

MIC28510 Evaluation Board

75V/4A Hyper Speed Control™
Synchronous DC/DC Buck Regulator

General Description

The MIC28510 DC/DC regulator operates over an input supply range of 4.5V to 75V and provides a regulated output at up to 4A of output current. The output voltage is adjustable down to 0.8V with a typical accuracy of $\pm 1\%$. The switching frequency is adjustable and once adjusted the switching frequency remains fairly constant with changes in input voltage and output load.

The basic parameters of the evaluation board are:

- Input Voltage – 5V to 75V
- Output Voltage – 0.8V to 5V at 4A⁽¹⁾
12V at up to 4A⁽²⁾
- 250kHz Switching Frequency
(Adjustable from 100kHz to 500kHz)

Notes:

1, 2. Refer to thermal de-rating curves shown in Typical Characteristics section.

Datasheets and support documentation can be found on Micrel's web site at: www.micrel.com

Requirements

The MIC28510 evaluation board requires only a single power supply with at least 10A current capability. A linear regulator, which includes a Zener and an NPN transistor, has been installed on the board to provide housekeeping (V_{DD}) for the MIC28510. The output load can either be a passive or an active load.

Precautions

The MIC28510 evaluation board does not have reverse polarity protection. Applying a negative voltage to the PVIN and GND terminals may damage the device. The maximum PVIN of the board is rated at 75V. Exceeding 75V on the PVIN could damage the device.

Getting Started

1. **V_{IN} Supply.** Connect a power supply to the V_{IN} and GND terminals, paying careful attention to the polarity and supply voltage range (5V < V_{IN} < 75V). The input current I_{IN} can be monitored with a current meter. Do not apply power until Step 4.
2. **Connect Load and Monitor Output.** Connect a load to the V_{OUT} and GND terminals. The load can be either a passive (resistive) or an active (as in an electronic load) type. A current meter may be placed between the V_{OUT} terminal and load to monitor the output current. Ensure the output voltage is monitored at the V_{OUT} terminal.
3. **Enable Input.** The EN pin has an internal 100k pull-up resistor to VDD, which allows the output to be turned on when VDD exceeds its UVLO threshold. An EN connector is provided on the evaluation board for users to easily access the enable feature. Applying an external logic signal on the EN pin to pull it low or using a jumper to short the EN pin to GND will shut off the output of the MIC28510 evaluation board.
4. **Turn On the Power.** Turn on the V_{IN} supply and verify that the output voltage is regulated to 3.3V.

Ordering Information

Part Number	Description
MIC28510 5V EV	Evaluation Board up to 5V Output
MIC28510 12V EV	Evaluation Board 12V Output

Features

Feedback Resistors

The output voltage on the MIC28510 evaluation board, which is preset to 3.3V, is determined by the feedback divider, shown in Equation 1:

$$V_{OUT} = V_{REF} \times \left(1 + \frac{R4}{R_{BOTTOM}} \right) \quad \text{Eq. 1}$$

where $V_{REF} = 0.8V$, and R_{BOTTOM} is one of R5-R12, which corresponds to 0.9V, 1.0V, 1.2V, 1.5V, 1.8V, 2.5V, 3.3V, or 5V. Leaving the R_{BOTTOM} open gives a 0.8V output voltage. All other voltages not listed above can be set by modifying R_{BOTTOM} value according to Equation 2:

$$R_{BOTTOM} = \frac{R4 \times V_{REF}}{V_{OUT} - V_{REF}} \quad \text{Eq. 2}$$

Note that the output voltage should not be set to exceed 5V due to the 6.3V voltage rating on the output capacitors.

If higher than 5V output is desired, it is recommended to use the designs shown in the MIC28510 12V/4A output evaluation board schematic, where the output capacitors, L1, R3, and R17 are optimized for 12V output.

SW Node

Test point J11 (V_{SW}) is placed for monitoring the switching waveform, one of the most critical waveforms for the converter.

Current Limit

The MIC28510 has internal FETs, and the current limit is implemented by sensing the R_{DS-ON} of bottom FET. The MIC28510 has a fixed current limit of 6.5A (typical).

Loop Gain Measurement

The resistor, R13, is placed in series with the regulator feedback path. The control loop gain can be measured by connecting an impedance analyzer across the resistor and selecting the resistor value in between 20Ω to 50Ω.

Setting the Switching Frequency

The MIC28510 is an adjustable-frequency, synchronous buck regulator featuring a unique digitally modified adaptive on-time control architecture.

The switching frequency can be adjusted between 100kHz and 500kHz by changing the resistor divider connected network consisting of R18 and R19 from PVIN to PGND.

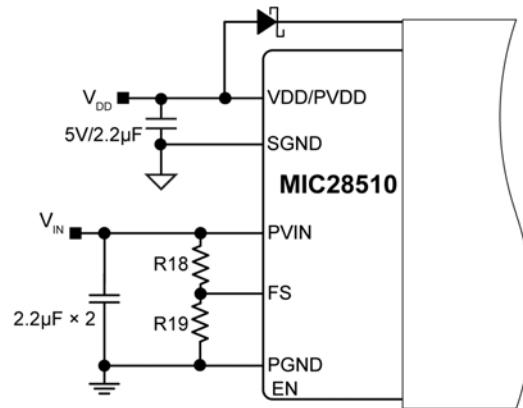

Figure 1. Switching Frequency Adjustment

Equation 3 illustrates the estimated switching frequency:

$$f_{SW_ADJ} = f_O \times \frac{R19}{R18 + R19} \quad \text{Eq. 3}$$

where f_O = Switching Frequency when R18 is 100k and R19 being open, f_O should be typically 450kHz. For more precise setting, it is recommended to use Figure 2:

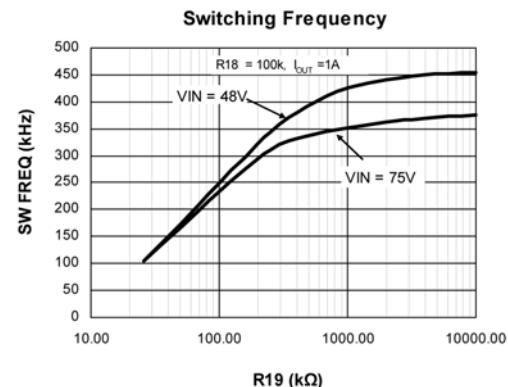

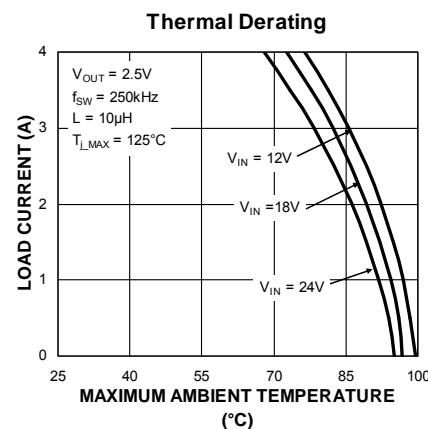

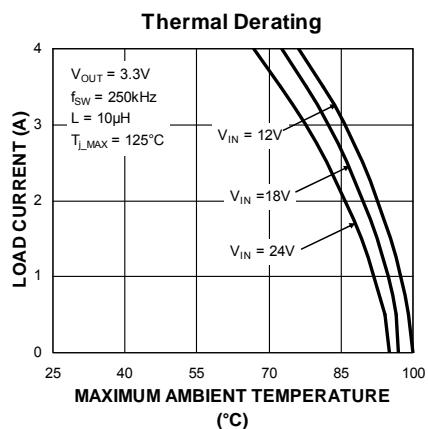

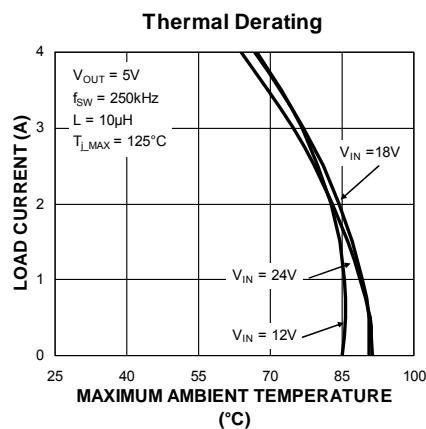

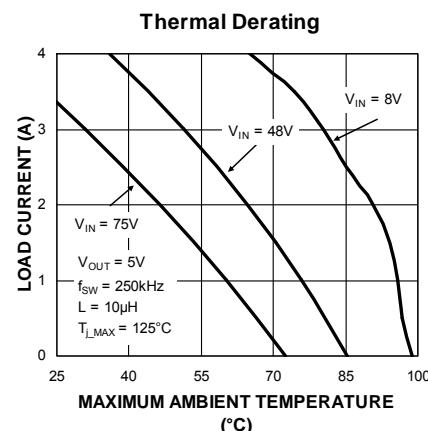

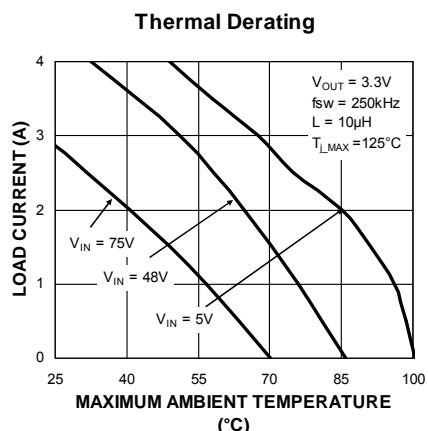

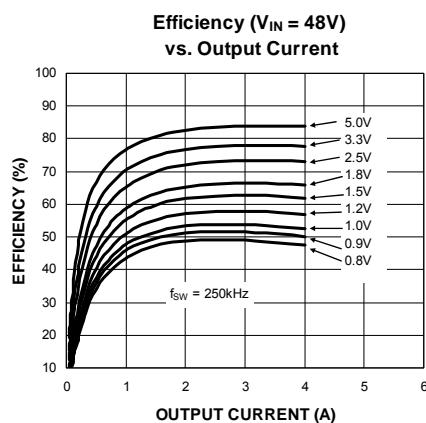

Figure 2. Switching Frequency vs. R19

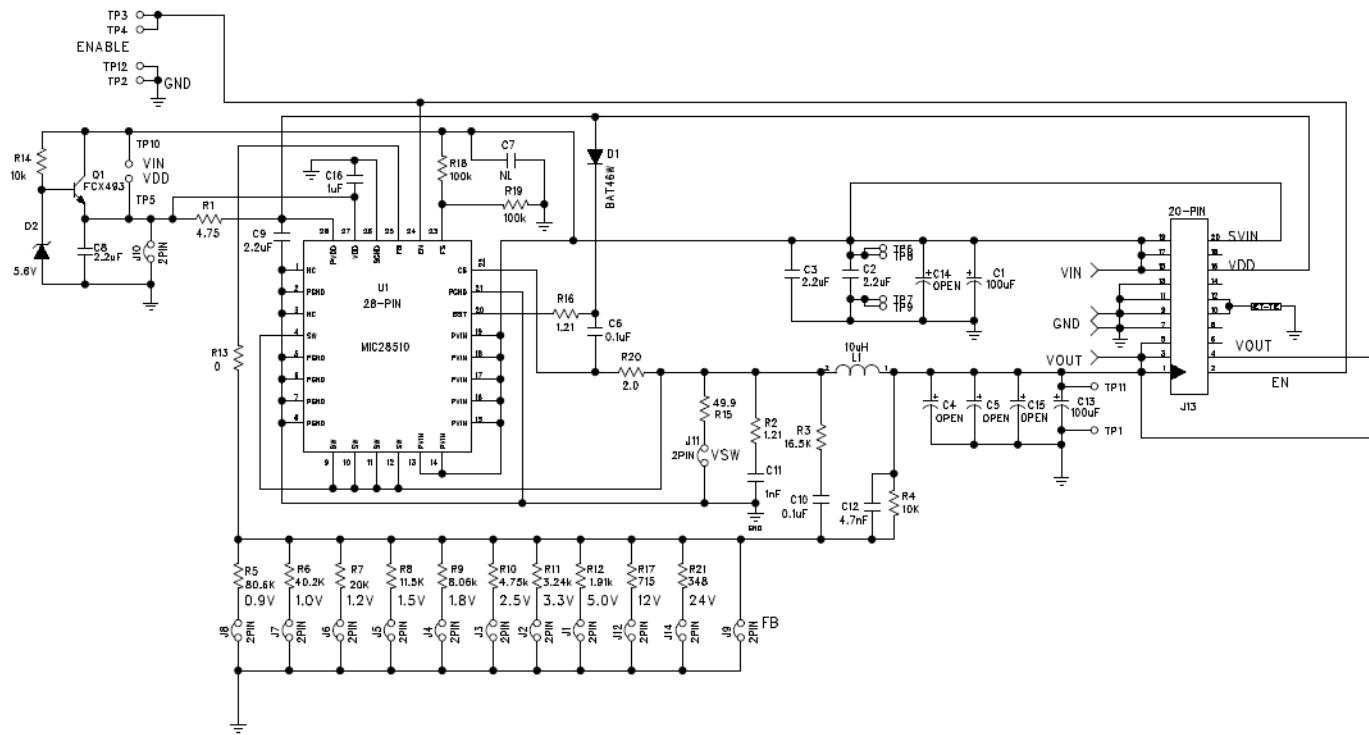

The evaluation board design is optimized for a switching frequency of 250kHz. If the switching frequency is programmed to either lower end or higher end, the design needs optimization.

MIC28510 0.8V to 5V/4A Evaluation Board Typical Characteristics

Die Temperature* : The temperature measurement was taken at the hottest point on the MIC28510 case mounted on a 5 square inch 4 layer, 0.62", FR-4 PCB with 2oz. finish copper weight per layer, see Thermal Measurement section. Actual results will depend upon the size of the PCB, ambient temperature and proximity to other heat emitting components.
