

MD52XX is ultra-low power consumption low dropout voltage regulator (LDO) manufactured in CMOS processes. It can deliver up to 500mA of current while consuming only 0.6 $\mu$ A of quiescent current. It consists of a reference voltage generator, an error amplifier, a current foldback circuit, and a phase compensation circuit plus a driver transistor. The MD52XX is designed specifically for applications where very-low  $I_Q$  is a critical parameter. This device maintains low quiescent current consumption even in dropout mode to further increase the battery life.

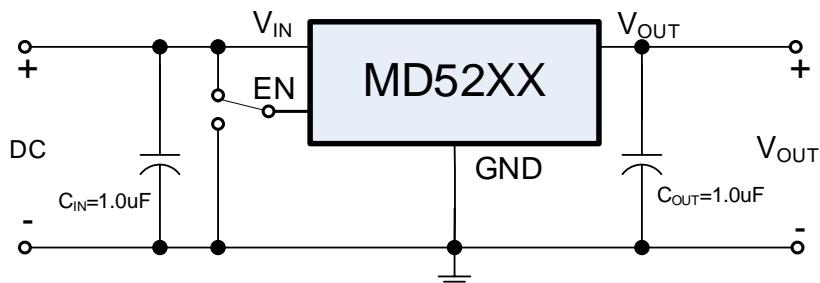

### ■ Features:

- Ultra-low Quiescent Current: 0.6 $\mu$ A
- Highly Accurate:  $\pm 2\%$
- Dropout Voltage: 230mV@ $I_{OUT}=500mA$
- Maximum Output Current: 500mA
- Input Voltage Range: 2.2V~7.0V
- Temperature Stability:  $\pm 50ppm/^\circ C$
- ON/OFF Logic = Enable High
- Standby Current: 10nA
- $C_{OUT}$  Discharge Circuit when EN Disable is Active
- Protections Circuits: Current Limiter, Short Circuit, Foldback
- Output Capacitor: Low ESR Ceramic Capacitor Compatible

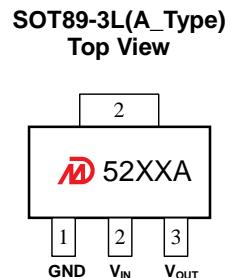

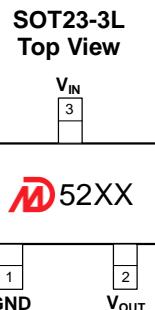

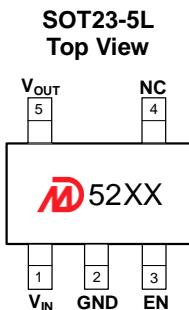

### ■ Applications:

- Smart wearer
- Long-life battery-powered devices
- Portable mobile devices, such as mobile phones, cameras, and so on
- Wireless communication equipment

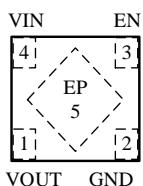

### ■ Typical Applications:

MD5240	4.0	DFN1*1-4L	MD52E40WB6	5240	
MD5250	5.0	DFN1*1-4L	MD52E50WB6	5250	

Notes: 1\* Customer can request to customize the output voltage ranged from 1.2V to 5V if desired voltage is not found in the selections.

2\* Customer can request customization of package choice.

3\* Please pay attention to the MARKING of the product package type.

### ■ Absolute Maximum Ratings:

(Unless otherwise indicated:  $T_a=25^\circ\text{C}$ )

PARAMETER	SYMBOL	RATINGS		UNITS
Input Voltage	$V_{IN}$	-0.3 ~ 8		V
Output Voltage	$V_{OUT}$	$V_{SS}-0.3 \sim V_{IN}+0.3\text{V}$		
Power Dissipation	$P_D$	SOT23-5	250	mW
		SOT23-3	250	
		SOT89-3	1000	
		DFN1*1-4L	200	
Thermal Resistance	$R_{\theta JB}^{(1)}$	SOT23-5	180	°C/W
		SOT23-3	200	
		SOT89-3	100	
		DFN1*1-4L	160	
Operating Ambient Temperature	$T_{opr}$	-40 ~ +85		°C
Storage Temperature	$T_{stg}$	-40 ~ +125		
ESD Protection	ESD HBM	6000		V

Note: Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device.

<sup>(1)</sup> Mounted on JEDEC standard 4layer (2s2p) PCB test board

### ■ Notes on Use:

Input Capacitor ( $C_{IN}$ ): 1.0 $\mu\text{F}$  above

Output Capacitor ( $C_{OUT}$ ): 1.0 $\mu\text{F}$  above

## ■ Electrical Characteristics:

MD52XX Series

(Unless otherwise indicated:  $T_a=25^\circ\text{C}$ )

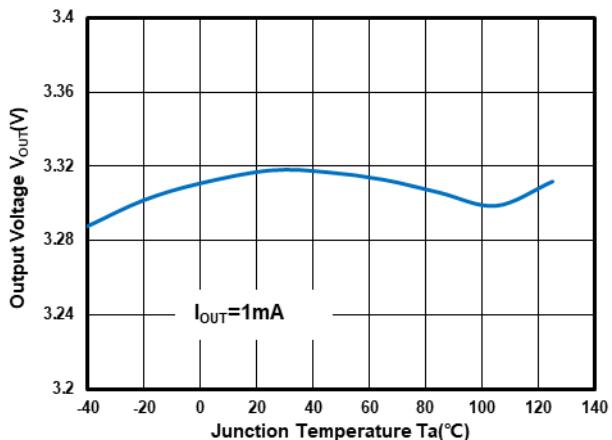

PARAMETER	SYMBOL	CONDITIONS	MIN.	TYP.	MAX.	UNIT

Test Conditions:  $V_{IN}=V_{OUT}+1.0V$ ,  $C_{IN}=1.0\mu F$ ,  $C_{OUT}=1.0\mu F$ ,  $T_a=25^{\circ}C$ , unless otherwise indicated.

Power Supply Rejection Ratio at  $V_{OUT}=3.3V$

## ■ Operational Explanation:

### 1. Output voltage control

The voltage divided by resistors R1 and R2 is compared with the internal reference voltage by the error amplifier. The amplifier output then drives the P-channel MOSFET connected to the V<sub>OUT</sub> pin. The output voltage at the V<sub>OUT</sub> pin is regulated by this negative feedback system. The current limit circuit and short protect circuit operate in relation to output current level. Further, the IC's internal circuitry can be in operation or shutdown modes controlled by the EN pin's signal.

### 2. Pass transistor

The pass transistor with low turn-on resistance used in MD52XX is a P-channel MOSFET. If the potential on V<sub>OUT</sub> pin is higher than V<sub>IN</sub>, it is possible that IC will be destroyed due to reverse current which is caused by parasitic diodes between V<sub>IN</sub> and V<sub>OUT</sub>. Therefore, the V<sub>OUT</sub> pin potential exceeds V<sub>IN</sub>+0.3V is not allowed.

### 3. Current foldback and short circuit protection

The MD52XX series includes a combination of a fixed current limiter circuit and a foldback circuit, which aid the operations of the current limiter and circuit protection. When the load current reaches the current limit level, the fixed current limiter circuit operates and output voltage drops. As a result of this drop in output voltage, the foldback circuit operates, output voltage drops further and output current decreases. The short circuit current is about 65mA (typical value). This design can prevent the chip be damaged due to over temperature, moreover, the heat dissipation is limited by the package type.

Special attention should be paid to that the product of the dropout voltage on the chip and the output current must be smaller than the heat dissipation.

### 4. C<sub>OUT</sub> Auto-Discharge Function

The MD52XX series can quickly discharge the electric charge at the output capacitor (C<sub>OUT</sub>), when a low signal is set to the EN pin, which puts the whole IC into OFF state. The discharge function is achieved by an internal switch located between the V<sub>OUT</sub> pin and the GND pin. In this state, the application is protected from a glitch operation caused by the electric charge at the output capacitor (C<sub>OUT</sub>).

Moreover, discharge time of the output capacitor (C<sub>OUT</sub>) is set by the C<sub>OUT</sub> auto-discharge resistance (R<sub>DCHG</sub>) and the output capacitor (C<sub>OUT</sub>). By setting time constant of a C<sub>OUT</sub> auto-discharge resistance value (R<sub>DCHG</sub>) and an output capacitor value (C<sub>OUT</sub>) as  $\tau = C_{OUT} \times R_{DCHG}$ , the output voltage after discharge via the internal switch is calculated by the following formulas.

$$V = V_{OUT(S)} \times e^{-t/\tau} \text{ or } t = \tau \ln(V_{OUT(S)} / V)$$

V: Output voltage after discharge

V<sub>OUT(S)</sub>: Output voltage

t: Discharge time

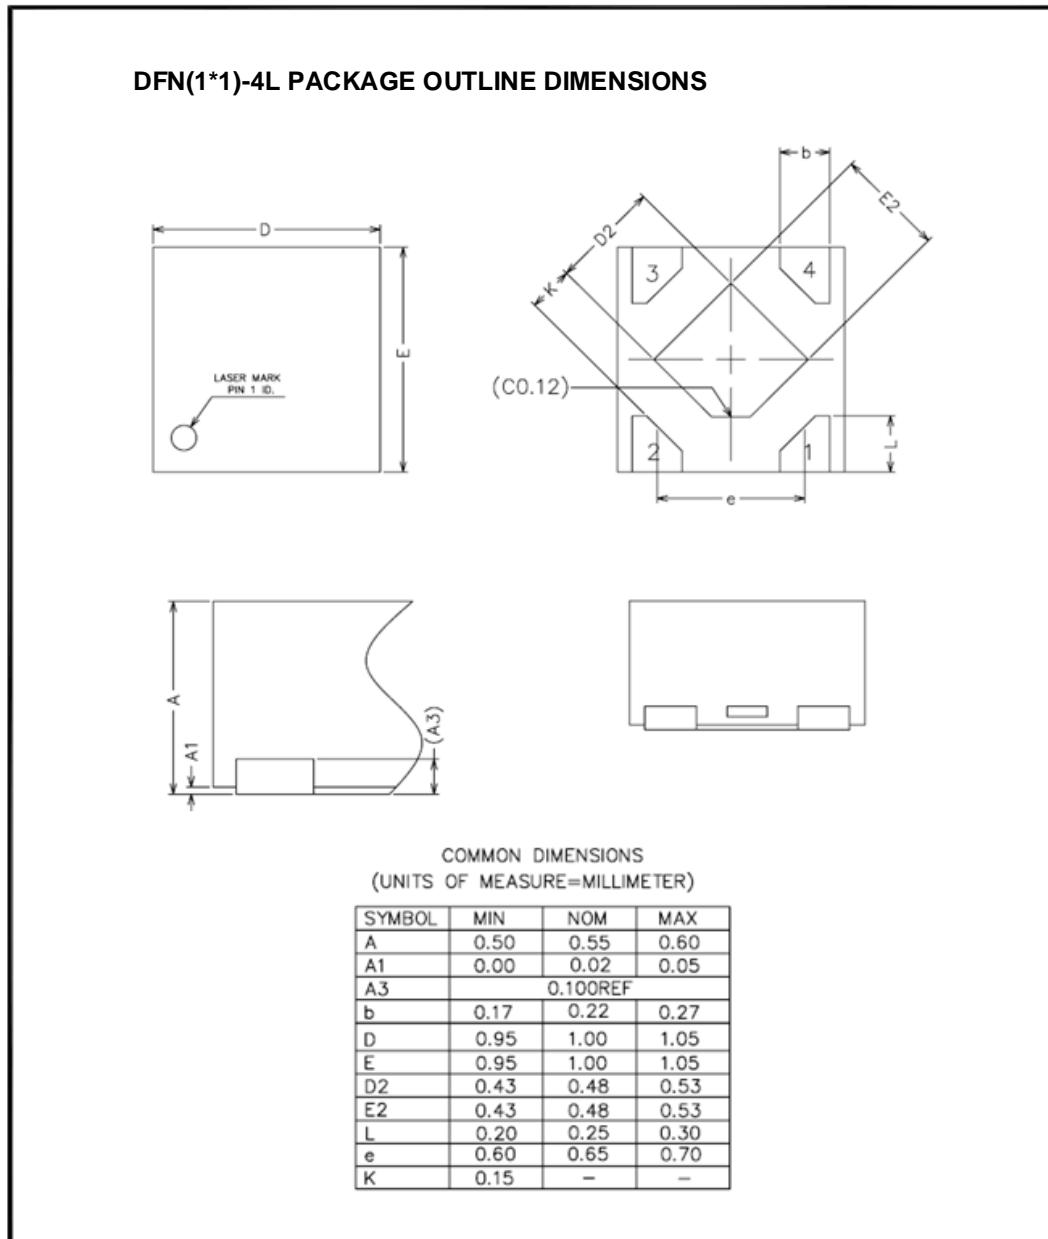

$$\tau: C_{\text{OUT}} \times R_{\text{DCHG}}$$

Please also note  $R_{\text{DCHG}}$  is depended on  $V_{\text{IN}}$  and When  $V_{\text{IN}}$  is high,  $R_{\text{DCHG}}$  is low.

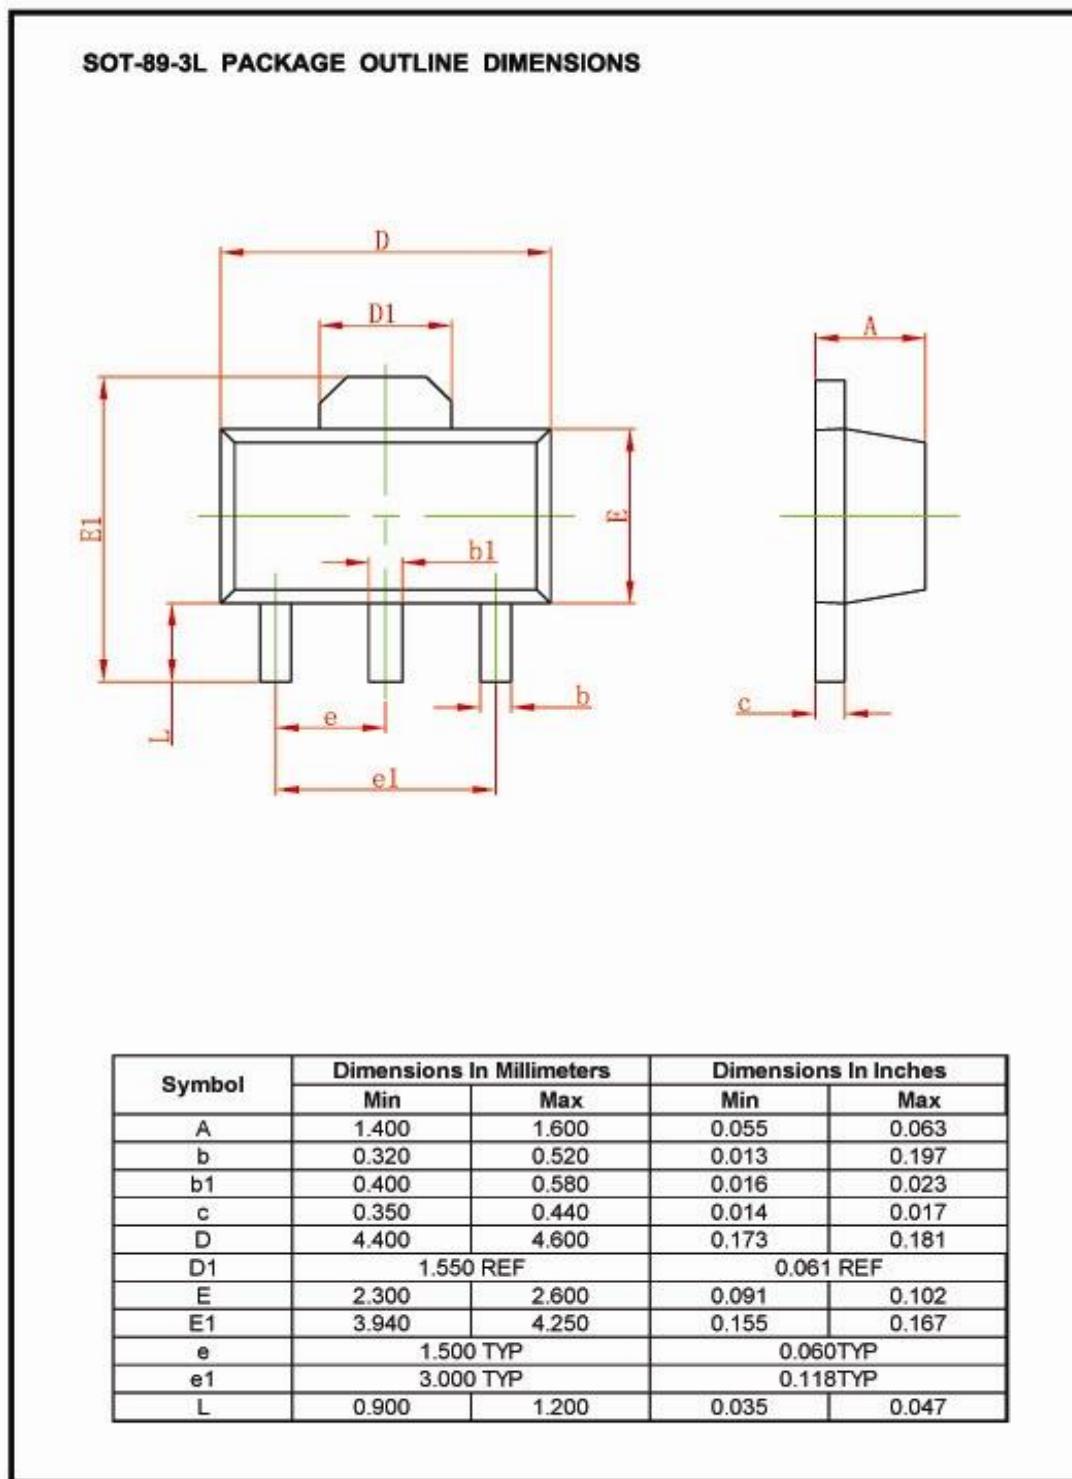

■ Notes:

1. The input and output capacitors should be placed as close as possible to the IC.
2. If the impedance of the power supply is high, which is caused by forgetting installing input capacitor or installing too small value capacitor, the oscillation may occur.
3. Pay attention to the operation conditions of input and output voltage and load current, such that the power consumption in the IC should not exceed the allowable power consumption of the package even though the chip has short circuit protection.
4. IC has a built-in anti-static protection (ESD) circuit, but please do not add excessive stress to the IC.
