

16+1-port Management Switch Controller with 16 PHYs inside (SOC_90nm, Green & Management)

Features

- 16 Ports 10/100Mb Ethernet Layer 2 Smart Switch
 - Built-in 16 PHYs
 - One MII interface
- Store & Forward, Share Memory Non_blocking Architecture
 - Built-in 2.5Mb SRAM (1.75Mb for packet buffer)
 - Max. length 1664B
- Wire-speed Operation On Every Port
- Head Of Line Blocking Prevention
- Flow Control Support
 - 802.3x compliant flow control in full duplex
 - Collision/Carrier_sneze based backpressure in half duplex
- Internal 8K MAC Address Entities
 - CRC/direct hashing algorithm
 - Aging timer programmable (55s~251.6hr) < 4 %
 - Wire speed address learning and resolution
 - CPU accessible for security and static MAC
 - Learning enable/disable
- Sniffer Function Support (in/out/in+out)
- IGMP Snooping Support
 - Version 1, 2
 - Snooping by Switch ASIC or external CPU
- Two Trunk Group Support
 - Two trunk groups, each trunk has 4 ports (max)
 - The ports belong to trunk group are configurable
 - Load balance based on (Port ID, DA, SA, DA/SA)
 - Link fault recovery
- VLAN (32 VLAN groups)
 - Port based
 - Tagged based
 - Tag remove/add/modify support
 - Special TAG support
 - Protected VLAN
 - Q-in-Q (double tag) support
- Class Of Service (CoS) Support
 - Port based
 - 802.1Q priority based tagged based
 - IP TOS based (IPv4/IPv6)
 - TCP/UDP port number based
 - Destination MAC address based
 - IP address based
 - 4 levels per port
 - WRR/FIFS/SP/SP+WRR
 - ACL based
- Broadcast Storm Control
 - Broadcast rate control per port selectable
 - With option to drop all ARP to CPU
 - Also has ARP and ICMP storm control
- Multi-cast/unknown DA frames can be counted
- Port Security
 - MAC based
 - IP(DIP/SIP) based (IPv4 32 bit only)
 - TCP/UDP port based
 - Port based
- Bandwidth Control
 - 32K bpsxN 256 levels
 - 512K bpsxN 256 levels
 - With flow control/Without flow control
 - WAN port control support
- Support SMI Interface Auto-polling
 - Speed, Duplex, Flow control, Link
 - CPU accessible (interrupt support)
 - CPU R/W PHY register
- Out Queue Aging Function
 - From 100 ms to 6.3 sec selectable
- Spanning Tree Protocol Port State Support
 - Discard/Block/Learning/Forwarding four states support
 - Forwarding STP frame to CPU port
 - RSTP support
- Support 16 ACL Entities Based On
 - Ingress port or VLAN
 - Destination/Source IP (specific or range)
 - TCP/UDP Destination/Source port number (specific, > 1023, <=1023)
 - Action : forward, to CPU, drop, priority, Q-in-Q tag
- Configuration
 - Pin initial setting
 - 2-wire serial interface for configuration EEPROM
 - 2-wire serial interface for low cost smart system application
- Per Port 2 Counter (32 bit x 2) Selectable
 - RX/TX packet count
 - CRC error packet count
 - Drop packet count
 - Collision count
- LED
 - Direct mode
 - 2-wire serial mode
- Support Auto Test Function For Mass-production
 - Auto generate test frames
 - Show the result on LED output
- Interrupt Pin For PHY Mode/Link/SMI R/W
 - Complete notification
- Build-in SRAM Self Test (BIST)
- Build-in Oscillator Circuit, Only One 25 MHz Crystal Needed
- IO Voltage Selectable (3 groups)
- 90 nm Process, 128 Pin PQFP

General Description

The IP1717B is a cost effective and fully integrated single chip. It integrates a 17-port switch controller, an 2X octal PHY transceiver and SSRAM. Each of PHY transceiver complies with 802.3u specification and HP-license Auto MDI/MDIX.

It supports full smart switch functions, including IGMP snooping, 4 priority queues, TOS, TCP/UDP port number priority, 802.1Q VLAN, port security, protocol filter/forwarding and bandwidth control.

4.1 MDI Pin Description

Table 2 MDI Pin

Pin No.	Label	Type	Description
105	TXOP0	O	Port1 Media Dependent Interface
104	TXOM0	O	The differential data from the media is transmitted and received on two pairs for port1. Auto MDI/MDIX can reverse the pairs TXOP0/TXOM0 and RXIP0/RXIM0.
107	RXIP0	I	
108	RXIM0	I	
112	TXOP1	O	Port2 Media Dependent Interface
113	TXOM1	O	The differential data from the media is transmitted and received on two pairs for port2. Auto MDI/MDIX can reverse the pairs TXOP1/TXOM1 and RXIP1/RXIM1.
110	RXIP1	I	
109	RXIM1	I	
118	TXOP2	O	Port3 Media Dependent Interface
117	TXOM2	O	The differential data from the media is transmitted and received on two pairs for port3. Auto MDI/MDIX can reverse the pairs TXOP2/TXOM2 and RXIP2/RXIM2.
120	RXIP2	I	
121	RXIM2	I	
125	TXOP3	O	Port4 Media Dependent Interface
126	TXOM3	O	The differential data from the media is transmitted and received on two pairs for port4. Auto MDI/MDIX can reverse the pairs TXOP3/TXOM3 and RXIP3/RXIM3.
123	RXIP3	I	
122	RXIM3	I	
3	TXOP4	O	Port5 Media Dependent Interface
2	TXOM4	O	The differential data from the media is transmitted and received on two pairs for port5. Auto MDI/MDIX can reverse the pairs TXOP4/TXOM4 and RXIP4/RXIM4.
5	RXIP4	I	
6	RXIM4	I	
10	TXOP5	O	Port6 Media Dependent Interface
11	TXOM5	O	The differential data from the media is transmitted and received on two pairs for port6. Auto MDI/MDIX can reverse the pairs TXOP5/TXOM5 and RXIP5/RXIM5.
8	RXIP5	I	
7	RXIM5	I	
14	TXOP6	O	Port7 Media Dependent Interface
13	TXOM6	O	The differential data from the media is transmitted and received on two pairs for port7. Auto MDI/MDIX can reverse the pairs TXOP6/TXOM6 and RXIP6/RXIM6.
15	RXIP6	I	
16	RXIM6	I	
21	TXOP7	O	Port8 Media Dependent Interface
22	TXOM7	O	The differential data from the media is transmitted and received on two pairs for port8. Auto MDI/MDIX can reverse the pairs TXOP7/TXOM7 and RXIP7/RXIM7.
19	RXIP7	I	
18	RXIM7	I	

Pin No.	Label	Type	Description
25	TXOP8	O	Port9 Media Dependent Interface
24	TXOM8	O	The differential data from the media is transmitted and received
26	RXIP8	I	on two pairs for port9. Auto MDI/MDIX can reverse the pairs
27	RXIM8	I	TXOP8/TXOM8 and RXIP8/RXIM8.
31	TXOP9	O	Port10 Media Dependent Interface
32	TXOM9	O	The differential data from the media is transmitted and received
29	RXIP9	I	on two pairs for port10. Auto MDI/MDIX can reverse the pairs
28	RXIM9	I	TXOP9/TXOM9 and RXIP9/RXIM9.
35	TXOP10	O	Port11 Media Dependent Interface
34	TXOM10	O	The differential data from the media is transmitted and received
36	RXIP10	I	on two pairs for port11. Auto MDI/MDIX can reverse the pairs
37	RXIM10	I	TXOP10/TXOM10 and RXIP10/RXIM10.
42	TXOP11	O	Port12 Media Dependent Interface
43	TXOM11	O	The differential data from the media is transmitted and received
40	RXIP11	I	on two pairs for port12. Auto MDI/MDIX can reverse the pairs
39	RXIM11	I	TXOP11/TXOM11 and RXIP11/RXIM11.
46	TXOP12	O	Port13 Media Dependent Interface
45	TXOM12	O	The differential data from the media is transmitted and received
47	RXIP12	I	on two pairs for port13. Auto MDI/MDIX can reverse the pairs
48	RXIM12	I	TXOP12/TXOM12 and RXIP12/RXIM12.
52	TXOP13	O	Port14 Media Dependent Interface
53	TXOM13	O	The differential data from the media is transmitted and received
51	RXIP13	I	on two pairs for port14. Auto MDI/MDIX can reverse the pairs
50	RXIM13	I	TXOP13/TXOM13 and RXIP13/RXIM13.
56	TXOP14	O	Port15 Media Dependent Interface
55	TXOM14	O	The differential data from the media is transmitted and received
58	RXIP14	I	on two pairs for port15. Auto MDI/MDIX can reverse the pairs
59	RXIM14	I	TXOP14/TXOM14 and RXIP14/RXIM14.
63	TXOP15	O	Port16 Media Dependent Interface
64	TXOM15	O	The differential data from the media is transmitted and received
61	RXIP15	I	on two pairs for port16. Auto MDI/MDIX can reverse the pairs
60	RXIM15	I	TXOP15/TXOM15 and RXIP15/RXIM15.

4.2 MII Pin Description

Table 3 MII Pin

Pin No.	Label	Type	Description
90	COL	I/O	MII Collision Detect Collision detect when operation on 10/100 half duplex mode. The pin must be pulled low with 4.7K ohm resistor when IP1717B works in MAC mode. The pin treats as output pin when IP1717B works in PHY mode.
81	MTXEN	O	MII Transmit Enable Transmit data enable that is sent synchronously at the rising edge when IP1717B works in MAC mode and falling edge in PHY mode.

Pin No.	Label	Type	Description
80	MTXD0	O	MII Transmit Data Output Bus
78	MTXD1		Transmit data output bus that is sent synchronously at the rising edge of MTXC when IP1717B works in MAC mode and falling edge in PHY mode.
77	MTXD2		
76	MTXD3		
84	MRXDV	I	MII Receive Valid Receive data valid that is sent synchronously at the rising edge.
85	MRXD0	I	MII Receive Data Input Bus
87	MRXD1		Receive data input bus that is sent synchronously at the rising edge of MRXC.
88	MRXD2		
89	MRXD3		
82	MTXC	I/O	MII Transmit Clock In 100Mbps, the pin is 25MHz clock input when IP1717B in MAC mode and output in PHY mode. In 10Mbps, the pin is 2.5MHz clock input when IP1717B in MAC mode and output in PHY mode.
83	MRXC	I/O	MII Receive Clock In 100Mbps, the pin is 25MHz clock input when IP1717B in MAC mode and output in PHY mode. In 10Mbps, the pin is 2.5MHz clock input when IP1717B in MAC mode and output in PHY mode.

4.3 SMI Pin Description

Table 4 SMI Pin

Pin No.	Label	Type	Description
73	MDC	O	Serial management bus clock output It's recommended to add a 30pf capacitor to ground for noise filtering.
74	MDIO	I/O	Serial management bus data input/output It's recommended to add a 4.7K pull up resistor connecting to 3.3V VCC and a 30pf capacitor connecting to ground.

4.4 EEPROM Pin Description

Table 5 EEPROM Pin

Pin No.	Label	Type	Description
69	EECLK	O	Serial EEPROM clock output
70	EEDAT	I/O	Serial EEPROM data input/output

4.5 CPU Pin Description

Table 6 CPU Pin

Pin No.	Label	Type	Description
71	CPUCLK	I	Serial CPU access clock input
72	CPUDAT	I/O	Serial CPU data input/output

4.6 Serial LED Pin Description

Table 7 Serial LED Pin

Pin No.	Label	Type	Description
98	LEDCLK	O	Serial LED clock output
99	LEDDAT	I/O	Serial LED data input/output

4.7 Direct LED Pin Description

Table 8 Direct LED Pin

Pin No.	Label	Type	Description
76,77, 78,80, 81,84, 85,87, 88,89, 90,91, 93,94, 95,96,	P0_LINK~ P15_LINK	O	Direct LED link/activity for port0~15 The LED should be connected to 3.3V VCC through a 220 ohm resistor.

4.8 Miscellaneous Pin Description

Table 9 Miscellaneous Pin

Pin No.	Label	Type	Description
67	X1	I	Crystal/ Oscillator 25MHz input
66	X2	O	Crystal output
68	RESETB	I	System reset (low active) Should be kept at "low" for at least 10 microseconds. The input voltage should be not higher than VDDIO.
91	INTR	O	Interrupt output. Active low
101	SCAN_MODE	I	Scan mode for testing

Pin No.	Label	Type	Description
100	SELF_TEST	I	Self test for switch mass production test The detail refer to chapter 5.14
17	BGRES	I	Band gap reference voltage It must be pull down by 6.19K ohm resistor.

4.9 Power & Ground Pin Description

Table 10 Power & Ground Pin

Pin No.	Label	Type	Description
38,49,79, 86,97,102, 115,128	DVDD	P	1V power for Core circuit
1,12,23, 33,44,54, 65,103, 114,116, 127	AVDD	P	1.9V power for analog circuit

4.10 Power on Setting

The state of these pins will be latched upon reset.

Table 11 Power on Setting

Pin No.	Label	Type	Description
69	Test mode enable	IL, PD	Test mode enable 0 : disable (default) 1 : enable If an external pull up resistor is used, it should be connected to VDDIO.
80	valid_learn	IL, PU	LUT entry overwrite method select 0 : write when entry is empty 1 : overwrite (default) The setting can be updated with register 0x8B[8]

Pin No.	Label	Type	Description
78	blink_time	IL, PU	LED blink time select 0 : 120 ms 1 : 40ms (default) The setting can be updated with register 0x54[3]
77	oq_aging_dis	IL, PU	Output queue aging time disable 0 : disable 1 : enable (default) The setting can be updated with register 44h[8]
76	rg_xen_on	IL, PU	Auto turn off flow control if priority queue 0 : enable 1 : disable (default) The setting can be updated with register 01h[7]
81	N_P17_force_link	IL, PU	Port 17 force link 0 : P17 force to link 1 : P17 is not force to link (default) The setting can be updated with register 61h[5]
91 93	led_mode0 led_mode1	IL, PU	LED mode selection led_mdoe1 led_mode0 0 0 : 2-bit serial LED mode 0 1 : 3-bit serial LED mode 1 0 : 3-bit serial bi-color LED mode 1 1 : direct LED mode (default) The setting can be updated with register 54h[1:0]
94	mode_select	IL, PU	Special mode select 0 : normal mode 1 : special mode (default)
95	bpdu_bcst_on	IL, PU	Broadcast the packet with MAC destination address 01-80-c2-00-00-04 ~ 01-80-c2-00-00-0F 0 : do not broadcast BPDU packets 1 : broadcast BPDU packets (default) The function can be updated with register 01h[2]
96	igmp_dis	IL, PU	IGMP disable 0 : enable IGMP function 1 : disable IGMP function (default) The setting can be updated with register 94h[0].
98	auto_slew	IL, PU	PAD auto slew rate 0 : disable 1 : enable (default)

Pin No.	Label	Type	Description
99	P17_full_duplex	IL, PU	Port 17 duplex mode select 0 : half duplex 1 : full duplex (default) The setting can be updated with register 0x5A[8].

5 Function Description

5.1 Switch Engine and Queue Management

5.1.1 Packet Forwarding

IP1717B utilizes the “store & forward” method to handle packet transfer. IP1717B begins to forward a packet to a destination port after the entire packet is received. A received packet will be forwarded to the destination port only if it is error free; otherwise, it will be discarded.

5.1.2 Address Learning and Hashing

Related registers	0x82[0] , 0x8A , 0x8B
-------------------	---

IP1717B can handle up to 8192 MAC address entries for 2 layers, 4096 MAC address entries per layer. It provides two kinds of hashing method to maintain the MAC address table. One is the direct mapping and the other is the CRC algorithm. When the direct mapping method is selected, register 0x82[0] is set to “0”. IP1717B recognizes the least significant 12 bits of the MAC address. When the CRC algorithm is used, register 0x82[0] is set to “1” IP1717B uses 48-bit MAC address to hash out 12bits access address.

The MAC address learning function for each port can be either enabled or disabled by setting the registers 0x8A[15:0] and 0x8B[7], and all zero pattern with MAC address can choose learning to MAC address table or not by setting register 0x8B[10] if the MAC address learning function is enabled.

IP1717B provide 2 layers LUT table with three methods can be selected. The first method is overwrite LUT even when the entry is valid, which can be enabled by programming register 0x8B[9:8] to ‘00’. The second method is do not overwrite LUT before aging out, which can be enabled by programming register 0x8B[9:8] to ‘01’ or ‘10’. The third method is only overwrite the second layer LUT before aging out, which can be enabled by programming register 0x8B[9:8] to ‘11’.

The packet with any the following conditions will not be stored in MAC address table.

- Erroneous packet
- 802.3x pause packet(option)
- 802.1D Reserved Group packet(option)
- Multicast source MAC address

5.1.3 Aging Time

5.1.3.1 Address Aging

Related registers	0x82[1] , 0x89[14:0]
-------------------	--

IP1717B supports programmable aging time to meet various system requirements, ranging from 27.6 sec to 904396.8 sec ±3.8%. The designer can program aging time by writing register 0x89[14:0]. The address aging function can be disabled by programming register 0x82[1] to “1”.

5.1.3.2 Packet Aging

Related registers	0x44[5:0] , 0x44[8]
-------------------	---

IP1717B supports packet aging (out queue aging). If a packet stays in IP1717B longer than the aging time defined in register 0x44[5:0], IP1717B will drop the packet to improve the efficiency of packet buffer. The packet aging function can be enabled by programming register 0x44[8] to “1”.

5.1.4 802.1D Packet Forwarding

Related registers	0x01[2] , 0x02[1:0] , 0x02[12]
-------------------	--

Besides the erroneous packet and the IEEE802.3x pause packet, the 802.1D Reserved Group packet with MAC address from 01-80-c2-00-00-04 to 01-80-c2-00-00-0f can be optionally dropped when register 0x01[2] is set to “0”. A packet with MAC address equal to 01-80-c2-00-00-00 can be forwarded to CPU or be dropped according to the setting in register 0x02[0]. A packet with MAC address equal to 01-80-c2-00-00-03 can be forwarded to CPU or be dropped according to the setting in register 0x02[1]. A packet with MAC address equal to 01-80-c2-00-00-02 can be forwarded to CPU or be dropped according to the setting in register 0x02[2].

IP1717B provides another option to forward the special 802.1D Reserved Group when register 0x02[12] is set to “1”. The detail configuration is shown in the table below.

Table 12 802.1D Reserved Group Packet Forwarding

Multicast MAC address	Normal mode Reg 0x02[12]=0	Special mode Reg 0x02[12]=1
01 80 C2 00 00 00	Pass Through	Pass Through
01 80 C2 00 00 01	Drop	Drop
01 80 C2 00 00 02	Drop	Drop
01 80 C2 00 00 03	Pass Through	Pass Through
01 80 C2 00 00 04~0D	Pass Through	Drop
01 80 C2 00 00 0E	Pass Through	Pass Through
01 80 C2 00 00 0F	Pass Through	Drop
01 80 C2 00 00 10	Pass Through	Drop
01 80 C2 00 00 21	Pass Through	Drop
01 80 C2 00 00 30~3F	Pass Through	Pass Through

5.1.5 Inter Frame Gap Compensation

Related registers	0x01[1:0]
-------------------	---------------------------

IP1717B supports an option to transmit a packet with IPG shrunk 40 ppm, 80 ppm or 160 ppm to compensation the data accumulation due to TX clock frequency difference between local machine and link partner. Programming register 0x01[1:0] can turn on this function.

5.1.6 Flow Control

IP1717B supports two kinds of flow control mechanisms, backpressure for half duplex operation and IEEE802.3x pause frame mechanism for full duplex operation.

5.1.6.1 IEEE802.3x

Related registers	0x5B~0x5E
-------------------	---------------------------

When operating in full duplex mode, IP1717B supports IEEE802.3x flow control with both symmetric pause and asymmetric pause function. Each port's flow control function can be enabled individually by programming registers 0x5B~0x5E. When packets in the buffer reach the threshold, IP1717B generates a "Xoff" pause packet immediately or right after the current packet has been transmitted. When receiving a pause packet, the link partner stops transmission for a period of time defined in the pause packet. This prevents the buffer of IP1717B from overflow. When the packets in buffer lower than threshold, IP1717B generates a "Xon" pause packet to notify the link partner the receive buffer is available.

5.1.6.2 Backpressure

Related registers	0x5F , 0x60 , 0x01[4:3]
-------------------	---

In half duplex mode, the IP1717B supports backpressure flow control. Each port's backpressure function can be enabled individually by programming registers 0x5F and 0x60. When the packets in buffer reach the threshold, IP1717B generates a jam pattern to back off the link partner. IP1717B supports the collision based and carrier-sense based backpressure. When the collision based backpressure is enabled, setting register 0x01[3] to "1", IP1717B generates a jam pattern only when the link partner is transmitting data and the receive buffer in IP1717B is not available. When detecting a collision on line, the link partner stops transmission until a back off time expires. When the carrier-sense based backpressure is enabled, register 0x01[3] is set to "0", and IP1717B transmits null packets continuously to prevent link partner's transmission when the buffer is not available.

To prevent the packet loss due to excessive collision caused by backpressure mechanism, designer can clear bit 4 of register 0x01 to disable the 16 consecutive collisions drop function defined in IEEE802.3.

5.1.6.3 Flow Control Off For High Priority Packet

Related registers	0x01[7]
-------------------	-------------------------

To prevent the flow control function from blocking the high priority traffic, each port of IP1717B can turn off flow control function for a period of time automatically when receiving a high priority packet. This function can be enabled by writing "0" to register 0x01[7].

5.1.6.4 Pause Frame with Invalid Uni-case DA

Related registers	0x02[8] , 0x3A~0x3C
-------------------	---

IP1717B provide one option that can be selected for pause frame type. If an incoming packet with pause frame type, however, the destination is not equal to the pause frame DA (01-80-c2-00-00-01) and the MAC address defined in registers 0x3A~0x3C. The designer can select two kinds of method. One is that the packet will be dropped by programming register 0x02[8] to '0'; the other is that the packet will be transmitted by programming register 0x02[8] to '1'.

5.1.7 Bandwidth Control

Related registers [0x05~0x1D](#), [0x01\[6\]](#)

IP1717B implements a sophisticated data rate control mechanism, which is very useful for the bandwidth-limited network. By controlling both the ingress and the egress data rate, IP1717B provides a variety of bandwidth configurations. It limits the maximum byte counts, for each port to send or receive packets. If the transmit byte counter or receive byte counter of a port reaches a pre-defined threshold, it will stop transmitting or receiving data.

Each port's egress/ingress data rate can be programmed individually. The maximum rate of port 1 to port 17 is defined in registers 0x05~0x1D. The higher byte of the registers defines the reception rate and the lower byte defines the transmission rate. The register 0x01[6] defines the high/low throttle value used in bandwidth control function. It should be noticed that once the rate has been set, it would be independent of the status of link speed and flow control. The detail configuration is shown in the table below.

Table 13 Bandwidth Throttle Selection Table

H/L throttle	Maximum output rate (transmit rate)	Maximum input rate (receive rate)
0x01[6]=0	Bit[7:0] * 32 kbps	Bit[15:8] * 32 kbps
0x01[6]=1	Bit[7:0] * 512 kbps	Bit[15:8] * 512 kbps

5.1.8 Broadcast Storm Control

Related registers [0x82\[3:2\]](#), [0x86](#), [0x87](#)

To prevent the broadcast storm, the IP1717B implements a broadcast storm control mechanism. By enabling this function, a port begins to drop the incoming broadcast packets if the received broadcast packet counter reaches the threshold defined in register 0x87[14:9]. Besides the DA equaling ff-ff-ff-ff-ff-ff, IP1717B supports broadcast storm type selection. The multicast patterns can also be regarded as broadcast packets when register 0x82[2] is set to "1", and the unknown DA patterns can also be regarded as broadcast packets when register 0x82[3] is set to "1". Each port's broadcast storm protection function can be enabled individually by programming registers 0x86 and 0x87[8]. IP1717B also provides two kinds of period to be selected with register 0x87[15]. The detailed configuration is shown in the following table.

Table 14 Broadcast Storm Counter Clear Period Selection Table

0x87[15]	100Mbps	10Mbps
0	500us	5ms
1	10ms	100ms

5.1.9 Block Broadcast Frames to CPU Port

Related registers [0x70\[0\]](#), [0x82\[4\]](#), [0x82\[6\]](#)

IP1717B supports an option to block broadcast frames to CPU port. To enable the function, the designer has to assign port 17 as a CPU port by programming register 0x70[0], and then turn on the function by programming register 0x82[4] to "1". When this function is enabled, IPv4 can be still forwarded to CPU port, if register 0x82[6] is set to "1".

5.1.10 ARP and ICMP Storm Control

Related registers	0x88
-------------------	----------------------

To prevent the ARP and ICMP storm, IP1717B implement ARP and ICMP storm control mechanism. When these function is enabled by programming registers 0x88[3] and 0x88[11], a port begins to drop incoming ARP packets if the received ARP packet counts reach the threshold defined in register 0x88[2:0]; a port begins to drop the incoming ICMP packets if the received ICMP packet counts reach the threshold in register 0x88[10:8]. Besides, IP1717B provides two kinds of period to be selected with registers 0x88[4] and 0x88[12].

5.1.11 Block ARP to CPU Port

Related registers	0x70[0] , 0x82[5]
-------------------	---

IP1717B supports an option to block ARP frames to CPU port. To enable the function, the designer has to assign port 17 as a CPU port by programming register 0x70[0], and then turn on the function by programming register 0x82[5] to "1".

5.1.12 Reduce IPG And Preamble For CPU Port

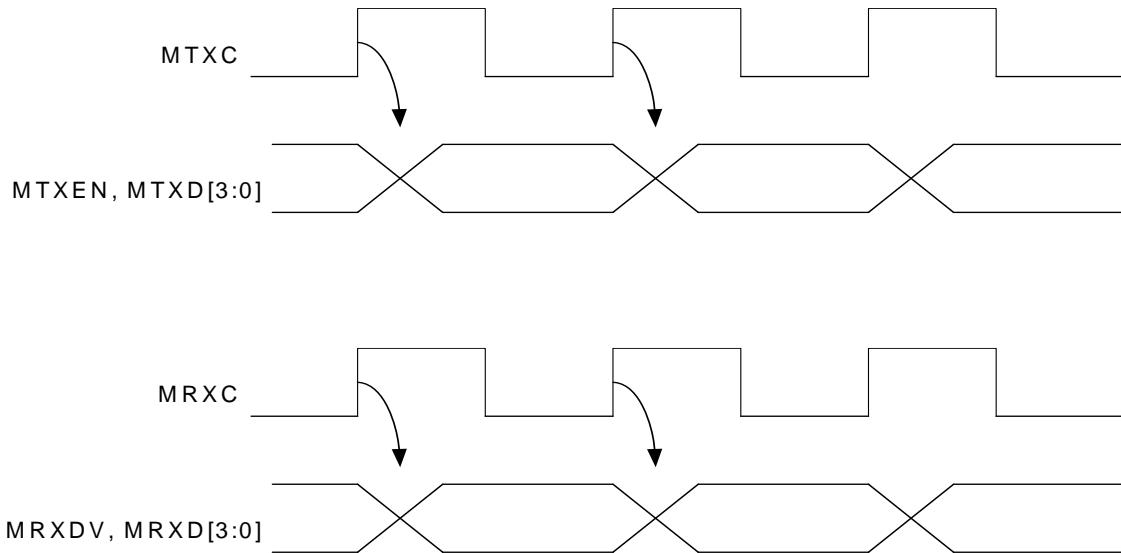

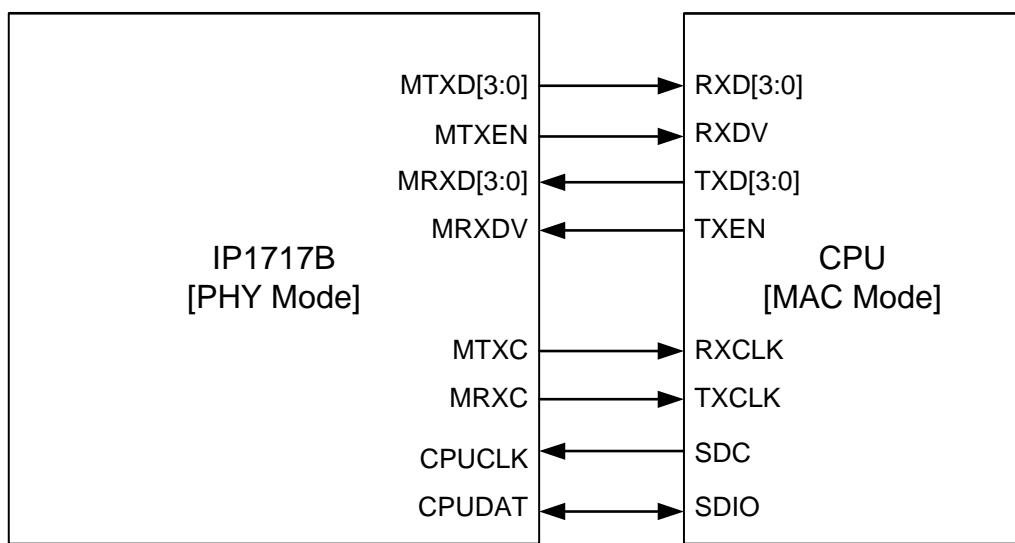

Related registers	0x02[11:10]
-------------------	-----------------------------

At some time, for example while transmitting the packets to CPU port and add special tag. Make IP1717B difficult to transmit packets to CPU at wire speed. IP1717B provides two alternatives for solving this problem. One alternative is to reduce the IPG of packets transmitted to CPU port, from 96 bit time to 64 bit time by programming register 0x02[10] to '1'. The other alternative is to reduce the preamble of packets transmitted to CPU port, from 8 bytes to 4 bytes by programming register 0x02[11] to '1'.

5.2 MII Interface

IP1717B sends out data MTXEN and MTXD[3:0] at the rising edge of MTXC when works in MAC mode and falling edge in PHY mode. By recognizing the MTXEN and MTXD[3:0], an external CPU can capture the correct data stream.

An external CPU sends out data MRXD[3:0] and control signal MRXDV at the rising edge of MRXC. By recognizing the MRXDV, MRXD[3:0], IP1717B can capture the correct data stream. IP1717B samples the correct data at the rising edge of MRXC.

Figure 5 MII Timing**Figure 6 MII Interface**

5.3 CPU Interface

There is no need to program the register of the IP1717B for the generic application. However it's probably necessary to program the internal register to fit some special applications. The interface between the IP1717B and the CPU is a serial bus, which comprises a clock and an I/O signal. Like the access cycle of the serial management interface, the serial interface comprises the switch ID, the read/write command, the address and the data. The access cycle is depicted as below.

The access cycle is much like the access cycle of MDC, MDIO. Care should be taken that the switch ID is 2-bit wide rather than 5-bit wide.

Figure 7 CPU Read Data Format

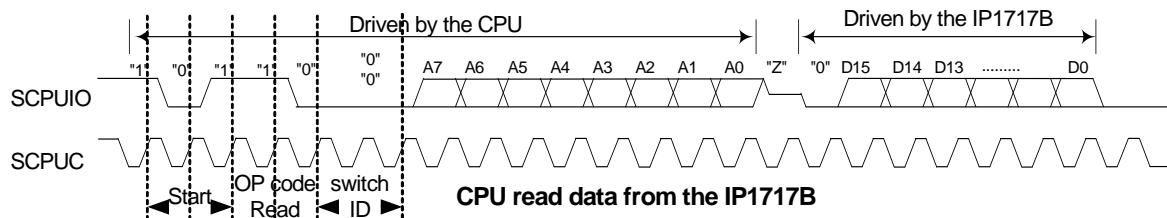

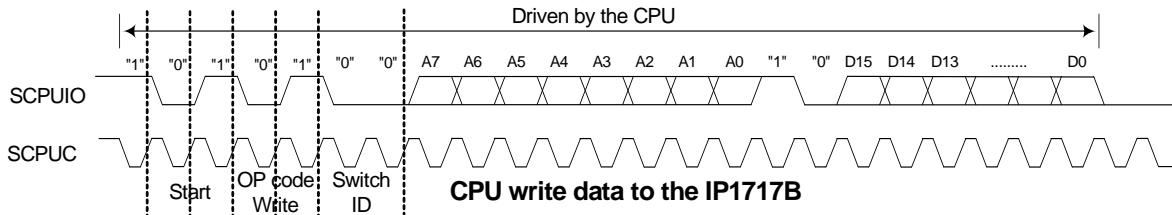

Figure 8 CPU Write Data Format

5.4 Configure the Port Properties

Related registers	0x55~0x60 , 0x65~0x6A , 0x6D
-------------------	--

The designer can configure properties of each port through the CPU interface. The designer can set the auto-negotiation, speed, duplex, pause, and backpressure function by writing registers 0x55~0x60.

The designer can get the status of a port by reading registers 0x65~0x6A and 0x6D. These registers provide the status of asymmetric pause, pause, duplex, speed and link of each port.

5.5 Force Link

Related registers	0x61[6:0] , 0x58[8] , 0x5A[8]
-------------------	---

IP1717B supports force link function for port 17. Port 17 can be configured individually by programming register 0x61[5], and can access CPU port PHY address by programming register 0x61[4:0]. This function is useful when IP1717B is connected to a CPU, which doesn't support SMI. In this case, IP1717B can't get the link status and will not transmit/receive packets through this port. The force link function will keep this port active regardless of the link status. Besides, IP1717B provides other

operation mode, which can be enabled with register 0x61[6] to judge link status by polling status or by registers 0x58[8] and 0x5A[8] of port 17 with link partner.

5.6 Read/Write Address Table (LUT)

Related registers	0xF5 ~ 0xF8
-------------------	---

The designer can access IP1717B's MAC address table, including 8192 entries. To write an entry to the MAC address table, the designer has to fill the 47-bit data to registers 0xF6~0xF8 and then specifies the address of the entry and issues a write command by programming register 0xF5. To read an entry from MAC address table, the designer has to specify the address of the entry and issues a read command by programming register 0xF5. The entry can be read from registers 0xF6~0xF8.

Because IP1717B builds and accesses the MAC address table with the address derived with hashing algorithm, designer has to calculate the address of an entry in the same way before accessing the table. That is, if direct hashing is selected, the address of an entry is the 12 LSB of a MAC address. If CRC hashing is selected, the address of an entry is the 12 LSB of CRC calculation result of a MAC address.

5.7 Read/Write PHY Register

Related registers	0x63 , 0x64
-------------------	---

The designer can access the register of a PHY connected to IP1717B through CPU I/F. To read a register of a PHY, the designer has to specify the PHY address and the MII register address and then issues a read command by programming register 0x63. The content of the register can be read from register 0x64. To write a register of a PHY, the designer has to specify the PHY address and the MII register address and then issues a write command by programming register 0x63. The write data should be written by programming register 0x64 before issuing a write command.

The associated PHY address from port 1 to port 16 is "8" to "23", the port 17 PHY address is "1" by default.

5.8 Read/Write EEPROM

Related registers	0x78 , 0x79
-------------------	---

The designer can access the EEPROM through CPU I/F. To read one byte from EEPROM, the designer has to specify the byte address and device address and then issues a read command by programming register 0x78. The data can be read from register 0x79. To write one byte to EEPROM through CPU I/F, designer has to specify the byte address and device address and then issues a write command by programming registers 0x78. The write data should be written by programming register 0x79 before issuing a write command.

5.9 EEPROM Interface

IP1717B supports EEPROM I/F to access 24C02/04/08/16. After detecting the rising edge of a reset input, IP1717B will start to read the content of EEPROM (acting like an EEPROM master). Being an EEPROM master, IP1717B provides two kinds of mode to download the content of EEPROM. The content of the first byte should be "25h" to be identified as IP1717B EEPROM. If the content of the

second byte is “0x0A”, it runs with continuous mode. If the content of the second byte is “0x0B”, it runs with command mode.

In the continuous mode, IP1717B will read the EEPROM address from 00h to 1FFh and map the read data into correspond registers.

In the command mode, one command occupies 4 EEPROM bytes. The content including 2 bytes address and 2 bytes data can be access by programming registers 0x78 and 0x79. The address byte equaling to “0xFF” means the end of command and IP1717B will stop the EEPROM reading. If the end of command is not set, IP1717B will read EEPROM until no acknowledge.

The mapping relationship between the IP1717B registers and the EEPROM address are depicted as the following table.

Table 15 Continuous Mode Format of EEPROM

Continuous mode		
EEPROM address	EEPROM content	IP1717B's Register
0x00	0x25	XX
0x01	0x0A	XX
0x02	Expected value	0x01[15:8]
0x03	Expected value	0x01[7:0]
0x04	Expected value	0x02[15:8]
0x05	Expected value	0x02[7:0]
---	---	---
0x1FC	Expected value	0xFE[15:8]
0x1FD	Expected value	0xFE[7:0]
0x1FE	Expected value	0xFF[15:8]
0x1FF	Expected value	0xFF[7:0]

Table 16 Command Mode Format of EEPROM

Command mode		
EEPROM address	EEPROM content	IP1717B's Register
0x00	0x25	XX
0x01	0x0B	XX
0x02	Expected value	0x00
0x03	Expected value	Addr[a]
0x04	Expected value	Data[15:8]
0x05	Expected value	Data[7:0]
0x06	Expected value	0x00
0x07	Expected value	Addr[b]
0x08	Expected value	Data[15:8]
0x09	Expected value	Data[7:0]
---	---	---
XX	Expected value	0x00
XX	Expected value	0xFF

Note:

1. EEPROM ID should be set to “3'b000”; i.e. A2=0; A1=0; A0=0
2. IP1717B downloads the content of EEPROM ranging from address 0x00 to 0x1FF; i.e. the register beyond this range is not recognized by IP1717B.
3. The ID for IP1717B recognition should be set at address 0x00 as shown in the table.
4. In command mode, only one byte is used to be the address data. The extra address byte can be used by user defined.

5.10 Statistic Counter

Related registers	0x01[9:8] , 0x3D~0x41
-------------------	---

IP1717B provides 34 statistic counters, two counters for each port. These counters are enabled if register 0x01[9] is set to “1”. The designer can select the function of counters to be RX packet count, TX packet count, collision count, packet drop count, or CRC error count by programming register 0x01[8], and registers 0x40 and 0x41. Each bit of registers 0x40 and 0x41 is corresponding to one port individually as shown in the following table.

Table 17 Port Statistic Counter Selection Table

The function of counters of one port		
0x01[8], one bit of 0x40 and 0x41	Counter 0(even addr)	Counter 1(odd addr)
0,0	Receive packet count	Transmit packet count
0,1	Transmit packet count	Collision count
1,0	Receive packet count	Packet drop count (MAC)
1,1	Receive packet count	CRC error packet count

To read the content of a counter, the designer has to specify the address of counter in register 0x3D[5:0] and issues a read command by setting register 0x3D[8]. The content of the counter can be read by accessing registers 0x3E and 0x3F. The address of counter of each port is shown in the following table.

Table 18 Address Format of Port Statistic Counter

Address of counter (0x3D[5:0])	Location of counter
0	Port 1 counter 0
1	Port 1 counter 1
2	Port 2 counter 0
3	Port 2 counter 1
---	---
30	Port 16 counter 0
31	Port 16 counter 1
48	Port 17 counter 0
49	Port 17 counter 1

5.11 Interrupt

Related registers [0x74](#), [0x75](#)

IP1717B provides one interrupt pin to indicate status change. When one of the following conditions happen, IP1717B will asserts the interrupt pin if the function is enabled.

1. A CPU R/W SMI command is completed
2. A CPU R/W EEPROM command is completed
3. Link status changes on the PHY of any port

By programming the corresponding bit of register 0x74, the interrupt mask register, can enable an interrupt function. The designer can read register 0x75 to identify the interrupt source.

5.12 802.3 OAM LoopBack

Related registers [0xFE](#), [0xFF](#)

IP1717B provides two kinds of 802.3 OAM loopback modes; one is the passive mode and the other is the active mode.

When the passive mode is selected, register 0xFF[8] is set to '0'. The packets with the following features:

1. In the OAM loopback ports, every frame received is transmitted back on that same port except pause frames and OAM frames.
2. Other ports send frame to OAM loopback port will be dropped.
3. CPU port can send OAM packets to specific OAM loopback port if CPU port is enabled.
4. OAM loopback ports send OAM packet to CPU port only.

When the active mode is selected, register 0xFF[8] is set to '1'. In the OAM loopback ports, the general packets will be dropped; OAM packets will be forwarded to CPU port only if register 0x02[2] is set to '1'.

Each bit of register 0xFE is corresponding to one port can be enabled individually.

5.13 LED Description

5.13.1 LED Mode Setting

Related registers	0x54
-------------------	----------------------

IP1717B supports serial LED mode and direct LED mode for display statuses of each port. The formats of LED display mode are shown below controlled by setting register 0x54[1:0]. All LED statuses are represented as active-low under 3 bit and 2 bit serial modes, except Link/Act whose polarity depends on speed status in bi-color mode or those LED pins whose polarity depends on the initial setting of pin under direct mode.

Table 19 LED Display Selection Table

Reg 0x54[1:0]	Mode	Output sequences (pins)
11	Direct mode	Link/Act
10	3-bit for serial mode bi-color mode	Col/Dupx, (Link/Act)/(Spd)
01	3-bit for serial mode	Col/Dupx, Link/Act, Spd
00	2-bit for serial mode	Spd, Link/Act

Table 20 LED Indication Table

LED indication	Description
Col/Dupx	Collision and Duplex Indicator. This LED blink rate depends on led_blink_rate setting by register 0x54[3:2] when collision happens. This function can disable by register 0x54[6] is set to "1". In duplex indicator, low for full duplex mode, and high for half duplex mode.
Link/Act	Link and Activity Indicator. For 3-bit serial stream mode, low for link established. For 3-bit bi-color LED mode and 100Mb/s, the Link/Act is high for link established. For 3-bit bi-color LED mode @ 10Mb/s, the Link/Act is low for link established. This LED blink rate depends on led_blink_rate setting by register 0x54[3:2] when the corresponding port is transmitting or receiving. This function can disable by register 0x54[7] is set to "1".
Spd	Speed Indicator. Low for 100Mb/s, and high for 10Mb/s.

5.13.2 LED Blink Rate Setting

IP1717B provides four kinds of LED blink rate setting through register 0x54[3:2]. The LED's blink rate of the Col/Dupx and the Link/Act will change according to register 0x54[3:2] setting. The detailed configuration is shown in the following table.

Table 21 LED Blinking Rate Selection Table

Reg 0x54[3:2]	LED blinking rate
00	40 ms
01	80 ms
10	120 ms
11	160 ms

5.13.3 LED Clock Rate Setting

IP1717B provides four kinds of clock rate setting through register 0x54[5:4]. The detailed configuration is shown in the following table.

Table 22 LED Clock Rate Selection Table

Reg 0x54[5:4]	LED clock rate
00	781 KHz
01	2.5 MHz
10	5 MHz
11	10 MHz

5.13.4 Serial Stream Mode

Bits stream are output sequentially from port 17 to port 1. For 2-bit serial stream mode, the sequence is Spd at first and then Link/Act. For 3-bit serial stream mode, the sequence is Col/Dupx, Link/Act, and then Spd.

5.13.5 Direct LED Mode

IP1717B also supports direct LED mode by setting register 0x54[1:0] to “11”, bits stream are output directly from port 1 to port 16. In this mode, Link/Act is available only.

Figure 10 External TTL for 2-bit Serial Stream LED Mode

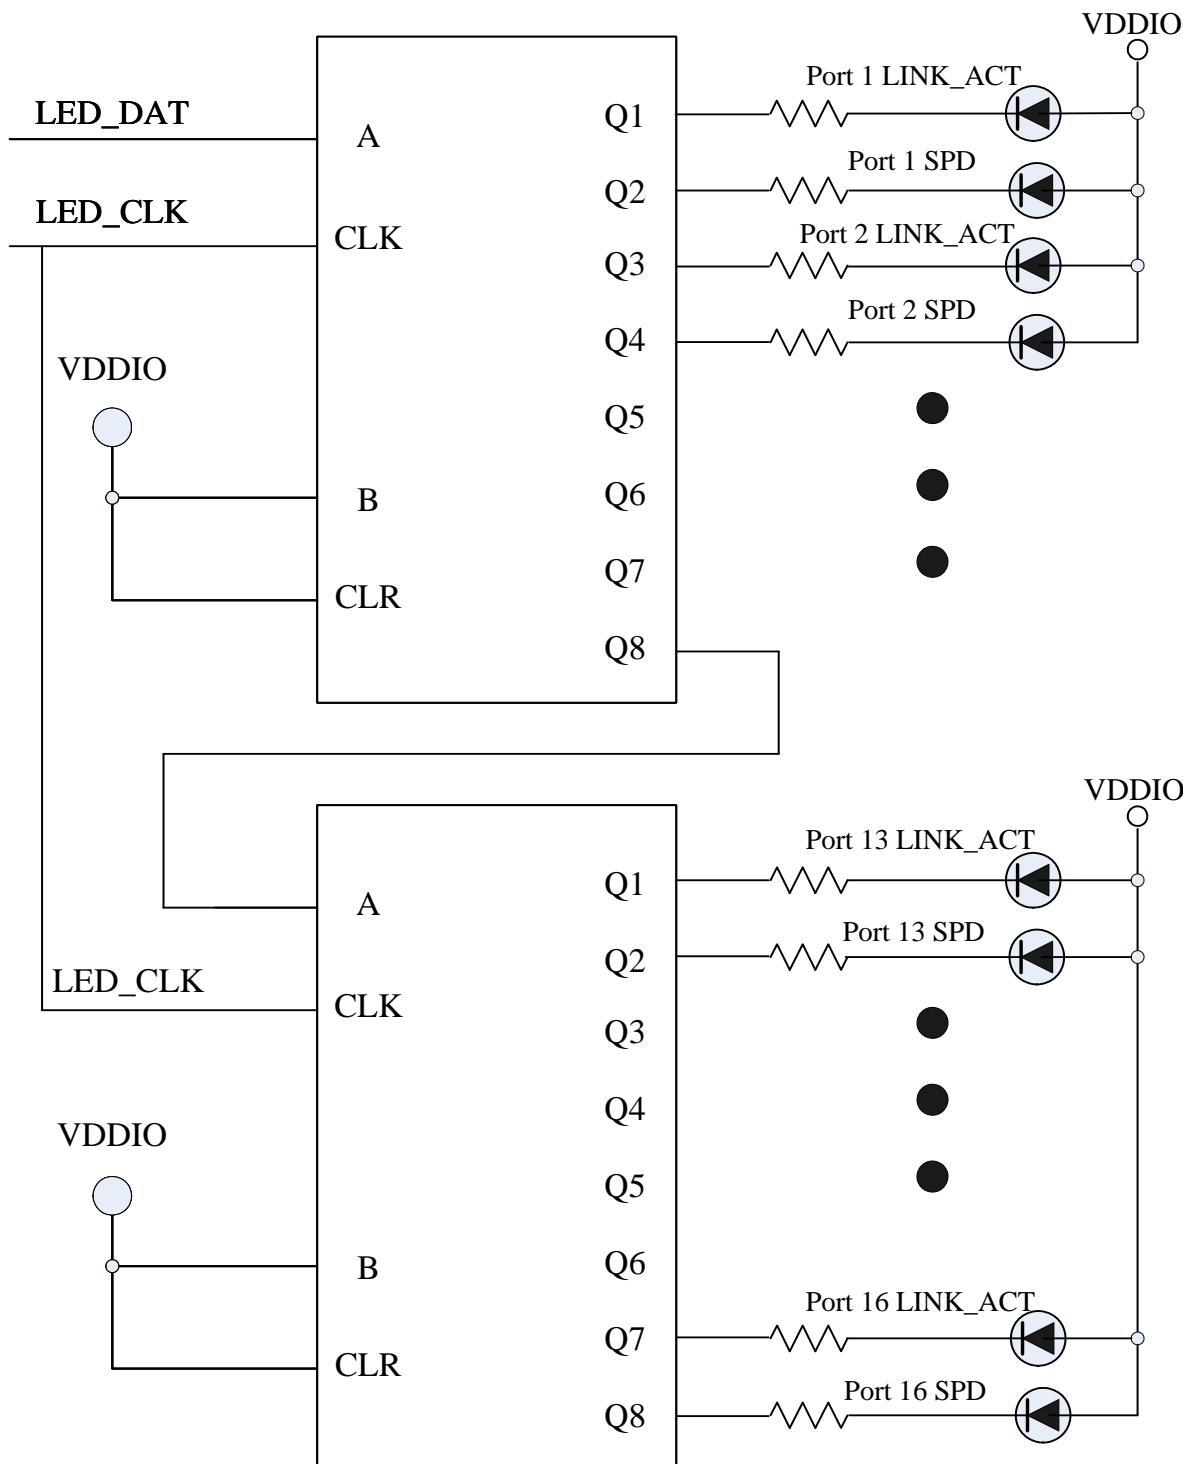

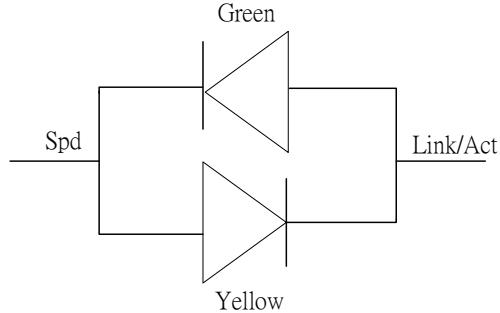

**External TTL for 2 Bit Serial Stream LED Mode**

Figure 11 3-bit Bi-color Serial Stream LED Mode**Table 23 Bi-color Serial Stream LED Status Table**

Spd	Link/Act	LED indication	Bi-color state
0	0	Unlink	Dark
1	1	Unlink	Dark
0	1	100Mbps Link	Green is light
0	1-0-1-0...	100Mbps Link and Active	Green is blinking
1	0	10Mbps Link	Yellow is light
1	0-1-0-1...	10Mbps Link and Active	Yellow is blinking

5.14 Selftest Mode

IP1717B implements a selftest mode mechanism, which is very useful for switch mass production test. When this function is triggered by switch hardware pin of 100, IP1717B physical ports are connected to port-pairs loopback and then IP1717B will generator frames for TX of all ports. The test will be the light-on period changing to the light-off period for 2 seconds; show result for 4 seconds following light-off for 1.5 seconds; then finish selftest mode. For example, when port 1 and port 2 are connected to loopback and selftest function is triggered. In first time, show LED test result are light-on for port 1 and port 2. The test result is pass. If show test result are light-off. The test result is fail.

5.15 VLAN

IP1717B supports port based VLAN and tag based VLAN as the function described below.

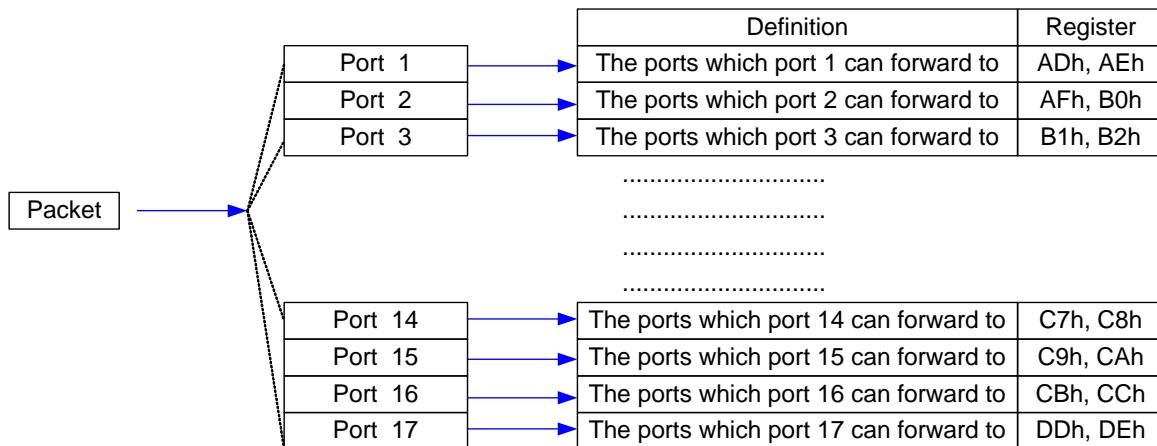

5.15.1 Port Based VLAN

Related registers	0x82[7] , 0xAD~0xCC , 0xDD , 0xDE
-------------------	---

IP1717B provides various port-based VLAN configurations. The designer can enable the function by programming register 0x82[7] to “0”. For each port, there are two registers to describe its port-based VLAN configuration. The overall numbers of VLAN group that IP1717B can support are “17”. The VLAN group can be defined in registers 0xAD~0xCC, 0xDD and 0xDE.

Take the following example for the detail description. The data incoming from port 1 will be forwarded to the corresponding port defined in registers 0xAD and 0xAE. For example, if register 0xAD and 0xAE are written with 16'h000F and 16'h0100, the packet from port 1 can be forwarded to port 2/3/4 and port 17 only. Similarly, the forwarding rule for the data incoming from port 2 will refer to the register 0xAF and 0xB0. The forwarding rule for the data incoming from port 17 will refer to the register 0xDD and 0xDE.

Table 24 VLAN Group Definition

Note: The port ID is counted from 1 to 17.

5.15.2 Tag Based VLAN

Related registers	0x82[7] , 0x9B~0xA0 , 0xA3 , 0xAD~0xEC , 0xFA , 0xFC
-------------------	--

IP1717B provides a 32-entry VLAN table, including VID entries from 0 to 31, to support 32 active VLANs out of 4096 VLANs defined in IEEE802.1Q. The designer can define 32 VID entries in the VID table and enable the tag-based VLAN function by programming registers 0xFA and 0xFC, and the register 0x82[7] is set to “1”. When a tagged packet is received, IP1717B compares the tag in the packet with the one defined in the VID table. If it does not match, IP1717B drops the packet. If it matches, IP1717B uses the corresponding index to check out one of the 32-entry in the VLAN table, which is defined in registers 0xAD~0xEC, as an output port mask. Finally, a set of ports to which the packet can be forwarded. IP1717B forwards the packet according to MAC address and the output port mask. If the

source port is not one of the members in the VLAN table entry, refer to 1.15.7. It is note that registers 0xAD~0xEC define port-based VLAN configuration and tag-based VLAN table entries.

When an un-tagged packet is received, IP1717B uses the default PVID for the source port as an index to the VID of the packet. The default PVID index of a port is defined in the registers 0x9B~0xA0 and 0xA3. IP1717B forwards the packet in the same way as mentioned above. For example, if port 1 receives a un-tag packet, IP1717B adopts the PVID index of port 1 defined in bit [4:0] of register 0x9B to select one of the VLAN table defined in registers 0xAD~0xEC. The priority tag packet (with VID equal to "000h") is handled as an un-tagged packet. More VLAN functions described below.

5.15.3 VLAN Function

Related registers	0x47 , 0x48 , 0x82 [12:11], 0x97 ~0x9A, 0x9B ~0xA0, 0xA3 , 0xA4 ~0xA8, 0xFA , 0xFC
-------------------	--

5.15.3.1 Add/Modify VLAN Tag

IP1717B supports two kinds of method to insert a tag to a frame, if the tag function is enabled. One is the port-based tagging function, which is enabled if register 0x82[11] is set to '0' and the corresponding bits in registers 0x97 and 0x98 are set. The other is VID-based tagging function which is enabled if register 0x82[11] is set to '1', and the designer must go to VID_TAG entry table to set up through registers 0xFA and 0xFC.

A set port always adds a tag to a forwarding packet with "8100" + PRI + VID selected by PVID. The PRI tag information is defined in registers 0xA4~0xA8; the VID tag information must go to VID_TAG entry table to read the value through registers 0xFA and 0xFC, and the PVID for each port is defined in registers 0x9B~0xA0 and 0xA3. A packet with VID equal to 12'b0 will be handled as un-tag frame.

When tag insertion is needed, the designer will select the insertion of PRI and PVID is according to the source port or the output port. Each bit of registers 0x47 and 0x48[8] is refer to each port.

5.15.3.2 Remove VLAN Tag

IP1717B supports two kinds of method to remove a tag of a frame if un-tagging function is enabled. One is the port-based un-tagging function of which is enabled if register 0x82[11] is set to '0' and the corresponding bits in registers 0x99 and 0x9A are set. The other is VID-based un-tagging function which is enabled if register 0x82[11] is set to '1', and the designer must go to VID_TAG entry table to set up through registers 0xFA and 0xFC. A set port always removes a tag from a forwarding packet.

In the VID-based tagging function mode, regardless of inserting tag or removing tag, don't modify tag if packets send to CPU port by programming register 0x82[12] to "0".

The operation is illustrated as follows. It is note that the VID defined in VLAN entry table for tagging is also used for 802.1Q tag-based VLAN.

Table 25 Forward the Packet with VLAN Configuration Table

Frame type of the received packet	The operation on a switch with VLAN configuration	
	Forward to a untagged field	Forward to a tagged field
Untagged	Forward the packet without modification	<ol style="list-style-type: none"> Insert a tag using the default VLAN tag value of the source or output port Calculate new CRC The default VLAN tag value is defined in the registers 0x9B~0xA0 and 0xA3.

Priority-tagged (VLAN ID=0)	1. Strip tag 2. Calculate new CRC	1. Keep priority field. 2. Replace the tag with the default VLAN tag value of the source or output port 3. Calculate new CRC 4. The default VLAN tag value is defined in the registers 0x9B~0xA0 and 0xA3.
VLAN-tagged	1. Strip tag 2. Calculate new CRC	Forward the packet without modification

Figure 12 Frame Format of Inserting VLAN or Special Tag

An packet without tag

An packet with VLAN tag

An packet with special tag and VLAN tag

5.15.4 Packets across a VLAN

Related registers [0x82\[8\]](#)

In the normal case, a packet is not allowed to be forward across a VLAN. That is, if the destination port does not belong to the same VLAN, the packet will be dropped. IP1717B provides a VLAN option to allow uni-cast packets to stride across a VLAN. This function is enabled by set bit 8 of the register 0x82.

5.15.5 VLAN up Link

Related registers [0x82\[9\], 0x8D, 0x8E](#)

Under the normal operation, if a destination port and a source port are in different VLAN, the packet will be dropped.

IP1717B supports an option to allow this dropped packet be sent to the specified up-link port if register 0x82[9] is set to "1". The up-link port is defined in registers 0x8D and 0x8E.

5.15.6 Force The Incoming Packet Use PVID

Related registers [0xA9, 0xAA](#)

IP1717B provides another kind of the mechanism for the packet forwarding. The designer can force the incoming packets to use the PVID index to search the VLAN entry, when registers 0xA9 and 0xAA are enabled. Each bit of registers 0xA9 and 0xAA is corresponding to one port can be enabled individually.

5.15.7 VLAN Ingress Check

Related registers [0xAB](#), [0xAC](#)

For packets forwarding, IP1717B provides a mechanism to check the ingress port, which is in or out of the VLAN group by setting registers 0xAB and 0xAC. For packets forwarding to the port, as long as the corresponding bit in register 0xAB or 0xAC is asserted, IP1717B will check the VLAN group; if the VID are not in VLAN group, IP1717B will drop those packets.

5.16 Q-in-Q Tag

Related registers [0x27](#), [0x4A~0x4F](#), [0x82\[15\]](#)

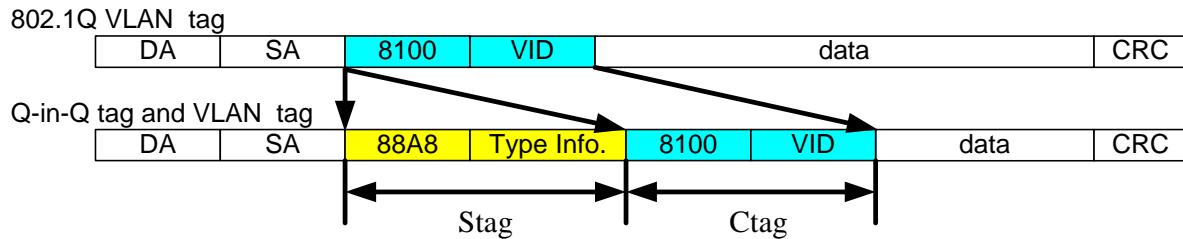

The “Q-in-Q” tag is purpose to expand the VLAN space by tagging the tag packets, thus producing a double tag frame. “Q-in-Q” tag feature provides the encapsulation of double VLAN tags within an Ethernet frame, with the inner VLAN tag being the 802.1Q VLAN tag is defined “Ctag”, while the outer one being the “Q-in-Q” VLAN tag assigned is defined “Stag”. Frames are forwarded based on the outer VLAN tag only, while the 802.1Q VLAN tag is shielded during data transmission.

IP1717B provides ingress packets control of Ctag/Stag by programming register 0x27 configurations.

If the incoming packets comprise “Q-in-Q double” tag, IP1717B will don't modify Ctag by programming register 0x82 to ‘0’.

IP1717B insert or remove a “Q-in-Q” tag of a frame by programming registers 0x4B[10:9], 0x4C and 0x4D when add/remove “Q-in-Q” tag function is enabled. Each bit of registers 4Ah and 0x4B[8] is corresponding to one port individually. The Q-in-Q double tag information is defined in register 4Fh.

Figure 13 Frame Format of Inserting Q-in-Q Tag

5.17 Class Of Service (CoS)

5.17.1 Output Queue Schedule Mode with Priority

Related registers [0x01\[7\]](#), [0x42](#), [0x43](#)

IP1717B implements four levels of priority queues (priority queue 0 to 3). The priority for each packet is based on the following schemes:

1. Physical port
2. 802.1Q VLAN tag
3. IP TOS/DS
4. TCP/UDP port number
5. Supreme priority (include ACL result, IP address, MAC address)

When CoS function is enabled, the following three schedule modes are selectable. When CoS function is not enabled, the first-in/first-out forwarding method is used. The detailed configuration is shown in the following table. The weight function, for the transmitting ratio from high to low priority, is defined in register 43h.

Table 26 Output Queue Schedule Mode Description Table

Reg 0x42[1:0]	Mode	Function description
00	Fist In Fist Out Schedule	All output packets are queued to one queue, first comes first outs.
01	Strict Priority	Packets are classified into high/low queues, unless the high priority queue is empty, low priority cannot transmit packets.
10	WRR	Packets are classified into four queues. The transmit weighting is based on the packet count defined in register 0x43.
11	WRR/Strict Priority Mixed	Packets are classified into four queues. The highest priority queue transmits packets when queue is not empty. The other three queues follow the weighting defined in register 0x43.

IP1717B provides five kinds of CoS priority described above. The precedence is Supreme priority > TCP/UDP port number base priority > IP CoS base priority > VLAN tag base priority > port base priority.

IP1717B provides an option to pause flow control function to prevent the extra delay for a high priority packet. A port's flow control function is disabled for 1.5s automatically when it receives a high priority packet. This function can be enabled by writing "0" to register 0x01[7].

5.17.2 Port Based Priority

Related registers [0x1E](#), [0x1F](#), [0x21](#)

The port-based priority only concerns the physical port location in a switch. A packet received by a high priority port is handled as a high priority packet. Each port of IP1717B can be configured as a high priority port individually by programming registers 0x1E, 0x1F and 0x21. For example, the bit 0 and bit 1 of register 0x1E corresponds to port 1 and the bit 0 and bit 1 of register 0x21 corresponds to port 17.

5.17.3 802.1Q VLAN Tag Based Priority

Related registers [0x22](#), [0x23](#)

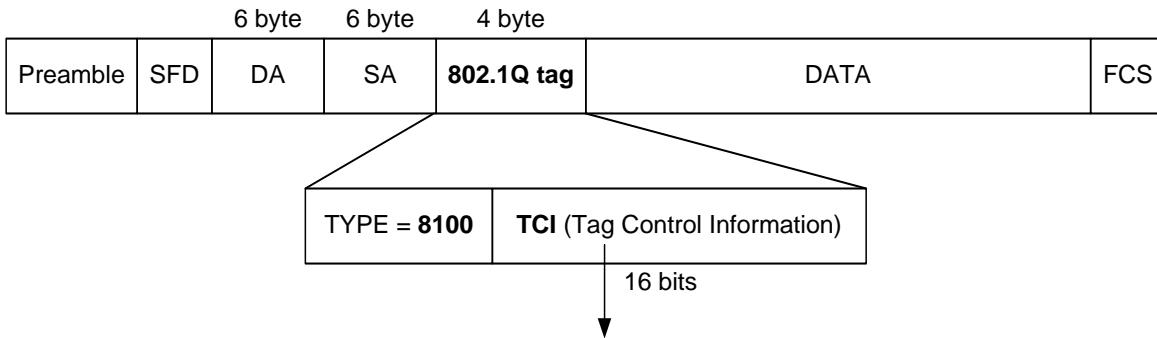

When the CoS for 802.1Q VLAN tag-base priority is enabled, IP1717B will examine 3 bits of the priority field carried by a VLAN tag and map it to the corresponding priority. The priority tag is shown in the following table. The CoS function of each port can be enabled individually by programming registers 0x22 and 0x23. For example, the bit 0 of register 0x22 corresponds to port 1 and the bit 8 of register 0x23 corresponds to port 17.

Table 27 QoS Selection Table

Priority tag bit [15:13]	Priority queue
00X	To queue 3
01X	To queue 2
10X	To queue 1
11X	To queue 0

Note: X means “don’t care”

Figure 14 Frame Format of 802.1Q Priority

Bit[15:13]: Priority

IP1717B uses these bits to define priority.

Bit 12: Canonical Format Indicator (CFI)

Bit[11~0]: VLAN ID.

5.17.4 IP CoS Based Priority

Related registers [0x24~0x26](#)

IP1717B provides the IP layer CoS function by recognizing the priority octet and mapping it to the corresponding priority. For an IPv4 packet, it is embedded in the TOS (Type of Service) Octet. For an IPv6 data packet, the Traffic Class Octet is used to differentiate the Class of Service. When this function is enabled, IP1717B will automatically recognize the IP version and capture either the TOS field (IPv4) or the Traffic Class field (IPv6).

Figure 15 Frame Format of IPv4 CoS Priority

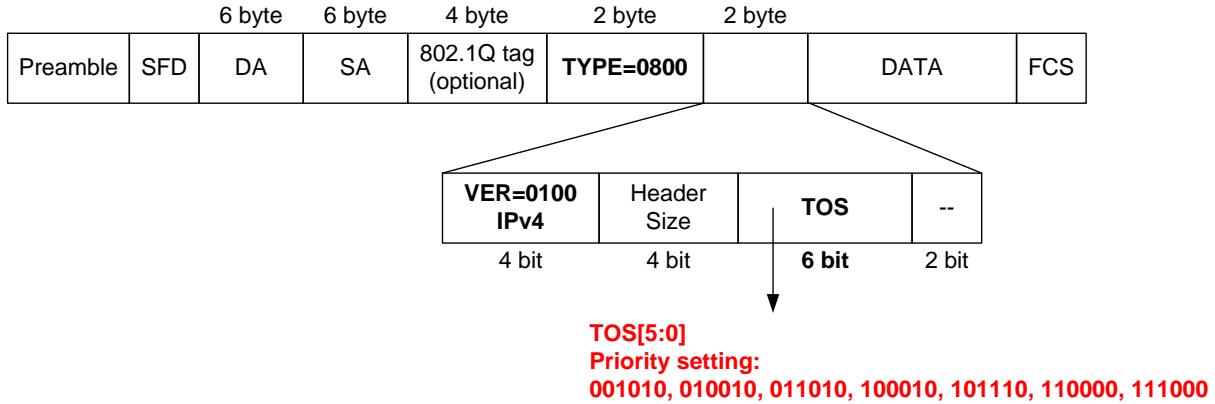

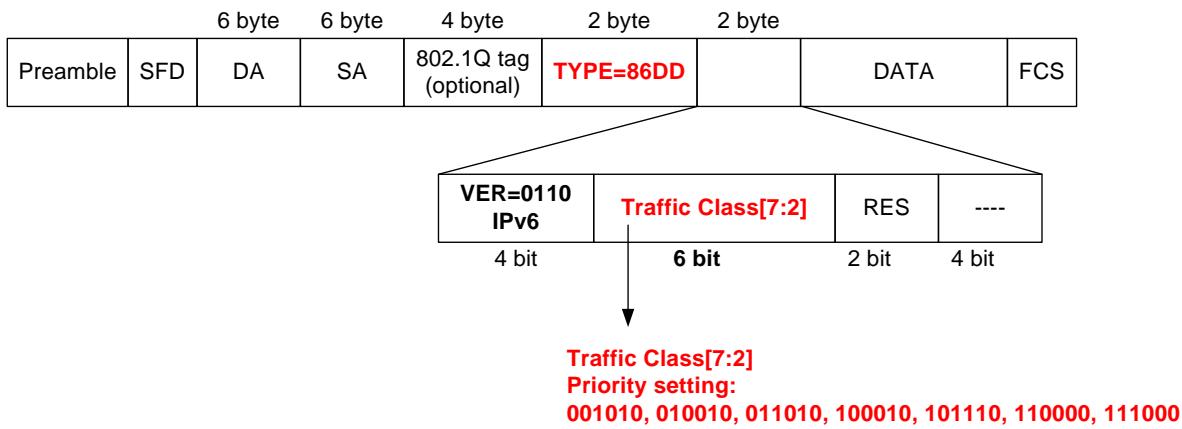

Figure 16 Frame Format of IPv6 CoS Priority

The IP TOS/DS priority function of each port can be enabled individually by programming registers 0x24 and 0x25, and designer can defines IP TOS/DS priority setting for seven kinds of CODEPOINT. If receive a packet with IP TOS/DS CODEPOINT which is not defined, IP1717B provides two kinds of method to handle. One is the zero priority method, the packet will be treated as a lowest priority by programming register 0x26[14] to '0'. The other is the Tag/Port based method, and the packet will be assigned a priority according to its priority setting on tag/port by programming register 0x26[14] to '1'. For example, the bit 0 of register 0x24 corresponds to port 1 and the bit 8 of register 0x25 corresponds to port 17.

5.17.5 TCP/UDP Port Number Based Priority

Related registers [0x2B~0x37](#)

When the CoS based on TCP/UDP port number function is enabled, IP1717B will examine the TCP/UDP destination port number in a packet to decide its priority.

The designer can define the priority of protocols, based on TCP/UDP port number, by programming registers 0x33~0x37. A packet with TCP/UDP port number matched what are listed in registers 0x33~0x37 will be treated as a priority packet according to the corresponding setting in the registers. For example, a packet with TCP/UDP port number equal to 20 or 21 (FTP) will be handled as a high priority packet if the register 0x33[2:0] is set to 3b'011. A packet with TCP/UDP port number equal to 20 or 21 (FTP) will be handled as a low priority packet if the register 0x33[2:0] is set to 3b'000. The priority of the TCP/UDP port number will override the priority of the user-defined port number if the priority of FTP (20, 21) is set to low and the priority of the port number (1~21) is set to high for user-defined setting, the priority of port number (20, 21) will be treated as low priority rather than high priority.

A packet with TCP/UDP port number matched the user-defined port number range in register 0x2B to 0x30 will be treated as a priority packet according to the setting in the register 0x37. IP1717B provides three groups for user-defined port number range. For example, a packet with TCP/UDP port number matched what are defined from register 0x2B to 0x2C will be handled as a high priority packet if the register 0x37[2:0] is set to 3b'011. The TCP/UDP port number base priority function of each port can be enabled individually by programming registers 0x31 and 0x32. For example, the bit 0 of register 0x31 corresponds to port 1 and the bit 8 of register 32h corresponds to port 17.

5.17.6 Supreme Priority

Related registers [0x01\[15:13\]](#)

When the CoS based supreme function is enabled by programming register 0x01[15] writing to “1”, the designer can select one of the three rules by programming register 0x01[14:13]. The configuration is shown in the following table. The detail settings refer to the configuration of the ACL result table, IP address table or MAC address table.

Table 28 Supreme CoS Selection Table

Reg 0x01[14:13]	Supreme CoS
00	ACL result
01	IP address
10	MAC address

5.18 ACL Function

IP1717B supports 16-entry ACL rules. When a packet is received, its Source port number/VLAN entry number, Source IP address, Destination IP address, TCP/UDP Source port or TCP/UDP destination port are recorded and compared to application ACL entry.

When a received packet matched multiple entries, the action table will be applied. If the action table is ‘Forward’, the packet will be forwarded to destination port. If the action table is ‘To CPU’, the packet will be forwarded to CPU port only. If the action table is ‘Drop’, the packet will be dropped. If the action table is ‘To Queue 0~3’, the packet will be assigned to relative priority mechanism. If the action table is ‘Q-in-Q tag 1~4’, the packet will be added relative Q-in-Q tag, and then be forwarded to destination port. If the packet doesn’t match any entries, it will be treated as ‘Forward’. The ACL table is shown in the following table. The detail settings refer to application note.

Table 29 ACL Configuration Table

Entry	Source port/ VLAN entry	Source IP	Destination IP	TCP/UDP Source Port	TCP/UDP Destinatio n Port	Action
Entry 0	15	128.001.002.003	111.222.033.044	0	61	1

5.19.1 In Band Management Frame

Related registers	0x01[10] , 0x70[0] , 0x3A~0x3C
-------------------	--

IP1717B has a default MAC address 00-90-c3-00-00-00. If an incoming packet with DA equaling to IP1717B's MAC address, it will be forwarded to the CPU port as long as the register 0x01[10] is set to “1” and register 0x70[0] is set to “1”. IP1717B's MAC address can be edited by programming registers 0x3A~0x3C.

5.19.2 Level Two Protocol Frame Capture

Related registers	0x01[2] , 0x02[5:0] , 0x02[9] , 0x05[7] , 0x70[0]
-------------------	---

IP1717B recognizes level two protocol frames (BPDU, 802.1x, MPCP, Slow Protocol, GxRP and ARP) as showing in the following table and will decide to forward it to CPU port or drop it according to the setting in registers 0x01[2], 0x02[5:0] and 0x02[9]. The register 0x70[0] defines the port 17 to be the CPU port.

Table 31 Level Two Protocol Frames Selection Table

5.19.3 Level Three Protocol Frame Capture

Related registers	0x03 , 0x04 , 0x70[0]
-------------------	---

IP1717B recognizes an incoming ICMP, TCP, UDP, and OSPF packets and will decide to forward it to CPU port or drop it according to the setting in register 0x03[7:0]. The register 0x70[0] defines the port 17 to be the CPU port. The detailed configuration is shown in the following table.

IP1717B also provides two level three protocols for user to define by editing the register 0x04.

Table 32 Level Three Protocol Frames Selection Table

Protocol	ICMP	TCP	UDP	OSPF	User define 1	User define 2
	Reg 0x03[1:0]	Reg 0x03[3:2]	Reg 0x03[5:4]	Reg 0x03[7:6]	Reg 0x03[9:8]	Reg 0x03[11:10]
Definition	00: send to its destination port only. 01: send to CPU port and its destination port. 10: send to CPU port only. 11: drop					

5.19.4 PPPoE Protocol Check

Related registers	0x02[6]
-------------------	-------------------------

IP1717B provides an option to check the PPPoE packets when register 0x02[6] is set to “1”. (This function only work when the layer three protocol is IP protocol)

5.20 Security

5.20.1 MAC Address Based Security

Related registers	0x8A , 0x8C
-------------------	---

IP1717B supports MAC address based security function if register 0x8C[1] is set to “0”. When this function is enabled, IP1717B drops the packet with a SA not found in the address table. This function is valid only if programming register 0x8A disables the address learning function.

IP1717B provides an option to forward the un-known SA packets to CPU when the function is enabled. An un-known SA packet is forwarded to CPU, when bit 0 of register 0x8C is cleared.

IP1717B also supports SA associated with source port if register 0x8C[2] is set to “1”, for example, if packets with specific SA learnt on port 1, when the packets SA that port 2 sent is the same port 1, the packets will not be forwarded. The packets with specific SA can send from any port if register 0x8C[2] is set to “0”.

5.20.2 802.1x Port Base Security

Related registers	0x01[2] , 0x01[10] , 0x02[1] , 0x29
-------------------	---

IP1717B supports 802.1x port base security function. If this function is enabled, IP1717B only forwards 802.1x EAPOL packets (DA=01 80 C2 00 00 03 and packet type=88 8E or DA= switch's MAC address, packet type=88 8E and 0x01[10]=1) to CPU port and drops other types of packets. ARP packets are not affected by this function and are forwarded according to their destination address.

This function can be enabled for each port individually by programming register 0x29. Designer has to write “1” to register 0x02[1] to enable 802.1x security function. If bit 1 of register 0x02 is writing to “0”, then all EAPOL packets will be dropped or broadcast depending on 0x01[2].

5.20.3 IP Address Base Security

Related registers [0x83~0x85](#)

IP1717B supports IP address base security function by examining the IP address and source port of an incoming packet. Designer can instruct IP1717B to check source IP address or destination IP address by programming register 0x83[3] and select one of the four matching modes by programming register 0x83[1:0] as shown in the following table. Programming registers 0x84 and 0x85 enables this function, port 1 is corresponding to register 0x84[0] and port 17 is corresponding to register 0x85[8].

For example, if register 0x83[3:0] is writing to 4'b1001, mode 2 is selected. A packet will be dropped by IP1717B if its destination IP doesn't match.

To perform IP security, designer has to fulfill the IP entries, which contains the source port and IP information. There are two ways to decide the location of an IP entry, hashing result and source port by programming register 0x83[2] configuration.

IP1717B supports an option to shift the location of IP entry. If register 0x83[6] is set to "1", IP1717B will add the address of an entry derived from the algorithm mention above by 1~3 according to the setting of register 0x83[5:4] to prevent entry collision in IP address table.

5.20.4 TCP/UDP Port Number Based Security

Related registers [0x31~0x37](#)

IP1717B supports TCP/UDP port number based security function by examining the port number in an incoming packet. Designer can enable the function by setting registers 0x31 and 0x32, port 1 is corresponding to bit 0 of register 0x31 and port17 is corresponding to bit 8 of register 0x32.

When this function is enabled, a packet with TCP/UDP port number matched that listed in registers 0x33~0x37 will be dropped or forwarded to CPU port. For example, a packet with TCP/UDP port number equal to 20 or 21 (FTP) will be dropped if register 0x33[2:0] is set to "101". A packet with TCP/UDP port number equal to 25 (SMTP) will be forwarded to CPU if register 0x33[11:9] is set to "100".

Figure 19 TCP/UDP Port Number Based Security Selection Table

Register 0x33

bit	14:12	11:9	8:6	5:3	2:0
Protocol	53	25	23	22	20, 21
definition	100: to CPU 101: to drop				

Register 0x34

definition	100: to CPU 101: to drop		

5.21 WAN Port Filtering

Related registers [0x2B~0x30](#), [0x38](#), [0x39](#), [0x71](#), [0x72](#)

IP1717B supports a function to enable/disable a WAN port to send out packets with specific TCP/UDP port number by programming register 0x39[9] to '1'. Each port can be configured to be WAN port individually by programming registers 0x71 and 0x72. When this function is enabled, IP1717B will forward or drop a packet with TCP/UDP port number defined in registers 0x38 and 0x39[6:0] to WAN port according to the setting of 0x39[8].

If designer defined TCP/UDP port number is selected, 0x39[6:4], IP1717B handles packets according to the TCP/UDP port number defined in registers 0x2B~0x30.

Figure 20 WAN Port Filtering Block Diagram

5.22 Port Mirroring Security

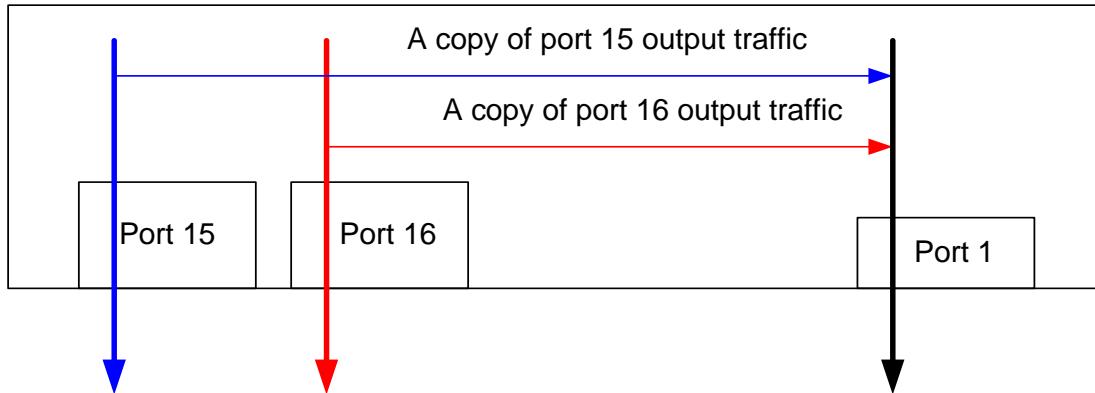

Related registers [0x90~0x93](#)

In some circumstances, the network administrator requires to monitor the network status. The port mirroring function helps the network administrator diagnose the network.

A port mirroring function is accomplished by assigning monitored ports (source ports), snooping ports (destination ports) and snooping method. IP1717B will copy the traffic of monitored ports to all snooping ports. The IP1717B supports three kinds of mirroring methods: the ingress, the egress and ingress plus egress. It is defined in register 0x93[10:9], registers 0x92 and 0x93[8] define the ports to be monitored (mirroring source), registers 0x90 and 0x91 specifies the ports to snoop (mirroring destination).

For example, if designer wants to monitor the output traffic of port 15 and port 16 from port 1 as shown in the following figure. He has to write "01" to register 0x93[10:9] to choose monitor method to be output traffic, write 0xC000 to registers 0x92 to select port 15 and port 16 to be monitored ports, write 0x0001 and 0x0000 to registers 0x90 and 0x91 to select port 1 as a monitoring port. IP1717B will copy the traffic out of port 15 and port 16 to port 1.

Figure 21 Port Mirroring Security Block Diagram

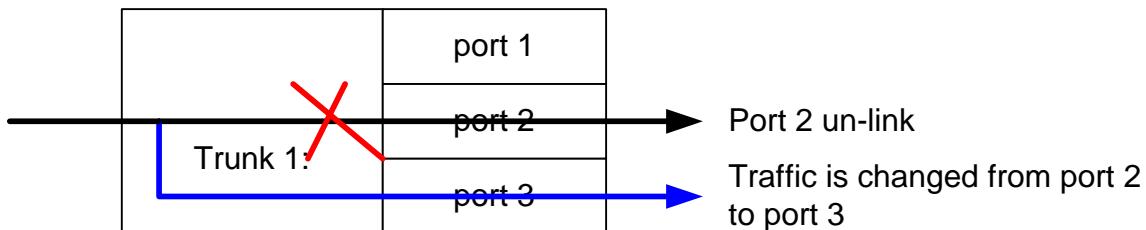

5.23 Trunk Channel

Related registers [0x8F](#)

5.23.1 Trunk Channel Behavior

IP1717B supports two kinds of trunk channels consisting of trunk 1 group and trunk 2 group by programming registers 0x8F[10:8] and 0x8F[13:11]. Each trunk group may comprise 2 to 4 ports. Designer can configure the trunk group members individually by writing non-zero values to the corresponding bits of a port in the registers 0x8F[3:0] and 0x8F[7:4] for trunk 1 groups and trunk 2 groups. A trunk channel works as if a "big" port with multiple times of bandwidth. If the destination port of a packet is un-link, IP1717B forwards the packet to the other port of the trunk(auto recovery).

Figure 22 Trunk Channel Behavior Block Diagram

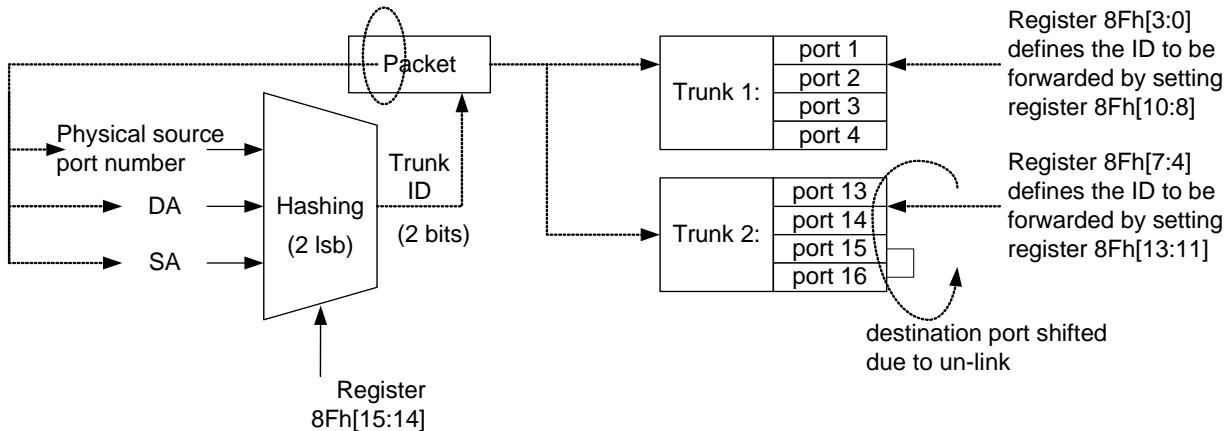

5.23.2 Load Balance

To fully utilize the bandwidth in a trunk channel, IP1717B supports load balance function. A physical port of a trunk forwards a packet only if the trunk ID of the packet matches the ID setting of the port. That is, when a packet is forwarded to a port in a trunk, its destination port is according to trunk ID.

IP1717B performs a hashing algorithm to calculate a 2-bit trunk ID of a packet. It is used to select one of the trunk ports to forward packets. Designer can select the least significant 2 bits hashing algorithm to be based on physical port number, SA, DA, or SA XOR DA by programming register 0x8F[15:14].

If the destination port of a trunk is un-link, the packet will be forwarded to the port shifted by 2. If the port is un-link, too, the packet will be forwarded to the port shifted by 3. For example, if port 1 is un-link, its packet will be forwarded to port 3. If port 3 is un-link, too, the packet will be forwarded to port 4.

Figure 23 Load Balance Block Diagram

5.24 Spanning Tree

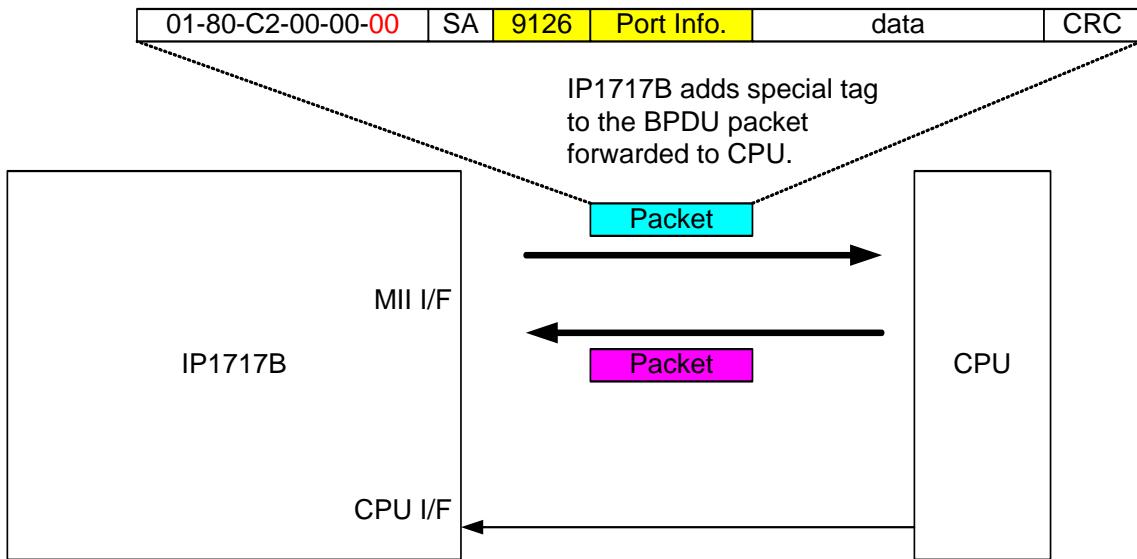

Related registers	0x01[2] , 0x02[0] , 0x46 , 0x49 , 0x70[0] , 0xEF~0xF2
-------------------	---

5.24.1 BPDU Packet Forwarding

IP1717B supports spanning tree function with the following features:

1. Detect BPDU frames by examining multicast address (01-80-c2-00-00-00).
2. Forward BPDU packets to CPU through port 17 and add special tag for source port information(optional), and special tag type is defined in register 0x49. The function is enabled by writing "1" to register 0x02[0], writing "0" to register 0x01[2], writing "1" to register 0x46 and writing "1" to register 0x70[0].

Figure 24 BPDU Packet Forwarding Block Diagram

5.24.2 Port States

To support IEEE802.1D spanning tree protocol, each port of IP1717B supports four states, as shown in the following table. Each port of IP1717B can be set in one of the four spanning tree states individually by programming registers 0xEF and 0xF1.

Table 33 Port States Selection Table

	Discard state	Block state	Learning state	Forwarding state
Corresponding bit 0 of register 0xEF	0	1	0	1
Corresponding bit 1 of register 0xF1	0	0	1	1

5.25 Non-association Port

Related registers	0xED , 0xEE
-------------------	---

IP1717B provide an option to support non-association port function, these ports will not receive packets from each other if the function is enabled, even if the ports belong to same VLAN. The non-association port can be enabled by writing “1” to corresponding bit of registers 0xED and 0xEE. For example, port 1 and port 17 of IP1717B will not be forwarded packets to each other if registers 0xED and 0xEE are written to 16'h0100 and 16'h0001.

5.26 Port Base Address Flush

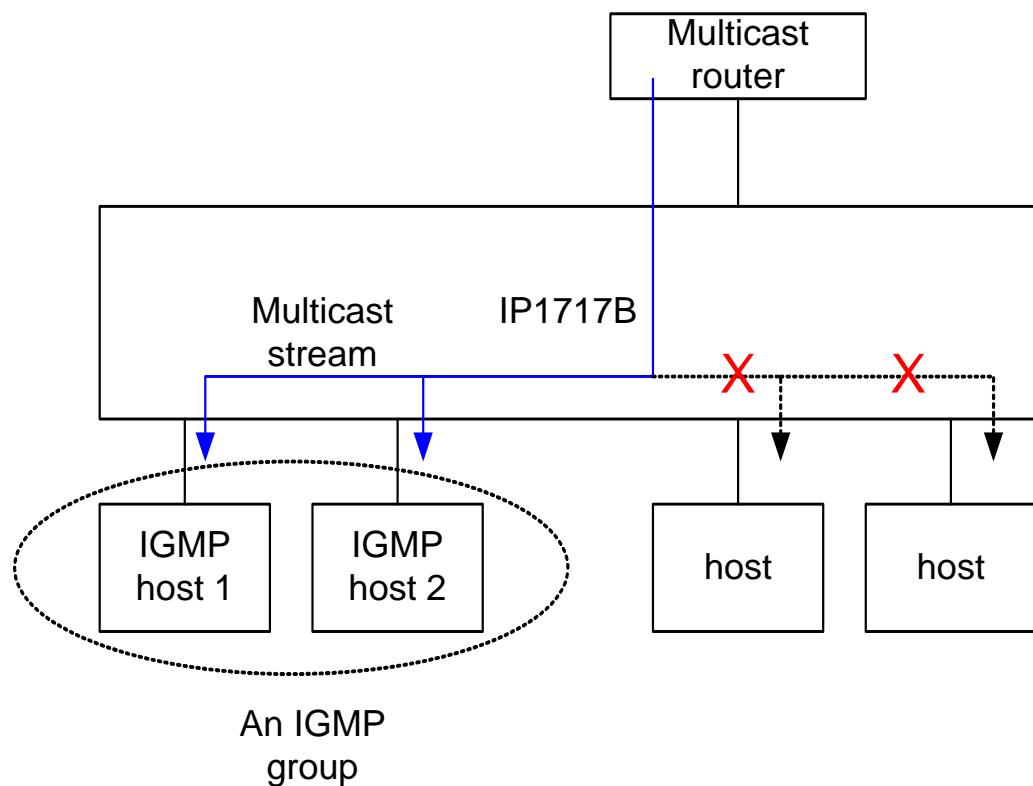

Related registers [0xF3](#), [0xF4](#)

IP1717B can clear the address learnt by specific port. The specific port can be enabled by writing “1” to corresponding bit of registers 0xF3 and 0xF4[8:0], and trigger the port base address flush function by writing “1” to register 0xF4[9].

5.27 IGMP Snooping

For a switch without IGMP snooping, a multicast packet is forwarded to all ports, that is, it is treated as a broadcast packet. With IGMP snooping, a multicast packet of a group is only forwarded to ports that are members of that group. IGMP (Internet Group Management Protocol) is used to establish membership in a Multicast group. It significantly reduces multicast traffic in the LAN.

6.1.2 Control Register

Table 36 Control Register

MII register 0 of PHY8~23 (Each PHY has its own MII register 0 with different PHY address)

PHY	MII	ROM	R/W	Description	Default
8~23	0.15	--	RW/ SC	Reset The PHY is reset if user write "1" to this bit. The reset period is around 2ms. User has to wait for at least 2ms to access IP1717B.	0
8~23	0.14	--	R/W	Loop back 1 : loop back mode 0 : normal operation When this bit set, IP1717B will be isolated from the network media, that is, the assertion of TXEN at the MII will not transmit data on the network. All MII transmission data will be returned to MII receive data path in response to the assertion of TXEN. Bit 0.12 is cleared automatically, if this bit is set. User has to program bit 0.12 again after loop back test.	0
8~23	0.13	--	RW	Speed Selection 1 : 100Mbps 0 : 10Mbps It is valid only if bit 0.12 is set to be 0.	1
8~23	0.12	--	RW	Auto-Negotiation Enable 1 : auto-negotiation enable 0 : auto-negotiation disable	1
8~23	0.11	--	R/W	Power Down 1 : power down mode 0 : normal operation	0
8~23	0.10	--		Isolate IP1717B doesn't support this function.	0
8~23	0.9	--	RW SC	Restart Auto-Negotiation 1 : re-starting Auto-Negotiation 0 : auto-negotiation re-start complete Setting this bit to logic high will cause IP1717B to restart an auto-negotiation cycle, but depending on the value of bit 0.12 (auto-negotiation enable). If bit 0.12 is cleared then this bit has no effect, and it is read only. This bit is self-clearing after auto-negotiation process is completed.	0
8~23	0.8	--	R/W	Duplex mode 1 : full duplex 0 : half duplex It is valid only if bit 0.12 is set to be 0.	0
8~23	0.7	--	R/W	Collision test	0
8~23	0[6:0]	--	RO	Reserved	0

6.1.3 Status Register

Table 37 Status Register

MII register 1 of PHY8~23 (Each PHY has its own MII register 1 with different PHY address)

PHY	MII	ROM	R/W	Description	Default
8~23	1.15	--	RO	100Base-T4 Capable 1 : 100Base-T4 capable 0 : not 100Base-T4 capable IP1717B does not support 100Base-T4. This bit is fixed to be 0.	0
8~23	1.14	--	RO	100Base-X full duplex Capable 1 : 100Base-X full duplex capable 0 : not 100Base-X full duplex capable	1
8~23	1.13	--	RO	100Base-X half duplex Capable 1 : 100Base-X half duplex capable 0 : not 100Base-X half duplex capable	1
8~23	1.12	--	RO	10Base-T full duplex Capable 1 : 10Base-T full duplex capable 0 : not 10Base-T full duplex capable	1
8~23	1.11	--	RO	10Base-T half duplex Capable 1 : 10Base-T half duplex capable 0 : not 10Base-T half duplex capable	1
8~23	1[10:7]	--	RO	Reserved	0
8~23	1.6	--	RO	MF Preamble Suppression 1 : preamble may be suppressed 0 : preamble always required	1
8~23	1.5	--	RO	Auto-Negotiation Complete 1 : auto-negotiation complete 0 : auto-negotiation in progress When read as logic 1, indicates that the auto-negotiation process has been completed, and the contents of register 4 and 5 are valid. When read as logic 0, indicates that the auto-negotiation process has not been completed, and the contents of register 4 and 5 are meaningless. If auto-negotiation is disabled (bit 0.12 set to logic 0), then this bit will always read as logic 0.	0
8~23	1.4	--	RO LH	Remote Fault 1 : remote fault detected 0 : not remote fault detected When read as logic 1, indicates that IP1717B has detected a remote fault condition. This bit is set until remote fault condition gone and before reading the contents of the register. This bit is cleared after IP1717B reset.	0
8~23	1.3	--	RO	Auto-Negotiation Ability 1 : auto-negotiation capable 0 : not auto-negotiation capable When read as logic 1, indicates that IP1717B has the ability to perform auto-negotiation.	1

MII register 1 of PHY8~23 (Each PHY has its own MII register 1 with different PHY address)

PHY	MII	ROM	R/W	Description	Default
8~23	1.2	--	RO LL	Link Status 1 : link pass 0 : linkfail When read as logic 1, indicates that IP1717B has determined a valid link has been established. When read as logic 0, indicates the link is not valid. This bit is cleared until a valid link has been established and before reading the contents of this registers.	0
8~23	1.1	--		Jabber Detect 1 : jabber condition detected 0 : no jabber condition detected When read as logic 1, indicates that IP1717B has detected a jabber condition. This bit is always 0 for 100Mbps operation and is cleared after IP1717B reset. When the duration of TXEN exceeds the jabber timer (21ms), the transmission and loop back functions will be disabled and the COL is active. After TXEN goes low for more than 500 ms, the transmitter will be re-enabled.	0
8~23	1.0	--	RO	Extended Capability 1 : extended register capabilities 0 : no extended register capabilities IP1717B has extended register capabilities.	1

8-23	5.7	--	RO	100BASE-TX 1 : link partner support 100BASE-TX 0 : link partner does not support 100BASE-TX For 100FX mode, this bit is set. When Nway is disabled, this bit is set if register 0.13=1.	0
8-23	5.6	--	RO	10BASE-T Full Duplex 1 : link partner support 10BASE-T full duplex 0 : link partner does not support 10BASE-T full duplex	0
8-23	5.5	--	RO	10BASE-T 1 : link partner support 10BASE-T 0 : link partner does not support 10BASE-T When Nway is disabled, this bit is set if register 0.13=0.	0
8-23	5[4:0]	--	RO	Selector Field Protocol selector of the link partner.	5'b0000 00

6.1.8 Auto-Negotiation Expansion Register**Table 42 Auto-Negotiation Expansion Register****MII register 6 of PHY8-23 (Each PHY has its own MII register 6 with different PHY address)**

PHY	MII	ROM	R/W	Description	Default
8-23	6[15:5]	--	RO	Reserved	0
8-23	6.4	--	RO	1 : a fault has been detected via parallel detection function 0 : a fault has not been detected via parallel detection function	0
8-23	6.3	--	RO	1 : link partner is next page able 0 : link partner is not next page able	0
8-23	6.2	--	RO	1 : IP1717B next page able. 0 : IP1717B is not next page able This bit is fixed to be "0" in IP1717B.	0
8-23	6.1	--	RO/ LH	1 : a new page has been received 0 : a new page has not been received	0

MII register 6 of PHY8-23 (Each PHY has its own MII register 6 with different PHY address)

PHY	MII	ROM	R/W	Description	Default
8-23	6.0	--	RO	If Nway is enabled, this bit means: 1 : link partner is Auto-Negotiation able 0 : link partner is not Auto-Negotiation able In 100FX or Nway disabled, this bit always =0.	0 (Nway) (100FX)

6.2 Switch Register

6.2.1 Switch Register Map

Table 43 Switch Register Map (Reg. Addr. 00h~FFh)

REG ADDR	Description	REG ADDR	Description
00h	Reserved	73h	Internal Status
01h	General MAC Operation Behavior	74h~75h	Interrupt Signal Setting
02h	Level 2 Protocol Frame capture	76h	MII Interface Signal Timing Setting
03h	Level 3 Protocol Frame capture	77h	Reserved
04h	User Define Level 3 Protocol Type	78h~79h	CPU Read/Write EEPROM Command
05h~1Dh	Egress/Ingress Rate Control	7Ah	Reserved
1Eh~21h	Port Base Priority	7Bh~81h	Frame Buffer Information
22h~23h	VLAN Tag Base Priority	82h	ARL Operation Setting
24h~25h	IP CoS Base Priority	83h	Source/Destination IP Address Security
26h	Differentiated Services Priority	84h~85h	IP Filter Enable
27h	Stag/Ctag Ingress Control	86h~87h	Broadcast Storm Control Setting
28h	Reserved	88h	ARP and ICMP Storm Control Setting
29h~2Ah	802.1x Port Lock	89h	Aging Timer Threshold Setting
2Bh~30h	User Define TCP/UDP Port Number A~C Range Setting	8Ah~8Bh	Enable Source MAC Address Learning
31h~37h	TCP/UDP Port Number Base Priority	8Ch	Security Configuration
38h~39h	TCP/UDP Port Number Base Filter Select to Wan Port	8Dh~8Eh	VLAN Uplink Function Support Selection
3Ah~3Ch	MAC Address	8Fh	Trunk Function Setting
3Dh~3Fh	CPU Read Statistic Counter	90h~93h	Sniffer Function Configuration
40h~41h	Port Statistic Counter Selection	94h	IGMP Snooping Function Configuration
42h~45h	Output Queue Configuration	95h~96h	Router Port
46h	CPU Port (Port 17) Special Tag	97h~9Ah	VLAN Output Port Add/Remove Tag Operation Configuration
47h~48h	Tag Inserting PVID/PRI Selection	9Bh~A3h	PVID Index Setting
49h	Special Tag Type-Length Definition	A4h~A8h	PVID Priority Setting
4Ah~53h	Q-IN-Q Double Tag	A9h~ECh	VLAN Setting
54h	LED Mode Setting	EDh~EEh	Non-association Port Setting
55h~56h	Auto Negotiation Configuration	EFh~F2h	Spanning Tree State
57h~58h	Speed Setting	F3h~ F4h	Port Base Address Flush
59h~5Ah	Duplex Setting	F5h~F8h	CPU Read/Write Address Table
5Bh~5Ch	Pause Setting	F9h	Table Address Access Method
5Dh~5Eh	Asymmetric Pause Setting	FAh~FCh	ACL/VID/VID-Tag Configuration
5Fh~60h	Backpressure Setting	FDh	Reserved
61h	CPU Port PHY Address Setting	FEh~ FFh	802.3 OAM LoopBack Enable
62h	Reserved		
63h~64h	CPU Read/Write PHY Register Command		
65h~6Dh	Port Status		
6Eh	Software Reset Information		
6Fh	Built In Self Test Information		
70h	CPU Mode Setting		
71h~72h	WAN Port Setting For TCP/UDP Port Filter setting		

6.2.2 Switch Register EEPROM Map

Table 44 Switch Register EEPROM Map (Rom. Addr. 00h~1FFh)

ROM ADDR	7	6	5	4	3	2	1	0	ROM ADDR	7	6	5	4	3	2	1	0
00h~01h	Reserved								E6h~E7h	Internal Status

6.2.7 Miscellaneous Control Register

Table 49 Miscellaneous Control Register

Miscellaneous Control Register				
Reg Addr.	ROM Addr.	Register Description	R/W	Default value
6Eh	DCh DDh	bit[0] :software reset 1 : software reset 0 : normal bit[1] : reset mask for mg_bist_RST 1 : do not reset when BIST finished 0 : reset when BIST finished bit[2] : reset mask for mg_ou_RST 1 : do not reset when over-flow observed 0 : reset when over-flow observed bit[3] : reset mask for oq_sw_reset_trig 1 : do not reset when out-queue op mode changed 0 : reset when out-queue op mode changed	RW / SC R/W	4'h0
6Fh	DEh DFh	Build in self test information bit[3:0] : BIST enable {OQ, FB, BM, LUT} LUT : look up table BM : buffer management FB : frame Buffer OQ : output queue bit[7:4] : BIST is busy {OQ, FB, BM, LUT} bit[11:8] : BIST is OK or not {OQ, FB, BM, LUT} bit[12] : frame buffer BIST repair function enable bit[13] : block/non-block MDC control in test mode 0 : don't block 1 : block bit[15] : fast test mode set 1 : switch is in fast test mode 0 : normal mode	R/W R/O R/O R/W R/W R/W	16'h3F0F
70h	E0h E1h	CPU mode setting bit[0] : port 17 linked to CPU bit[1] : CPU interface RvMII mode	R/W	2'h2
71h	E2h E3h	WAN port setting for TCP/UDP port filter setting bit[15:0] : port 16~port 01 port filter Ref offset address 0x39[8] : 0 : negative filtering list (if TCP/UDP number matched, packet sent to filter setting port will be dropped)	R/W	16'h0

Miscellaneous Control Register

Reg Addr.	ROM Addr.	Register Description	R/W	Default value
		1 : positive filtering list (if TCP/UDP port number matched, packet sent to filter setting port will be allowed, others will be dropped) 0x39[9] : filter enable		
72h	E4h E5h	WAN port setting for TCP/UDP port filter setting bit[7:0] : (unused) bit[8] : port 17 port filter (same definition as above)	R/W	9'h0
73h	E6h E7h	Internal Status : bit[2:0] : port page count under-flow counter indicates the number of under-flow condition after power on (port page under flow trigger) bit[3] : reserved bit[6:4] : out queue over flow counter indicates the number of overflow condition after power on bit[7] : reserved bit[8] : share page count is not equal to setting value indication	R	9'h0
74h	E8h E9h	Interrupt signal setting bit[0] : enable interrupt for CPU R/W SMI command complete bit[1] : enable interrupt for PHY link status notification bit[2] : (reserved, should be 0) bit[3] : enable interrupt for CPU R/W EPROM command complete bit[4] : interrupt pin active mode 0 : Low active 1 : High active	R/W	5'h2
75h	EAh EBh	Interrupt signal setting bit[0] : interrupt of CPU R/W SMI command complete bit[1] : PHY link status change notification bit[2] : (reserved) bit[3] : interrupt of PU R/W EPROM command complete Note : interrupt signal that is triggered by any event will assert until user read this register	R/C	4'h0
76h	EC _h ED _h	MII Interface signal timing setting bit[2:0] : the driving current setting for MII interface 000 : minimum current 011 : 5mA (default) 111 : maximum current bit[3] : auto driving current enable 1 : IP1717B will auto adjust the driving current by loading 0 : the driving current is based on bit[2:0] bit[5:4] : (D_SEL, reserved for test) bit[6] : (custom_sr, reserved for test)	R/W	7'h13

Miscellaneous Control Register

Reg Addr.	ROM Addr.	Register Description	R/W	Default value
77h	EEh EFh	(reserved)		
78h	F0h F1h	CPU read/write EEPROM command bit [7:0] : byte address bit [10:8] : device address bit [12:11] : reserved bit [13] : 0 : command not complete 1 : command complete bit [14] : 0 : read operation 1 : write operation bit [15] : the read/write command trigger 0 : idle or command complete 1 : start command	R/W	16'h0
79h	F2h F3h	CPU read/write EEPROM command data bit [7:0] : in read command - the read back data in write command - data want to write	R/W	8'h0

6.2.8 Buffer Management Control Register

Table 50 Buffer Management Control Register

Buffer Management Control Register				
Reg Addr.	ROM Addr.	Register Description	R/W	Default value
7Ah	F4h F5h	(reserverd)	R/O	
7Bh	F6h F7h	bit[6:0] : the dedicate frame buffer threshold for flow control on	R/W	7'h32
7Ch	F8h F9h	bit[6:0] : the dedicate frame buffer threshold for flow control off	R/W	7'h62
7Dh	FAh FBh	bit[7:0] : the dedicate frame buffer threshold for drop packet on	R/W	8'h1
7Eh	FC _h FD _h	bit[6:0] : the dedicate frame buffer threshold for drop packet off	R/W	7'h19
7Fh	FEh FFh	bit[10:0] : frame buffer share pool page count bit[11] : 1 : use present share page count as read back data 0 : use register setting share page count as read back data	R/W	12'h46E
80h	100h 101h	bit[6:0] : frame buffer per port allocated memory page count (port 01~port 16, CPU) bit[7] : (reserved) bit[8] : rd_port_page_cnt_err (if 0xC5[12] = 1)	R/W R/O	9'h64
81h	102h 103h	bit[9:0] : the max. page count that one port can get from share memory bit[10] : 1 : the max. share page count is static equal to bit[9:0] 0 : the max. share page count is allocated dynamically by switch	R/W R/O	11'h380

6.2.9 Address Resolution Logic Register

Table 51 Address Resolution Logic Register

Address Resolution Logic Register				
Reg Addr.	ROM Addr.	Register Description	R/W	Default value
82h	104h 105h	<p>ARL operation setting</p> <p>bit[0] : hash algorithm selection 0 : direct map base 1 : CRC map base</p> <p>bit[1] : address table aging function disable 0 : aging enable 1 : aging disable</p> <p>bit[3:2] : broadcast storm type selection [2] : multicast also regard as Bcast [3] : unknow DA also regard as Bcast</p> <p>bit[4] : block broadcast frames to CPU port 0 : disable blocking 1 : enable blocking</p> <p>bit[5] : block ARP to CPU port 0 : don't block 1 : block</p> <p>bit[6] : pass all IPv4 packet when block broadcast frame to CPU port 0 : disable pass 1 : enable pass</p> <p>bit[7] : VLAN type 0 : port based VLAN 1 : 802.1Q tag based VLAN</p> <p>bit[8] : unicast packet stride across VLAN</p> <p>bit[9] : VLAN blocked packet forward to uplink port enable (uplink port setting establish at offset address 0x8D,8E)</p> <p>bit[10] : drop priority tag enable 0 : don't drop 1 : drop</p> <p>bit[11] : select the tag/untag method 0 : base on Ports (ref. reg 0x97~0x9A) 1 : base on VIDs (ref. reg 0xFA and 0xFC)</p> <p>bit[12] : modify tag in VID_TAG mode for CPU port 0 : do not modify tag 1 : modify tag by setting register 0xFA and 0xFC</p> <p>bit[13] : CPU route enable, if enable, the packets will route according to register</p> <p>bit[14] : CPU route function do not care VLAN and trunk result</p> <p>bit[15] : Ctag remove/modify enable 0 : don't change Ctag 1 : remove/modify Ctag enable</p>	R/W	16'h1
83h	106h 107h	<p>Source/Destination IP address security setting</p> <p>bit[1:0] : IP address filter mode cfg</p>	R/W	16'h0

Address Resolution Logic Register

Reg Addr.	ROM Addr.	Register Description	R/W	Default value
		00 : IP dis-match can pass 01 : IP match can pass 10 : IP match and source port match can pass 11 : IP match and source port not match can pass bit[2] : IP address filter subnet mode 0 : IP address in LUT will base on hashing result 32 bits IP should match exactly 1 : IP address in LUT will base on source port ex : packets from port 0 will check LUT address 12'h000, and IP should match the correspond subnet mask setting bit[3] : IP selection 0 : source IP 1 : destination IP bit[5:4] : IP address shift in LUT 00 : none 01 : add 1 10 : add 2 11 : add 3 bit[6] : IP address shift in LUT enable bit[7] : IP address equal to 0.0.0.0 can pass bit[15:8] : IP subnet mask setting for IP filter function the subnet mask will be 255.255.bit[15:8].0		
84h	108h 109h	IP filter enable for port 01~port 16 0 : disable 1 : enable	R/W	16'h0
85h	10Ah 10Bh	IP filter enable for port 17 bit[7:0] : (unused) bit[8] : 0 : disable 1 : enable	R/W	9'h0

7 Electrical Characteristics

7.1 Absolute Maximum Rating

Permanent device damage may occur if Absolute Maximum Ratings are applied. Functional operation should be restricted to the conditions as specified in the following section. Exposure to the Absolute Maximum Conditions for extended periods may affect device reliability.

Table 52 Absolute Maximum Rating

Parameter		Symbol	Min.	Max.	Unit
Supply Voltage	I/O	$V_{DDI/O}$	-0.5	+3.6	V
	Core	V_{DDCore}	-0.5	+2.2	V
Input Voltage		V_I	-0.5	$V_{DDI/O}$	V
Output Voltage		V_O	-0.5	$V_{DDI/O}$	V
Storage Temperature		T_{STG}	-65	+150	°C
Operation Temperature		T_{OPT}	0	70	°C

Note: The maximum ratings are the limit value that must never be exceeded even for short time.

7.2 DC Characteristics

7.2.1 Operating Conditions

Table 53 Operating Conditions

Parameter	Min.	Typ.	Max.	Unit	Conditions
Power Consumption				W	10Mbps Full duplex active
				W	100Mbps Full duplex active

7.2.2 I/O Electrical Characteristics

Table 54 I/O Electrical Characteristics

Parameter	Symbol	Min.	Typ.	Max.	Unit
Output low voltage	V_{OL}	-	-	0.4	V
Output high voltage	V_{OH}	3.0	-	-	V
Low level output current	I_{OL}	-	-	TBD	mA
High level output current	I_{OH}	TBD	-	-	mA
DVDD supply voltage	V_{DVDD}	0.95	1.0	1.1	V
AVDD supply voltage	V_{AVDD}	1.8	1.9	2.09	V
VDDIO supply voltage	V_{VDDIO}	2.97	3.3	3.63	V
Pull-down resistor	R_{PD}	51	-	127	$K\Omega$

7.4 External Oscillator Specifications

7.4.1 Crystal Specifications

Table 63 Crystal Specifications

Item	Parameter	Range
1	Nominal Frequency	25.000 MHz
2	Oscillation Mode	Fundamental Mode
3	Frequency Tolerance at 25 °C	+/- 50 ppm
4	Temperature Characteristics	+/- 50 ppm
5	Operating Temperature Range	-10 °C ~ +70 °C
6	Equivalent Series Resistance	40 ohm Max.
7	Load Capacitance	15 pF
8	Shunt Capacitance	7 pF Max

7.4.2 Oscillator Specifications

Table 64 Oscillator Specifications

Parameter	Symbol	Min.	Typ.	Max.	Unit	Conditions
Frequency		-	25	-	MHz	
Duty cycle		40	-	60	%	
Rise time	T _R	-	-	4	ns	
Fall time	T _F	-	-	4	ns	
Max voltage		-	-	2	V	
Input high voltage	V _{IH}	-	1.5	-	V	
Input low voltage	V _{IL}	-	0.6	-	V	
Jitter		-	300	-	ps	
Frequency Tolerance		-50	-	+50	PPM	

7.5 Thermal Data

The junction temperature of chip (T_j) is a well-known key factor of IC characteristics and life time. There are three thermal resistance coefficients, θ_{JA} , ψ_{JT} , and θ_c , which are defined in JEDEC 51-2 and 51-6, will be provided to estimate T_j . If the T_j is over maximum limit, it is necessary to disperse heat by extra dissipation device, such as heat sink and electrical fan.

Thermal resistance represents the capability of an IC package to carry out the heat inside an IC chip. It is a complex function of package structure, material property, input power, environment variables such as air flow speed and PCB layers. The major thermal dissipation paths can be illustrated as following,

Table 65 Operation Range

Parameter	Min	Typical	Max	unit
T_j			125	°C
T_a		25	70	°C

Table 66 Thermal Resistance

Parameter	Condition	Min	Typical	Max	Unit
θ_{JA}	0 ft/s Air flow 2 layers PCB				°C/W
ψ_{JT}	0 ft/s Air flow 2 layers PCB				°C/W

8 Design and Layout Guide

Note: 49.9 ohm must be close to IP1717B.
