

LOW VOLTAGE AUDIO POWER AMPLIFIER

■ GENERAL DESCRIPTION

The NJM2135 is a Low voltage audio power amplifier for speaker drivers. No external coupling capacitors are required because of the differential output. The closed loop gain is adjusted by two external resistors. The low supply current in power down mode contributes to the reduction of power consumption of portable battery powered equipment, cellular phones, for example.

■ APPLICATION CIRCUIT

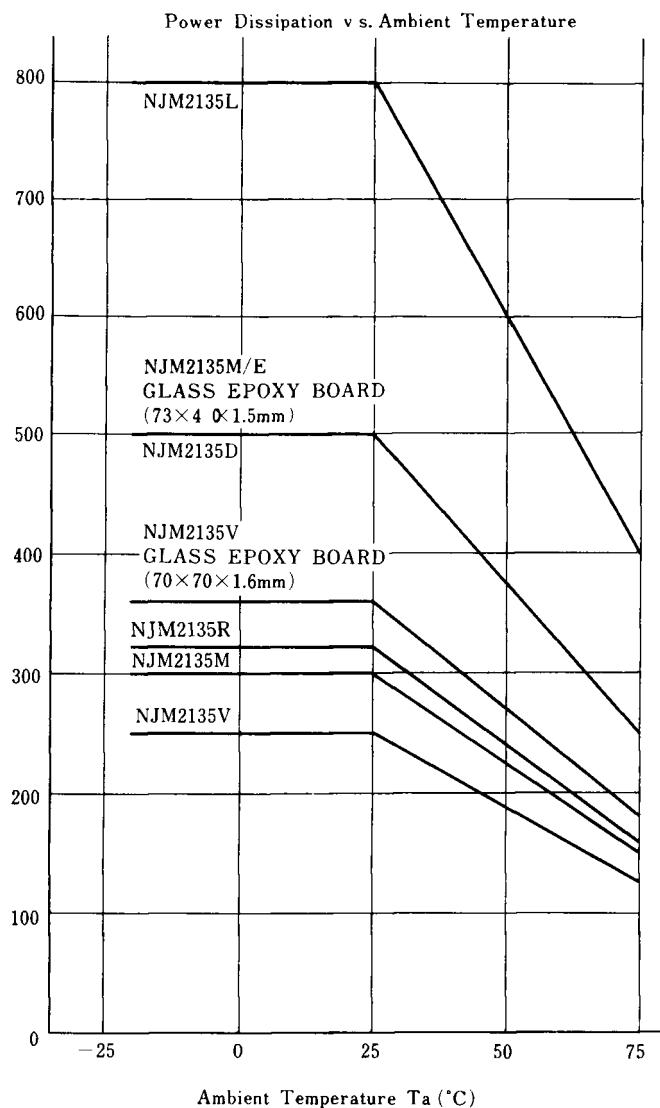

(note)

1. The NJM2135 is active mode during the CD terminal is High level ($>2.0V$) and it is stand-by mode during the CD terminal is Low level ($<0.8V$).
2. C_1 and C_2 improve power supply rejection ratio.
In case of C_1 is enough large, C_2 is unnecessary.
3. Please note that the C_1 and C_2 make slow power rise up to the NJM2135 regardless the external power supply condition.
4. Input current flow on the internal resistor shown in the equivalent circuit of CD terminal.
5. No snubber resistor and capacitor are required normally. But the snubber resistor and capacitor are required if the NJM2135 oscillates by condition of PCB layout, stray capacitor and speaker wire length.
6. When the NJM2135 change the mode to active or stand-by the CD terminal ON/OFF, the actual operation takes some delay by the charge and discharge of C_1, C_2 .
7. When the power turns on in stand-by mode, the NJM2135 operates during charging time of C_1 and C_2 .
8. If the supply voltage fluctuate large during the stand-by mode, the mode of active and stand-by of NJM2135 becomes unstable.

■ POWER DISSIPATION

The allowable power is restricted by the ambient temperature. Characteristics of the allowable power (PD : Power Dissipation) against ambient temperature is indicated below.
