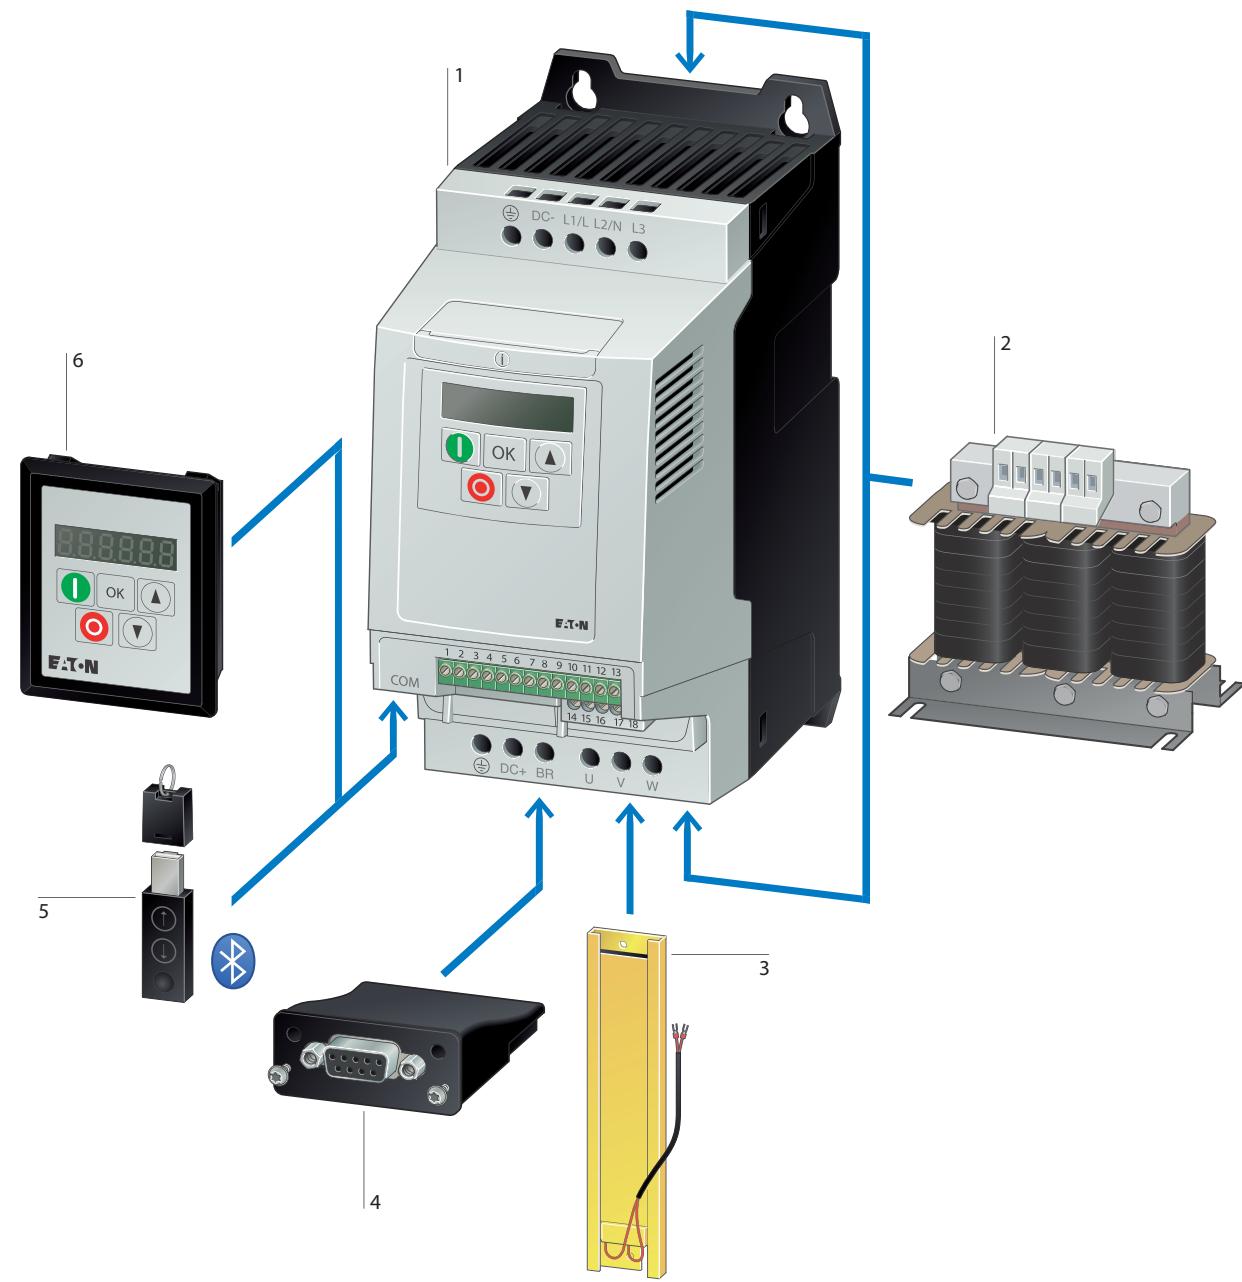

- Fast commissioning with 14 basic parameters
- Performance range (allocated motor output)
 - 0.37 - 4 kW (U_{IN} : 1~ 230 V / U_{OUT} : 3~ 230 V)
 - 0.37 - 4 kW (U_{IN} : 3~ 230 V / U_{OUT} : 3~ 230 V)
 - 0.75 - 11 kW (U_{IN} : 3~ 400 V / U_{OUT} : 3~ 400 V), up to 7.5 kW at IP66
 - 0.37 - 1.1 kW (U_{IN} : 1~ 230 V / U_{OUT} : 1~ 230 V), single-phase motor
 - 0.37 - 0.55 kW (U_{IN} : 1~ 115 V / U_{OUT} : 1~ 115 V), single-phase motor
 - 0.37 - 1.1 kW (U_{IN} : 1~ 115 V / U_{OUT} : 3~ 230 V) with voltage doubler
- Large overload capability: 150% for 60 seconds, 175% for 2 seconds
- Maximum ambient temperature: 50 °C without derating (IP20) / 40 °C (IP66)
- Integrated® CANopen and Modbus
- Degree of protection to IP20 and IP66
- EMC filter
- Optional internal braking transistor for IP20 degree of protection
- Integrated PI controller
- V/Hz control with start voltage boost and slip compensation
- International standards (CE, UL, cUL, C-Tick, UkrSEPRO, RoHS)
- Side-by-side mounting

Accessory consideration

- SmartWire-DT field bus module
- I/O expansion with plug-in modules
- External keypad for control panel door
- Mains choke
- Motor choke
- sine filter
- braking resistances

Description

DA1 frequency inverters are ideal for demanding, speed-dependent applications. Their wide performance range of up to 250 kW, together with their compact dimensions and high level of functionality, are sure to leave a lasting impression. Accordingly, DA1 units come with an integrated EMC filter and braking transistor. Moreover, the Modbus RTU and CANopen protocols are integrated as standard.[®] With sensorless vector control, DA1 variable frequency drives are able to provide 200% torque at zero rpm. This makes them the perfect choice for applications that involve lifting or tractive forces. Comprehensive expansions such as additional inputs and outputs (analog, digital) and various field bus modules round off this variable frequency drive's flexibility.

When configured with an IP66 degree of protection, DA1 variable frequency drives can be installed in humid and wet locations as well.

In addition, these variable frequency drives can also be used as stand-alone units directly on site if they are equipped with a setpoint potentiometer, a selector switch, and a mains transfer switch.

Essential features

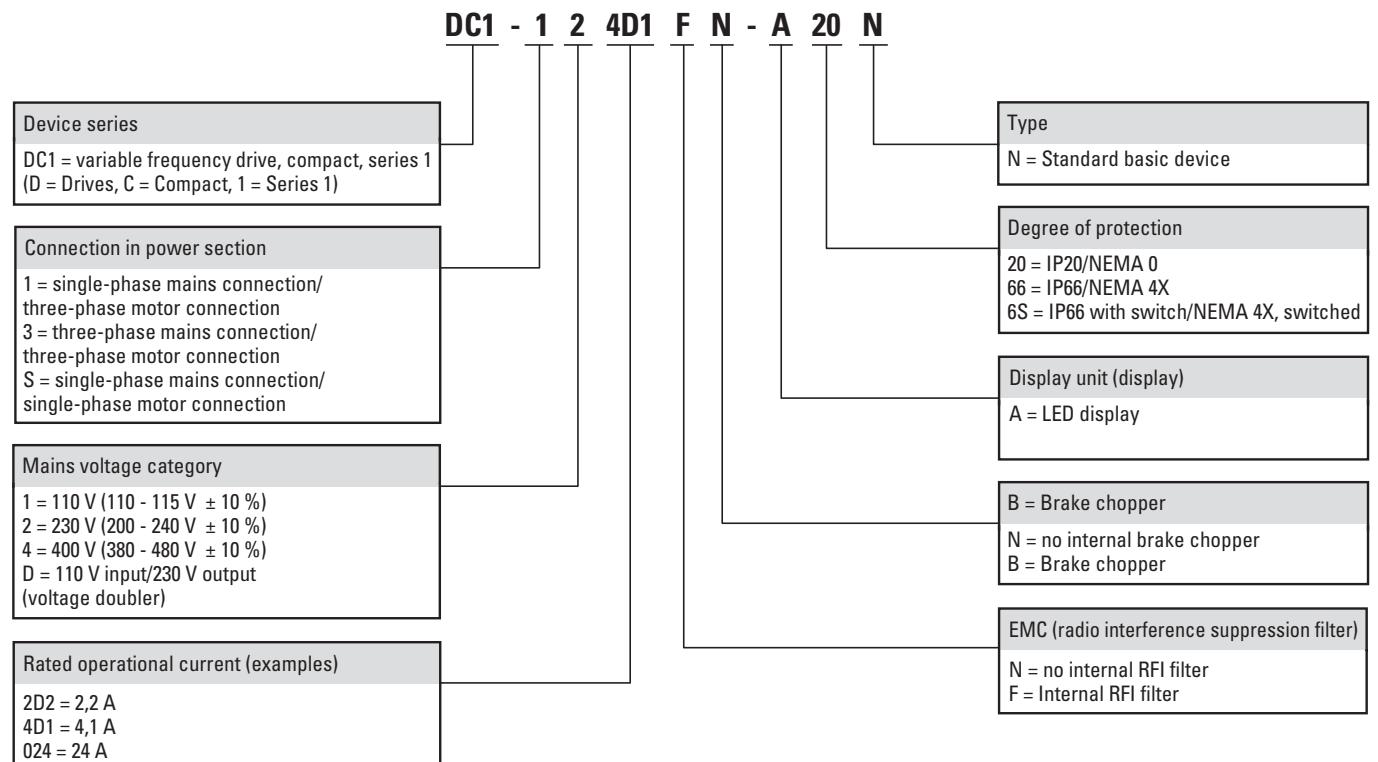

- Performance range:
– 0.75 - 2.2 kW (U_{IN} : 1~ 230 V / U_{OUT} : 3~ 230 V)
– 0.75 - 75 kW (U_{IN} : 3~ 230 V / U_{OUT} : 3~ 230 V)
– 0.75 - 250 kW (U_{IN} : 3~ 400 V / U_{OUT} : 3~ 400 V)
- Large overload capability: 150% for 60 seconds, 200% for 4 seconds
- Degrees of protection
– IP20 to 11 kW at 400 V
– IP40 at 200/250 kW at 400 V
– IP55 for 11 to 160 kW with 400 V
– IP66 up to 7.5 kW with 400 V; 0.75-4 kW with 230 V
- The maximum allocated motor output is 7.5 kW with degree of protection IP66.
- Integrated[®] CANopen and Modbus
- EMC filter, integrated
- Braking transistor, integrated
- Control method: V/Hz control, sensorless vector control, vector control with encoder
- Safe Torque Off (STO)
- Can be used to drive high-efficiency PM motors
- International standards (CE, UL, cUL, C-Tick, UkrSEPRO, RoHS)
- Side-by-side mounting
- Ambient air temperature 50 °C without derating (IP20), max. 40 °C (IP66)
- Master/Slave functionality

Accessory consideration

- SmartWire-DT field bus module
- Field bus modules (PROFIBUS, PROFINET, Ethernet/IP, EtherCat, Modbus TCP, BACnet, and DeviceNet)
- I/O expansion with plug-in modules
- External keypad for control panel door
- High-resolution OLED display
- Mains choke
- Motor chokes
- Sine filter
- Braking resistances

External keypad					
	with LED display Front IP54 With approx. 3 m-long, plug-in connection cable (RJ45, 8-pin)	DC1, DA1 DX-KEY-LED 169132		1 off  	UL/CSA certification not required
	with OLED display Front IP54 Multilingual With approx. 3 m-long, plug-in connection cable (RJ45, 8-pin)	DC1, DA1 DX-KEY-OLED 169133			
Bluetooth communications stick					
	For transferring parameters to a computer with drivesConnect software via Bluetooth With 2 function keys for uploading and downloading parameters with configuration memory	DC1, DA1 DX-COM-STICK 169134		1 off  	UL/CSA certification not required
License Keys					
	For enabling the drivesConnect program's PLC function	DA1 DX-COM-SOFT 169136		1 off  	UL/CSA certification not required
Connection cable					
	Connection cable with RJ45 plugs, 8 pole Length 0.5 m	DC1, DA1 DX-CBL-RJ45-0M5 169137		1 off  	UL/CSA certification not required
	Length 1 m	DC1, DA1 DX-CBL-RJ45-1M0 169138			
	Length 3 m	DC1, DA1 DX-CBL-RJ45-3M0 169139			
Bus termination resistor					
	With 2 resistors, 120 Ω RJ45 plug, 8-pin for CANopen® and Modbus RTU	DX-SPL-RJ45-2SL-1PLT 169140		1 off  	UL/CSA certification not required
	8 pole RJ45 124 Ω Connection to PIN 1 and PIN 2 für CANopen®	easyNet easyNet EASY-NT-R 256281		2 off  	
Cable and splitter					
	RJ45, 8-pin, 2 sockets/1 plug	DC1, DA1 DX-SPL-RJ45-2SL1PL 169142		1 off  	UL/CSA certification not required
Interface converter					
For directly connecting the variable-frequency drive to a computer with drivesConnect software					
	Interface converter USB/RS485 with connection cable, RJ45, 8 pole electrically isolated	DC1, DA1 DX-CBL-PC-1M5 171018		1 off  	UL/CSA certification not required
	Interface converter USB/RS485 with connection cable, RJ45, 8 pole electrically isolated 1 × SUB-D plug, 9-pole Terminal strip, 5-terminal LED indicators	DC1, DA1 DX-COM-PCKIT 169135		1 off  	UL/CSA certification not required

Electrical mains connection

Frequency inverters can be connected to and operated on star point-earthed AC supply systems (as per IEC 60364) without restrictions.

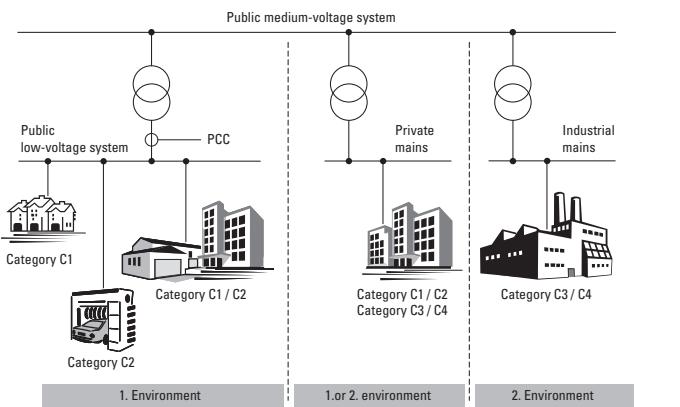

Connecting them to and operating them on asymmetrically earthed networks, such as phase-earthed delta networks (grounded delta, USA) or non-earthed or high-resistance earthed ($> 30 \Omega$) IT networks is permitted with limitations. In these

networks, only frequency inverters without internal radio interference suppression filters (EMC) may be used. In the case of devices with an integrated radio interference suppression filter, the filter's protective earth connection must be disconnected.

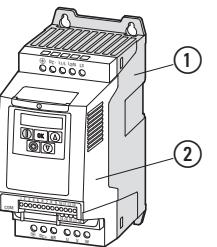

The standardized rated operating voltages of the utility companies fulfil the following conditions at the point of transfer to the consumer:

- maximum deviation from the rated voltage (U_{LN}): $\pm 10\%$
- Maximum deviation in the voltage symmetry: $\pm 3\%$
- Maximum deviation from the rated frequency: $\pm 4\%$

A further voltage drop of up to 4% in the consumer networks is permissible relative to the lower voltage value ($U_{LN} - 10\%$) of the mains voltage. In ring-operated mesh networks (such as in the EU) the standardized consumer voltages (230/400/690 V) are identical to the utility company's supply voltages. In star networks (for example in North America/USA), the stated consumer voltages take the voltage drop from the utility company's infeed point to the last consumer into account.

**Frequency inverters**

A frequency inverter is an electronic apparatus used for the variable-speed control of three-phase motors. It is intended for installation in a machine or for assembly with other components to a machine or plant. The main components of a modern compact frequency inverter are a power section ① and a control section ②.

The functional control of the frequency inverter and the output values in the power section (such as frequency, voltage and current) can be adjusted through:

- Control terminals (I/O) with analog and digital (binary) inputs,
- A keypad with function keys and display units,
- Serial interfaces (BUS) with RS485 (Modbus RTU) and optional fieldbus connections (CANopen, PROFIBUS-DP etc.) and an optional PC connection.

Internal open and closed-loop control circuits monitor all variable values in the frequency inverter and automatically switch the process off if a value reaches a dangerous level. The power section of a static compact frequency generally consists of three subgroups:

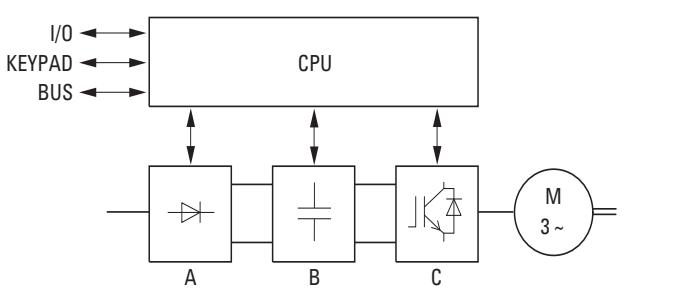

- Rectifier (A),
- Internal DC link (B),
- Inverter module (C).

① Power section with:

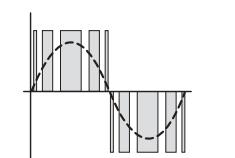

- A = Rectifier
- B = Internal DC link
- C = Inverter (IGBT)

② Control section with:

- I/O = Analog and binary inputs and outputs
- KEYPAD = Operating unit with display unit
- BUS = Serial ports/interfaces (RS485, field bus, PC interface)

U_{LN} = phase voltage from supplying AC mains
 $U_{DC} = 1.41 \times U_{LN}$

$Output\ voltage =$
 switched DC link voltage with sinusoidal pulse width modulation (PWM)

Block diagram with main components of a frequency inverter

Control methods

The IGBTs in the variable frequency series' inverter are controlled with sinusoidal pulse-width modulation (PWM). In real-life applications, the industry draws a distinction between the following control methods:

- Voltage frequency control (U/f control),
- V/Hz control with slip compensation
- Sensorless vector control (speed control)
- Vector control (closed-loop)

The Voltage frequency control is the best known and most commonly used method. A simple characteristic curve (linear or quadratic) defines the motor's rotating field frequency and the corresponding three-phase line-to-line motor voltage is selected such that the motor is neither over nor under-magnetized.

Main applications of U/f control:

- pump and fan drives,
- horizontal conveying and transportation systems,
- multiple motor drives (parallel operation of several motors at the variable frequency drive's output).

Bei der V/Hz control with slip compensation can compensate for the load-dependent speed change in individual drives (sensorless).

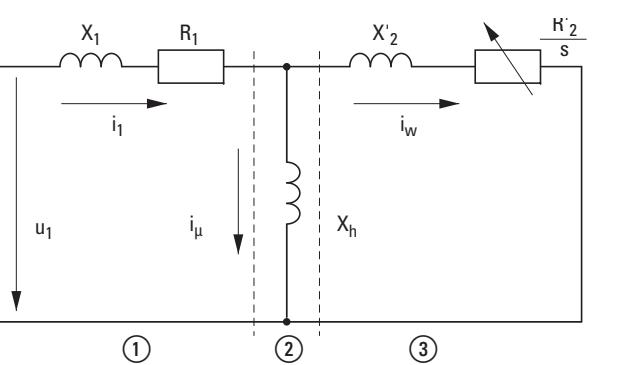

Bei der In sensorless vector control the magnetic fields of the stator and rotor windings are aligned so as to oppose each other. With asynchronous motors the magnetic flux in the rotor must be mapped in an electronic model of the motor. This requires the physical parameters on the motor's rating plate to be entered.

In vector operation the frequency inverter can control only one motor. A parallel operation of several motors is not possible here. The exact calculation of the phase voltages at the variable frequency drive's output, however, improves the motor's operational behavior. The motor also heats up less in the lower speed range. The field-oriented vector control results in a significant improvement in the drive dynamics as well as optimizing performance; it also increases the range of possible applications.

The main applications of sensorless vector control are:

- Material machining and processing equipment
- Condensers (compressor),
- Heavy starting duty (extruder, agitators, mixer),
- Horizontal conveying equipment (cranes, elevators).

Bei der Vector control uses the variable frequency drive's output current as a controlled variable. This makes it possible to perfectly adjust the three-phase motor in line with the corresponding torque boost. The motor speed can be controlled in connection with an rpm sensor (tachometer, pulse generator) (closed loop).

- ① Stator winding
- ② Air gap
- ③ Transformed rotor winding

Simplified equivalent circuit diagram for a three-phase motor

Motor model**Explanation:**

Regardless of the control method used, a variable frequency drive uses the measured voltage and current values on the stator winding (u_1, i_1) to calculate the required manipulated variable for flux-generating component i_μ and torque-generating component in the rotor i_w . The motor's load dependent slip is represented as resistor $R'/2/s$. During no-load operation, this value approaches infinity ($i_w \rightarrow 0$). On the other hand, the value approaches zero as the load increases. The current in the rotor grows at this point.

EMC = Electromagnetic compatibility
EVU = Utility company
IGBT = Insulated-gate bipolar transistor
PDS = Magnet system
RCD = Residual current device

Technical information concerning braking resistances:

The braking resistors' specified P_{DB} power dissipation applies to continuous operation.

In short-time operation these values can be increased by multiplying them with the type-specific power factor using the following formula:

$$P_{max} \leq (P_{DB} \times 100\%) \div ED [\%]$$

P_{max} = maximum pulse rating

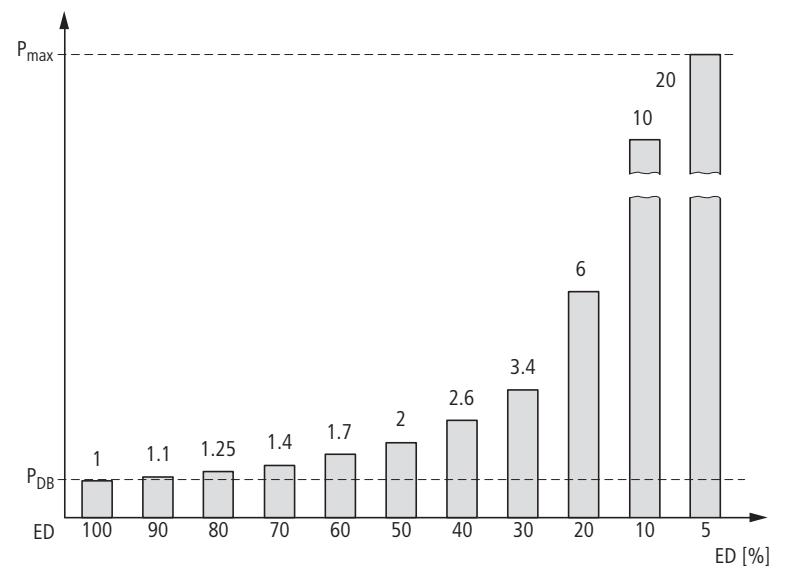

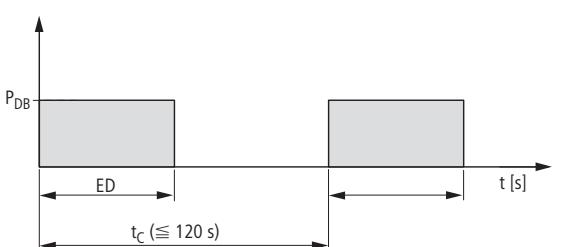

P_{DB} = continuous rating at a duty factor of 100 %

ED = duty factor

t_c = Cycle time (max. 120 seconds)

The duty factor is stated as a percentage (%) and is calculated with the formula:

$$ED [\%] = (ED \times 100\%) \div t_c$$

PowerXL™ variable frequency drives

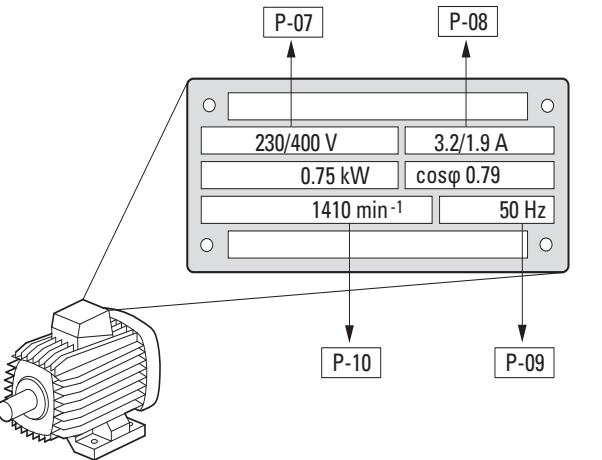

Connection example for DC1

Connecting example for a 0.75 kW motor with the rating plate illustrated here.

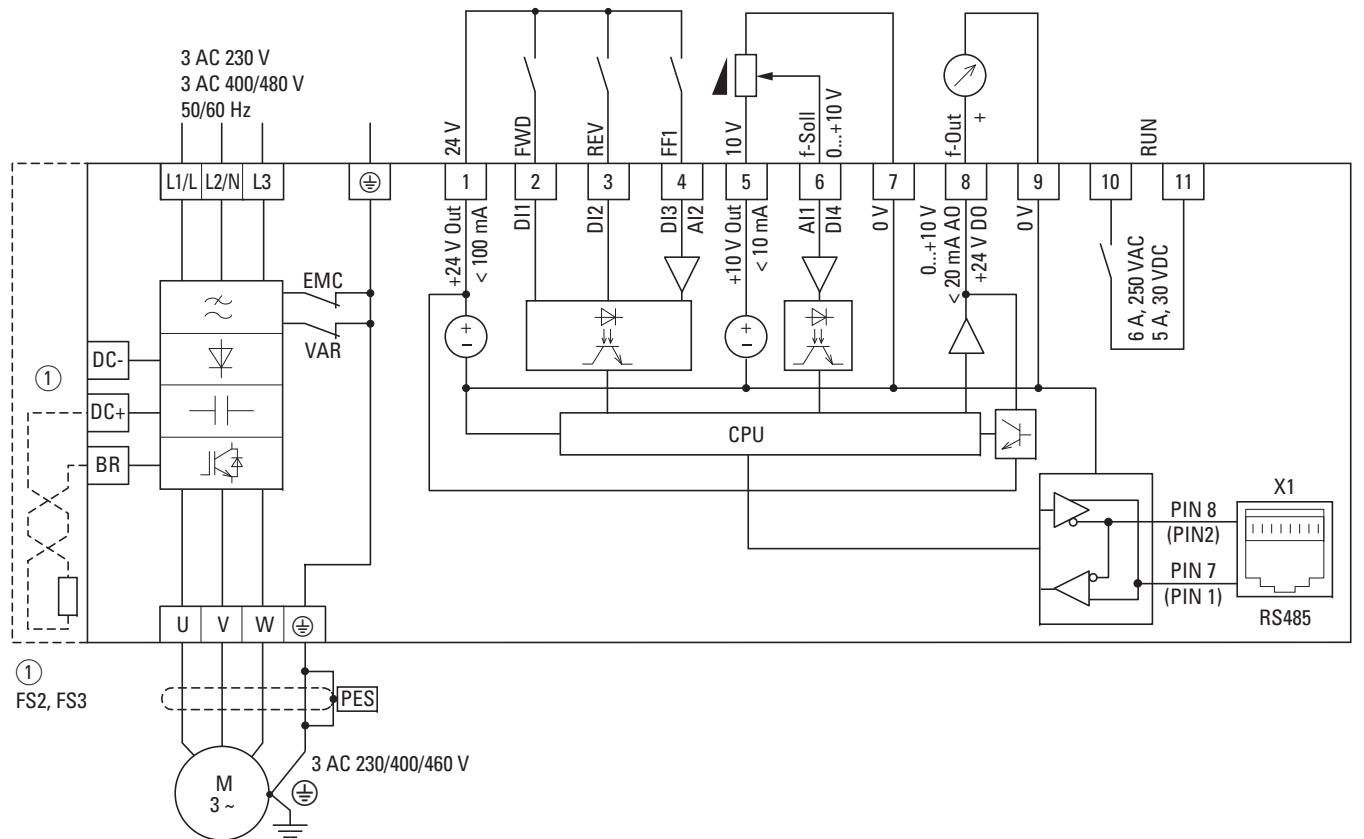

The variable frequency drives are configured by default in such a way that they can be operated immediately with V/Hz control when connected to the assigned motor rating without having to configure any additional parameters.

To ensure ideal operational behavior (e.g., slip compensation, vector control, etc.), the data on the motor's rating plate should be entered into the variable frequency drive (electric motor map).

The following example shows the necessary parameter settings for a variable frequency drive (a DC1 in this example)

and connection examples for single-phase and three-phase mains voltages:

Block diagram for DC1-32... and DC1-34... with internal radio interference suppression filter

① Only sizes FS2 and FS3 have connection terminals DC+ and BR- for an external braking resistance (optional).

The control signal terminals are factory set as follows:

- 1: 24 V: +24 V control voltage, max. 100 mA
- 2: DI1: FWD = Clockwise rotating field enable (Forward)
- 3: DI2: REV = Anticlockwise rotating field enable (Reverse)
- 4: DI3: FF1 = Fixed frequency 1 or AI2
- 5: 10 V: +10 V reference voltage, max. 10 mA
- 6: AI1: f-setpoint = Frequency setpoint value (0 - +10 V)
- 7: 0 V, reference potential
- 8: AO: f-Out = Output frequency to motor (0 - +10 V)

9: 0 V, reference potential
10/11: Relay: RUN = Operating signal (N/O)

DI: Digital input = +24 VDC digital input

AI: Analog input = 0 - 10 V,
0/4 - 20 mA analog input

DO: Digital output = +24 VDC,
max. 20 mA digital output

AO: Analog output = 0 - +10 V,
max. 20 mA analog output

Parameters are used to define the function and mode of operation for the digital and analog inputs/outputs. These parameters are described in manual MN04020003Z.

Connection example for a 0.75 kW motor

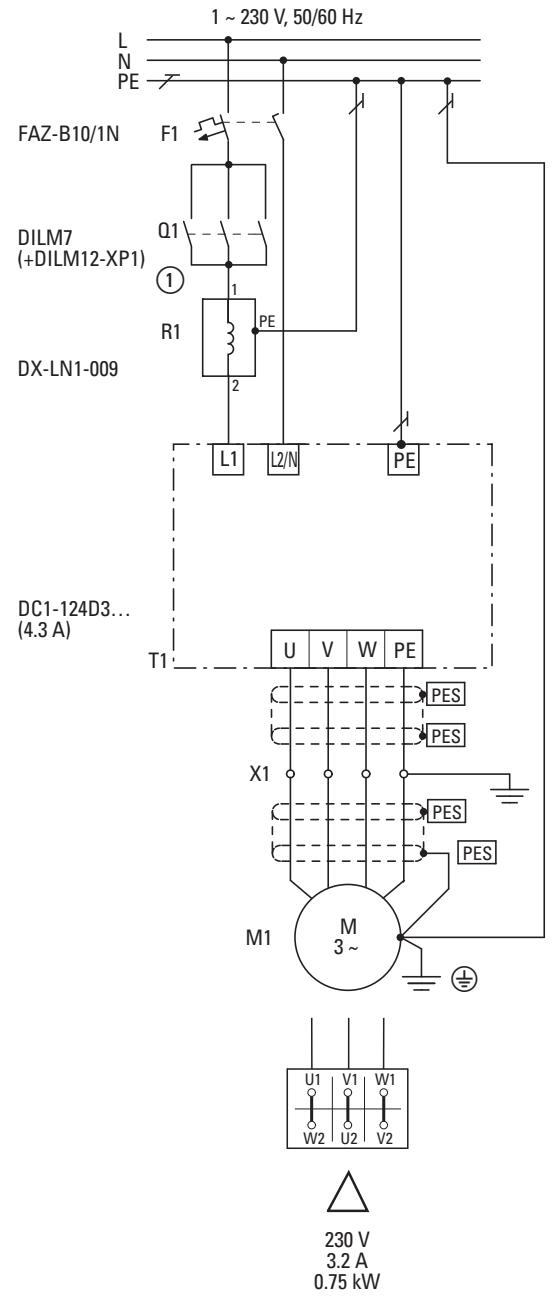

Motor: P = 0.75 kW
Mains: 3/N/PE 400 V 50/60 Hz
Connection examples meeting EMC requirements: Power section (see figure below)

The previously indicated 0.75 kW motor can be connected in a delta configuration for a single-phase 230-V supply system (version A) or in a star configuration for a 400-V supply system (version B).
The frequency inverter and the type-specific accessories are selected for 1 AC 230 V (DC1-124D3...) or for 3 AC 400 V (MMX34AA2D4) depending on the mains voltage selected.

Variant A:

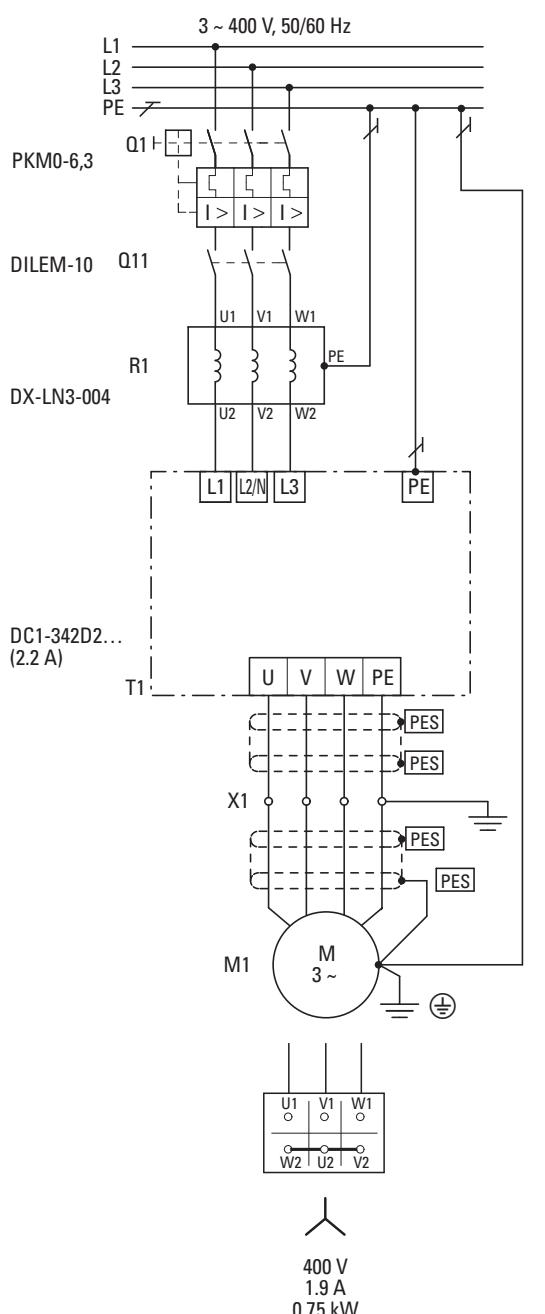

Motor in delta configuration

DC1... frequency inverter with single-phase mains supply (230 V)

Motor in star configuration

DC1... frequency inverter with three-phase mains supply (400 V)

① Optional connection option for single-phase connections

Height tolerance depends on gap
The position of connection lugs U2-V2-W2 depends on the coil material and can deviate from the position illustrated here.

9000X SVX, SPX variable frequency drive

9000X variable frequency drives are ideal for sophisticated applications. With two different device series, they make a compelling case in a variety of scenarios: SVX standard variable frequency drives when it comes to simple and complex motor control systems in industrial machine building environments, and SPX application frequency drives when it comes to sophisticated, high-performance requirements. In both open-loop and closed-loop modes, their vector control guarantees reliable, dynamic, and sophisticated motor control performance when working with three-phase induction or permanent magnet motors.

SVX variable frequency drive

Variable frequency drives for operation with two overload options: 150% or 110%. The compact enclosures are rated IP21 (NEMA 1) and IP54 (NEMA 12) and come with an integrated radio interference suppression filter. A braking chopper is integrated into all units up to size FR6, and, in addition, there are two different models.

SVX...-4A...: U_{IN} 3~400 V/ U_{OUT} 3~400 V, allocated motor outputs 0.75 – 132 kW
SVX...-5A...: U_{IN} 3~690 V/ U_{OUT} 3~690 V, allocated motor outputs 2.2 – 160 kW

SPX variable frequency drive

Variable frequency drives for operation with two overload options: 150% or 110%. The enclosures for the compact devices are rated IP21 (NEMA 1) and IP54 (NEMA 12) and come with an integrated radio interference suppression filter. A braking chopper is integrated into all units up to size FR6, and, in addition, there are two different models.

SPX...-4A...: U_{IN} 3~400 V/ U_{OUT} 3~400 V, allocated motor outputs 0.75 – 132 kW¹⁾
SPX...-5A...: U_{IN} 3~690 V/ U_{OUT} 3~690 V, allocated motor outputs 2.2 – 160 kW¹⁾

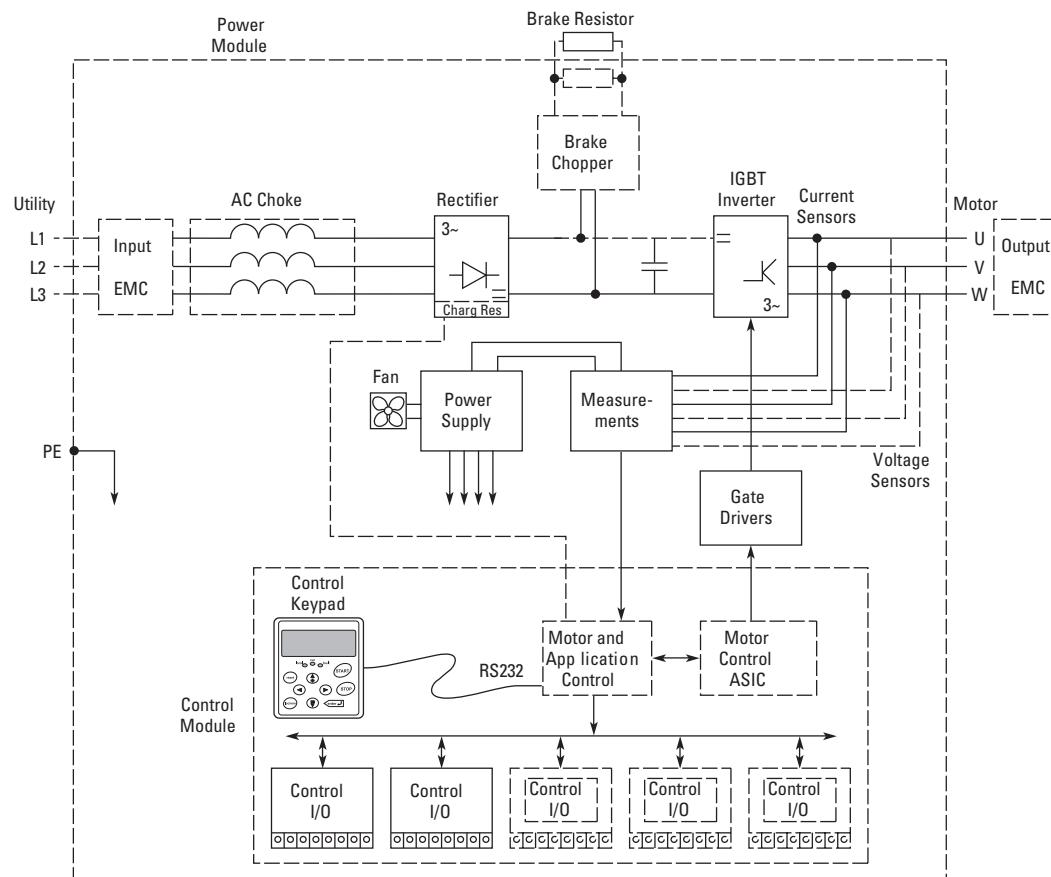

1) Higher outputs of up to 1,100 kW (400 V) and 2,000 kW (690 V) are covered by variable frequency drives with sizes FR10 to FR14. These devices are available upon request from your sales office.

Description

SVX variable frequency drive

SVX units are heavy-duty, all-purpose standard variable frequency drives. Featuring a variety of application settings, they can be configured to meet virtually any challenge that arises when used to control induction motors, including applications involving multiple motors or multiple pumps run in parallel. SVX variable frequency drives are suitable for all standard applications in machines, buildings, and industrial projects. One of the factors contributing to this is their sturdy design, which features integrated chokes and EMC filters and provides effective protection against interference from the grid. In addition, their sophisticated motor control design and effective protection features for both motor and variable frequency drive guarantee reliable operation.

Essential features

- Performance range:
– 0.75 - 132 kW (U_{IN} : 3~ 400 V / U_{OUT} : 3~ 400 V)
– 2.2 - 160 kW (U_{IN} : 3~ 690 V / U_{OUT} : 3~ 690 V)
- High load capacity:
– H = 2x rated operational current (2 seconds/20 seconds) and 150% overload (60 seconds/600 seconds)
– L = 2x rated operational current (2 seconds/20 seconds) and 110% overload (60 seconds/600 seconds)
- Ambient air temperature: -10 °C up to +50 °C without derating
- Degree of protection with compact design: IP21 (NEMA1) and IP54 (NEMA12)
- I/O expansion with plug-in modules (5 slots)
- Optional fieldbus connection (CANopen, PROFIBUS-DP, DeviceNet), LonWorks
- PID control and power factor correction (PFC) for 1 to 5 pumps
- Programmable start and application wizard for an easy parameter configuration process
- Multiple display (multi-monitoring) for monitoring up to 3 different readings at the same time
- V/Hz control with boost and slip compensation
- Dynamic open-loop and closed-loop vector control
- Internal braking chopper available in sizes of up to FR9 (compact design)

SPX variable frequency drive

SPX variable frequency drives are the perfect choice when it comes to demanding applications in which reliability, a highly dynamic response, precision, and power are a must. Popular applications include lifting equipment and conveyances (cranes, winches, elevators, lifts), compressors and oil pumps, chippers, crushers, mixers, extruders, take-up and pay-off units, and tunnel boring machines. Multi-purpose SPX variable frequency drives are designed to cover a wide variety of applications while keeping things simple. In fact, with their excellent flexibility, they make it easy to adapt to additional process requirements for custom and complex applications used to control induction and permanent magnet motors. On top of this, their sturdy design, which features integrated chokes and EMC filters, provides effective protection against interference from the grid. Finally, their sophisticated motor control design and effective protection features for both motor and variable frequency drive guarantee reliable operation.

Essential features

- Performance range:
– 0.75 - 132 kW (U_{IN} : 3~ 400 V / U_{OUT} : 3~ 400 V)
– 2.2 - 160 kW (U_{IN} : 3~ 690 V / U_{OUT} : 3~ 690 V)
- Expanded performance range with distributed design (IP00). Please enquire:
– up to 1100 kW (U_{IN} : 3~ 400 V / U_{OUT} : 3~ 400 V)
– up to 2000 kW (U_{IN} : 3~ 690 V / U_{OUT} : 3~ 690 V)
- High load capacity:
– H = 2x rated operational current (2 seconds/20 seconds) and 150% overload (60 seconds/600 seconds)
– L = 2x rated operational current (2 seconds/20 seconds) and 110% overload (60 seconds/600 seconds)
- Ambient air temperature: -10 °C up to +50 °C without derating
- Degree of protection with compact design: Up to 132/160 kW: IP21 (NEMA1) and IP54 (NEMA12)
- I/O expansion with plug-in modules (5 slots)
- Optional fieldbus connection (CANopen, PROFIBUS-DP, DeviceNet), LonWorks
- PID control and power factor correction (PFC)
- Direct and parallel circuit solutions, even for PM motors with high outputs
- Programmable start and application wizard for an easy parameter configuration process
- Multiple display (multi-monitoring) for monitoring up to 3 different readings at the same time
- V/Hz control with boost and slip compensation
- Dynamic open-loop and closed-loop vector control
- Internal braking chopper available in sizes up to FR9

DS7 soft starters in xStart system – Soft to start, powerful in torque

The soft starters have become increasingly established as an alternative to the star-delta starter. The DS7 replaces the mechanical contactor and extends the function "Motor soft start". Motor run-up is soft but still at a higher torque than other available solutions using the patented method. Extended service intervals and reduced operating costs are welcomed side effects.

Designed for normal applications such as pumps, fans and small conveyors, the compact DS7 is ideal. The DS7 is also available with a SmartWire-DT connection to simplify wiring and enhance functionality as an automation solution.

DS7

Key to type references

Description

Application

The DS7 series soft starters are two-phased controlled soft starters used for soft starting three-phase AC motors for applications with a normal operating frequency and a performance range of 3 to 200 A (1.1 to 110 kW with a 400 V mains voltage). Closing transients and DC components during startup are effectively suppressed and guarantee even motor starting.

The special actuation method (asymmetrical trigger phase control) for the soft starter function avoids the DC components (Eaton patent) that would normally occur in two-phase-controlled soft starters. This suppresses the generation of an elliptical rotating field, which would cause uneven motor starting and increase the motor's acceleration. The true run behavior of the DS7 is therefore comparable with that of a three-phase controlled soft starter.

Functions

- Typical fields of application for Series DS7 soft starters are:
 - Pump drives: pressure surges are prevented through soft starting. The mechanical load on the whole plant is reduced and its service life increases.
 - Fan drives: soft starting keeps fan belts from slipping, preventing premature wear. This lowers operating costs and extends the system's lifespan.
 - Conveyor belts: conveyor belts start running smoothly, instead of starting with a jolt. This ensures that any goods being conveyed do not topple over. Mechanical damage to the belt itself is avoided, making it more durable.

Features

- The ramp time can be adjusted by potentiometer within a range of 1 to 30 s (for starting) or 0 to 30 s (for stopping) with a potentiometer.
- The start voltage (or start torque) can be adjusted within a range of 30 to 100 percent of the mains voltage with a potentiometer.
- Significant reduction in switch-on current, achieved with a short soft start ramp time (min. 1 s) for lamp and heating loads.
- Internal bypass relay: switches on automatically after the end of the ramp, bypassing the internal thyristors.
- This makes it possible to comply with radio interference level B without any additional measures.
- The motor's thermal load is smaller than it would be without asymmetric ignition control.
- Designed specifically for long cables.

Documentation

- Surface mounting and standard mounting procedures are described in the corresponding mounting instructions and in the manual.
- Instructional leaflets:
IL03902003Z: for size 1 devices (up to 12 A motor output)
IL03902004Z: for size 2 devices (up to 32 A motor output)
IL03902005Z: for size 3, 4 devices (up to 200 A motor output)
- Manual:
MN03901001Z
- You can download the documentation for the DS7 soft starters from the Internet at: www.moeller.net/support

Communication interface SmartWire-DT

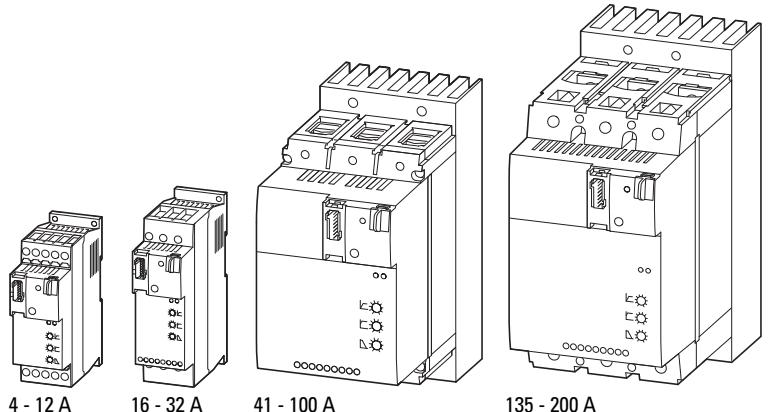

The DS7-SWD comes with a detailed diagnostic system with options that extend far beyond those of wired devices. In addition to having an error log, the DS7-SWD can detect and report nine different device faults. A warning parameter reports any present alarm messages. Moreover, the response to each individual fault can be customized. Finally, there are 35 additional messages for communication errors. Using the DS7 in connection with the PKE opens up new functionalities that were previously thought impossible to implement with a low-cost soft starter and that were reserved to significantly more expensive devices. Combining a PKE unit and a DS7-SWD makes it possible to completely protect the DS7-SWD device against overloads. In addition, it provides a current limiting function and can report thermal capacity utilization levels to higher level controllers.

Expanded temperature range

DS7-340SX...-L soft starters can operate at temperatures as low as -40 °C.

Engineering

Generalized phase control of motor voltage

By means of generalized phase control, the soft starter adjusts the grid's voltage (U_{LN}) smoothly from an adjustable start value to 100 % of the rated value U_{LN} .

U_{LN} : Mains supply voltage

U -Start: start voltage

t-Start: Ramp time of the voltage change at start

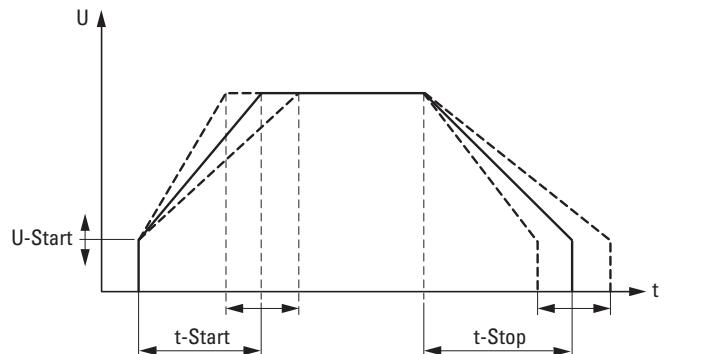

TOR (Top of Ramp): Signals the end of the set "t-Start" ramp time (output voltage U_2 = Mains supply voltage U_{LN}). The internal bypass contacts are closed after this.

This voltage control enables the inrush current of a three-phase asynchronous motor to be limited and its starting torque to be reduced. This enables a smooth and jerk-free increase in torque, adjusted in line with the machine's load behavior. This has a positive effect on the lifespan, operating behavior, and operating processes of the mechanical equipment and prevents negative effects such as:

- Impacting of cog edges in the gearbox
- Pressure surge in pipe systems (water impact)
- Slipping of V belts or
- Jitter with conveyor systems.

In DS7 and S801+/S811+ series soft starters, generalized phase control is achieved with anti-parallel thyristors that are bypassed for continuous operation by using bypass contacts (TOR = Top Of Ramp) after the time for a time-triggered voltage change (t-Start) has elapsed. The transition resistance of these bypass contacts is considerably lower than the transition resistance of the power semiconductors. This reduces the heat dissipation in the soft starter and extends the lifespan of the power semiconductors.

As well as the time-controlled startup of a motor, the soft starter also enables a time-controlled reduction of the motor voltage and thus a controlled stopping of the motor.

The output voltage of a soft starter determines the torque of the motor ($M \sim U^2$). Because of this, it is necessary to make sure that, when a machine starts up, the selected U -Start start voltage is not too low and the t-Start ramp time for the linear voltage change is set to be as short as possible.

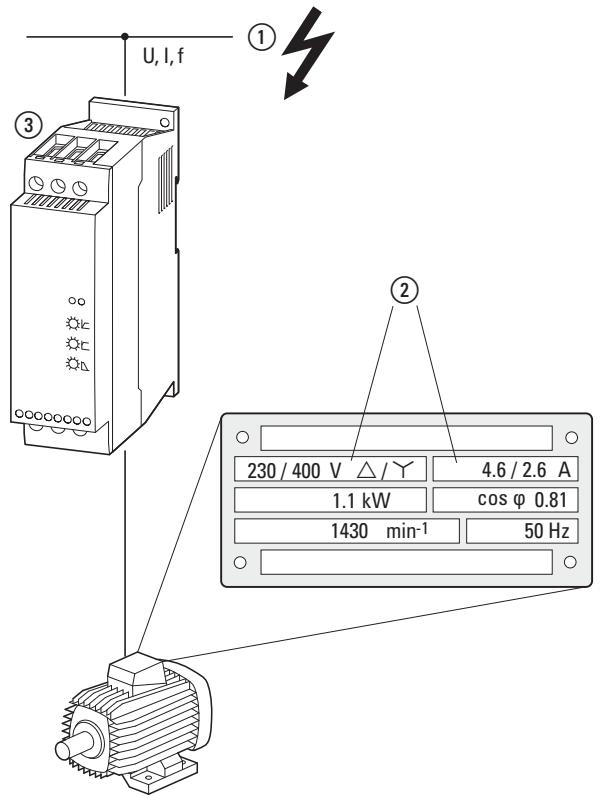

Please note:

- Long ramp times (t-Start) will produce a soft startup behavior, but will also result in a higher thermal load on the thyristors
- A high start voltage (U -Start) will produce a higher torque and a high starting current
- Set the lowest possible start voltage and the shortest possible start ramps.

The following pages include application and setting configuration examples for DS7 soft starters.

If controlled deceleration is required, t-Stop must be set to a longer time than would be necessary for the machine to coast freely based on the load. For the thyristors, the controlled deceleration constitutes a load comparable to that produced during startup. If, for example, the deceleration ramp is activated on a soft starter with a maximum of 10 permissible starts per hour, the number of permissible starts will be reduced to five per hour (plus five stops within that hour).

Selection criteria

When different operating frequencies, run-up times and/or starting currents are involved, the thermal capacity of the DS7 soft starter must be taken into account in the design. This can be done by using the following diagrams or by calculating the I^2t values. These I^2t values define the corresponding load capacity and overload cycle and are defined in product standard IEC/EN 60947-4-2.

DS7-34...SX032... soft starter:

- 32A AC-53a: 3-5: 75-10
- Rated operational current (I_e) 32 A
- Load cycle AC-53a
- 300% overcurrent for 5 seconds
- 75% duty factor with 10 starts per hour

The resulting I^2t value is: $(3 \times 32 \text{ A})^2 \times 5 \text{ s} = 46.080 \text{ A}^2\text{s}$

The maximum I^2t value of the connected motor load must be smaller:

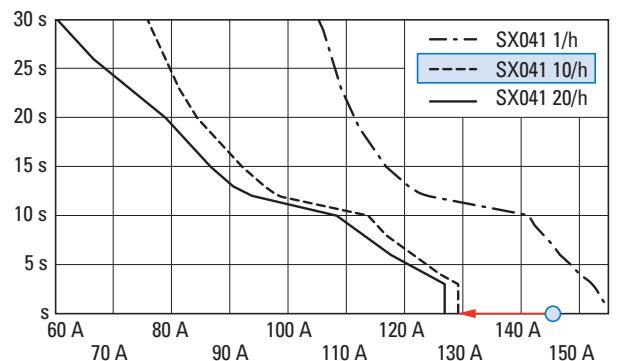

$$(3 \times 29 \text{ A})^2 \times 5 \text{ s} = 37.845 \text{ A}^2\text{s}$$

Soft starter DS7-34...SX032... is the right choice for this application.

If the motor had a higher inrush current, e.g., 5 times the starting current, a more powerful soft starter would have to be selected:

- Motor inrush current: $I_{LRP} = 5 \times 29 = 145 \text{ A}$, I^2t value = $(5 \times 29 \text{ A})^2 \times 5 \text{ s} = 105.125 \text{ A}^2\text{s}$
- DS7-34...SX041...: 41A: AC-53a: 3-5: 75-10
=> $(3 \times 41 \text{ A})^2 \times 5 \text{ s} = 75.645 \text{ A}^2\text{s}$

Soft starter DS7-34...SX041... cannot meet the required startup and load conditions required in this case.

DS7

Soft starters (3) are selected based on the supply voltage of the corresponding grid (1) (ULN) and the rated operational current of the assigned motor (2). The motor's circuit configuration (Δ/Y) must be selected in such a way that it matches the supply voltage. In addition, the soft starter's rated operational current (I_e) must be at least equal to that of the motor.

Additional selection criteria include:

- Ambient air temperature (rated value +40 °C)
- The number of starts per hour (< 10 starts, take stops into account)
- Load torque (quadratic, linear)
- Starting torque

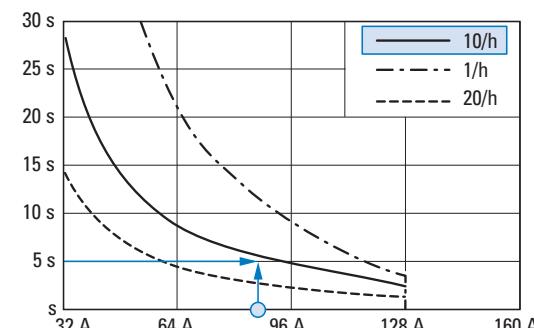

Centrifugal pumps, centrifugal fans, simple and smooth-running conveyor belts and traction drives, and circular saws and ribbon saws are some of the typical applications for which soft starters are used. Reciprocating compressors, mixers, mills, crushers, and lifting gear are instead categorized as heavy starting duty machines. In this case, the soft starter must be oversized in terms of its overload capacity.

In the case of applications that are typical for a soft starter, such as water pumps (centrifugal pumps), and that feature comparable operational data (operating frequency, run-up time, and/or inrush currents) a soft starter can be assigned directly to the motor on the basis of the rated operational current.

Example:

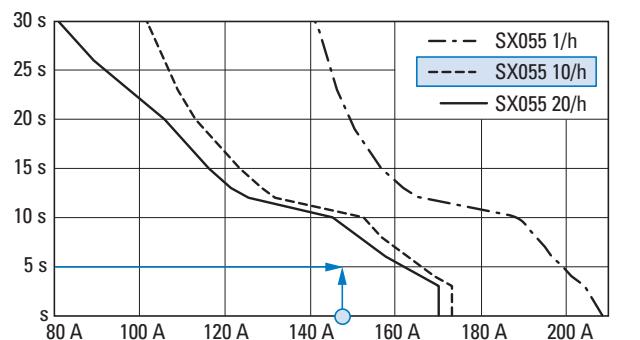

- 15 kW Pump motor
- 400 V
- Rated operational current 29 A
- About three times the starting current ($I_{LRP} = 87 \text{ A}$)
- A maximum of 10 starts per hour
- 5-second start-up time
- ambient air temperature 40 °C.

=> DS7-34...032... ($I_e = 32 \text{ A}$)

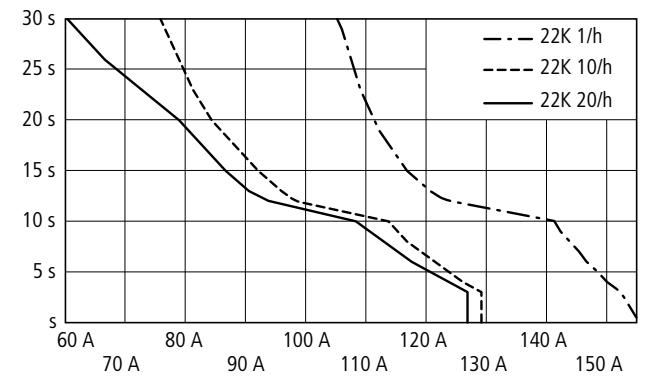

DS7-34...SX055...:
55A AC-53a: 3-5: 75-10
=> $(3 \times 55 \text{ A})^2 \times 5 \text{ s} = 136.125 \text{ A}^2\text{s}$
Soft starter DS7-34...SX055..., however, does meet the required startup and load conditions.

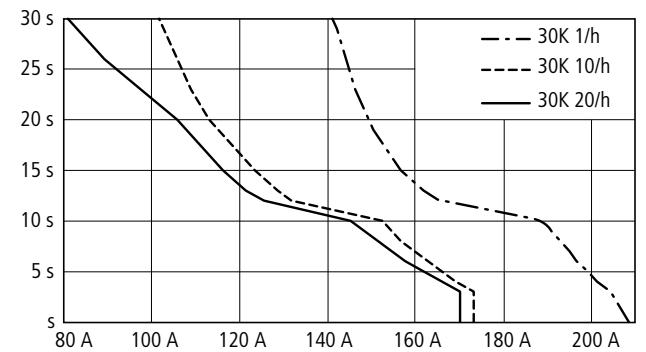

Note: As the following diagram shows, the DS7-34...SX055... unit can handle even more demanding startup and load requirements, e.g., up to 20 starts per hour and longer start-up times (up to 10 seconds).

Notes ¹⁾ Rated operational current based on the load cycle specified here.

²⁾ Used to specify the circuit-breaker required for the specified load cycle. At different duty cycles (operating frequency, overcurrent, overcurrent time, duty factor), this value changes and must then be adapted accordingly.

³⁾ An external overload relay is required if the main contacts should not be disconnected in the event of an overload and a controlled soft stop is desired instead.

⁴⁾ A mains contactor is not required. Disconnection characteristics in accordance with VDE can only be ensured with the specified circuit-breaker.

⁵⁾ The superfast semiconductor fuses protect the soft starter from short circuits on the motor side. This can not, however, prevent damage caused by voltage peaks, for example through lightning strike.

S801+/S811+ Soft Starters – Powerful Performance in a Small Package

The incredible performance of our two new S801+ and S811+ soft starter series is shaped by the expanded functionality that we have integrated into our tried-and-true series of soft starters. With only five sizes and rated operational currents of 37 A to 1,000 A for line voltages of 200 V to 690 V, the S801+ and S811+ are two of the smallest, most compact soft starters in the world.

These three-phase controlled soft starters, which feature an internal bypass and extensive monitoring and protection mechanisms, guarantee not only soft motor start-ups, but also the safe and reliable continuous operation of three-phase motors even in applications involving high load torques. In addition, these soft starters can be connected with a standard in-line configuration or with an inside-the-delta (also called "six wire connection") configuration as needed.

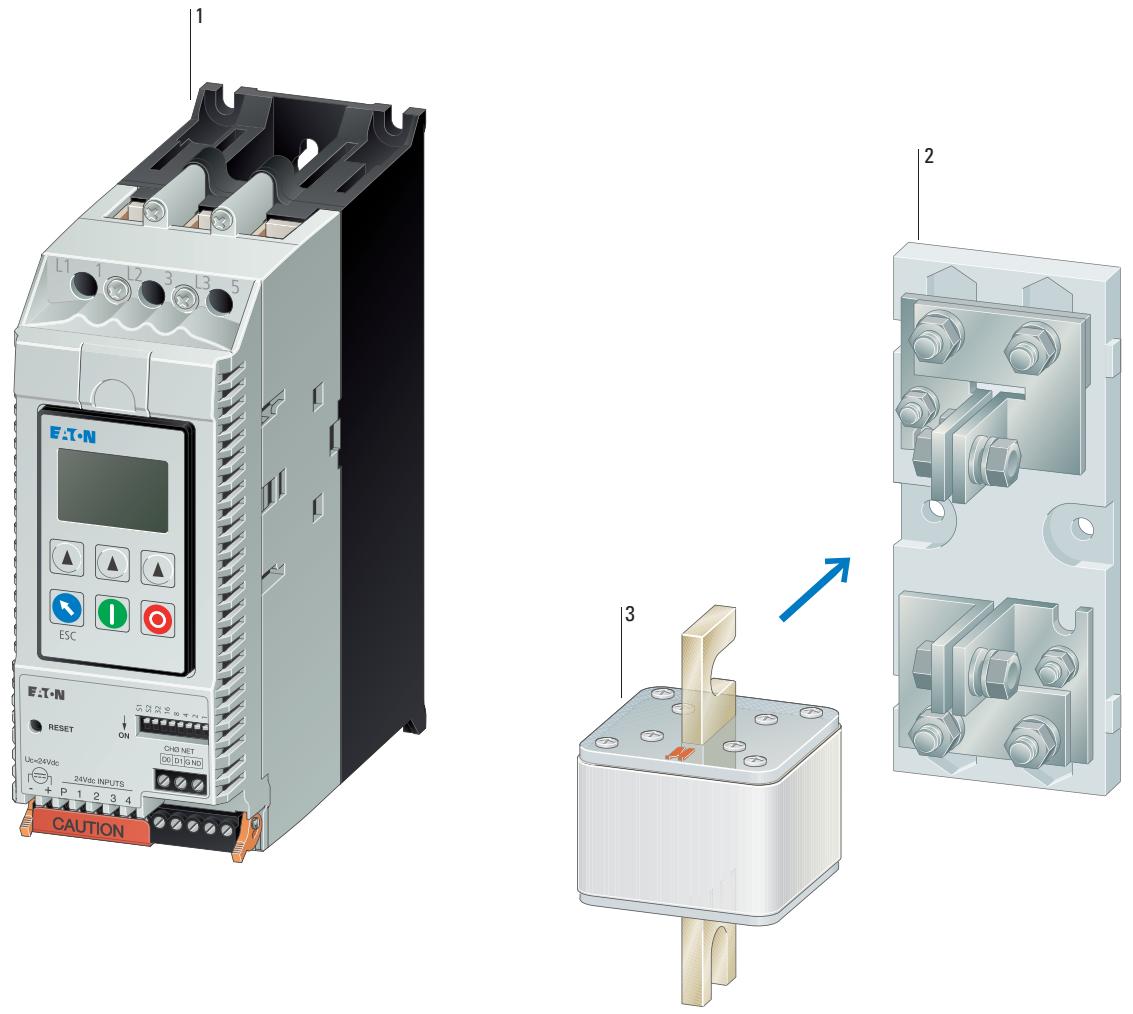

S801+ soft starters were designed with standard applications in mind and owe an important part of their appeal to their ease of use, while the devices in the S811+ series are characterized by a digital control and display unit that provides access to extended functions for sophisticated applications.

Description

S801+ series soft starters are an innovative addition that further enhances their tried-and-true predecessors. They are designed to guarantee reliable operation even under harsh and challenging ambient conditions. In addition, the series makes a compelling case as a result of its ease of use and is the perfect choice for standard applications such as pumps, fans, compressors, and conveyor belts.

S801+ soft starters are three-phase controlled and come with internal bypass contacts for continuous operation. With them, motors can be connected with a standard in-line circuit or inside the delta circuit (inside-the-delta circuit, V3 circuit). Using an inside-the-delta circuit will reduce the current flowing through the soft starter by approximately 42%. This makes it possible, for example, to start and run a motor with a rated operational current of 100 A using a 58-A soft starter. In addition, their comprehensive protection and monitoring features enable S801+ soft starters to ensure that three-phase motors with rated operational currents of 11 A to 1000 A will have soft startups and safe and reliable continuous operation at mains voltages of 200 V to 600 V – up to 690 V in the case of S811+ soft starters. Accordingly, for instance, their controlled coasting (soft stop control) and torque monitoring features can be used to prevent water impact in pumps and to reduce the mechanical loads on pump systems significantly.

Essential features S801+ / S811+

- Rated operational current: 37 - 1000 A
- Parameterizable overload settings: 31–100%
- Adjustable overload classes: class 5, 10, 20, 30
- Base setting: 15 s start ramp, 4 starts per hour, 300% starting current at 40 °C ambient temperature
- Allocated motor outputs for in-line connection:
 - 7.5 - 277 kW (3~ 230 V)
 - 18.5 - 525 kW (3~ 400 V)
 - 30 - 900 kW (3~ 690 V)
- Ambient air temperature: -30 °C to +50 °C
- any required mounting position
- Degree of protection with compact design (IP20 optional)
- 5 compact designs
- Adjustable torque control
- Adjustable kick start
- Efficient use of power achieved with internal bypass contacts during continuous operation
- 24-V control voltage:
 - External supply required
 - 1 A continuous current
 - 10 A starting current (peak value for 15 ms)

S801+ specific characteristics

- Microswitches and potentiometers make it easy to configure these soft starters

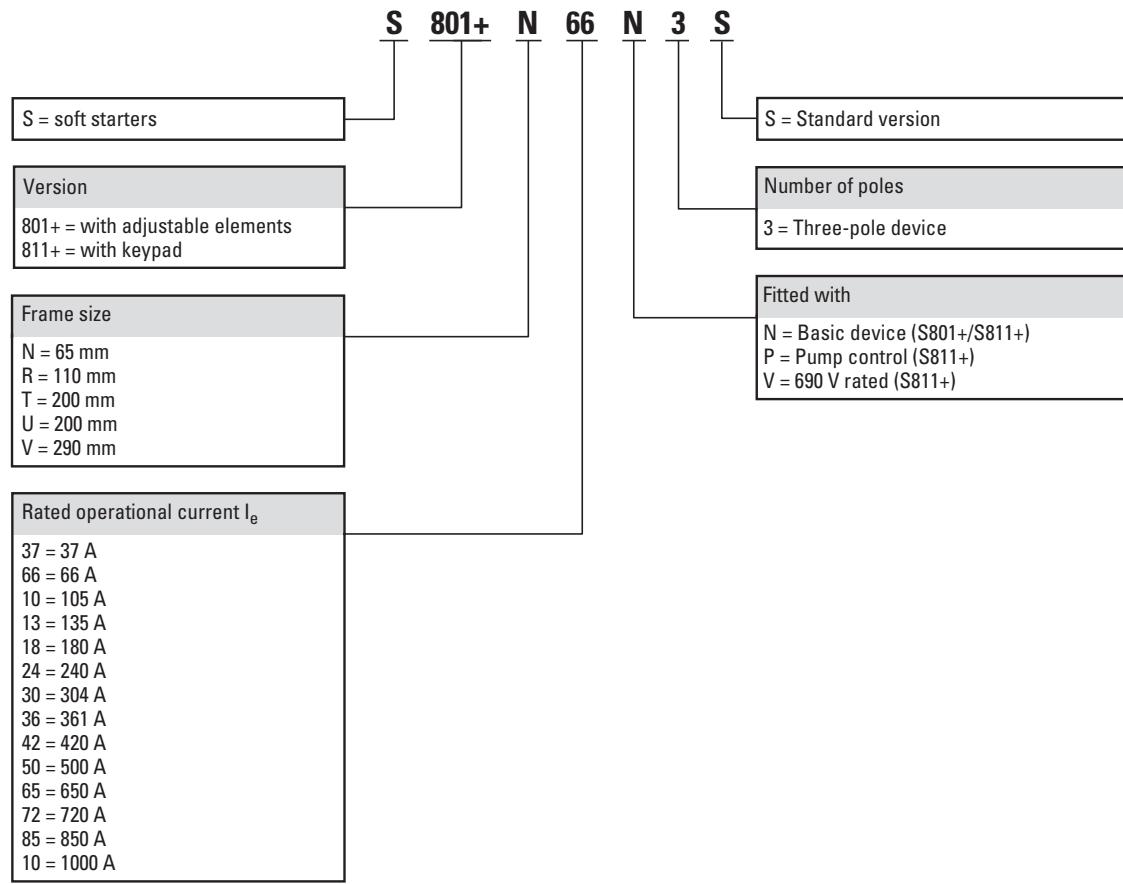

S811+ series soft starters provide all the features and characteristics of S801+ soft starters, plus expanded functionality and an operating unit (DIM = digital interface module).

**Important operating unit characteristics (S811+)**

- Language-neutral LCD display with backlight
- Easy to use and configure with function keys
- System parameter configuration
- Diagnostic and monitoring options
- Reading display (e.g., L1, L2, L3 phase currents)
- Error display
- Offset placement (mounted on door), connection via plug-in patch cord with RJ45 plug
- Front IP54

S811+ specific characteristics

- Mains voltage up to 690 V?
- Special pump control algorithm with prolonged soft stop ramp

Key to type references**UL/CSA**

Engineering**Connection examples for S811+...N3S**

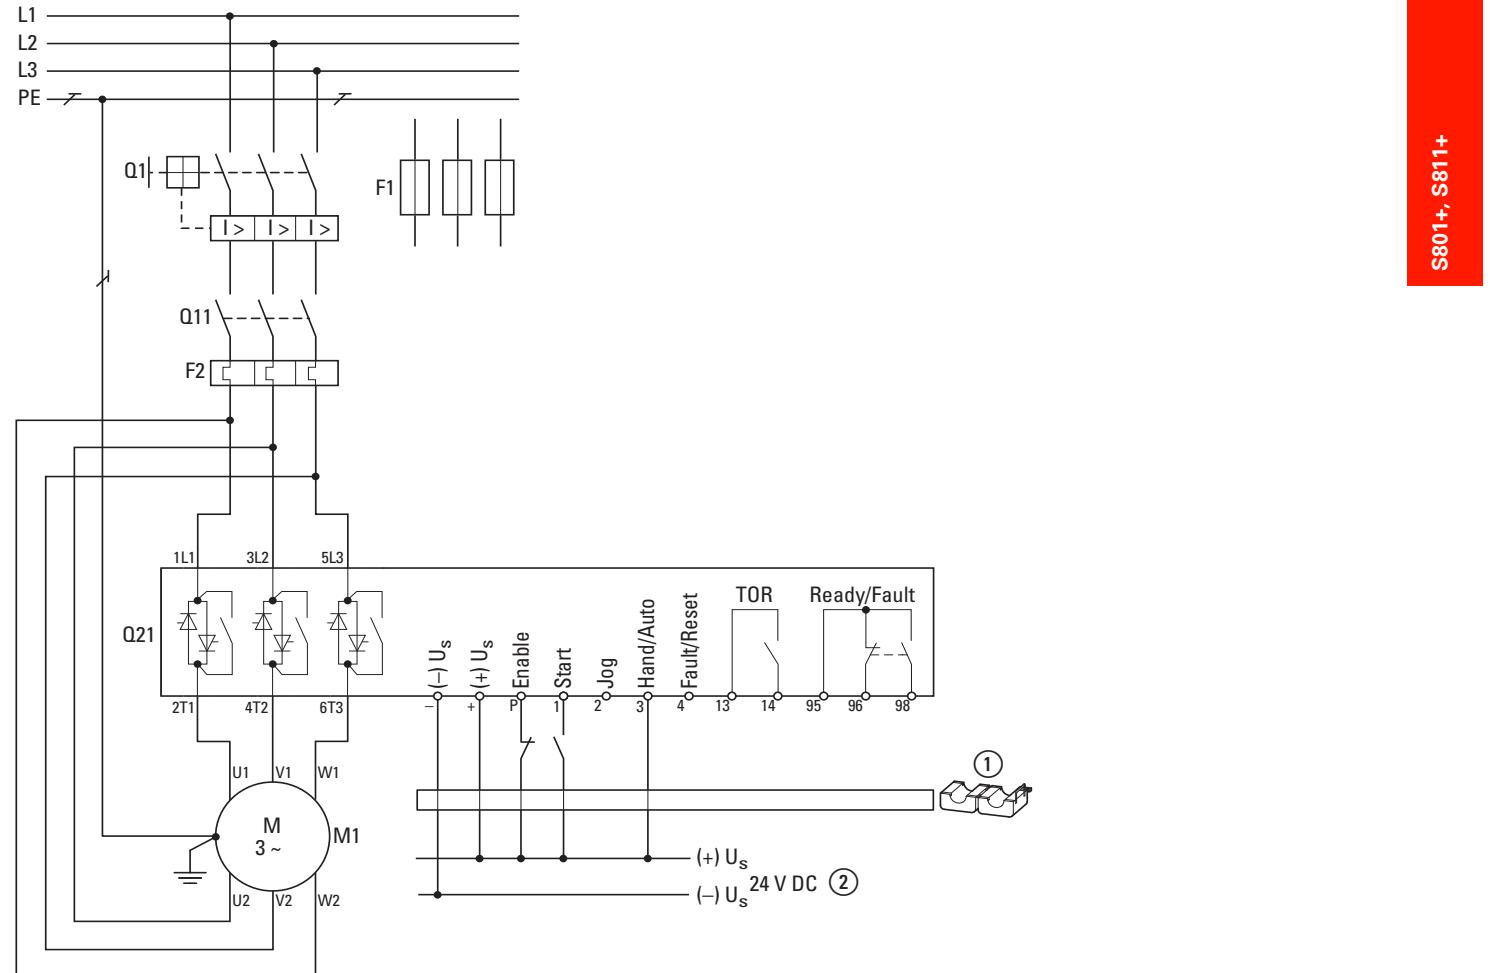

Standard connection (in-line connection)

(1) Snap-on ferrite core, included as standard

(2) External control voltage (24 VDC) required, IS 100 mA, IPeak = 10 A for 15 ms when bypass contacts are switched

Delta circuit (inside-the-delta circuit)

S801+, S811+

(1) Snap-on ferrite core, included as standard

(2) External control voltage (24 VDC) required, IS 100 mA, IPeak = 10 A for 15 ms when bypass contacts are switched

Short-circuit and cable protection: Q1 circuit-breakers or F1 fuses.

Rapid Link 4.0 distributed, electronic drive system

Standardized installation procedures, the ability to directly and locally configure parameters with a plug and play configuration, and networked communications – these are the needs of material handling system applications today when it comes to state-of-the-art drive engineering and the systems it produces.

Eaton delivers a modern answer with the Rapid Link 4.0 distributed electronic drive system. With its flexible power spectrum, its simple handling and its intelligent programming options, this new motor starter and variable frequency drives generation is the first choice for all kinds of conveying engineering applications.

RAMO electronic motor starters

Electronic DOL and reversing starters with a lifespan of more than 10 million switching operations, IP 65 degree of protection. Rated adjustable operational current of 0.3 – 6.6 A with three-phase mains connection of 400 V; allocated motor output of 0.09 – 3.0 kW

RAMO-D...: DOL starter

RAMO-W...: reversing starter

RASP speed controllers

Frequency-controlled motor starters with Volts-per-Hertz control (V/Hz control) and slip compensation or voltage-controlled vector control, as well as an integrated radio interference suppression filter (EMC), IP65 degree of protection.

RASP-2...: Rated operational current of 0.48 – 2.4 A with three-phase mains connection of 400 V; assigned motor output of up to 0.75 kW

RASP-3...: Rated operational current of 0.66 – 3.3 A with three-phase mains connection of 400 V; assigned motor output of up to 1.1 kW

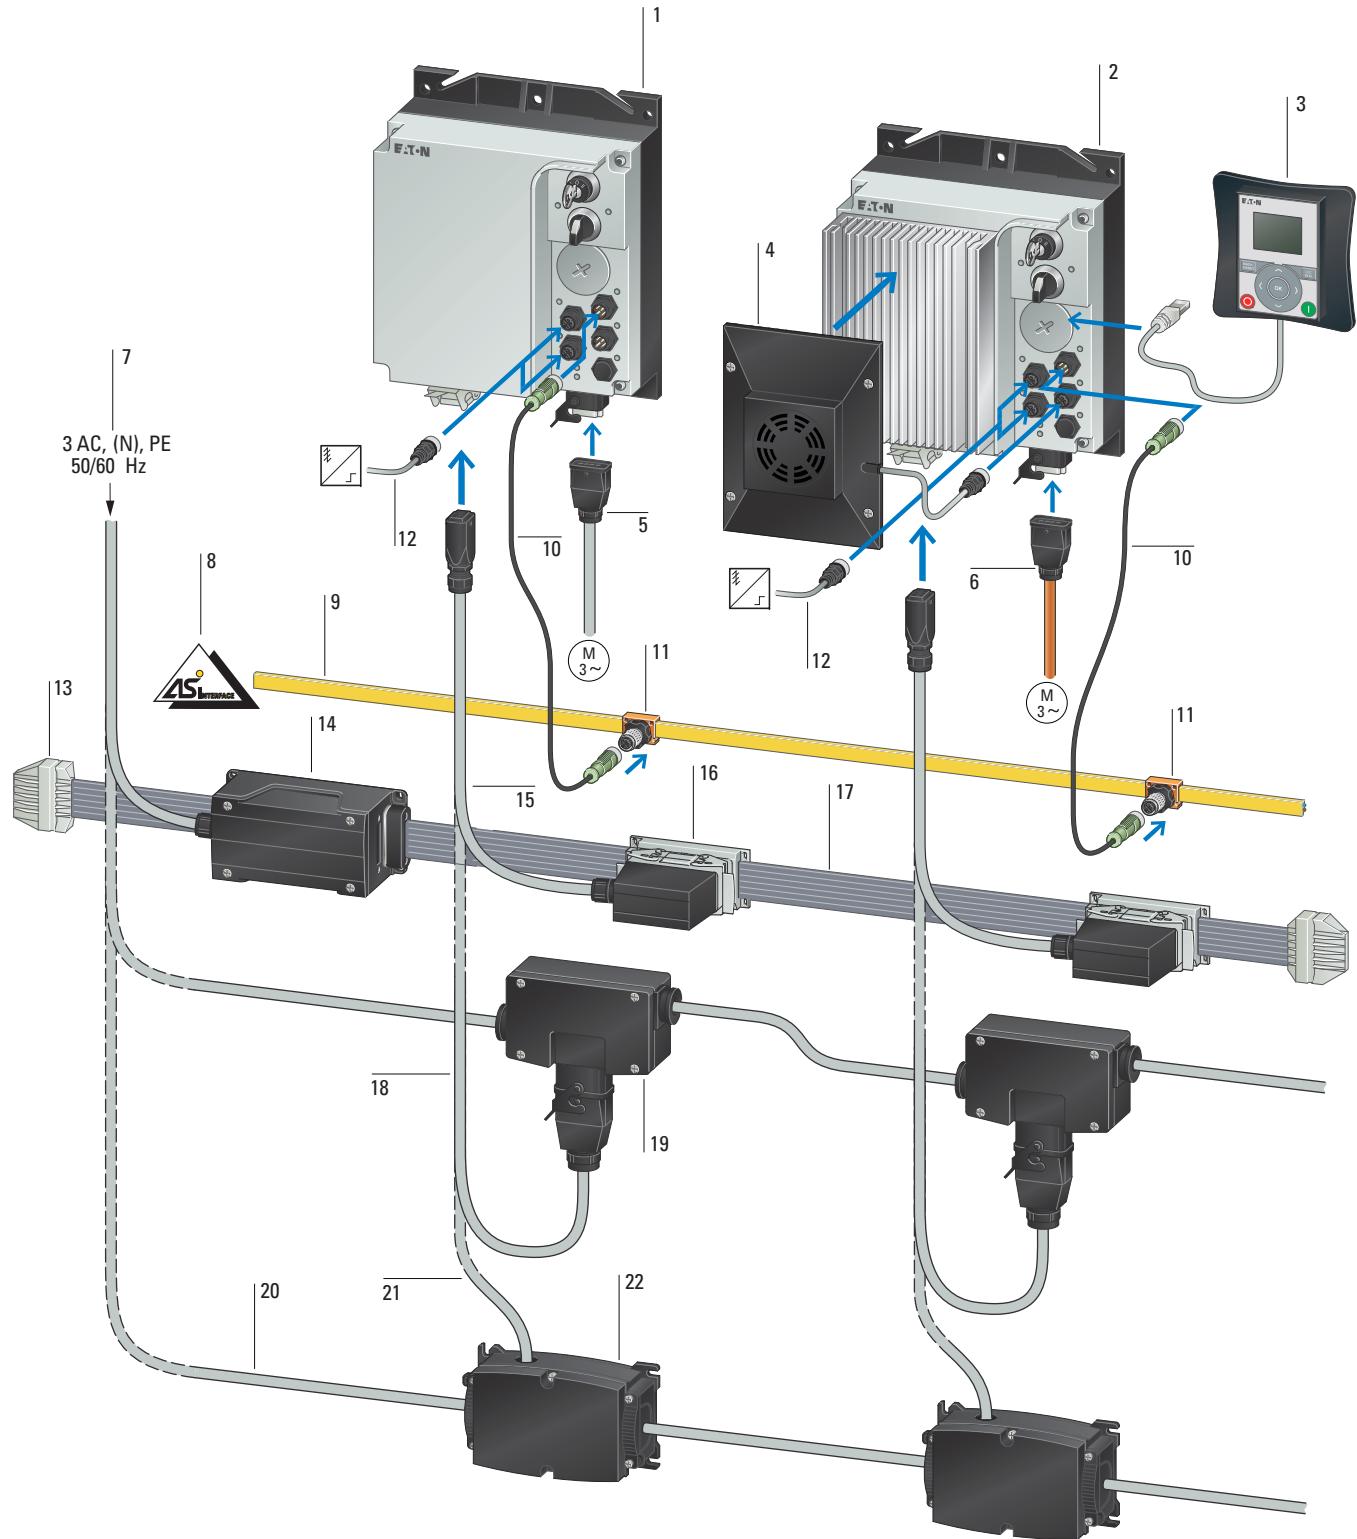

RASP-4...: Rated operational current of 0.86 – 4.3 A with three-phase mains connection of 400 V; assigned motor output of up to 1.5 kW

RASP-5...: Rated operational current of 1.12 – 5.6 A with three-phase mains connection of 400 V; allocated motor output of up to 2.2 kW

Rapid Link

Rapid Link 4.0 is a modern, efficient drive and PLC. It is the competent further development of the Rapid Link 2.1/3.0 device series, suitable for simple and complex tasks in all aspects of material handling. For example in airports, industrial production and logistics centers. The Rapid Link system consists of the RAMO electronic motor starters and the RASP frequency controlled motor starters.

The RAMO and RASP motor starters are designed with IP65 protection and can be installed in direct proximity to the drive. Their versions and mounting depend on the required specifications and the local conditions. The RAMO and RASP are connected with standard plug connectors to the energy and databus systems predominantly used in material handling systems (AS-Interface). Connection can be implemented without interrupting the required location. This simplifies installation and reduces the wiring requirement.

Overview of features

RAMO 4.0 electronic motor starters

Application and function

The RAMO motor starters enable the electronic DOL or reversing starting of three-phase motors in automatic or manual mode. The electronic overload protection for motor ratings from 90 W to 3 kW at 400 V (50/60 Hz) is configured with DIP switches. Full motor protection is ensured when used in connection with temperature sensors.

The operating mode is set via the AUTO - OFF/RESET - MANUAL key switch and can be combined with the 'Quick stop' and 'Interlocked manual operation' via the two sensor inputs (M12 sockets). Operating states are diagnosed and error messages (Reset) acknowledged on the device or via the AS-Interface. RAMO is available in different versions:

- with actuator output (24 V DC) for a direct actuation of external switching devices, e.g. solenoid valves.
- with electronic actuation for mechanical motor brakes.
- with lockable repair switch for diagnostic and maintenance work, making it possible to safely de-energize the device locally.

Essential features

- Standard size in square enclosure. The bottom section with the two power terminals (power plug, motor feeder socket) and the repair and maintenance switch can be turned 90° clockwise and counterclockwise.
- Long lifespan up to 10 million switching operations and up to 3,000 switch cycles per hour at 2.2 kW.
- Rated operational current 6.6 A.
- Operating and ambient temperature from -10 to +55 °C, without derating.
- Monitoring of thermistor and motor cable.
- Maximum motor cable length: 10 m.

Frequency controlled motor starter RASP 4.0

Application and function

The RASP motor starter enables the infinitely variable speed control of three-phase motors in the range from zero to 320 Hz. The standard size for 400 V (50/60 Hz) is assigned four motor ratings: 0.75 kW, 1.1 kW, 1.5 kW and 2.2 kW. Full motor protection is ensured by the adjustable current limitation (I²t controller).

The operating mode is set via the AUTO - OFF/RESET - MANUAL key switch and can be combined with the 'Quick stop' and 'Interlocked manual operation' via the two sensor inputs (M12 sockets). Settable fixed frequencies and cyclical program sequences extend the application range and relieve the load on the higher-level head-end controller (PLC). Operating states are diagnosed and error messages (Reset) acknowledged on the device or via the AS-Interface. A hand-held programmer and a PC interface are available for the parameterization of the variable frequency drive module.

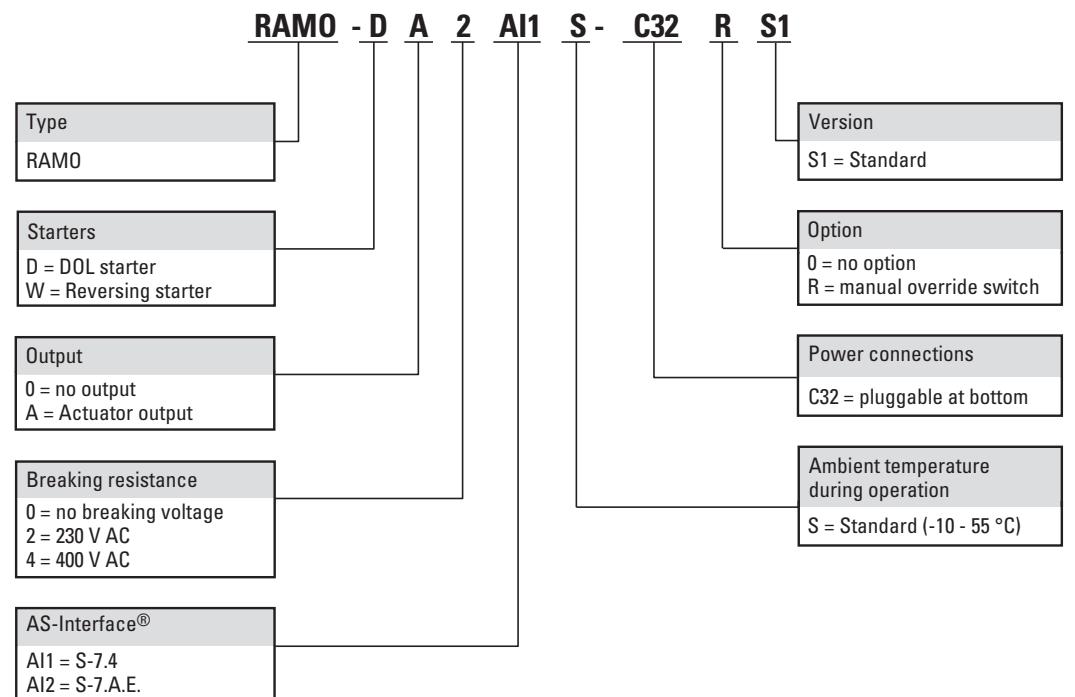

RASP is available in different versions:

- with integrated brake chopper with braking resistance for dynamic braking.
- with electronic actuation for mechanical motor brakes.
- with lockable repair switch for diagnostic and maintenance work, making it possible to safely de-energize the device locally.

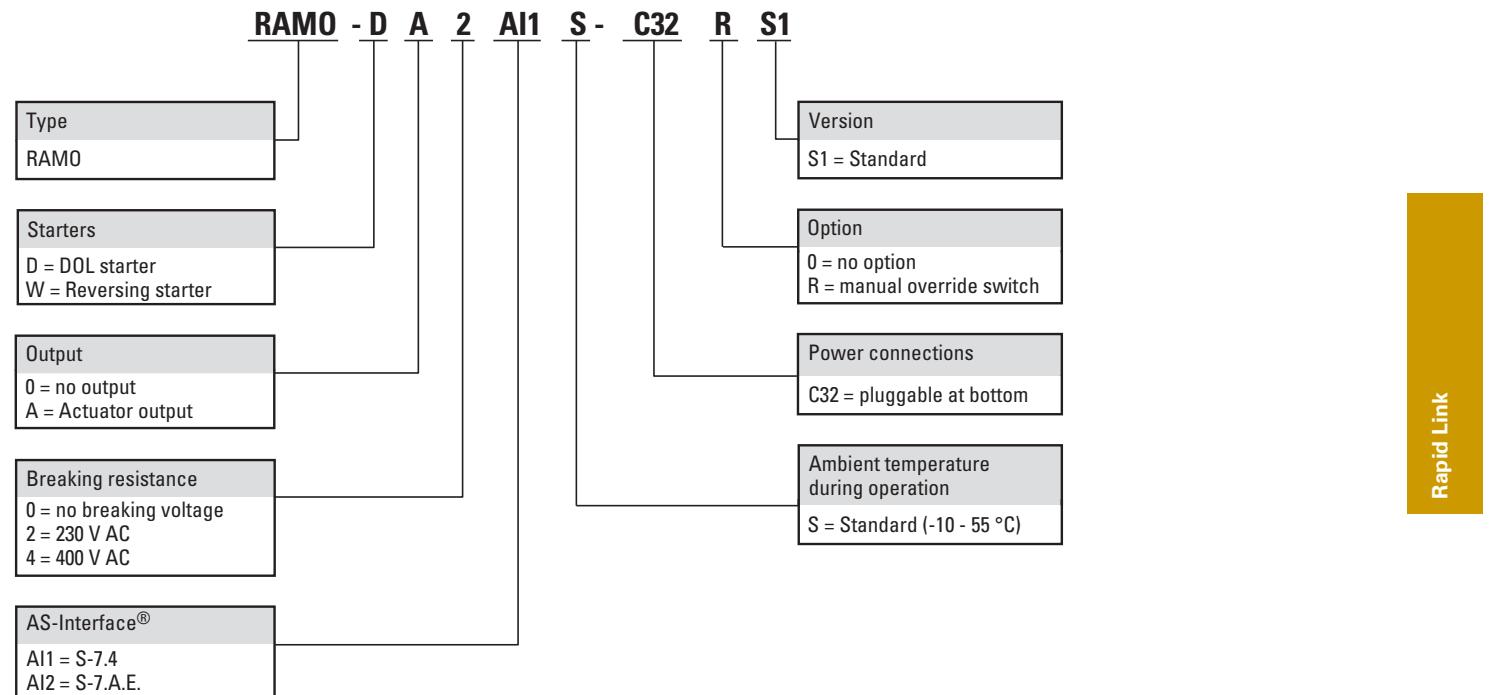

Essential features

- Standard size in square enclosure. The bottom section with the two power terminals (power plug, motor feeder socket) and the repair and maintenance switch can be turned 90° clockwise and counterclockwise.
- Monitoring of thermistor and motor cable.
- Operating and ambient temperatures from 0 to +40 °C without derating, with optional fan in the performance range up to 1.5 kW max. +55 °C.
- Rated operational current: 2.4 A, 3.3 A, 4.3 A, 5.6 A
- EMC class C3 in 2nd environment
- Maximum motor cable length: 5 m.

Spare keys for AUTO - OFF/RESET - HAND key-switches						
	Lock mechanism MS1	RAMO RASP	M22-ES-MS1 216416		5 off	-

Rapid Link

The Rapid Link 4.0 electronic drive system enables remote and flexible installation in the direct proximity of the drive unit. The entire system is designed with protection to IP65. All electrical connections (mains voltage, motor feeder, sensors) are implemented simply with the standard connectors that are primarily used in materials handling applications.

- ① Sensor (light barriers)
- ② RAMO
- ③ Motor connection cable
- ④ Mains connection on power bus
- ⑤ AS-Interface

Motor starter selection

All motor starters (RAMO, RASP) can provide electronic motor protection and the additional connection of temperature sensors (theristor, ThermoClick, PTC). The motor starters are available in the following variants, with or without a lockable repair switch (mains transfer switch):

- RAMO-D, electronic DOL starter for one operating direction.
- RAMO-W, electronic reversing starter (two operating directions).
- RASP, frequency-controlled motor starter with several speeds for two operating direction in assigned ratings.

Electrical mains connection

The motor starters can be connected to and operated on 400 V three-phase, star point-earthed AC supply systems (in accordance with IEC 60364) without any restriction. The neutral conductor must be connected for motor starter variants that actuate a 230 V motor brake.

Safety and protective device

The power bus must have short-circuit protection. The length of the power bus depends on the upstream group protection. Calculations for design examples are provided in the Rapid Link manual (MN03406003Z):

- PKZM0-25 motor-protective circuit-breaker, max. approx. 40 m.
- FAZ C25/3 miniature circuit-breaker, max. approx. 60 m.
- PKE32/XTU-32 system protective circuit-breaker, 50 m to 220 m.

The group protective devices listed here protect:

- the power bus from overloads and short-circuits.
- the spur lines to the motor starter (RAMO, RASP) from overloads and short-circuits.
- the motor feeder of the RAMO

On the RASP frequency-controlled motor starter, the motor feeder is protected by the internal variable frequency drive.

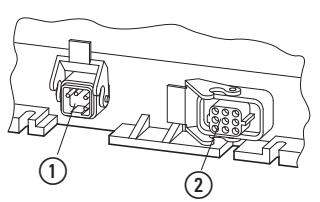

When using residual current devices, a Type B AC/DC sensitive residual current circuit-breaker must be used with the RASP frequency-controlled motor starter.

EMC compliance

All motor starters observe the required EMC limit values when connected as specified. The RASP frequency-controlled motor starter must be provided with a shielded motor cable (RASP-CM1-...) and installed with the specified EMC measures. The internal RFI filter then allows operation in accordance with category C3 in the second environment.

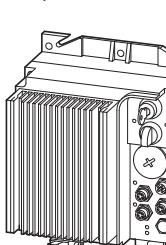

Terminal Models

The electrical connection in the power section (mains voltage, motor feeder) is implemented with plug-in terminals in the base.

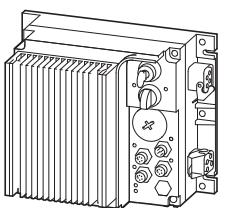

- (1) 5-pole power connector for connecting the 3 AC 400 V mains voltage, (N), PE.
- (2) 8-pole motor feeder socket as per DESINA specification.

By rotating the base 90 degrees, connection is also possible from the right or left. This makes it possible to keep the operating and connection area and the heat sink on the RASP in the preferred vertical position.

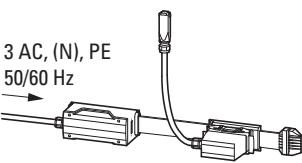

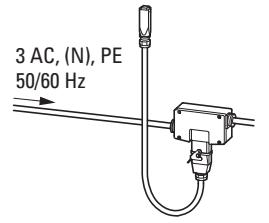

Example RASP:

Connection from below (standard)

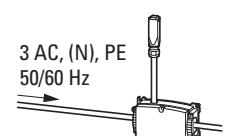

Connection from the right (90 degree rotation of the base to the left)

Three installation systems are available for connecting the power plug to the mains:

**RA-C1, flat cable system**

Connection from below (standard)

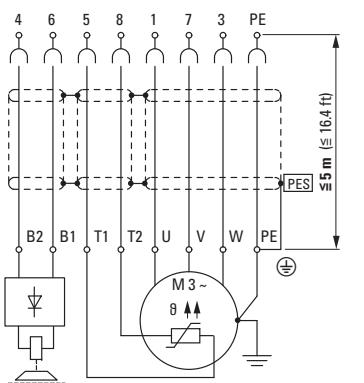

Connection from the right (90 degree rotation of the base to the left)

Device variants with a repair switch (RAMO-....-C32R..., RASP-....-C32R...) ensure that the drive can be isolated locally from the power supply for repair or maintenance work, even when it is still connected. A padlock can be used to secure the repair switch.

The 8-pole motor feeder can be used to connect:

- a three-phase AC motor (U1, V1, W1, PE),
- a motor brake (B1, B2) with a control voltage of 230 V AC or 400 V AC,
- a thermistor or temperature switch (ThermoClick). These connection cables (T1, T2) can at the same time be used to monitor the motor cable and the connection of the motor feeder plug.

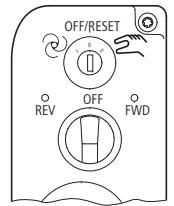

RA-C4, round cable system with contact connectors

Example: Motor feeder with shielded motor cable on the RASP

Control level

The control level features a selector switch (key switch) for selecting automatic mode and manual mode locally. The RAMO-W and RASP motor starters are also provided with a selector switch for reversing the motor direction in manual mode.

The automatic mode and the control voltage power supply are implemented via the AS-Interface. All connections in the control level (AS-i, sensors etc.) are implemented with M12 plug connectors. For this the M12 connectors just have to be fitted on [1] and rotated to secure them [2] (see illustration below).

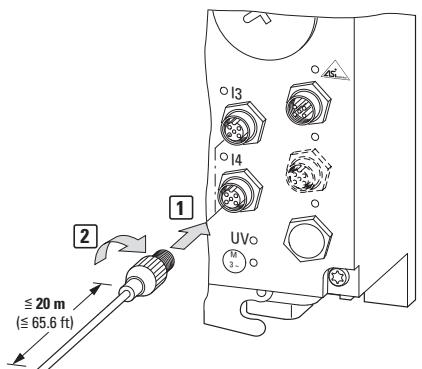

The sensor inputs (I3, I4) enable the Rapid Link motor starters to execute sensor-controlled functions immediately and independently of PLC and bus cycle times:

- Interlocked manual operation,
- Quick Stop,
- Rotation direction change (on RAMO-W and RASP),
- Controlled speeds (only RASP)

On the RAMO-DA... and RAMO-WA... a 24 V DC output (max. 1 A, 03) also makes it possible to control external actuators (valves, couplings, indicator lights) directly.

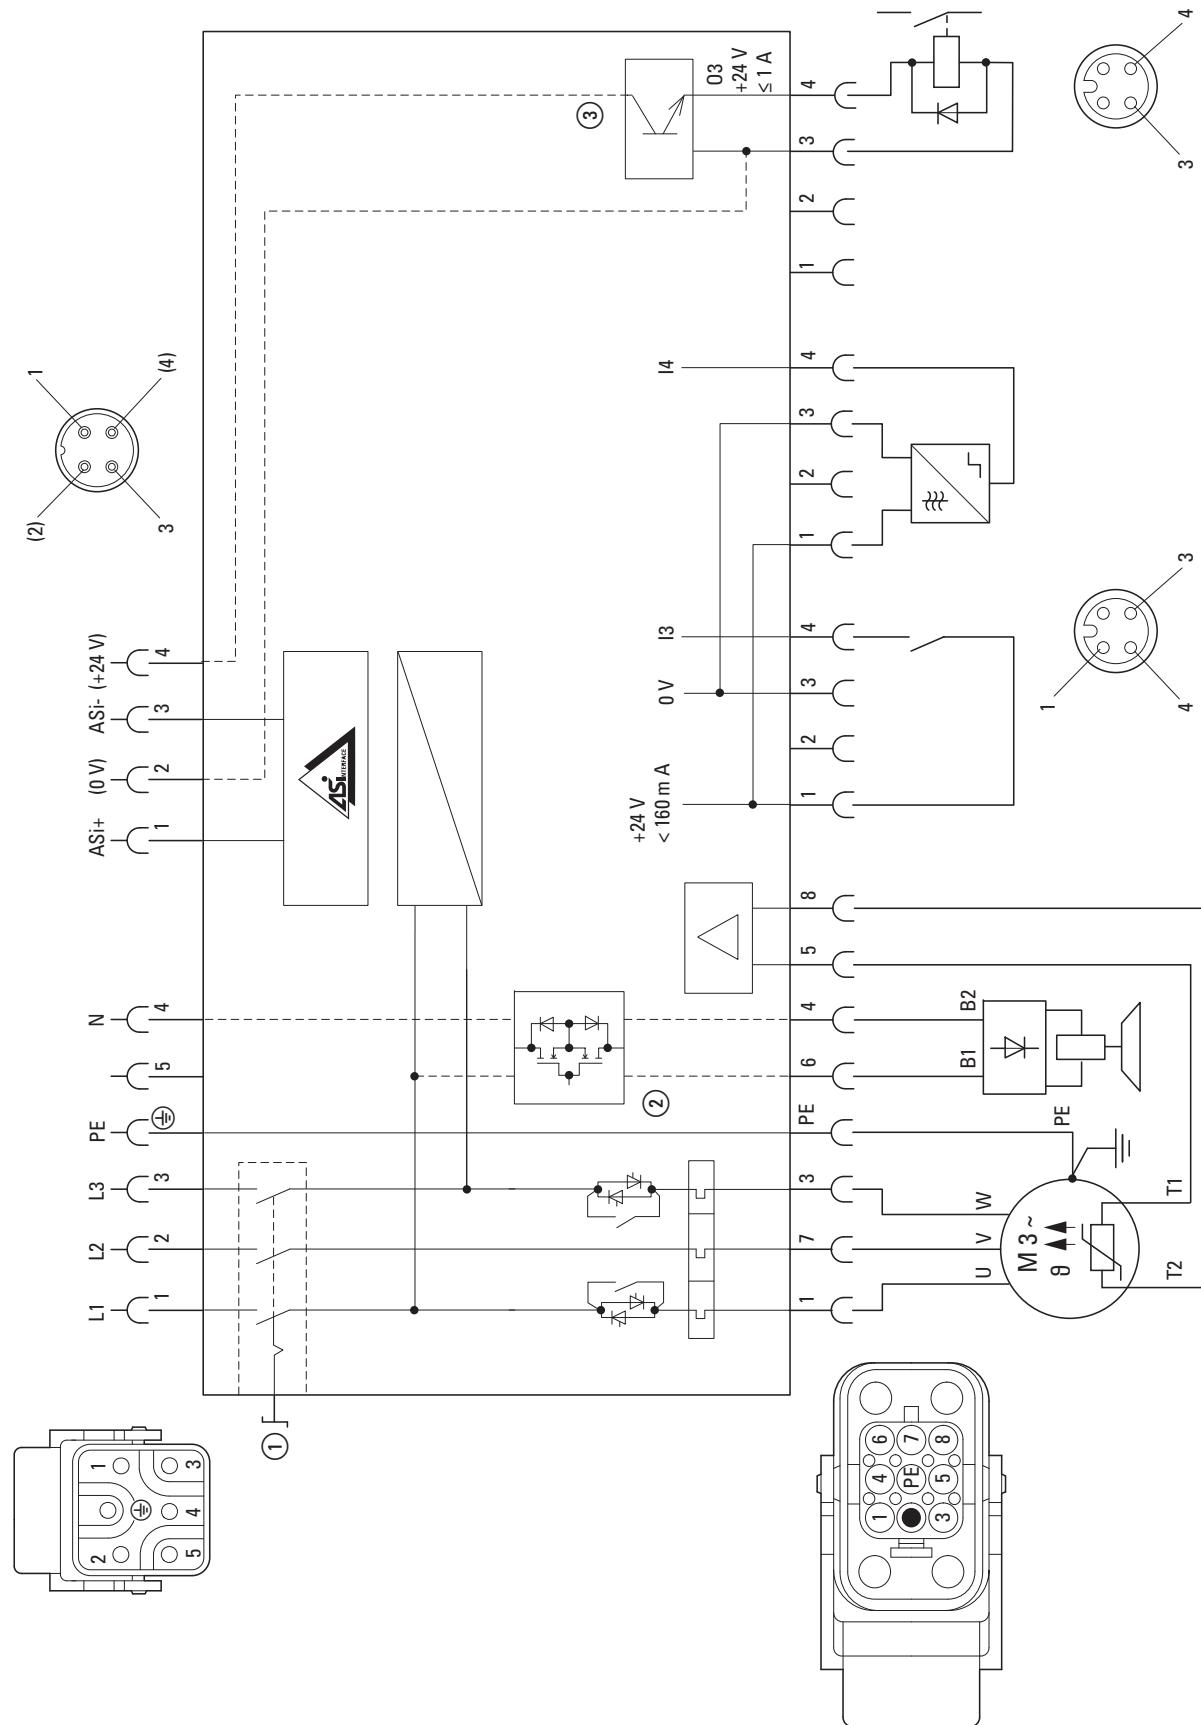

The functions are selected directly on the motor starter via microswitches. On the RASP additional settings (variable frequency drives) can be made from a hand-held terminal or from the parameter software.

SmartWire-DT™ – Cost-optimized communication for switchgear

Manufacturers of machines and systems strive to achieve a balance between the maximum level of functionality and cost optimization. Designed for further development, SmartWire-DT is a communication system for industrial switchgear in control panels and the periphery: from control, protection and switching to actuation, operation and monitoring. One technology from which you will profit, now and in the future.

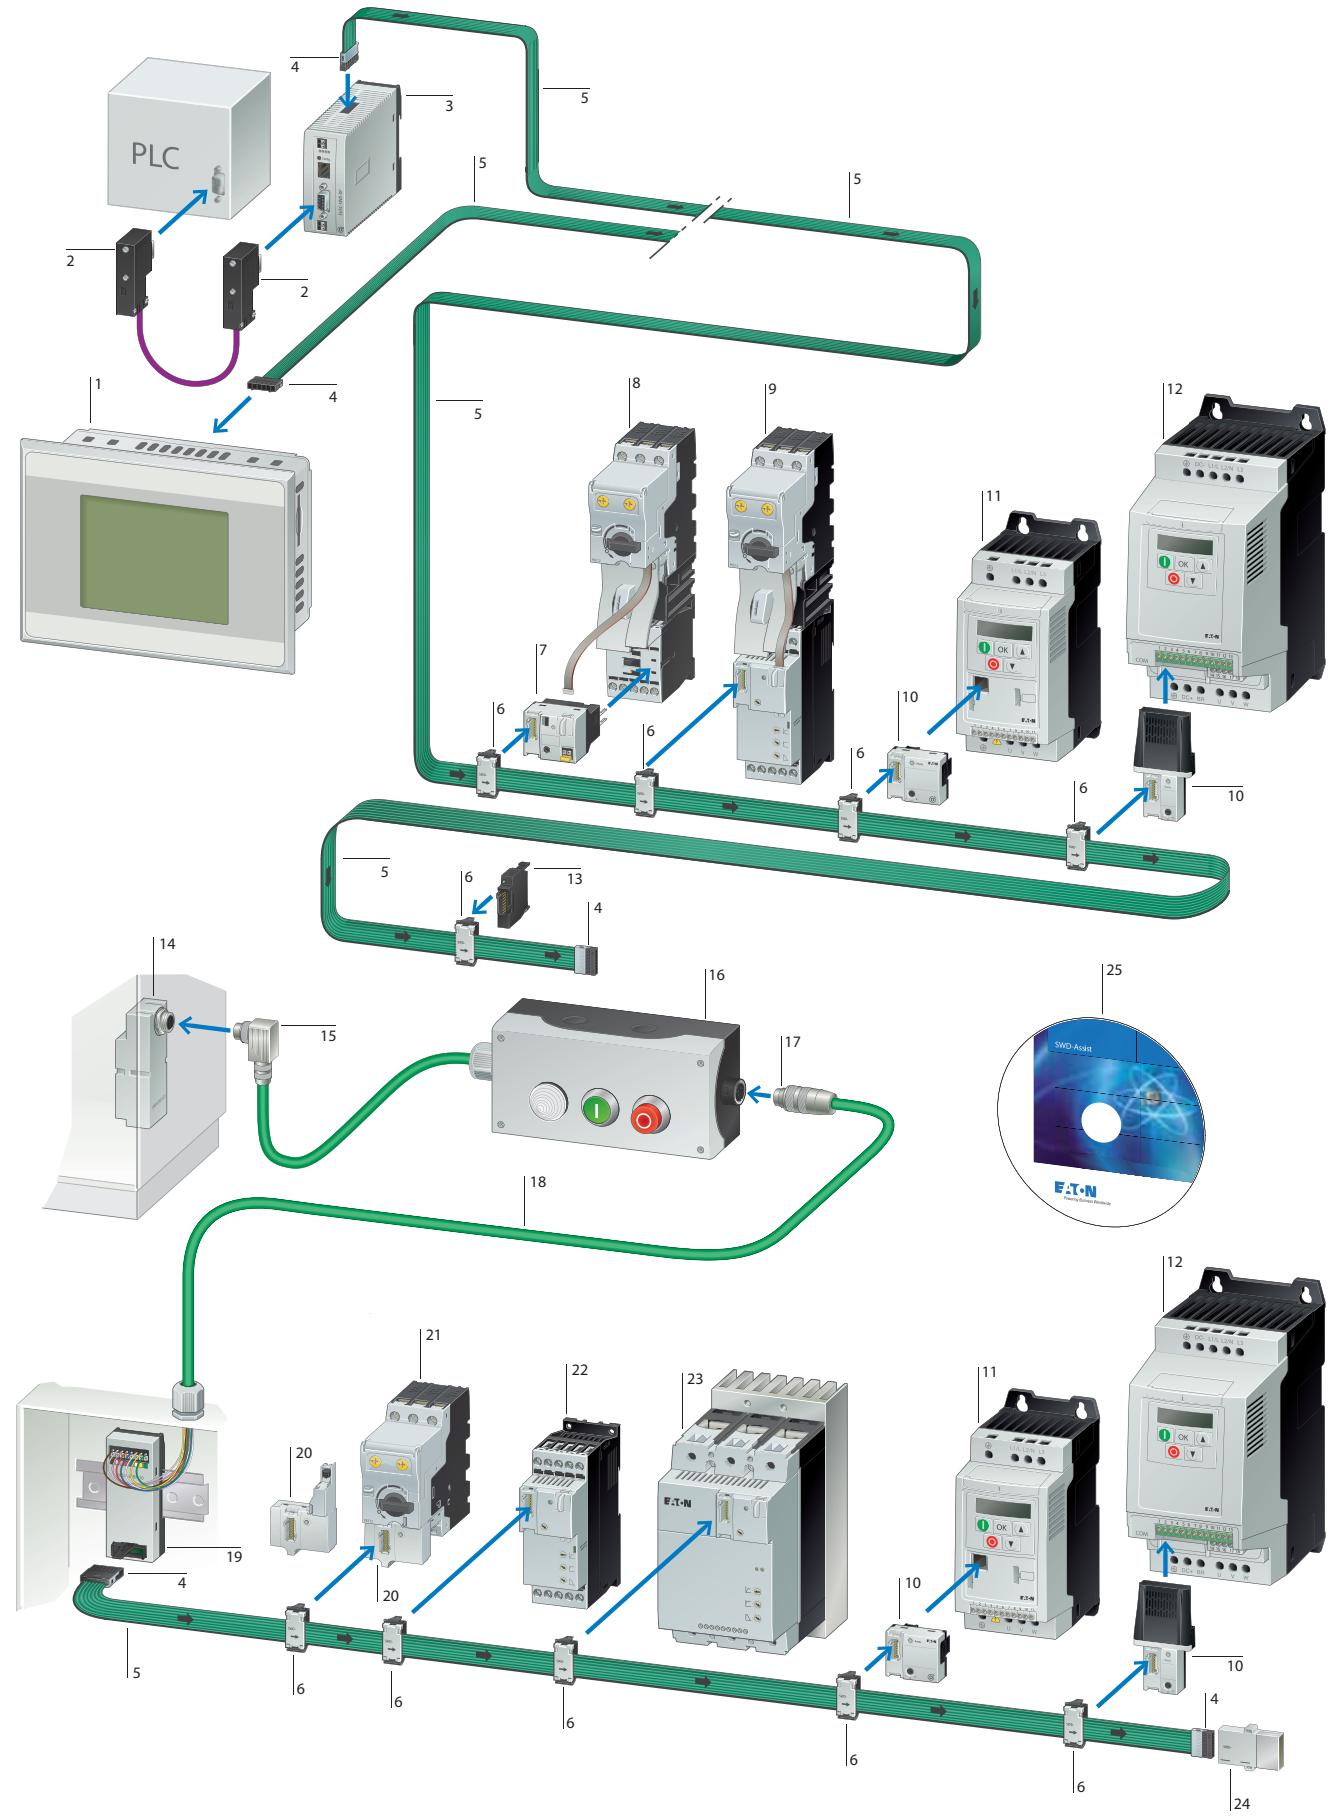

PowerXL variable frequency drives and DS7 soft starters – Communicate with SmartWire-DT

Being able to use a controller to directly access all of a soft starter's and/or variable frequency drive's parameters via SmartWire-DT is the epitome of ease of operation. Users can read and overwrite potentiometer settings. Extended status, error, and diagnostic messages can be retrieved directly. The result: absolute data transparency. The plug-in units make installation fast and foolproof, and the resulting connection includes the soft starter's control current supply. SmartWire-DT modules for expanding the functionality of the variable frequency drives in the DC1 and DA1 series are scheduled to hit the market soon. This will enable users to communicate with their variable frequency drives via SmartWire-DT on the basis of the relevant Profidrive profile. Other profiles will also be available for simple applications. Another important function that will complement the ability to change parameters in variable frequency drives will be the ability to use extended diagnostic functions. Within this context, function blocks will make it easy to connect to Eaton PLCs and HMI's.

Note: You can find the entire SmartWire-DT range of products by consulting our industrial main catalog or our online catalog at <http://ecat.moeller.net>

Features

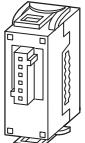

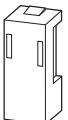

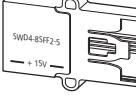

- SmartWire-DT HMI-PLC**
 - with SmartWire-DT master interface and PLC function
 - Compact design with light plastic enclosures
 - Wide selection of onboard interfaces
 - 3.5", 5.7" or 7" TFT-LCD screen

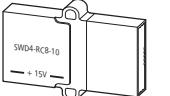

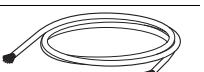

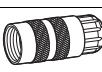

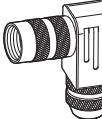

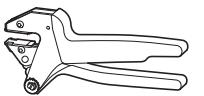

- SmartWire-DT Gateways**
 - Connection of SmartWire-DT to field bus.
 - Field bus address setting with dip switches
 - Automatic baud rate detection
 - Feeding the supply voltage for the SmartWire-DT modules
 - Supplies the control voltage for the motor starter or contactor
 - Configuration button for automatic addressing of the SmartWire-DT module.
 - Support of up to 99 SmartWire-DT modules.

- SmartWire-DT module**
 - Function element for connecting to RMQ-Titan pilot devices.
 - Function element for connecting to DLM contactors
 - Function element for connecting to PKZ/PKE motor-protective circuit-breakers
 - Function module for connecting to NZM2,3,4 circuit-breakers
 - Connection of digital and analog input/output modules
 - DS7 Soft starter connection
 - Function element for connecting to PowerXL™ DC1, DA1 variable frequency drives

- SmartWire-DT Assist (SWD-Assist)**
 - Easy creation of SmartWire-DT networks
 - Integrated validity check
 - Generation of ordering lists.
 - Online-Functionality
 - Simple pre-commissioning
 - Configuration check and comparison
 - Display of parameters and diagnostics
 - Easy diagnostics of SmartWire-DT module
 - Free download under: <http://downloadcenter.moeller.net>

Planning safety and process optimization – CAD data at the click of a mouse!

ePLAN[®]

- 9,500 article data items and macros
- Convenient selection tool
- Version P8

Eaton is providing its customers with CAD data to offer optimum support during planning. Both electrical and mechanical design data can be called up quickly and conveniently from the Internet at any time. This reduces processing times, minimizes errors and thus reduces costs already in the engineering phase of control panels, systems and machinery.

- Models for approx. 10,000 products
- 70 different neutral & native formats

eCAD: Eaton makes product data and macros available for the EPLAN planning system and the Electric P8 version. Device data for over 9,500 products can be downloaded from the Eaton website and integrated in customer article databases using a specially developed selector.

mCAD: Eaton makes 2D and 3D data available for more than 10,000 products. Over 70 different neutral and native formats guarantee compatibility with the project engineering systems of the customer. The models can either be integrated directly into the planning software from the Partcommunity Portal on the Internet or via the CADENAS Partsolution software.

Worldwide export of machines and plants

European machine and system building and worldwide exports are closely related. Even if you don't export your machines at present, you should be prepared for it in the future. Eaton provides switchgear and protective devices with all the essential approvals and certificates for machine and system building. In most countries around the world, conformity with international standards is the sole requirement for successful exports. This is because components in these locations are governed by compliance with well known and established IEC standards. In this respect, the European CE mark is not only the passport for exports within Europe but also far beyond its borders.

World market equipment for machine building

Nearly all the switchgear and protective devices of Eaton's Moeller® series are world market devices. Each product line thus carries all the approvals and certification marks required for worldwide use.

These product lines include those for

- Pilot devices, limit switches
- Contactors and various timing and special relays
- Motor-protective circuit-breakers and relays
- Electronic components and systems.

With circuit-breakers and switch-disconnectors, Eaton offers IEC devices for use in most countries in the world and NA devices with virtually the same dimensions and the same accessories for the North American market. This considerably simplifies device selection since the North American standards often involve the need for considerably different technical specifications.

Electrical engineering products and their applications are not harmonized internationally.

The greatest differences to the IEC world are in North America, i.e. the USA and Canada. For many newcomers to the export business, it is initially surprising to experience the very different approaches and solutions.

Special components, such as handles for main switches that can only be operated by the intentional switching of an

additional handle when the control panel door is opened, may sometimes be required for export to North America. Likewise, the European motor-protective circuit-breaker is only accepted with an upstream protective device or with larger air and creepage distances at the incoming terminals. Eaton is the competent partner of choice for export-related issues here.

Qualified information is a critical key to success

The screenshots illustrate the detailed information provided in the Eaton Main Catalogue and the Moeller website for North American approvals. The top part shows a catalog page with a callout to a specific product's approval details, which include:

Information relevant for export to North America	Product Standards	UL 508; CSA-C22.2 No. 14-05; IEC/EN 60947-3; CE marking
UL File No.	ES6332	
CSA File No.	NLRV	
IEC File No.	12528	
UL Certification	3211-05	
IEC Certification	UL Listed, CSA certified	
Branch circuits	Branch circuits	
Degree of Protection	IEC: IP65; UL/CSA Type 3R, 12	

The bottom part shows a screenshot of the Moeller website with a callout to a specific product's approval details, which include:

Product Standards	UL 508; CSA-C22.2 No. 14-05; IEC/EN 60947-3; CE marking
UL File No.	ES6332
CSA File No.	NLRV
IEC File No.	12528
UL Certification	3211-05
IEC Certification	UL Listed, CSA certified
Branch circuits	Branch circuits
Degree of Protection	IEC: IP65; UL/CSA Type 3R, 12

Anyone wishing to avoid unfortunate experiences, should make use beforehand of the large number of publications that Eaton is offering on the issue of exports to North America. They contain the implementation of the codes & standards and a description of different practices.

These technical articles can be accessed via <http://www.moeller.net/en/company/news/publications/index.jsp>. They can be downloaded or ordered free of charge.

The link <http://www.moeller.net/eaton-approbationen/en/index.jsp> shows the relevant approvals or permits for each component type. This therefore enables you to view the certificates provided or, depending on the test authority, also the product report. The information given is the same as what is provided in the databases of the authorities.

How to find the right contact:

At Eaton, an efficient customer relationship management is standard practice.

This guarantees you our support right from the start of any new project. Use these contact addresses to find your personal customer contact:

In just a few steps we can direct you to specialist local support specifically for your business sector.

Your customer contact in your region: Your customer contact worldwide:

→ <http://salesbonn.moeller.net>

→ www.eaton.eu/electrical/contact

Service and consulting for UPS systems and hydraulic solutions.

Further developing relations with our customers is particularly important to us. Your requirements and suggestions will be passed on promptly to the relevant specialists. After all, we take up the challenges you give us as if they were our own.

Are your questions about uninterruptible power supplies (USPs)?

Technical support

If you have any questions about our products and for technical advice send an email to our support team:

supportgermany@eaton.com

or contact our telephone hotline at

Tel.: +49 (0)7841 604 - 334

Service

If you have a problem or a fault on one of our products contact us by email:

servicegermany@eaton.com

or contact us by phone at:

Tel.: +49 (0)7841 604 - 334

We can be contacted here between Monday – Thursday from 08.00 – 17.00 CET and Friday from 08.00 – 16.00 CET.

Are your questions about hydraulic solutions?

Please contact the help desk of our Customer Service in Baden-Baden. This service will put you in touch with a customer contact in your locality.

Instructions

The rated motor currents apply to normal internally and surface-cooled three-phase motors with 1500 rpm.
For higher rated currents, starting currents and/or longer starting times, larger fuses will be required. Table applies for time delay and gL fuses (VDE 0636)
DOL starting: Starting current max. 6 × rated motor current.
Starting time max. 5 s.
Y/Δ-start: Starting current max. 2 × motor rated current.
Starting time max. 15 s.
Set overload relay in line to 0.58 × motor rated current.

For LV h.b.c. fuse with aM characteristics
the fuse should be equal to the rated operational current.

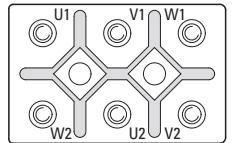

Drives engineering selection criteria

Each drive task requires a drive motor. The speed, torque and controllability of each motor must fulfill the requirements of the task. The following generally applies: the application determines the drive. The drive motor most frequently used worldwide in industrial plants and large buildings is the 3-phase asynchronous motor. Its robust and simple construction as well as its high degrees of protection and standard types are the main features of this inexpensive electric motor.

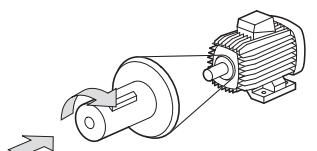

Motor connection

When connecting a 3-phase motor to the mains supply, the data on the rating plate of the motor must correspond to the mains voltage and frequency.

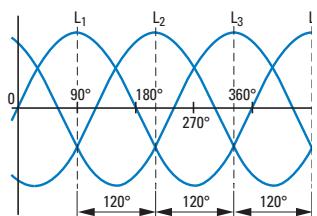

The standard connection is implemented via six screw terminals in the terminal box of the motor and with two types of circuit, the star connection and the delta circuit, depending on the mains voltage.

The rotation direction of a motor is always determined by directly looking at the drive shaft of the motor (from the drive end). On motors with two shaft ends, the driving end is denoted with D (= Drive), the non-driving end with N (= No drive).

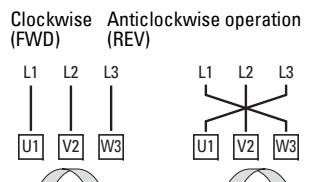

Regardless of the circuit type and the type of three-phase asynchronous motor, the connections must be labeled, so that their alphabetical sequence (e.g. U1, V1, W1) corresponds with the order of the mains voltage phase sequence (L1, L2, L3) and causes the motor to rotate clockwise.

On the three-phase asynchronous motor, three windings are arranged offset from each other by $120^\circ/p$ (p = number of pole pairs). To generate a rotating field in the motor, an alternating voltage is applied to each phase in turn at a time delay of 120° .

The effect of inductance causes the rotation field and torque to be formed in the rotor winding. The speed of the motor thus depends on the number of pole pairs and the frequency of the supply voltage. The operating direction can be reversed by swapping over two of the supply phases.

FWD = forward run (clockwise rotation field)
REV = reverse run (anticlockwise rotation field)

Information on the rating plate

The electrical and mechanical rating data of the motor must be stated on its rating plate (IEC 34-1, VDE 0530). The data on the rating plate describes the stationary operation of the motor in the area of its operating point (MN, e.g. at 400 V and 50 Hz). The operational data is unstable in the motor start phase. The following examples show the rating plates for two motors with a motor shaft output of 4 kW and the respective connection circuits on a 3-phase AC network with 400 V and 50 Hz.

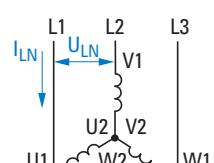

Star circuit

230 / 400 V	Δ / γ	14.5 / 8.5 A
S1	4.0 kW	$\cos \varphi 0.82$
	1410 min ⁻¹	50 Hz
	IP 54	Iso. Kl F

Delta circuit

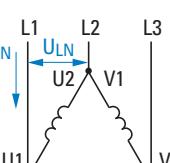

400 / 690 V	Δ / γ	8.5 / 4.9 A
S1	4.0 kW	$\cos \varphi 0.82$
	1410 min ⁻¹	50 Hz
	IP 54	Iso. Kl F

Clockwise Anticlockwise operation (FWD) (REV)

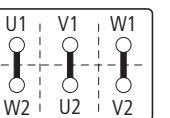

FWD = forward run (clockwise rotation field)
REV = reverse run (anticlockwise rotation field)

Information on the rating plate

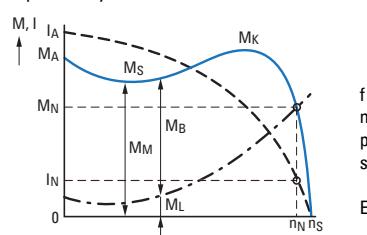

$$U_{LN} = \sqrt{3} \times U_W \cdot I_{LN} = I_W$$

- With the specified 230/400 V voltage, this motor must be connected to the 3-phase system ($U_{LN} = 400$ V) in a star-connected circuit.
- The voltage of each motor winding is designed for 230 V. The windings must therefore be connected in sequence to the phase voltage (400 V).
- The three winding phases (W2-U2-V2) are configured in the terminal box to the so-called star point. The voltage of the individual phases to the star point is 230 V (= U_W).

Startup characteristics

The following figure shows the characteristic startup curves of a 3-phase asynchronous motor.

$$s = \frac{n_s - n}{n_s} \cdot 100\%$$

3-phase asynchronous motor speed:

$$n = \frac{f}{p} \cdot (1 - s)$$

f: Frequency of voltage in Hz (= s⁻¹)

n: Speed in r.p.m.

p: Number of pole pairs

s: Slip speed in r.p.m.

Electric power:

$$P_1 = U \times I \times \sqrt{3} \times \cos \varphi$$

P₁: Electrical power in W

U: Rated operating voltage in V

I: Rated operational current in A

$\cos \varphi$: Power factor

Motor output (power equation):

$$P_2 = \frac{M_N \times n}{9550}$$

P₂: Mechanical shaft output power in kW

M_N: Rated torque in Nm

n: Speed in r.p.m.

Efficiency:

$$\eta = \frac{P_2}{P_1}$$

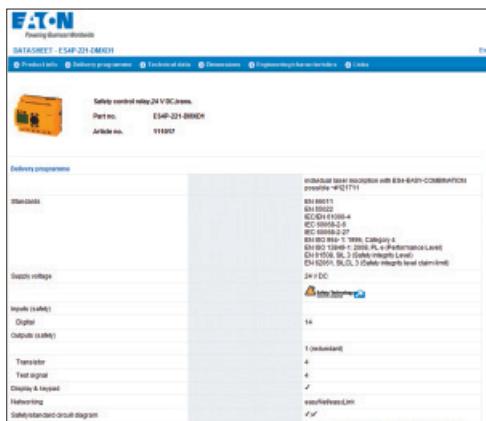

Slip speed in %:

Eaton Online Catalog – find product details quickly and efficiently!

You can find comprehensive up-to-date product information at <http://ecat.moeller.net>

Lookup

You can search by keywords, product names, article numbers, technical data: The search understands everything and takes you straight to the product you're looking for.

Graphical navigation

Graphical representation of the fields of application and product groups.

Selection aids

Tailored to the typical expert's approach, this search aid helps you quickly find the product you need.

Data sheets

For every article the catalog can generate a technical data sheet, which you can convert to a PDF file for printing or saving with a single click.

Parts lists

From your search results you can create a parts list that you can then send to your Eaton sales partner as a query.

Item	Qty.	Photo	Article no.	Part no.	Short Text
1	1		111917	E54P-221-000D1	Safety control relay, 24 V DC, trans.
2	1		229758	FAK-COMBINATION-*	Complete unit
3	1		284831	HZ225-DOLM-GR-X10/N	Double act. latching, fail-off-button ext.
4	1		280098	DLM15-01	Contactor, 7.5kW/140VAC-operated
5	1		138516	PNE65XKTU-05	PNE65 + trip block Standard 5-65A

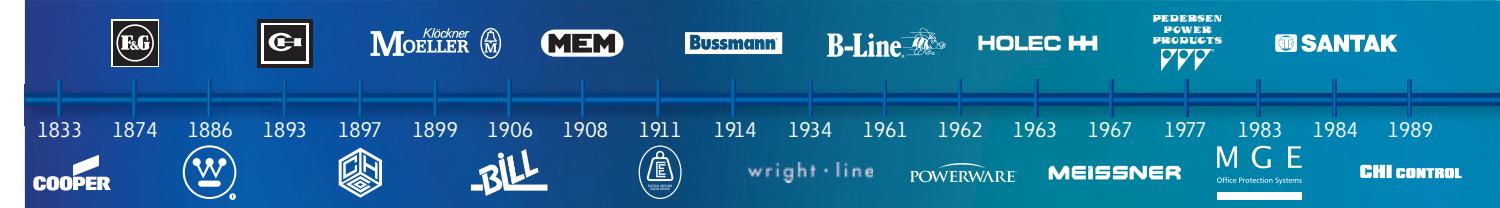

Parts list, e.g. for queries to Eaton Sales.

You can find comprehensive up-to-date information about Eaton's automation products and switchgear in our Online Catalog.

A large, circular graphic on a blue background. In the center is the Eaton logo with the tagline 'Powering Business Worldwide'. Surrounding the center are several other company logos, including Cutler-Hammer, Cooper, Bussmann, Powerware, Bill, MGE Office Protection Systems, Westinghouse, Santak, Holec, Moeller, Crouse-Hinds, Mem, and B-Line. The background has a subtle radial blur effect.

The power of fusion.

There's a certain energy at Eaton. It's the power of uniting some of the world's most respected names to build a brand you can trust to meet your every power management need.

Eaton is dedicated to ensuring that reliable, efficient and safe power is available when it's needed most. Building on over 100 years of experience in electrical power management, the experts at Eaton deliver customized, integrated solutions to solve your most critical challenges. To learn more visit www.eaton.eu/electrical.
