Espressif Systems

Product Overview

ESP32-S3 is a low-power MCU-based system-on-chip (SoC) that supports 2.4 GHz Wi-Fi and Bluetooth® Low Energy (Bluetooth LE). It consists of high-performance dual-core microprocessor (Xtensa® 32-bit LX7), a low power coprocessor, a Wi-Fi baseband, a Bluetooth LE baseband, RF module, and peripherals. The block diagram of the SoC is shown below.

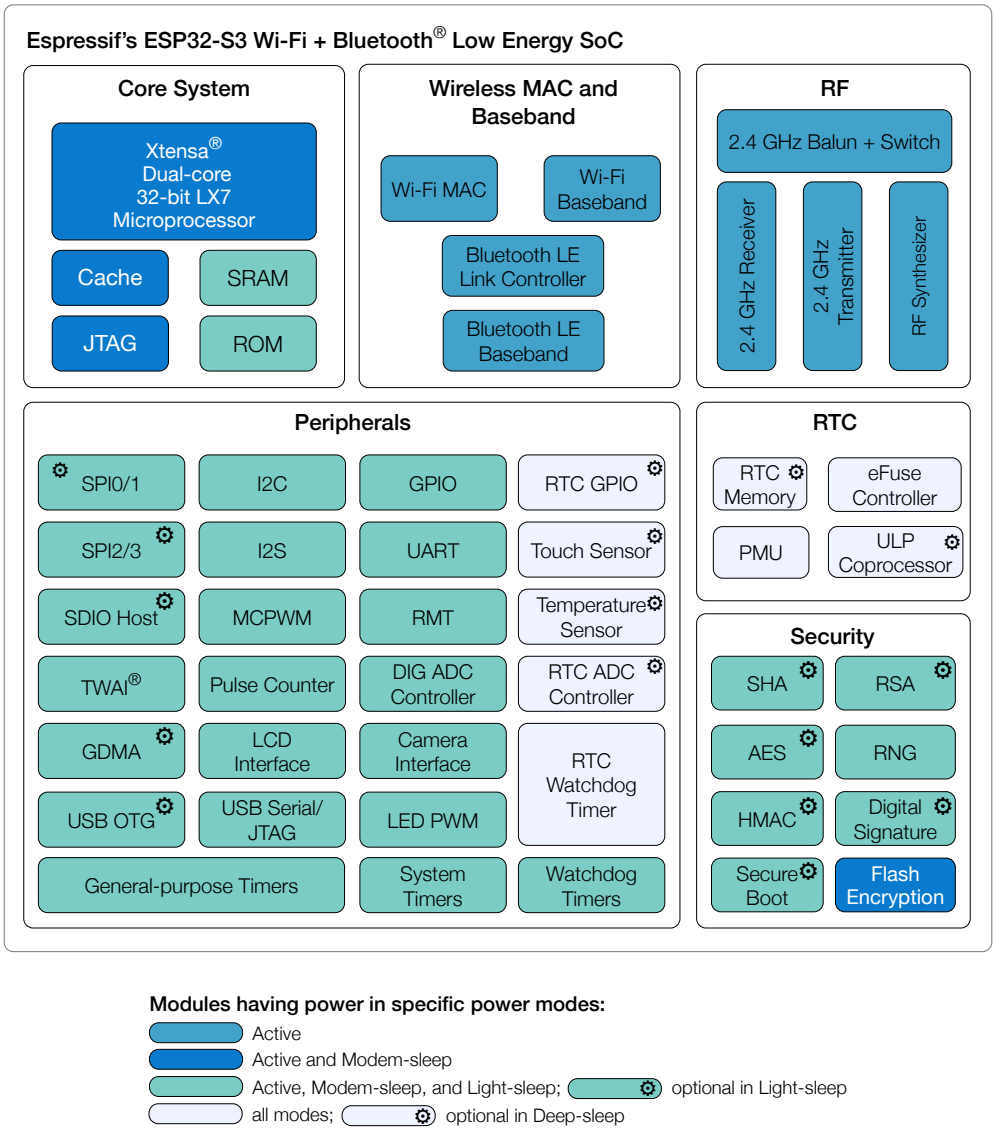

Figure 1: Block Diagram of ESP32-S3

Solution Highlights

- **A complete Wi-Fi subsystem** that complies with IEEE 802.11b/g/n protocol and supports Station, SoftAP, and SoftAP + Station modes
- **A Bluetooth LE subsystem** that supports features of Bluetooth 5 and Bluetooth mesh
- **Xtensa® 32-bit LX7 dual-core processor** with a five-stage pipeline that operates at up to 240 MHz
  - A 128-bit data bus and dedicated SIMD instructions to provide high computing

performance
    - Efficient L1 cache to improve execution of external memory
    - Single-precision floating-point unit (FPU) to accelerate computing
- **Highly-integrated RF module** that provides industry-leading power and RF performance
- **State-of-the-art power management** designed for a wide range of applications with its multiple low-power modes. The ULP coprocessor can operate in ultra-low-power mode.
- **Powerful storage capacities** ensured by 512 KB SRAM and 384 KB ROM on the chip, and SPI, Dual SPI, Quad SPI, Octal SPI, QPI, and OPI interfaces that allow connection to flash and external RAM
- **Reliable security features** ensured by
    - Cryptographic hardware accelerators that support AES-128/256, Hash, RSA, HMAC, digital signature, and secure boot
    - Random number generator
    - Permission control on accessing internal and external memory
    - External memory encryption and decryption
- **Rich set of peripheral interfaces and GPIOs,** ideal for various scenarios and complex applications

Features

Wi-Fi

- IEEE 802.11 b/g/n-compliant
- Supports 20 MHz, 40 MHz bandwidth in 2.4 GHz band
- 1T1R mode with data rate up to 150 Mbps
- Wi-Fi Multimedia (WMM)
- TX/RX A-MPDU, TX/RX A-MSDU
- Immediate Block ACK
- Fragmentation and defragmentation
- Automatic Beacon monitoring (hardware TSF)
- 4 × virtual Wi-Fi interfaces
- Simultaneous support for Infrastructure BSS in Station, SoftAP, or Station + SoftAP modes
  Note that when ESP32-S3 scans in Station mode, the SoftAP channel will change along with the Station channel
- Antenna diversity
- 802.11mc FTM
- External PA is supported

Bluetooth

- Bluetooth LE: Bluetooth 5, Bluetooth mesh
- High power mode (20 dBm, share the same PA with Wi-Fi)
- Speed: 125 Kbps, 500 Kbps, 1 Mbps, 2 Mbps
- Advertising extensions
- Multiple advertisement sets
- Channel selection algorithm #2
- Internal co-existence mechanism between Wi-Fi and Bluetooth to share the same antenna

CPU and Memory

- Xtensa® dual-core 32-bit LX7 microprocessor, up to 240 MHz
- CoreMark® score:
    - 1 core at 240 MHz: 613.86 CoreMark; 2.56 CoreMark/MHz
    - 2 cores at 240 MHz: 1181.60 CoreMark; 4.92 CoreMark/MHz
- 128-bit data bus and SIMD commands
- 384 KB ROM
- 512 KB SRAM
- 16 KB SRAM in RTC
- SPI, Dual SPI, Quad SPI, Octal SPI, QPI and OPI

interfaces that allow connection to multiple flash and external RAM

- Flash controller with cache is supported
- Flash in-Circuit Programming (ICP) is supported

Advanced Peripheral Interfaces

- 45 × programmable GPIOs
- Digital interfaces:
  - 4 × SPI
  - 1 × LCD interface (8-bit ~16-bit parallel RGB, I8080 and MOTO6800), supporting conversion between RGB565, YUV422, YUV420 and YUV411
  - 1 × DVP 8-bit ~16-bit camera interface
  - 3 × UART
  - 2 × I2C
  - 2 × I2S
  - 1 × RMT (TX/RX)
  - 1 × pulse counter
  - LED PWM controller, up to 8 channels
  - 1 × full-speed USB OTG
  - 1 × USB Serial/JTAG controller
  - 2 × MCPWM
  - 1 × SDIO host controller with 2 slots
  - General DMA controller (GDMA), with 5 transmit channels and 5 receive channels
  - 1 × TWAI® controller, compatible with ISO 11898-1 (CAN Specification 2.0)
- Analog interfaces:
  - 2 × 12-bit SAR ADCs, up to 20 channels
  - 1 × temperature sensor
  - 14 × touch sensing IOs
- Timers:
  - 4 × 54-bit general-purpose timers
  - 1 × 52-bit system timer
  - 3 × watchdog timers

Low Power Management

- Power Management Unit with five power modes
- Ultra-Low-Power (ULP) coprocessors:
  - ULP-RISC-V coprocessor
  - ULP-FSM coprocessor

Security

- Secure boot
- Flash encryption
- 4-Kbit OTP, up to 1792 bits for users
- Cryptographic hardware acceleration:
  - AES-128/256 (FIPS PUB 197)
  - Hash (FIPS PUB 180-4)
  - RSA
  - Random Number Generator (RNG)
  - HMAC
  - Digital signature

Applications (A Non-exhaustive List)

With low power consumption, ESP32-S3 is an ideal choice for IoT devices in the following areas:

- Smart Home
  - Light control
  - Smart button
  - Smart plug
- Industrial Automation
  - Industrial robot
  - Mesh network
  - Human machine interface (HMI)
- Health Care
  - Health monitor

  - Baby monitor
- Consumer Electronics
  - Smart watch and bracelet
  - Over-the-top (OTT) devices
  - Wi-Fi and bluetooth speaker
  - Logger toys and proximity sensing toys
- Smart Agriculture
  - Smart greenhouse
  - Smart irrigation
  - Agriculture robot
- Retail and Catering
  - POS machines
  - Service robot
- Audio Device
  - Internet music players
  - Live streaming devices
  - Internet radio players
- Generic Low-power IoT Sensor Hubs
- Generic Low-power IoT Data Loggers
- Cameras for Video Streaming
- USB Devices
- Speech Recognition
- Image Recognition
- Wi-Fi + Bluetooth Networking Card
- Touch Sensing
  - Waterproof design
  - Distance sensing applications
  - Linear slider, wheel slider designs

Note:
ESP32-S3 Touch Sensor has not passed the Conducted Susceptibility (CS) test for now, and thus has limited application scenarios.

[2] Pin functions in bold font are the default pin functions in SPI Boot mode. For pins No.38 ∼ 42, the default function is d

[3] Power supply for GPIO33, GPIO34, GPIO35, GPIO36 and GPIO37 is configurable to be either VDD3P3_CPU (default)

[4] The pin function in this table refers only to some fixed settings and do not cover all cases for signals that can be inpu more information on the GPIO matrix, please refer to *ESP32-S3 Technical Reference Manual*.

2.3 Pin Name Description

The explanation of each pin name is briefly described below.

Table 3: Pin Name Description

Pin Name	Description
GPIOx	General-purpose input and output (x is GPIO number). GPIO pins can be assigned various functions, including digital and analog functions. For more information on digital functions, please refer to Table 5.
SPIx	SiP flash/PSRAM and external flash/RAM interface (x is CLK, CS0, CS1, D, Q, WP, HD, IO4~7 or DQS).
XTAL_32K_P/N	32 KHz external clock input/output (connecting to ESP32-S3's oscillator). P/N means differential clock positive/negative.
XTAL_P/N	External clock input/output (connecting to ESP32-S3's oscillator). P/N means differential clock positive/negative.
U0RXD/U0TXD	UART0 receive/transmit signals.
MTCK/MTDO/MTDI/MTMS	JTAG interface signals.
LNA_IN	Low-Noise Amplifier (RF LNA) input/output signals.
CHIP_PU	Chip power up pin.
GND	External ground connection.
VDDA	Power supply for analog domain.
VDD3P3_RTC	Power supply for RTC digital domain.
VDD3P3_CPU	Power supply for digital domain.
VDD_SPI	Power supply for SPI IOs.

2.4 Function Name Description

The explanation of each function name is briefly described below.

Table 4: Function Name Description

Function Name	Description
RTC_GPIOx	RTC domain GPIO function for low power management.
TOUCHx	Analog function for touch sensing.
ADCx_CHy	Analog to digital conversion channel (x is ADC number, y is channel number).
SUBSPIx	Sub-SPI0/1 bus, differing from SPIx bus (x is CLK, CS0, CS1, D, Q, WP or HD), used for different voltage level of flash and PSRAM
FSPIx	8-line Fast-SPI2 bus function (x is CLK, CS0, CS1, D, Q, WP, HD, IO4~7 or DQS)
SPIx	SPI0/1 bus function (x is CLK, CS0, CS1, D, Q, WP, HD, IO4~7 or DQS)
UxRTS/UxCTS	UARTx hardware flow control signals (x is UART number).
U1RXD/U1TXD	UART1 receive/transmit signals.
CLK_OUTx	Clock output for debug (x is clock number).
USB_D-/USB_D+	USB OTG and USB Serial/JTAG function. USB signal is a differential signal transmitted over a pair of D+ and D- wires.
SPICLK_N/P_DIFF	Serial peripheral interface differential clock negative/positive.

2.5 GPIO Functions

ESP32-S3 has 45 GPIO pins (numbering 22-25 is not used) which can be assigned various functions as listed in Table 5. T
(F0-F4). RTC functions and analog functions can be found in Table 2.

Type

Each digital function (F*n*, *n*=0~4) is associated with a "Type". The description of "Type" is as follows:

- O: Output only.
- O/T: The signal can be output or high-impedance.
- I/O/T: The signal can be input, output, and high-impedance.
- I1: Input only. If the pin is assigned a function other than F*n*, the input signal of F*n* is always "1".
- I1/O/T: The signal can be input, output, and high-impedance. If F*n* is not selected, the input signal of F*n* is always "1".
- I0/O/T: The signal can be input, output, and high-impedance. If F*n* is not selected, the input signal of F*n* is always "0".

At Reset/After Reset

The default configuration of each pin at reset and after reset:

- **IE0** - input disabled
- **IE1** - input enabled
- **IE1, WPD1** - input enabled, internal weak pull-down resistor enabled
- **IE1, WPU1** - input enabled, internal weak pull-up resistor enabled
- **IE1, or IE1&WPU1** - When the value of eFuse bit EFUSE_DIS_PAD_JTAG is
  1, the MTCK pin floats after chip reset (IE1)
  0, the MTCK pin connects to internal weak pull-up resistor after chip reset (IE1&WPU1)

Notes

- **R** - These pins have RTC or analog functions.

Drive Strength

- The default drive strength of GPIO19 ~ 20 is 2'd3 (~40 mA).
- The default drive strength of other pins is 2'd2 (~20 mA).

2.6 Pin-to-Pin Mapping Between Chip and SiP Flash/PSRAM

Table 6 lists the pin-to-pin mapping between the chip and the SiP flash/PSRAM. The chip pins listed here are not recommended for other usage. For the data port connection between ESP32-S3 and external flash please refer to Section 3.5.2.

2.7 Power Scheme

ESP32-S3 has four input power pins:

- VDDA1
- VDDA2
- VDD3P3_RTC
- VDD3P3_CPU

And one input/output power pin:

- VDD_SPI

VDDA1 and VDDA2 are the input power supply for the analog domain.

VDD_SPI can be an input power supply or output power supply. It can be powered by Flash Voltage Regulator (nominal 1.8 V) or by VDD3P3_RTC via R_{SPI} (nominal 3.3 V). As the SiP flash/PSRAM in ESP32-S3FN8, ESP32-S3R2, and ESP32-S3R8 operates at 3.3 V, VDD_SPI must be powered by VDD3P3_RTC via R_{SPI}. Software can power off VDD_SPI to minimize current leakage of flash in Deep-sleep mode.

VDD3P3_RTC is the input power supply for Low Power Voltage Regulator that powers the RTC domain.

VDD3P3_CPU and VDD3P3_RTC power Digital System Voltage Regulator at the same time that further powers the Digital System domain.

VDD3P3_RTC is the input power supply for RTC IO.

VDD3P3_CPU is the input power supply for Digital IO.

VDD_SPI is the input power supply for SPI IO.

Either VDD_SPI or VDD3P3_CPU can be selected as the input power supply for SPI/Digital IO.

The power scheme diagram is shown in Figure 4.

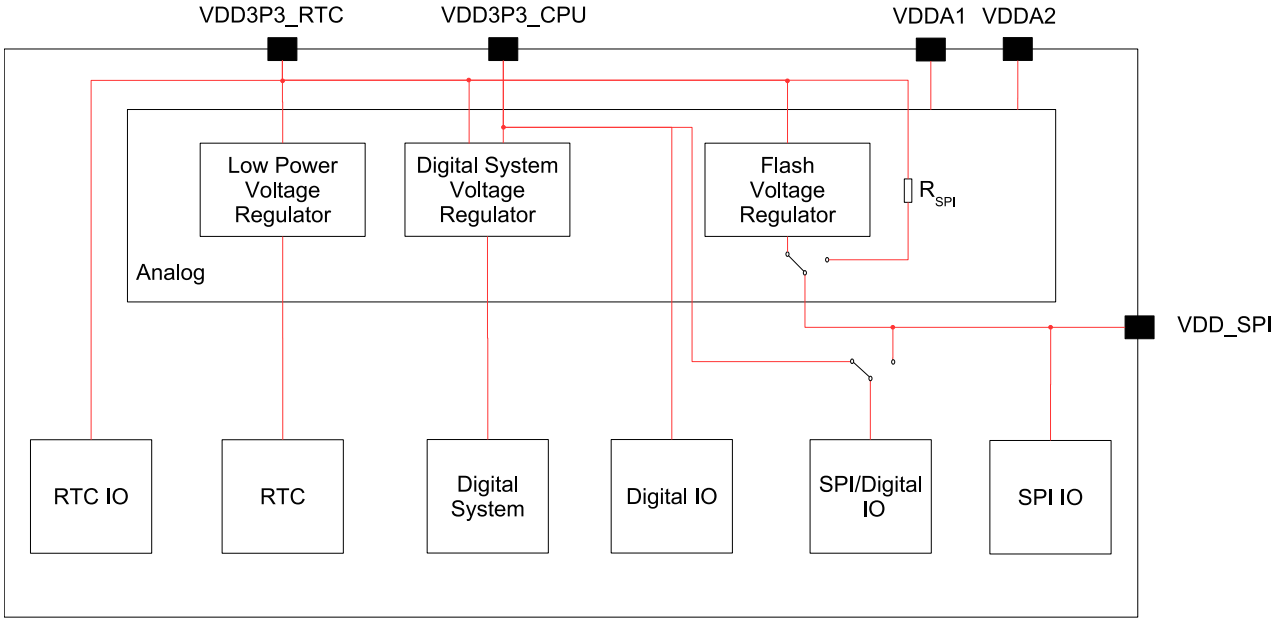

Figure 4: ESP32-S3 Power Scheme

Notes on CHIP_PU:

Figure 5 shows the power-up and reset timing of ESP32-S3 series. Details about the parameters are listed in Table 7.

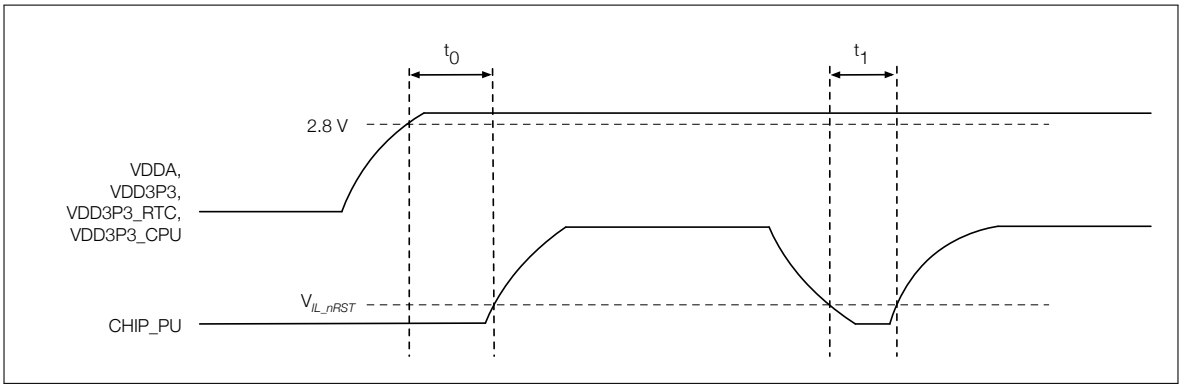

Figure 5: ESP32-S3 Power-up and Reset Timing

Table 7: Description of ESP32-S3 Power-up and Reset Timing Parameters

Parameter	Description	Min (μs)
t_0	Time between bringing up the VDDA, VDD3P3, VDD3P3_RTC, and VDD3P3_CPU rails, and activating CHIP_PU	50
t_1	Duration of CHIP_PU signal level < V_{IL_nRST} (refer to its value in Table 17) to reset the chip	50

2.8 Strapping Pins

ESP32-S3 has four strapping pins:

- GPIO0
- GPIO45
- GPIO46
- GPIO3

Software can read the values of corresponding bits from register “GPIO_STRAPPING”.

During the chip’s system reset (power-on-reset, RTC watchdog reset, brownout reset, analog super watchdog reset, and crystal clock glitch detection reset), the latches of the strapping pins sample the voltage level as strapping bits of “0” or “1”, and hold these bits until the chip is powered down or shut down.

GPIO0, GPIO45 and GPIO46 are connected to the chip’s internal weak pull-up/pull-down during the chip reset. Consequently, if they are unconnected or the connected external circuit is high-impedance, the internal weak pull-up/pull-down will determine the default input level of these strapping pins.

GPIO3 is floating by default. Its strapping value can be configured to determine the source of the JTAG signal inside the CPU, as shown in Table 9. In this case, the strapping value is controlled by the external circuit that cannot be in a high impedance state. Table 8 shows more configuration combinations of EFUSE_DIS_USB_JTAG, EFUSE_DIS_PAD_JTAG, and EFUSE_STRAP_JTAG_SEL that determine the JTAG signal source.

Table 8: JTAG Signal Source Selection

EFUSE_STRAP_JTAG_SEL	EFUSE_DIS_USB_JTAG	EFUSE_DIS_PAD_JTAG	JTAG Signal Source
1	0	0	Refer to Table 9
0	0	0	USB Serial/JTAG controller
don’t care	0	1	USB Serial/JTAG controller
don’t care	1	0	On-chip JTAG pins
don’t care	1	1	N/A

To change the strapping bit values, users can apply the external pull-down/pull-up resistances, or use the host MCU’s GPIOs to control the voltage level of these pins when powering on ESP32-S3.

After reset, the strapping pins work as normal-function pins.

Refer to Table 9 for a detailed configuration of the strapping pins.

GPIO3	N/A	0: JTAG signal from on-chip JTAG pins 1: JTAG signal from USB Serial/JTAG controller

Note:

1. The strapping combination of GPIO46 = 1 and GPIO0 = 0 is invalid and will trigger unexpected behavior.
2. ROM boot messages can be printed over U0TXD (by default) or GPIO17 (U1TXD), depending on the eFuse bit EFUSE_UART_PRINT_CHANNEL.
3. When both EFUSE_DIS_USB_SERIAL_JTAG and EFUSE_DIS_USB_OTG are 0, ROM boot messages will be printed to the USB Serial/JTAG controller. Otherwise, the messages will be printed to UART, controlled by GPIO46 and EFUSE_UART_PRINT_CONTROL. Specifically, when EFUSE_UART_PRINT_CONTROL value is:
   0, print is normal during boot and not controlled by GPIO46.
   1 and GPIO46 is 0, print is normal during boot; but if GPIO46 is 1, print is disabled.
   2 and GPIO46 is 0, print is disabled; but if GPIO46 is 1, print is normal.
   3, print is disabled and not controlled by GPIO46.

VDD_SPI voltage is determined either by the strapping value of GPIO45 or by EFUSE_VDD_SPI_TIEH. When EFUSE_VDD_SPI_FORCE is 0, VDD_SPI voltage is determined by the strapping value of GPIO45; when EFUSE_VDD_SPI_FORCE is 1, VDD_SPI voltage is determined by EFUSE_VDD_SPI_TIEH. Please refer to the following table for default configurations:

Table 10: The Default Value for VDD_SPI Voltage

Chip Variant	EFUSE_VDD_SPI_FORCE	EFUSE_VDD_SPI_TIEH	VDD_SPI Voltage
ESP32-S3	0	0	Determined by GPIO45
ESP32-S3R2	1	1	Force to 3.3 V
ESP32-S3R8	1	1	Force to 3.3 V

3. Functional Description

This chapter describes the functional modules of ESP32-S3.

3.1 CPU and Memory

3.1.1 CPU

ESP32-S3 has a low-power Xtensa® dual-core 32-bit LX7 microprocessor with the following features:

- Five-stage pipeline that supports the clock frequency of up to 240 MHz
- 16-bit/24-bit instruction set providing high code density
- 32-bit customized instruction set and 128-bit data bus that provide high computing performance
- Support for single-precision floating-point unit (FPU)
- 32-bit multiplier and 32-bit divider
- Unbuffered GPIO instructions
- 32 interrupts at six levels
- Windowed ABI with 64 physical general registers
- Trace function with TRAX compressor, up to 16 KB trace memory
- JTAG for debugging

3.1.2 Internal Memory

ESP32-S3's internal memory includes:

- **384 KB ROM**: for booting and core functions
- **512 KB on-chip SRAM**: for data and instructions, running at a configurable frequency of up to 240 MHz
- **RTC FAST memory**: 8 KB SRAM that supports read/write/instruction fetch by the main CPU (LX7 dual-core processor). It can retain data in Deep-sleep mode
- **RTC SLOW Memory**: 8 KB SRAM that supports read/write/instruction fetch by the main CPU (LX7 dual-core processor) or coprocessors. It can retain data in Deep-sleep mode
- **4 Kbit eFuse**: 1792 bits are reserved for user data, such as encryption key and device ID
- **SiP flash and PSRAM**: See details in Table 1 *Comparison*

3.1.3 External Flash and RAM

ESP32-S3 supports SPI, Dual SPI, Quad SPI, Octal SPI, QPI and OPI interfaces that allow connection to multiple external flash and RAM.

The external flash and RAM can be mapped into the CPU instruction memory space and read-only data memory space. The external RAM can also be mapped into the CPU data memory space. ESP32-S3 supports up to 1 GB of external flash and RAM, and hardware encryption/decryption based on XTS-AES to protect users' programs and data in flash and external RAM.

Through high-speed caches, ESP32-S3 can support at a time up to:

- External flash or RAM mapped into 32 MB instruction space as individual blocks of 64 KB

- External RAM mapped into 32 MB data space as individual blocks of 64 KB. 8-bit, 16-bit, 32-bit, and 128-bit reads and writes are supported. External flash can also be mapped into 32 MB data space as individual blocks of 64 KB, but only supporting 8-bit, 16-bit, 32-bit and 128-bit reads.

Note:
After ESP32-S3 is initialized, firmware can customize the mapping of external RAM or flash into the CPU address space.

3.1.4 Address Mapping Structure

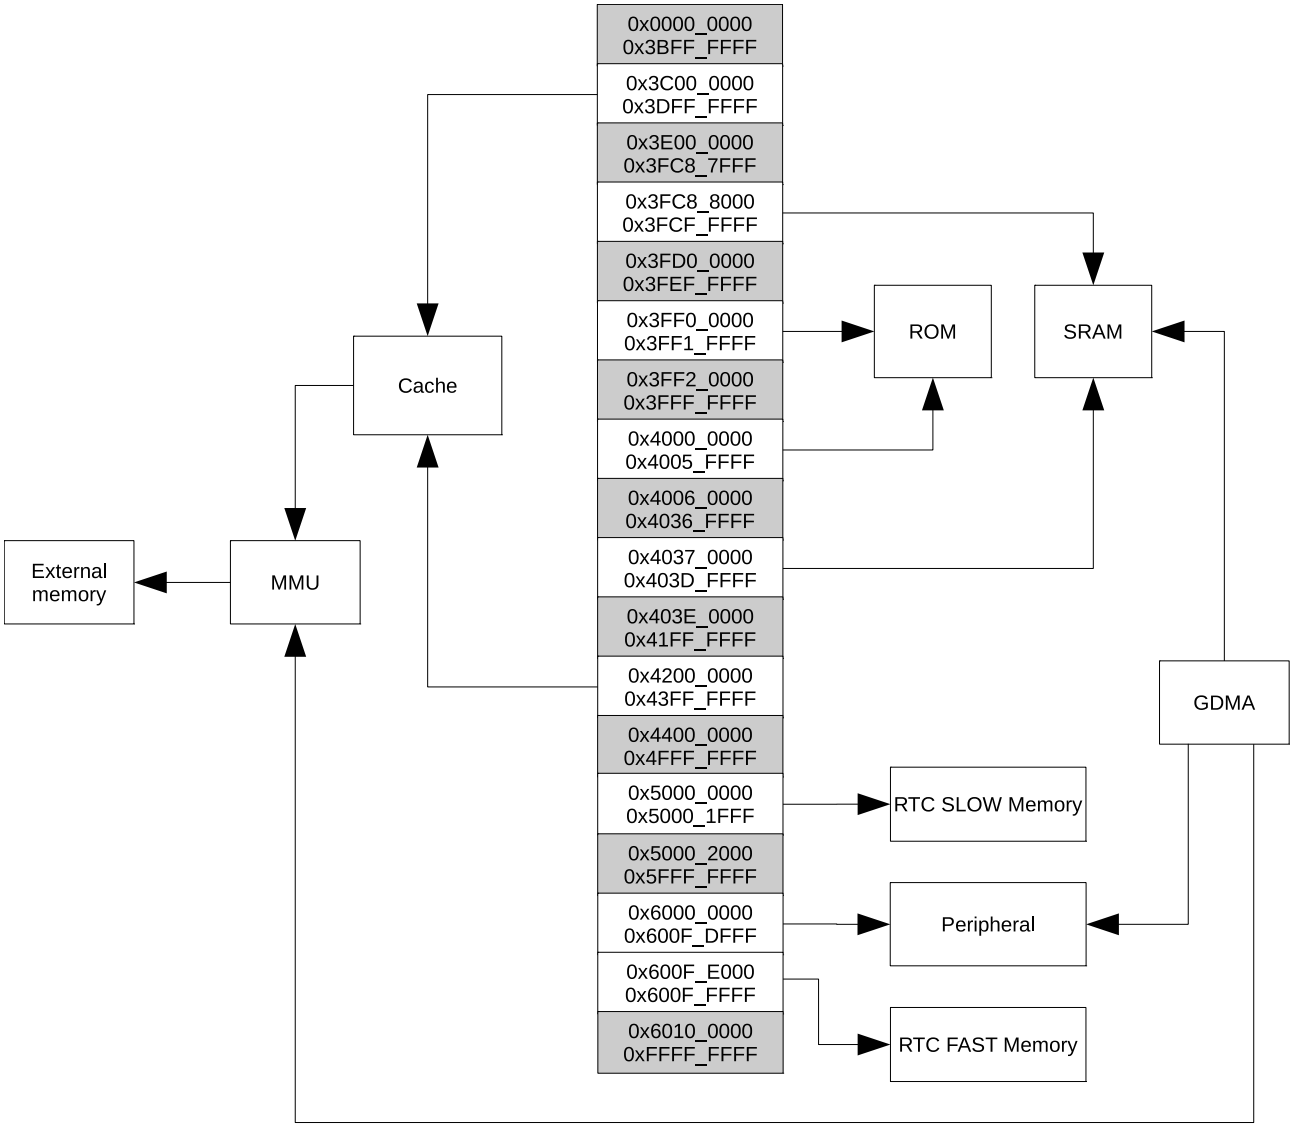

Figure 7: Address Mapping Structure

Note:
The memory space with gray background is not available to users.

3.1.5 Cache

ESP32-S3 has an instruction cache and a data cache shared by the two CPU cores. Each cache can be partitioned into multiple banks and has the following features:

- Instruction cache: 16 KB (one bank) or 32 KB (two banks)
  Data cache: 32 KB (one bank) or 64 KB (two banks)
- Instruction cache: four-way or eight-way set associative
  Data cache: four-way set associative
- Block size of 16 bytes or 32 bytes for both instruction cache and data cache
- Pre-load function
- Lock function
- Critical word first and early restart

3.1.6 eFuse Controller

ESP32-S3 contains a 4-Kbit eFuse to store parameters, which are burned and read by an eFuse Controller. The eFuse Controller has the following features:

- 4 Kbits in total, with 1792 bits reserved for users, e.g., encryption key and device ID
- One-time programmable storage
- Configurable write protection
- Configurable read protection
- Various hardware encoding schemes to protect against data corruption

For detailed information, please refer to Chapter eFuse Controller in *ESP32-S3 Technical Reference Manual*.

3.1.7 Processor Instruction Extensions

The ESP32-S3 contains a series of new extended instruction set in order to improve the operation efficiency of specific AI and DSP (Digital Signal Processing) algorithms. The Processor Instruction Extensions (PIE) has the following features:

- 128-bit new general-purpose registers
- 128-bit vector operations, e.g., complex multiplication, addition, subtraction, multiplication, shifting, comparison, etc
- Data handling instructions and load/store operation instructions combined
- Non-aligned 128-bit vector data
- Saturation operation

3.2 RTC and Low-Power Management

3.2.1 Power Management Unit (PMU)

With the use of advanced power-management technologies, ESP32-S3 can switch between different power modes.

- **Active mode**: CPU and chip radio are powered on. The chip can receive, transmit, or listen.
- **Modem-sleep mode**: The CPU is operational and the clock speed can be reduced. The wireless baseband and radio are disabled, but wireless connection can remain active.

- **Light-sleep mode**: The CPU is paused. The RTC peripherals, as well as the ULP coprocessor can be woken up periodically by the timer. Any wake-up events (MAC, host, RTC timer, or external interrupts) will wake up the chip. Wireless connection can remain active. Users can optionally decide what peripherals to shut down/keep on (refer to Figure 1), for power-saving purpose.
- **Deep-sleep mode**: CPU and most peripherals are powered down. Only the RTC memory is powered on and RTC peripherals are optional. Wi-Fi connection data are stored in the RTC memory. The ULP coprocessor is functional.

For power consumption in different power modes, please refer to Table 21.

3.2.2 Ultra-Low-Power Coprocessor

The ULP coprocessor is designed as a simplified, low-power replacement of CPU in sleep modes. It can be also used to supplement the functions of the CPU in normal working mode. The ULP coprocessor and RTC memory remain powered on during the Deep-sleep mode. Hence, the developer can store a program for the ULP coprocessor in the RTC slow memory to access RTC GPIO, RTC peripheral devices, RTC timers and internal sensors in Deep-sleep mode.

ESP32-S3 has two ULP coprocessors, one based on RISC-V instruction set architecture (ULP-RISC-V) and the other on finite state machine (ULP-FSM). The clock of the coprocessors is the internal fast RC oscillator.

ULP-RISC-V has the following features:

- Support for RV32IMC instruction set
- Thirty-two 32-bit general-purpose registers
- 32-bit multiplier and divider
- Support for interrupts
- Booted by the CPU, its dedicated timer, or RTC GPIO

ULP-FSM has the following features:

- Support for common instructions including arithmetic, jump, and program control instructions
- Support for on-board sensor measurement instructions
- Booted by the CPU, its dedicated timer, or RTC GPIO

Note that these two coprocessors cannot work simultaneously.

3.3 Analog Peripherals

3.3.1 Analog-to-Digital Converter (ADC)

ESP32-S3 integrates two 12-bit SAR ADCs and supports measurements on 20 channels (analog-enabled pins). For power-saving purpose, the ULP coprocessors in ESP32-S3 can also be used to measure voltage in sleep modes. By using threshold settings or other methods, we can awaken the CPU from sleep modes.

3.3.2 Temperature Sensor

The temperature sensor generates a voltage that varies with temperature. The voltage is internally converted via an ADC into a digital value.

The temperature sensor has a range of –20 °C to 110 °C. It is designed primarily to sense the temperature changes inside the chip. The temperature value depends on factors such as microcontroller clock frequency or I/O load. Generally, the chip's internal temperature is higher than the ambient temperature.

3.3.3 Touch Sensor

ESP32-S3 has 14 capacitive-sensing GPIOs, which detect variations induced by touching or approaching the GPIOs with a finger or other objects. The low-noise nature of the design and the high sensitivity of the circuit allow relatively small pads to be used. Arrays of pads can also be used, so that a larger area or more points can be detected. The touch sensing performance can be further enhanced by the waterproof design and digital filtering feature.

3.4 System Components

3.4.1 Reset and Clock

ESP32-S3 provides four reset levels, namely CPU Reset, Core Reset, System Reset, and Chip Reset.

- Support four reset levels:
  - CPU Reset: only resets CPU*x* core. CPU*x* can be CPU0 or CPU1 here. Once such reset is released, programs will be executed from CPU*x* reset vector. Each CPU core has its own reset logic. If CPU Reset is from CPU0, the sensitive registers will be reset, too.
  - Core Reset: resets the whole digital system except RTC, including CPU0, CPU1, peripherals, Wi-Fi, Bluetooth® LE (BLE), and digital GPIOs.
  - System Reset: resets the whole digital system, including RTC.
  - Chip Reset: resets the whole chip.
- Support software reset and hardware reset:
  - Software reset is triggered by CPU*x* configuring its corresponding registers.
  - Hardware reset is directly triggered by the circuit.

For detailed information, please refer to Chapter Reset and Clock in *ESP32-S3 Technical Reference Manual*.

3.4.2 Interrupt Matrix

The interrupt matrix embedded in ESP32-S3 independently allocates peripheral interrupt sources to the two CPUs' peripheral interrupts, to timely inform CPU0 or CPU1 to process the interrupts once the interrupt signals are generated. The Interrupt Matrix has the following features:

- 99 peripheral interrupt sources as input
- Generate 26 peripheral interrupts to CPU0 and 26 peripheral interrupts to CPU1 as output. Note that the remaining six CPU0 interrupts and six CPU1 interrupts are internal interrupts.
- Disable CPU non-maskable interrupt (NMI) sources
- Query current interrupt status of peripheral interrupt sources

For detailed information, please refer to Chapter Interrupt Matrix (INTERRUPT) in *ESP32-S3 Technical Reference Manual*.

3.4.3 Permission Control

In ESP32-S3, the Permission Control module is used to control access to the slaves (including internal memory, peripherals, external flash and RAM). The host can access its slave only if it has the right permission. In this way, data and instructions are protected from illegitimate read or write.

The ESP32-S3 CPU can run in both Secure World and Non-secure World where independent permission controls are adopted. The Permission Control module is able to identify which World the host is running and then proceed with its normal operations.

The Permission Control module has the following features:

- Manage access to internal memory by:
  - CPU
  - CPU trace module
  - GDMA
- Manage access to external flash and RAM by:
  - MMU
  - SPI1
  - GDMA
  - CPU through Cache
- Manage access to peripherals, supporting
  - independent permission control for each peripheral
  - monitoring non-aligned access
  - access control for customized address range
- Integrate permission lock register
  - All permission registers can be locked with the permission lock register. Once locked, the permission register and the lock register cannot be modified, unless the CPU is reset.
- Integrate permission monitor interrupt
  - In case of illegitimate access, the permission monitor interrupt will be triggered and the CPU will be informed to handle the interrupt.

3.4.4 System Registers

ESP32-S3 system registers can be used to control the following peripheral blocks and core modules:

- System and memory
- Clock
- Software Interrupt
- Low-power management
- Peripheral clock gating and reset
- CPU Control

For detailed information, please refer to Chapter System Registers in *ESP32-S3 Technical Reference*

Manual.

3.4.5 GDMA Controller

ESP32-S3 has a general-purpose DMA controller (GDMA) with five independent channels for transmitting and another five independent channels for receiving. These ten channels are shared by peripherals that have DMA feature, and support dynamic priority.

The DMA controller controls data transfer using linked lists. It allows peripheral-to-memory and memory-to-memory data transfer at a high speed. All channels can access internal and external RAM.

The ten peripherals on ESP32-S3 with DMA feature are SPI2, SPI3, UHCI0, I2S0, I2S1, LCD/CAM, AES, SHA, ADC, and RMT.

For detailed information, please refer to Chapter GDMA Controller (GDMA) in *ESP32-S3 Technical Reference Manual*.

3.4.6 CPU Clock

The CPU clock has three possible sources:

- External main crystal clock
- Internal fast RC oscillator (typically about 17.5 MHz, and adjustable)
- PLL clock

The application can select the clock source from the three clocks above. The selected clock source drives the CPU clock directly, or after division, depending on the application. Once the CPU is reset, the default clock source would be the external main crystal clock divided by 2.

> **Note:**
> ESP32-S3 is unable to operate without an external main crystal clock.

For more information about clocks, please refer to Chapter Reset and Clock in *ESP32-S3 Technical Reference Manual*.

3.4.7 RTC Clock

The RTC slow clock is used for RTC counter, RTC watchdog and low-power controller. It has three possible sources:

- External low-speed (32 kHz) crystal clock
- Internal slow RC oscillator (typically about 136 kHz, and adjustable)
- Internal fast RC oscillator divided clock (derived from the internal fast RC oscillator divided by 256)

The RTC fast clock is used for RTC peripherals and sensor controllers. It has two possible sources:

- External main crystal clock divided by 2
- Internal fast RC oscillator (typically about 17.5 MHz, and adjustable)

3.4.8 Clock Glitch Detection

The Clock Glitch Detection module on ESP32-S3 monitors input clock signals from XTAL_CLK. If it detects a glitch with a width shorter than 3 ns, input clock signals from XTAL_CLK are blocked.

For more information, please refer to Chapter Clock Glitch Detection in *ESP32-S3 Technical Reference Manual*.

3.5 Digital Peripherals

3.5.1 IO MUX and GPIO Matrix

GPIO Matrix Features

- A full-switching matrix between the peripheral input/output signals and the GPIO pins
- 175 digital peripheral input signals can be sourced from the input of any GPIO pins
- The output of any GPIO pins can be from any of the 184 digital peripheral output signals
- Supports signal synchronization for peripheral inputs based on APB clock bus
- Provides input signal filter
- Supports sigma delta modulated output
- Supports GPIO simple input and output

IO MUX Features

- Provides one configuration register IO_MUX_GPIO*n*_REG for each GPIO pin. The pin can be configured to
  - perform GPIO function routed by GPIO matrix.
  - or perform direct connection bypassing GPIO matrix.
- Supports some high-speed digital signals (SPI, JTAG, UART) bypassing GPIO matrix for better high-frequency digital performance. In this case, IO MUX is used to connect these pins directly to peripherals.

RTC IO MUX Features

- Controls low power feature of 22 RTC GPIO pins.
- Controls analog functions of 22 RTC GPIO pins.
- Redirects 22 RTC input/output signals to RTC system.

For more information, please refer to Chapter IO MUX and GPIO Matrix (GPIO, IO MUX) in *ESP32-S3 Technical Reference Manual*.

3.5.2 Serial Peripheral Interface (SPI)

ESP32-S3 features four SPI interfaces (SPI0, SPI1, SPI2 and SPI3). SPI0 and SPI1 can be configured to operate in SPI memory mode; SPI2 and SPI3 can be configured to operate in general-purpose SPI mode.

- **SPI Memory mode**

  In SPI memory mode, SPI0 and SPI1 interface with external SPI memory. Data transmission is in multiples of bytes. Up to 8-line SDR/DDR (Single Data Rate/Double Data Rate) reads and writes are supported. The clock frequency is configurable to a maximum of 120 MHz for OPI SDR/DDR mode.

- **SPI2 General-purpose SPI (GP-SPI) mode**

  SPI2 can operate in master and slave modes. The master mode supports two-line full-duplex communication and single-/two-/four-/eight-line half-duplex communication. The slave mode supports two-line full-duplex communication and single-/two-/four-line half-duplex communication. The host's clock

frequency is configurable. Data transmission is in multiples of bytes. The clock polarity (CPOL) and phase (CPHA) are also configurable. The SPI2 interface supports DMA.

  - In two-line full-duplex communication mode, the host's clock frequency is configurable to 80 MHz at most, and the slave's clock frequency to 60 MHz at most. Four modes of SPI transfer format are supported. Only SDR reads and writes are supported.
  - In single-/two-/four-/eight-line half-duplex communication mode, the host's clock frequency is configurable to 80 MHz at most for SDR reads/writes and 40 MHz for DDR reads/writes. Four modes of SPI transfer format are supported.
  - In single-/two-/four-line half-duplex communication mode, the slave's clock frequency is configurable to 60 MHz at most. Only SDR reads and writes are supported. Four modes of SPI transfer format are supported.

- **SPI3 General-purpose SPI (GP-SPI) mode**

  SPI3 can operate in master and slave modes, in two-line full-duplex and single-line, two-line and four-line half-duplex communication modes. Only SDR reads and writes are supported. The host's clock frequency is configurable. Data transmission is in multiples of bytes. The clock polarity (CPOL) and phase (CPHA) are also configurable. The SPI3 interface supports DMA.

  - In two-line full-duplex communication mode, the host's clock frequency is configurable to a maximum of 80 MHz, and the slave's clock frequency to a maximum of 60 MHz. Four modes of SPI transfer format are supported.
  - In single-line, two-line and four-line half-duplex communication mode, the host's clock frequency is configurable to a maximum of 80 MHz, and the slave's clock frequency to 60 MHz at most. Four modes of SPI transfer format are supported.

In most cases, the data port connection between ESP32-S3 and external flash is as follows:

Table 12: Connection Between ESP32-S3 and External Flash

	External Flash Data Port			
Chip Pin	**SPI Single-Line Mode**	**SPI Two-Line Mode**	**SPI Four-Line Mode**	**SPI Eight-Line Mode**

GPIO34	—	—	—	IO5
GPIO35	—	—	—	IO6
GPIO36	—	—	—	IO7
GPIO37	—	—	—	DQS

3.5.3 LCD Interface

ESP32-S3 supports 8-bit ~16-bit parallel RGB, I8080, and MOTO6800 interfaces. These interfaces operate at 40 MHz or lower, and support conversion among RGB565, YUV422, YUV420, and YUV411.

3.5.4 Camera Interface

ESP32-S3 supports an 8-bit ~16-bit DVP image sensor, with clock frequency of up to 40 MHz. The camera interface supports conversion among RGB565, YUV422, YUV420, and YUV411.

3.5.5 UART Controller

ESP32-S3 has three UART (Universal Asynchronous Receiver Transmitter) controllers, i.e., UART0, UART1, and UART2, which support IrDA and asynchronous communication (RS232 and RS485) at a speed of up to 5 Mbps. Each UART Controller has the following features:

- Three clock sources that can be divided
- Programmable baud rate
- 1024 x 8-bit RAM shared by TX FIFOs and RX FIFOs of the three UART controllers
- Full-duplex asynchronous communication
- Automatic baud rate detection of input signals
- Data bits ranging from 5 to 8
- Stop bits of 1, 1.5, 2 or 3 bits
- Parity bit
- Special character AT_CMD detection
- RS485 protocol
- IrDA protocol
- High-speed data communication using GDMA
- UART as wake-up source
- Software and hardware flow control

For more information, please refer to Chapter UART Controller (UART) in *ESP32-S3 Technical Reference Manual*.

3.5.6 I2C Interface

ESP32-S3 has two I2C bus interfaces which are used for I2C master mode or slave mode, depending on the user's configuration. The I2C interfaces support:

- Standard mode (100 kbit/s)
- Fast mode (400 kbit/s)
- Up to 800 kbit/s (constrained by SCL and SDA pull-up strength)
- 7-bit and 10-bit addressing mode
- Double addressing mode (slave addressing and slave register addressing)

The hardware provides a command abstraction layer to simplify the usage of the I2C peripheral.

For more information, please refer to Chapter I2C Controller (I2C) in *ESP32-S3 Technical Reference Manual*.

3.5.7 I2S Interface

ESP32-S3 includes two standard I2S interfaces. They can operate in master mode or slave mode, in full-duplex mode or half-duplex communication mode, and can be configured to operate with an 8-bit, 16-bit, 24-bit, or 32-bit resolution as an input or output channel. BCK clock frequency, from 10 kHz up to 40 MHz, is supported.

The I2S interface has a dedicated DMA controller. It supports TDM PCM, TDM MSB alignment, TDM LSB alignment, TDM Phillips, and PDM interface.

3.5.8 Remote Control Peripheral

The RMT (Remote Control Peripheral) module is designed to send and receive infrared remote control signals. It has the following features:

- Four TX channels
- Four RX channels
- Support multiple channels (programmable) transmitting data simultaneously
- Eight channels share a 384 x 32-bit RAM
- Support modulation on TX pulses
- Support filtering and demodulation on RX pulses
- Wrap TX mode
- Wrap RX mode
- Continuous TX mode
- DMA access for TX mode on channel 3
- DMA access for RX mode on channel 7

For more information, please refer to Chapter Remote Control Peripheral (RMT) in *ESP32-S3 Technical Reference Manual*.

3.5.9 Pulse Count Controller

The pulse count controller captures pulse and counts pulse edges through multiple modes. It has the following features:

- Four independent pulse counters (units) that count from 1 to 65535
- Each unit consists of two independent channels sharing one pulse counter
- All channels have input pulse signals (e.g. sig_ch0_u*n*) with their corresponding control signals (e.g. ctrl_ch0_u*n*)
- Independently filter glitches of input pulse signals (sig_ch0_u*n* and sig_ch1_u*n*) and control signals (ctrl_ch0_u*n* and ctrl_ch1_u*n*) on each unit
- Each channel has the following parameters:
  1. Selection between counting on positive or negative edges of the input pulse signal
  2. Configuration to Increment, Decrement, or Disable counter mode for control signal's high and low states

For more information, please refer to Chapter Pulse Count Controller (PCNT) in *ESP32-S3 Technical Reference*

Manual.

3.5.10 LED PWM Controller

The LED PWM controller can generate independent digital waveforms on eight channels. The LED PWM controller has the following features:

- Can generate a digital waveform with configurable periods and duty cycle. The duty cycle resolution can be up to 14 bits within a 1 ms period.
- Has multiple clock sources, including APB clock and external main crystal clock.
- Can operate when the CPU is in Light-sleep mode.
- Supports gradual increase or decrease of duty cycle, which is useful for the LED RGB color-fading generator.

For more information, please refer to Chapter LED PWM Controller (LEDC) in *ESP32-S3 Technical Reference Manual*.

3.5.11 USB 2.0 OTG Full-Speed Interface

ESP32-S3 features a full-speed USB OTG interface along with an integrated transceiver. The USB OTG interface complies with the USB 2.0 specification. It has the following features:

General Features

- FS and LS data rates
- HNP and SRP as A-device or B-device
- Dynamic FIFO (DFIFO) sizing
- Multiple modes of memory access
  - Scatter/Gather DMA mode
  - Buffer DMA mode
  - Slave mode
- Can choose integrated transceiver or external transceiver
- Utilizing integrated transceiver with USB Serial/JTAG by time-division multiplexing when only integrated transceiver is used
- Support USB OTG using one of the transceivers while USB Serial/JTAG using the other one when both integrated transceiver or external transceiver are used

Device Mode Features

- Endpoint number 0 always present (bi-directional, consisting of EP0 IN and EP0 OUT)
- Six additional endpoints (endpoint numbers 1 to 6), configurable as IN or OUT
- Maximum of five IN endpoints concurrently active at any time (including EP0 IN)
- All OUT endpoints share a single RX FIFO
- Each IN endpoint has a dedicated TX FIFO

Host Mode Features

- 8 channels (pipes)

  - A control pipe consists of two channels (IN and OUT), as IN and OUT transactions must be handled separately. Only Control transfer type is supported.
  - Each of the other seven channels is dynamically configurable to be IN or OUT, and supports Bulk, Isochronous, and Interrupt transfer types.
- All channels share an RX FIFO, non-periodic TX FIFO, and periodic TX FIFO. The size of each FIFO is configurable.

For more information, please refer to Chapter USB On-The-Go (USB) in *ESP32-S3 Technical Reference Manual*.

3.5.12 USB Serial/JTAG Controller

ESP32-S3 integrates a USB Serial/JTAG controller that supports the following features:

- USB Full-speed device.
- Can be configured to either use internal USB PHY of ESP32-S3 or external PHY via GPIO matrix.
- Fixed function device, hardwired for CDC-ACM (Communication Device Class - Abstract Control Model) and JTAG adapter functionality.
- 2 OUT Endpoints, 3 IN Endpoints in addition to Control Endpoint 0; Up to 64-byte data payload size.
- Internal PHY, so no or very few external components needed to connect to a host computer.
- CDC-ACM adherent serial port emulation is plug-and-play on most modern OSes.
- JTAG interface allows fast communication with CPU debug core using a compact representation of JTAG instructions.
- CDC-ACM supports host controllable chip reset and entry into download mode.

For more information, please refer to Chapter USB Serial/JTAG Controller (USB_SERIAL_JTAG) in *ESP32-S3 Technical Reference Manual*.

3.5.13 Motor Control PWM (MCPWM)

ESP32-S3 integrates two MCPWM that can be used to drive digital motors and smart light. Each MCPWM peripheral has one clock divider (prescaler), three PWM timers, three PWM operators, and a capture module. PWM timers are used for generating timing references. The PWM operators generate desired waveform based on the timing references. Any PWM operator can be configured to use the timing references of any PWM timers. Different PWM operators can use the same PWM timer's timing references to produce related PWM signals. PWM operators can also use different PWM timers' values to produce the PWM signals that work alone. Different PWM timers can also be synchronized together.

For more information, please refer to Chapter Motor Control PWM (MCPWM) in *ESP32-S3 Technical Reference Manual*.

3.5.14 SD/MMC Host Controller

ESP32-S3 has an SD/MMC Host Controller with the following features:

- Secure Digital (SD) memory version 3.0 and version 3.01
- Secure Digital I/O (SDIO) version 3.0
- Consumer Electronics Advanced Transport Architecture (CE-ATA) version 1.1
- Multimedia Cards (MMC version 4.41, eMMC version 4.5 and version 4.51)

- Up to 80 MHz clock output
- Three data bus modes:
  - 1-bit
  - 4-bit (supports two SD/SDIO/MMC 4.41 cards, and one SD card operating at 1.8 V in 4-bit mode)
  - 8-bit

For more information, please refer to Chapter SD/MMC Host Controller (SDHOST) in *ESP32-S3 Technical Reference Manual*.

3.5.15 TWAI® Controller

The Two-wire Automotive Interface (TWAI) is a multi-master, multi-cast communication protocol with error detection and signaling as well as inbuilt message priorities and arbitration. The TWAI controller in ESP32-S3 supports the following features:

- Compatible with ISO 11898-1 protocol (CAN Specification 2.0)
- Standard frame format (11-bit ID) and extended frame format (29-bit ID)
- Bit rates from 1 Kbit/s to 1 Mbit/s
- Multiple modes of operation:
  - Normal
  - Listen Only
  - Self-Test (no acknowledgment required)
- 64-byte receive FIFO
- Acceptance filter (single and dual filter modes)
- Error detection and handling:
  - Error counters
  - Configurable error interrupt threshold
  - Error code capture
  - Arbitration lost capture

For more information, please refer to Chapter Two-wire Automotive Interface (TWAI®) in *ESP32-S3 Technical Reference Manual*.

3.6 Radio and Wi-Fi

The ESP32-S3 radio consists of the following blocks:

- 2.4 GHz receiver
- 2.4 GHz transmitter
- Bias and regulators
- Balun and transmit-receive switch
- Clock generator

3.6.1 2.4 GHz Receiver

The 2.4 GHz receiver demodulates the 2.4 GHz RF signal to quadrature baseband signals and converts them to the digital domain with two high-resolution, high-speed ADCs. To adapt to varying signal channel conditions, ESP32-S3 integrates RF filters, Automatic Gain Control (AGC), DC offset cancelation circuits, and baseband filters.

3.6.2 2.4 GHz Transmitter

The 2.4 GHz transmitter modulates the quadrature baseband signals to the 2.4 GHz RF signal, and drives the antenna with a high-powered CMOS power amplifier. The use of digital calibration further improves the linearity of the power amplifier.

To compensate for receiver imperfections, additional calibration methods are built into the chip, including:

- Carrier leakage compensation
- I/Q amplitude/phase matching
- Baseband nonlinearities suppression
- RF nonlinearities suppression
- Antenna matching

These built-in calibration routines reduce the cost and time to the market for your product, and eliminate the need for specialized testing equipment.

3.6.3 Clock Generator

The clock generator produces quadrature clock signals of 2.4 GHz for both the receiver and the transmitter. All components of the clock generator are integrated into the chip, including inductors, varactors, filters, regulators, and dividers.

The clock generator has built-in calibration and self-test circuits. Quadrature clock phases and phase noise are optimized on chip with patented calibration algorithms which ensure the best performance of the receiver and the transmitter.

3.6.4 Wi-Fi Radio and Baseband

The ESP32-S3 Wi-Fi radio and baseband support the following features:

- 802.11b/g/n
- 802.11n MCS0-7 that supports 20 MHz and 40 MHz bandwidth
- 802.11n MCS32
- 802.11n 0.4 μs guard-interval
- Data rate up to 150 Mbps
- RX STBC (single spatial stream)
- Adjustable transmitting power
- Antenna diversity:
  ESP32-S3 supports antenna diversity with an external RF switch. This switch is controlled by one or more GPIOs, and used to select the best antenna to minimize the effects of channel imperfections.

3.6.5 Wi-Fi MAC

ESP32-S3 implements the full 802.11 b/g/n Wi-Fi MAC protocol. It supports the Basic Service Set (BSS) STA and SoftAP operations under the Distributed Control Function (DCF). Power management is handled automatically with minimal host interaction to minimize the active duty period.

The ESP32-S3 Wi-Fi MAC applies the following low-level protocol functions automatically:

- 4 × virtual Wi-Fi interfaces
- Simultaneous Infrastructure BSS Station mode, SoftAP mode, and Station + SoftAP mode
- RTS protection, CTS protection, Immediate Block ACK
- Fragmentation and defragmentation
- TX/RX A-MPDU, TX/RX A-MSDU
- TXOP
- WMM
- GCMP, CCMP, TKIP, WAPI, WEP, and BIP
- Automatic beacon monitoring (hardware TSF)
- 802.11mc FTM

3.6.6 Networking Features

Users are provided with libraries for TCP/IP networking, ESP-WIFI-MESH networking, and other networking protocols over Wi-Fi. TLS 1.2 support is also provided.

3.7 Bluetooth LE

ESP32-S3 includes a Bluetooth Low Energy subsystem that integrates a hardware link layer controller, an RF/modem block and a feature-rich software protocol stack. It supports the core features of Bluetooth 5 and Bluetooth mesh.

3.7.1 Bluetooth LE Radio and PHY

Bluetooth Low Energy radio and PHY in ESP32-S3 support:

- 1 Mbps PHY
- 2 Mbps PHY for high transmission speed and high data throughput
- Coded PHY for high RX sensitivity and long range (125 Kbps and 500 Kbps)
- Class 1 transmit power without external PA
- Listen before talk (LBT), implemented in hardware
- Antenna diversity with an external RF switch. This switch is controlled by one or more GPIOs, and used to select the best antenna to minimize the effects of channel imperfections.

3.7.2 Bluetooth LE Link Layer Controller

Bluetooth Low Energy Link Layer Controller in ESP32-S3 supports:

- LE advertising extensions, to enhance broadcasting capacity and broadcast more intelligent data
- Multiple advertisement sets

- Simultaneous advertising and scanning
- Multiple connections in simultaneous central and peripheral roles
- Adaptive frequency hopping and channel assessment
- LE channel selection algorithm #2
- Connection parameter update
- High duty cycle non-connectable advertising
- LE privacy 1.2
- LE data packet length extension
- Link layer extended scanner filter policies
- Low duty cycle directed advertising
- Link layer encryption
- LE Ping

3.8 Timers and Watchdogs

3.8.1 General Purpose Timers

ESP32-S3 is embedded with four 54-bit general-purpose timers, which are based on 16-bit prescalers and 54-bit auto-reload-capable up/down-timers.

The timers' features are summarized as follows:

- A 16-bit clock prescaler, from 2 to 65536
- A 54-bit time-base counter programmable to be incrementing or decrementing
- Able to read real-time value of the time-base counter
- Halting and resuming the time-base counter
- Programmable alarm generation
- Timer value reload (Auto-reload at alarm or software-controlled instant reload)
- Level interrupt generation

For more information, please refer to Chapter Timer Group (TIMG) in *ESP32-S3 Technical Reference Manual*.

3.8.2 System Timer

ESP32-S3 integrates a 52-bit system timer, which has two 52-bit counters and three comparators. The system timer has the following features:

- Counters with a clock frequency of 16 MHz
- Three types of independent interrupts generated according to alarm value
- Two alarm modes: target mode and period mode
- 52-bit target alarm value and 26-bit periodic alarm value
- Read sleep time from RTC timer when the chip is awaken from Deep-sleep or Light-sleep mode
- Counters can be stalled if the CPU is stalled or in OCD mode

For more information, please refer to Chapter System Timer (SYSTIMER) in *ESP32-S3 Technical Reference Manual*.

3.8.3 Watchdog Timers

The ESP32-S3 contains three watchdog timers: one in each of the two timer groups (called Main System Watchdog Timers, or MWDT) and one in the RTC Module (called the RTC Watchdog Timer, or RWDT).

During the flash boot process, RWDT and the first MWDT are enabled automatically in order to detect and recover from booting errors.

Watchdog timers have the following features:

- Four stages, each with a programmable timeout value. Each stage can be configured, enabled and disabled separately
- Interrupt, CPU reset, or core reset for MWDT upon expiry of each stage; interrupt, CPU reset, core reset, or system reset for RWDT upon expiry of each stage
- 32-bit expiry counter
- Write protection, to prevent RWDT and MWDT configuration from being altered inadvertently
- Flash boot protection
  If the boot process from an SPI flash does not complete within a predetermined period of time, the watchdog will reboot the entire main system.

For more information, please refer to Chapter Watchdog Timers in *ESP32-S3 Technical Reference Manual*.

3.8.4 XTAL32K Watchdog Timers

Interrupt and Wake-Up

When the XTAL32K watchdog timer detects the oscillation failure of XTAL32K_CLK, an oscillation failure interrupt RTC_XTAL32K_DEAD_INT (for interrupt description, please refer to ESP32-S3 Technical Reference Manual) is generated. At this point, the CPU will be woken up if in Light-sleep mode or Deep-sleep mode.

BACKUP32K_CLK

Once the XTAL32K watchdog timer detects the oscillation failure of XTAL32K_CLK, it replaces XTAL32K_CLK with BACKUP32K_CLK (with a frequency of 32 kHz or so) derived from RTC_CLK as RTC's SLOW_CLK, so as to ensure proper functioning of the system.

For more information, please refer to Chapter XTAL32K Watchdog Timers (XTWDT) in *ESP32-S3 Technical Reference Manual*.

3.9 Cryptography/Security Components

3.9.1 External Memory Encryption and Decryption

ESP32-S3 integrates an External Memory Encryption and Decryption module that complies with the XTS-AES standard. It supports the following features:

- General XTS_AES algorithm, compliant with IEEE Std 1619-2007
- Software-based manual encryption
- High-speed auto encryption, without software's participation
- High-speed auto decryption, without software's participation

- Encryption and decryption functions jointly determined by registers configuration, eFuse parameters, and boot mode

For more information, please refer to Chapter External Memory Encryption and Decryption (XTS_AES) in *ESP32-S3 Technical Reference Manual*.

3.9.2 Secure Boot

Secure Boot feature uses a hardware root of trust to ensure only signed firmware (with RSA-PSS signature) can be booted.

3.9.3 HMAC Accelerator

The Hash-based Message Authentication Code (HMAC) module computes Message Authentication Codes (MACs) using Hash algorithm and keys as described in RFC 2104. The HMAC Accelerator in ESP32-S3 supports the following features:

- Standard HMAC-SHA-256 algorithm
- Hash result only accessible by configurable hardware peripheral (in downstream mode)
- Compatible to challenge-response authentication algorithm
- Generates required keys for the Digital Signature (DS) peripheral (in downstream mode)
- Re-enables soft-disabled JTAG (in downstream mode)

For more information, please refer to Chapter HMAC Accelerator (HMAC) in *ESP32-S3 Technical Reference Manual*.

3.9.4 Digital Signature

A Digital Signature is used to verify the authenticity and integrity of a message using a cryptographic algorithm. The Digital Signature (DS) in ESP32-S3 supports the following features:

- RSA Digital Signatures with key length up to 4096 bits
- Encrypted private key data, only decryptable by DS peripheral
- SHA-256 digest to protect private key data against tampering by an attacker

For more information, please refer to Chapter Digital Signature (DS) in *ESP32-S3 Technical Reference Manual*.

3.9.5 World Controller

The ESP32-S3 can divide the hardware and software resources into a Secure World and a Non-Secure World to prevent sabotage or access to device information. Switching between the two worlds is performed by the World Controller, which supports the following features:

- Control of the CPU switching between secure and non-secure worlds
- Control of 15 DMA peripherals switching between secure and non-secure worlds
- Record of CPU's world switching logs
- Shielding of the CPU's NMI interrupt

3.9.6 SHA Accelerator

ESP32-S3 integrates an SHA accelerator, which is a hardware device that speeds up SHA algorithm significantly. The SHA Accelerator supports the following features:

- All the hash algorithms introduced in FIPS PUB 180-4 Spec.
  - SHA-1
  - SHA-224
  - SHA-256
  - SHA-384
  - SHA-512
  - SHA-512/224
  - SHA-512/256
  - SHA-512/*t*
- Two working modes
  - Typical SHA
  - DMA-SHA
- interleaved function when working in Typical SHA working mode
- Interrupt function when working in DMA-SHA working mode

For more information, please refer to Chapter SHA Accelerator (SHA) in *ESP32-S3 Technical Reference Manual*.

3.9.7 AES Accelerator

ESP32-S3 integrates an Advanced Encryption Standard (AES) Accelerator, which is a hardware device that speeds up AES Algorithm significantly. The AES Accelerator supports the following features:

- Typical AES working mode
  - AES-128/AES-256 encryption and decryption
- DMA-AES working mode
  - AES-128/AES-256 encryption and decryption
  - Block cipher mode
    - ECB (Electronic Codebook)
    - CBC (Cipher Block Chaining)
    - OFB (Output Feedback)
    - CTR (Counter)
    - CFB8 (8-bit Cipher Feedback)
    - CFB128 (128-bit Cipher Feedback)
  - Interrupt on completion of computation

For more information, please refer to Chapter AES Accelerator (AES) in *ESP32-S3 Technical Reference Manual*.

3.9.8 RSA Accelrator

The RSA Accelerator provides hardware support for high precision computation used in various RSA asymmetric cipher algorithms. The RSA Accelerator in ESP32-S3 supports the following features:

- Large-number modular exponentiation with two optional acceleration options
- Large-number modular multiplication
- Large-number multiplication
- Operands of different lengths
- Interrupt on completion of computation

For more information, please refer to Chapter RSA Accelrator (RSA) in *ESP32-S3 Technical Reference Manual*.

3.9.9 Random Number Generator

The random number generator in ESP32-S3 generates true random numbers, which means random number generated from a physical process, rather than by means of an algorithm. No number generated within the specified range is more or less likely to appear than any other number.

For more information, please refer to Chapter Random Number Generator (RNG) in *ESP32-S3 Technical Reference Manual*.

4. Electrical Characteristics

4.1 Absolute Maximum Ratings

Stresses beyond the absolute maximum ratings listed in the table below may cause permanent damage to the device. These are stress ratings only, and do not refer to the functional operation of the device.

Table 14: Absolute Maximum Ratings

Symbol	Parameter	Min	Max	Unit
VDDA, VDD3P3, VDD3P3_RTC, VDD3P3_CPU, VDD_SPI	Voltage applied to power supply pins per power domain	–0.3	3.6	V
I_{output} *	Cumulative IO output current	—	1500	mA
T_{STORE}	Storage temperature	–40	150	°C

* The chip worked properly after a 24-hour test in ambient temperature at 25 °C, and the IOs in three domains (VDD3P3_RTC, VDD3P3_CPU, VDD_SPI) output high logic level to ground.

4.2 Recommended Operating Conditions

Table 15: Recommended Operating Conditions

Symbol	Parameter		Min	Typ	Max	Unit
VDDA, VDD3P3 VDD3P3_RTC	Voltage applied to power supply pins per power domain		3.0	3.3	3.6	V
VDD_SPI (working as input power supply) [1]	—		1.8	3.3	3.6	V
VDD3P3_CPU [2, 3]	Voltage applied to power supply pin		3.0	3.3	3.6	V
I_{VDD} [4]	Current delivered by external power supply		0.5	—	—	A
T_A	Ambient temperature	ESP32-S3	–40	—	105	°C
		ESP32-S3FN8			85	
		ESP32-S3R2			85	
		ESP32-S3R8			65	
		ESP32-S3R8V			65	

[1] For more information, please refer to Section 2.7 *Power Scheme*.

[2] When writing to eFuses, VDD3P3_CPU should not exceed 3.3 V.

[3] When VDD_SPI is used to drive peripherals, VDD3P3_CPU should comply with the peripherals' specifications. For more information, please refer to Table 16.

[4] If you use a single power supply, the recommended output current is 500 mA or more.

4.3 VDD_SPI Output Characteristics

Table 16: VDD_SPI Output Characteristics

Symbol	Parameter	Typ	Unit
R_{SPI}	On-resistance in 3.3 V mode	14	Ω
I_{SPI}	Output current in 1.8 V mode	40	mA

In real-life applications, when VDD_SPI works in 3.3 V output mode, VDD3P3_CPU may be affected by R_{SPI}. For example, when VDD3P3_CPU is used to drive a 3.3 V flash, it should comply with the following specifications:

VDD3P3_CPU > VDD_flash_min + I_flash_max*R_{SPI}

Among which, VDD_flash_min is the minimum operating voltage of the flash, and I_flash_max the maximum current.

For more information, please refer to section 2.7 *Power Scheme*.

4.4 DC Characteristics (3.3 V, 25 °C)

Table 17: DC Characteristics (3.3 V, 25 °C)

Symbol	Parameter	Min	Typ	Max	Unit
C_{IN}	Pin capacitance	—	2	—	pF
V_{IH}	High-level input voltage	0.75 × VDD[1]	—	VDD[1]+ 0.3	V
V_{IL}	Low-level input voltage	–0.3	—	0.25 × VDD[1]	V
I_{IH}	High-level input current	—	—	50	nA
I_{IL}	Low-level input current	—	—	50	nA
V_{OH}[2]	High-level output voltage	0.8 × VDD[1]	—	—	V
V_{OL}[2]	Low-level output voltage	—	—	0.1 × VDD[1]	V
I_{OH}	High-level source current (VDD[1]= 3.3 V, V_{OH} >= 2.64 V, PAD_DRIVER = 3)	—	40	—	mA
I_{OL}	Low-level sink current (VDD[1]= 3.3 V, V_{OL} = 0.495 V, PAD_DRIVER = 3)	—	28	—	mA
R_{PU}	Internal weak pull-up resistor	—	45	—	kΩ
R_{PD}	Internal weak pull-down resistor	—	45	—	kΩ
V_{IH_nRST}	Chip reset release voltage (CHIP_PU voltage is within the specified range)	0.75 × VDD[1]	—	VDD[1]+ 0.3	V
V_{IL_nRST}	Chip reset voltage (CHIP_PU voltage is within the specified range)	–0.3	—	0.25 × VDD[1]	V

[1] VDD is the I/O voltage for a particular power domain of pins.

[2] V_{OH} and V_{OL} are measured using high-impedance load.

4.5 ADC Characteristics

Table 18: ADC Characteristics

Symbol	Parameter	Min	Max	Unit
DNL (Differential nonlinearity) [1]	ADC connected to an external 100 nF capacitor; DC signal input; Ambient temperature at 25 °C; Wi-Fi off	–4	4	LSB
INL (Integral nonlinearity)		–8	8	LSB
Sampling rate	—	—	100	kSPS [2]

[1] To get better DNL results, you can sample multiple times and apply a filter, or calculate the average value.

[2] kSPS means kilo samples-per-second.

ESP-IDF provides couple of calibration methods for ADC. Results after calibration using hardware + software calibration are shown in Table 19. For higher accuracy, users may apply other calibration methods provided in ESP-IDF, or implement their own.

Table 19: ADC Calibration Results

Parameter	Description	Min	Max	Unit

	ATTEN1, effective measurement range of 0 ~ 1250	-6	6	mV
	ATTEN2, effective measurement range of 0 ~ 1750	-10	10	mV
	ATTEN3, effective measurement range of 0 ~ 3100	-50	50	mV

4.6 Current Consumption

The current consumption measurements are taken with a 3.3 V supply at 25 °C of ambient temperature at the RF port. All transmitters' measurements are based on a 100% duty cycle.

Table 20: Wi-Fi Current Consumption Depending on RF Modes

Revision History

Date	Version	Release Notes
2022-04	v1.1	• Synchronized eFuse size throughout • Updated pin description in Table 2 • Updated SPI resistance in Table 16 • Added information about chip ESP32-S3FH4R2
2022-01	v1.0	• Added wake-up sources for Deep-sleep mode • Added Table 10 for default configurations of VDD_SPI • Added ADC calibration results in Table 19 • Added typical values when all peripherals and peripheral clocks are enabled to Table 22 • Added more descriptions of modules/peripherals in Section 3 • Updated Figure 1 • Updated JEDEC specification • Updated Wi-Fi RF data in Section 4.6 • Updated temperature for ESP32-S3R8 and ESP32-S3R8V • Updated description of Deep-sleep mode in Table 21 • Updated wording throughout
2021-10-12	v0.6.1	Updated text description
2021-09-30	v0.6	• Updated to chip revision 1 by swapping pin 53 and pin 54 (XTAL_P and XTAL_N) • Updated Figure 1 • Added CoreMark score in section Features • Updated Section 2.8 • Added data for cumulative IO output current in Table 14 • Added data for Modem-sleep current consumption in Table 22 • Updated data in section 4.6, 4.8, and 4.9 • Updated wording throughout
2021-07-19	v0.5.1	• Added ”for chip revision 0” on cover, in footer and watermark to indicate that the current and previous versions of this datasheet are for chip version 0 • Corrected a few typos
2021-07-09	v0.5	Preliminary version
