MP8200

1.0V Precision Shunt Voltage Regulator

The Future of Analog IC Technology

DESCRIPTION

The MP8200 is a low voltage (1.0V), precision shunt regulator. It is offered in both fixed versions. It can operate from 1V to 12V, giving designers outstanding flexibility in the development of power supplies and instrumentation. The operating current of 100uA makes the part well suited for battery-powered portable electronic applications. The 8200 regulates the output voltage from as low as 1V. The part has a sharp turn-on characteristic and a dynamic resistance of less than 0.5Ω.

The MP8200 is offered in a surface mounted 3-pin SOT23 package. Different voltage tolerance ±1%.

Notes:

1) Exceeding these ratings may damage the device.
2) The maximum allowable power dissipation is a function of the maximum junction temperature T_J (MAX), the junction-to-ambient thermal resistance θ_{JA}, and the ambient temperature T_A. The maximum allowable continuous power dissipation at any ambient temperature is calculated by P_D (MAX) = (T_J (MAX)-T_A)/θ_{JA}. Exceeding the maximum allowable power dissipation will cause excessive die temperature, and the regulator will go into thermal shutdown. Internal thermal shutdown circuitry protects the device from permanent damage.
3) The device is not guaranteed to function outside of its operating conditions.
4) Measured on approximately 1" square of 1 oz copper.

APPLICATION INFORMATION

External Bias Resistor

In the case of shunt voltage references, an external bias resistor (R_{BIAS}) is required between the supply voltage and the MP8200. R_{BIAS} sets the current that is required to pass through the load and the IC.

The load and supply voltages can vary, so R_{BIAS} should be chosen such that is it small enough to supply the minimum current to the MP8200 when the supply voltage is at its minimum and the load current is at its maximum. In addition, R_{BIAS} needs to be large enough that the quiescent current does not exceed 10mA when the supply voltage is at its maximum and the load current is at its minimum.

Choose R_{BIAS} using the following equation:

$$R_{BIAS} = \frac{V_{SUPPLY} - V_{OUT}}{I_L + I_Q}$$

Adjustable Precision Voltage Source

The MP8200 can be combined with a precision op amp to produce a precise adjustable output voltage. See Figure 1.

The output of the op amp is determined by the gain of the circuit using the following equation:

$$V_{OUT} = 1 + \frac{R1}{R2}$$

An optional capacitor can be added in parallel with R2 to filter out high frequency noise.

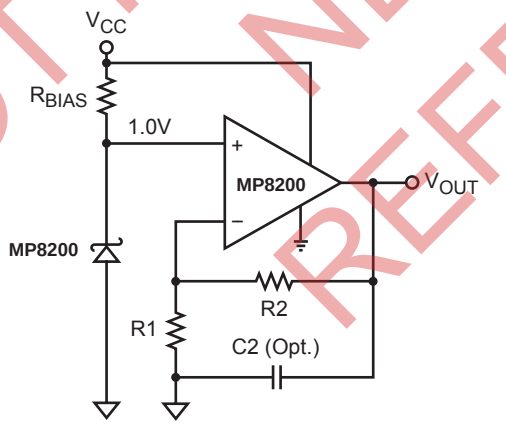

Figure 1—Adjustable Precision Voltage Source

Output Voltage Trim

Using a mechanical or digital potentiometer, the output voltage of the MP8200 can be trimmed to ±0.5%. See Figure 2. Note that trimming other resistor values may not produce an accurate output from the MP8200.

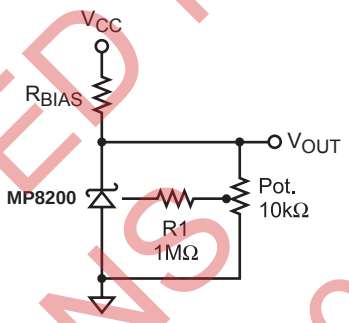

Figure 2—Output Voltage Trim

Precise Negative Voltage Reference

The MP8200 can be configured for use in applications where a precise negative voltage reference is needed.

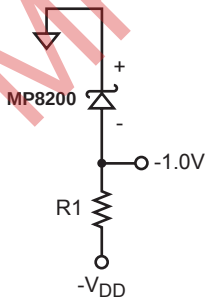

Figure 3—Precise –1.0V Reference

Choose R1 such that 100µA to 10mA is provided to properly bias the MP8200, using the equation:

$$R1 = \frac{V_{DD}}{I}$$
