PCB Signal Relay

PCB Signal Relay with a Small Size and Low Profile for Space Saving on Circuit Board

- Subminiature model as small as 5.2 (H) × 6.5 (W) × 10 (L) mm is ideal for high-density mounting (G6K(U)-2F(-Y)).
- Standard models achieve high sensitivity with a low power consumption of 100 mW.
- -Y models offer an impulse withstand voltage of 2,500 V for 2 × 10 μs by optimizing the distance between coil and contacts.
- Standard model conforms to UL/CSA standards, certified by BSI (EN62368-1).
- Standard models support a carry current of 2 A.
- Models with support for a contact switching current of 2 A are available. (-T1 type)
- Models with support for an ambient operating temperature of 125°C are available. (-T1 type)
- Products with surface-mount terminal-type sockets of through-hole terminal type are available to streamline relay replacement and reduce maintenance costs.

■Tube Packing and Tape Packing

Surface mounting terminal (SMT) standard models are shipped in moisture-proof package, and Through-hole terminals do not require moisture proof packaging and therefore shipped in non-moisture-proof package.

Please refer to "Correct Use" for handling after opening moisture-proof packaging for Surface mounting terminal (SMT) models.

(1) Tube Packing

- Relays in tube packing are arranged so that the orientation mark of each Relay in on the left side. Fifty Relays are packed on one tube.

Be sure not to make mistakes in Relay orientation when mounting the Relay to the PCB.

Tube length: 520 mm (stopper not included)

No. of Relays per tube: 50 pcs

(2) Tape Packing (Surface Mounting Terminal Models)

- When ordering Relays in tape packing, add the prefix "-TR" or "-TRS" to the model number, otherwise the Relays in tube packing will be provided.

Relays per Reel: 900 pcs

Precautions

Please refer to "PCB Relays Common Precautions" for correct use.

Correct Use

Long-term Continuously ON Contacts

- Using the Relay in a circuit where the Relay will be ON continuously for long periods (without switching) can lead to unstable contacts because the heat generated by the coil itself will affect the insulation, causing a film to develop on the contact surfaces. We recommend using a latching relay (magnetic-holding relay) in this kind of circuit. If a single-side stable model must be used in this kind of circuit, we recommend using a fail-safe circuit design that provides protection against contact failure or coil burnout.

Relay Handling

- Use the Relay as soon as possible after opening the moistureproof package. (As a guideline, use the Relay within one week at 30°C or less and 60% RH or less.) If the Relay is left for a long time after opening the moisture-proof package, the appearance may suffer and seal failure may occur after the solder mounting process. To store the Relay after opening the moisture-proof package, place it into the original package and sealed the package with adhesive tape.
- When washing the product after soldering the Relay to a PCB, use a water-based solvent or alcohol-based solvent, and keep the solvent temperature to less than 40°C. Do not put the Relay in a cold cleaning bath immediately after soldering.

Claw Securing Force During Automatic Mounting

- During automatic insertion of Relays, make sure to set the securing force of each claw to the following so that the Relays characteristics will be maintained.

Environmental Conditions During Operation, Storage, and Transportation

- Protect the Relay from direct sunlight and keep the Relay under normal temperature, humidity, and pressure.

Latching Relay Mounting

- Make sure that the vibration or shock that is generated from other devices, such as relays in operation, on the same panel and imposed on the Latching Relay does not exceed the rated value, otherwise the Latching Relay that has been set may be reset or vice versa. The Latching Relay is reset before shipping. If excessive vibration or shock is imposed, however, the Latching Relay may be set accidentally. Be sure to apply a reset signal before use.

Voltage Applied to Coils

- The Relays will operate at the must-operate voltage or greater, but the rated voltage must be applied to the coils in order to obtain the specified performance.

BSI certified (EN62368-1) (File No. VC669855)

Contact form	Isolation category	Voltage
DPDT (2c)	Basic Insulation	125 VAC

Changes in Must-operate Voltage Due to Coil Temperature

- Be sure to check operation under the actual application conditions as it may not be possible to satisfy the catalog values for must-operate voltages during a hot start or when the ambient temperature exceeds 23°C. Coil resistance is increased by a rise in temperature causing the must-operate voltage to increase. The resistance thermal coefficient of a copper wire is approximately 0.4% per 1°C, and the coil resistance also increases at this percentage. The catalog values for the must-operate voltage and must-release voltage are given for a coil temperature of 23°C.

Maximum Allowable Voltage

- The maximum allowable voltage of the coil can be obtained from the coil temperature increase and the heat-resisting temperature of coil insulating sheath material. (Exceeding the heat-resisting temperature may result in burning or short-circuiting.) The maximum allowable voltage also involves important restrictions which include the following:
 - Must not cause thermal changes in or deterioration of the insulating material.
 - Must not cause damage to other control devices.
 - Must not cause any harmful effect on people.
 - Must not cause fire.Therefore, be sure to use the maximum allowable voltage beyond the value specified in the catalog.
- As a rule, the rated voltage must be applied to the coil. A voltage exceeding the rated value, however, can be applied to the coil provided that the voltage is less than the maximum allowable voltage. It must be noted that continuous voltage application to the coil will cause a coil temperature increase thus affecting characteristics such as electrical life and resulting in the deterioration of coil insulation.

Coating

- The Relay mounted on the PCB may be coated or washed but do not apply silicone coating or detergent containing silicone, otherwise the silicone coating or detergent may remain on the surface of the Relay.

PCB Mounting

- If two or more Relays are closely mounted with the long sides of the Relays facing each other and soldering is performed with infrared radiation, the solder may not be properly exposed to the infrared rays. Be sure to keep the proper distance between adjacent Relays as shown below.

- Two or more Relays may be closely mounted with the short sides of the Relays facing each other.

●Socket Washing

- Do not wash the entire socket, as washing may compromise socket performance, such as causing contact failure.
When washing after mounting the PCB, perform cleaning only on the soldered sections.

●Precautions When Replacing a Relay

- Improper insertion or removal, such as forcing the relay into the socket backwards or at an angle, may cause deformation of the relay terminals, prevent the relay from being removed, or damage the socket.

●Manual Socket Soldering Rework

- When performing manual rework with a soldering iron after mounting this product on the PCB, ensure that all work is performed within the conditions listed in the specifications.
When performing manual rework with a soldering iron, do not use excessive solder or flux.
Solder wicking or flux oozing may cause poor connection or malfunction.
