

### Lxx04xx & Qxx04xx Series

#### Description

The Lxx04xx and Qxx04xx are 4 Amp bidirectional solid state switch series. They are designed for AC switching and phase control applications such as motor speed and temperature modulation controls, lighting controls, and static switching relays.

**Sensitive** type devices guarantee gate control in Quadrants I & IV as needed for digital control circuitry.

**Standard** type devices normally operate in Quadrants I & III triggered from AC line.

#### Agency Approval

Agency	Agency File Number
	E71639

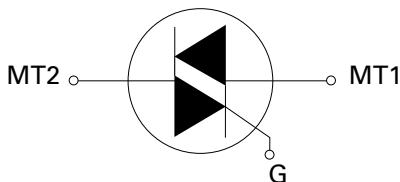

**Notes:**

- L Package only.
- 400V and 600V for Sensitive Triac (L Device Type)
- 400V, 600V, 800V, or 1000V for Standard Triac (Q Device Type)

#### Main Features

Symbol	Value	Unit
$I_{TRMS}$	4	A
$V_{DRM}/V_{RRM}$	400, 600, 800 or 1000	V
$I_{GT(Q1)}$	3 to 25	mA

#### Schematic Symbol

#### Features & Benefits

- RoHS-compliant
- Glass – passivated junctions
- Voltage capability up to 1000 V
- Surge capability up to 55 A
- The L-package has an isolation rating of 2500V<sub>RMS</sub>
- Solid-state switching eliminates arcing or contact bounce that create voltage transients
- No contacts to wear out from reaction of switching events
- Restricted (or limited) RFI generation, depending on activation point of sine wave
- Requires only a short gate activation pulse in each half-cycle

#### Applications

Typical applications are AC solid-state switches, power tools, home/brown goods and white goods appliances.

Sensitive gate Triacs can be directly driven by microprocessor or popular opto-couplers/isolators.

Internally constructed isolated packages are offered for ease of heat sinking with highest isolation voltage.

#### Absolute Maximum Ratings — Sensitive Triacs (4 Quadrants)

### Design Considerations

Careful selection of the correct component for the application's operating parameters and environment will go a long way toward extending the operating life of the Thyristor. Good design practice should limit the maximum continuous current through the main terminals to 75% of the component rating. Other ways to ensure long life for a power discrete semiconductor are proper heat sinking and selection of voltage ratings for worst case conditions. Overheating, overvoltage (including dv/dt), and surge currents are the main killers of semiconductors. Correct mounting, soldering, and forming of the leads also help protect against component damage.
