# AS1170 High current LED/VCSEL driver

## 1 General description

The AS1170 is an inductive high efficient DCDC step up converter with two current sinks. The DCDC step up converter operates at a fixed frequency of 4 MHz and includes soft startup to allow easy integration into noise sensitive RF systems. The AS1170 includes flash timeout, overvoltage, over temperature, undervoltage and short circuit protection functions. The AS1170 is controlled by an I<sup>2</sup>C interface and has a hardware automatic shutdown if SCL=0 for 100 ms. Therefore, no additional enable input is required for shutting down of the device once the system shuts down. The AS1170 is available in a space-saving WL-CSP package measuring only 2.25 mm x 1.5 mm x 0.6 mm.

### 1.1 Key benefits & features

The AS1170 module is specifically designed for:

Table 1: Added value overview

Features	Benefits
High efficiency 4 MHz fixed frequency DCDC Boost converter	Stable even in coil current limit
Independent channel control	Combine channels for higher current output
PWM operation for lower output current	31.25 kHz to avoid audible noise
WL-CSP package	Tiny footprint of 2.25 mm x 1.5 mm x 0.6 mm
Automatic current adjustment for low battery voltage	Long battery lifetime
High output current	Current adjustable up to 2000 mA

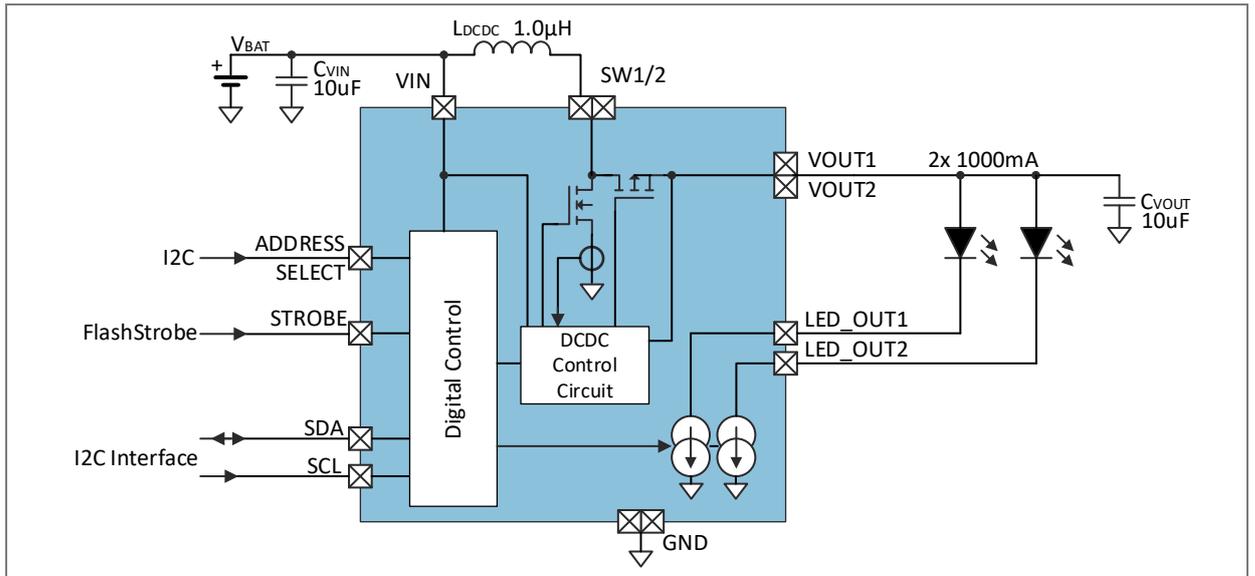

### 1.2 Applications

- Flash / torch / video light for smartphones, feature-phones
- 3D sensing – Active stereo vision / structured light
- Handheld scanners
- Safety signage

### 1.3 Block diagram

The functional block of this device is shown below:

Figure 1: Functional block of AS1170

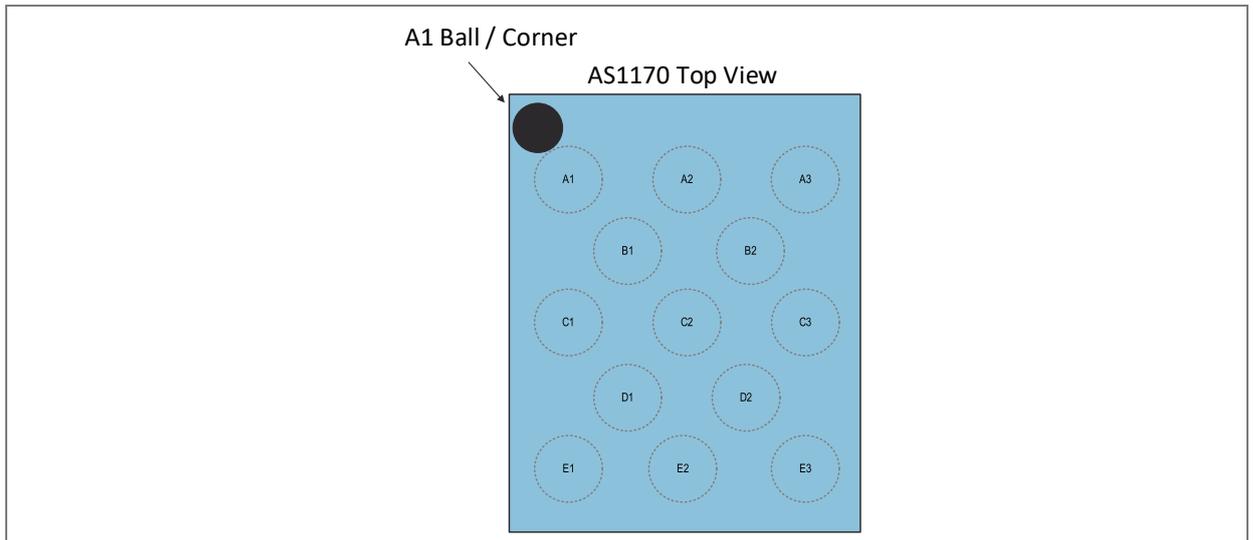

## 2 Ordering information

Product code	Q-number	Package	Delivery form	Delivery quantity
AS1170	Q65113A7128	AS1170 WLP LF T&R	Tape and reel	10000 pcs
AS1170	Q65113A7129	AS1170 WLP LF T&R	Tape and reel	500 pcs

## 3 Pin assignment

Figure 2: Pin assignment

### 3.1.1 Pin description

Table 2: Pin description

Pin number	Pin name	Value
A1	VOUT1	DCDC converter output capacitor - make a short connection to $C_{VOUT}$ / $V_{OUT2}$ .
A2	GND	Power and analog ground; make a short connection between both balls.
A3	LED_OUT1	Flash LED current sink.
B1	SW1	DCDC converter switching node - make a short connection to SW2 / coil $L_{DCDC}$ .
B2	GND	Power and analog ground; make a short connection between both balls.
C1	VOUT2	DCDC converter output capacitor - make a short connection to $C_{VOUT}$ / $V_{OUT1}$ .
C2	SW2	DCDC converter switching node - make a short connection to SW1 / coil $L_{DCDC}$ .
C3	LED_OUT2	Flash led current sink.
D1	SCL	Serial clock input for I <sup>2</sup> C interface.
D2	VIN	Positive supply voltage input - connect to supply and make a short connection to input capacitor $C_{VIN}$ and to coil $L_{DCDC}$ .
E1	SDA	Serial data input/output for I <sup>2</sup> C interface (needs external pull-up resistor).
E2	STROBE	Digital input with pulldown to control strobe time for flash function.
E3	A-SELECT	Alternative I <sup>2</sup> C address pin.

## 4 Absolute maximum ratings

Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only. Functional operation of the device at these or any other conditions beyond those indicated under “Operating Conditions” is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 3: Absolute maximum ratings of AS1170

Parameter	Min	Max	Unit	Comments
V <sub>IN</sub> to GND	-0.3	+7.0	V	
Strobe, SCL, SDA to GND	-0.3	V <sub>IN</sub> + 0.3	V	Max. +7 V
SW1/2, VOUT1/2, LED_OUT1/2 to GND	-0.3	+7.0	V	
VOUT1/2 to SW1/2	-0.3	0.0	V	<b>Note:</b> Diode between VOUT1/2 and SW1/2
Voltage between GND pins	0.0	0.0	V	Short connection recommended
Input pin current without causing latchup	-100	+100 + I <sub>IN</sub>	mA	EIA/JESD78
Continuous power dissipation (T <sub>A</sub> = +70 °C)				
Continuous power dissipation		1230	mW	P <sub>T</sub> @ 70 °C
Continuous power dissipation de-rating factor		16.7	mW/K	PDERATE2
<b>Electrostatic discharge</b>

<b>Temperature ranges and storage conditions</b>				
Junction to ambient thermal resistance		604	K/W	
Junction temperature		150	°C	Internally limited (over temperature protection), max. 20000s
Storage temperature range	-55	125	°C	
Humidity	5	85	%	Non condensing
Body temperature during soldering		260	°C	According to IPC/JEDEC J-STD-020

Parameter	Min	Max	Unit	Comments
Moisture sensitivity level (MSL)	MSL1			Represents a max. floor life time of unlimited

- (1) Depending on actual PCB layout and PCB used measured on demoboard; for peak power dissipation during flashing see document AS1170 thermal measurements.
- (2) PDERATE de-rating factor changes the total continuous power dissipation ( $P_T$ ) if the ambient temperature is not 70 °C. Therefore for e.g.  $T_{AMB} = 85$  °C, calculate  $P_T$  at 85 °C =  $P_T - PDERATE * (85$  °C to 70 °C).
- (3) Pins LED\_OUT1 connected to LED\_OUT2 and capacitor  $C_{VOUT}$  connected to VOUT1/2 and GND; both GND pins connected together.
- (4) Measured on AS1170 demoboard.

## 5 Electrical characteristics

I <sub>LIMIT</sub>	Current limit for coil L <sub>DCDC</sub> (Pin SW) measured at 40% PWM duty cycle maximum 40000s lifetime operation in overcurrent limit	Default value	coil_peak=00b	1.8	2.0	2.23	A
			coil_peak=01b	2.25	2.5	2.78	
			coil_peak (see Page 24 =10b)	2.7	3.0	3.34	
			coil_peak=11b	3.15	3.5	3.9	

Symbol	Parameter	Condition	Min	Typ.	Max	Unit
V <sub>LED</sub> SHORT	Flash LED short circuit detection voltage	Voltage measured between pins VOUT1,2 and LED_OUT1,2		1.0		V
T <sub>OVTEMP</sub>	Overtemperature protection	Junction temperature		144		°C
T <sub>OVTEMPHYST</sub>	Overtemperature hysteresis			5		°C
t <sub>FLASH</sub> TIMEOUT	Flash timeout timer	Can be adjusted with register flash_timeout	2		1280	ms
		Accuracy	-7.5		+7.5	%
V <sub>UVLO</sub>	Undervoltage lockout	Falling V <sub>VIN</sub>	2.25	2.4	2.5	V
		Rising V <sub>VIN</sub>	V <sub>UVLO</sub> +0.05	V <sub>UVLO</sub> +0.1	V <sub>UVLO</sub> +0.15	V
<b>Digital interface</b>						
V <sub>IH</sub>	High level input voltage	Pins SCL, SDA	1.26		V <sub>VIN</sub>	V
V <sub>IL</sub>	Low level input voltage		0.0		0.54	V
V <sub>IH</sub> FLASH	High level input voltage	Pin STROBE	0.7		V <sub>VIN</sub>	V
V <sub>IL</sub> FLASH	Low level input voltage		0.0		0.54	V
V <sub>OL</sub>	Low level output voltage	Pin SDA, I <sub>OL</sub> =3 mA			0.3	V
I <sub>LEAK</sub>	Leakage current	Pins SCL, SDA	-1.0	0.0	+1.0	μA
I <sub>PD</sub>	Pulldown current to GND	Pins STROBE		36		μA
t <sub>TIMEOUT</sub>	SCL timeout	In indicator, assist or flash mode, if SCL is low longer than this timeout, the AS1170 automatically enters shutdown mode	35		100	ms

(1) V<sub>VIN</sub> = +2.7 V to +4.4 V, T<sub>AMB</sub> = -30 °C to 85 °C, unless otherwise specified. Typical values are at V<sub>VIN</sub> = +3.7 V, T<sub>AMB</sub> = 25 °C, unless otherwise specified.

## 5.1 I<sup>2</sup>C specifications

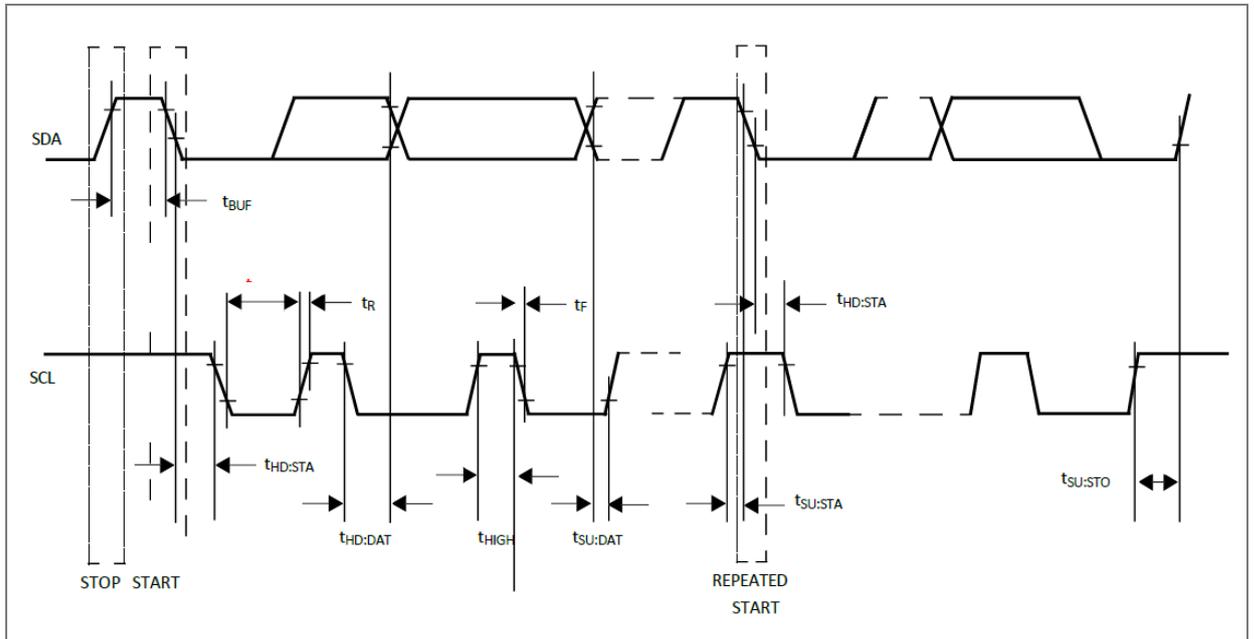

Table 5: I<sup>2</sup>C specifications

Symbol	Parameter	Condition	Min	Typ.	Max	Unit
<b>I<sup>2</sup>C mode timings – see Figure 3</b>						
f <sub>SCLK</sub>	SCL clock frequency		1 / t <sub>TIMEOUT</sub>		400	kHz
t <sub>BUF</sub>	Bus free time between a STOP and START condition		1.3			µs
t <sub>HD:STA</sub>	Hold time (repeated) START Condition <sup>(7)</sup>		0.6			µs
t <sub>LOW</sub>	LOW period of SCL clock		1.3			µs
t <sub>HIGH</sub>	HIGH period of SCL clock		0.6			µs
t <sub>SU:STA</sub>	Setup time for a repeated START condition		0.6			µs
t <sub>HD:DAT</sub>	Data hold time <sup>(8)</sup>		0		0.9	µs
t <sub>SU:DAT</sub>	Data setup time <sup>(9)</sup>		100			ns
t <sub>R</sub>	Rise time of both SDA and SCL signals		20 + 0.1C <sub>B</sub>		300	ns
t <sub>F</sub>	Fall time of both SDA and SCL signals		20 + 0.1C <sub>B</sub>		300	ns
t <sub>SU:STO</sub>	Setup time for STOP condition		0.6			µs
C <sub>B</sub>	Capacitive load for each bus line	C <sub>B</sub> - total capacitance of one bus line in pF			400	pF
C <sub>I/O</sub>	I/O capacitance (SDA, SCL)				10	pF

- (1) For V<sub>BAT</sub>=4.5 V, SCL=1.8 V, SDA=1.8 V maximum I<sub>STANBY</sub> is <16 µA.
- (2) To improve efficiency at low output currents, the active part of the internal switching transistor PMOS is reduced in size to 1/5 its original size. This reduces the current required to drive the PMOS transistor and therefore improves overall efficiency at low output currents.
- (3) The maximum current driving capability depends on supply voltage V<sub>VIN</sub>, LED forward voltage and coil peak current limit.
- (4) Due to slope compensation of the current limit, I<sub>LIMIT</sub> changes with duty cycle – see Figure 17.
- (5) The logic input levels V<sub>IH</sub> and V<sub>IL</sub> allow for 1.2 V or 1.8 V supplied driving circuit.
- (6) A pulldown current of 36 µA is equal to a pulldown resistor of 42 kΩ at 1.5 V.
- (7) After this period, the first clock pulse is generated.
- (8) A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the V<sub>IHMIN</sub> of the SCL signal) to bridge the undefined region of the falling edge of SCL.
- (9) A fast-mode device can be used in a standard-mode system, but the requirement t<sub>SU:DAT</sub> = to 250 ns must then be met. This is automatically the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line t<sub>R max</sub> + t<sub>SU:DAT</sub> = 1000 + 250 = 1250 ns before the SCL line is released.

## 7 Detailed description

The AS1170 is a high performance DCDC step up converter with internal PMOS and NMOS switches. Its output is connected to one or two flash LEDs<sup>1</sup> with an internal current sink. The device is controlled by the pins SDA and SCL in I<sup>2</sup>C mode.

The actual operating mode like standby, assist light, indicator or flash mode, can then be chosen by the interface. If not in standby mode, the device automatically enters shutdown mode by keeping SCL low for more than  $t^2$ .

The AS1170 includes a fixed frequency DCDC step-up with accurate startup control. Together with the current sink (on LED\_OUT1/2) it includes several protection and safety functions.

Figure 16: Internal circuit diagram

<sup>1</sup> If two LEDs are connected, it is possible to operate each of the two LEDs individually as the LED current can be selected individually.

<sup>2</sup> Following registers are reset to their default value if the timeout expires: out\_on=0, mode\_setting=00, const\_v\_mode=0.

## 7.1 Softstart / soft ramp down

During startup and ramp down the LED current is smoothly ramped up and ramped down. If the DCDC converter goes out of regulation (measured by monitoring the voltage across the current sinks), the ramp up is temporarily stopped in order for the DCDC to return to regulation<sup>3</sup>.

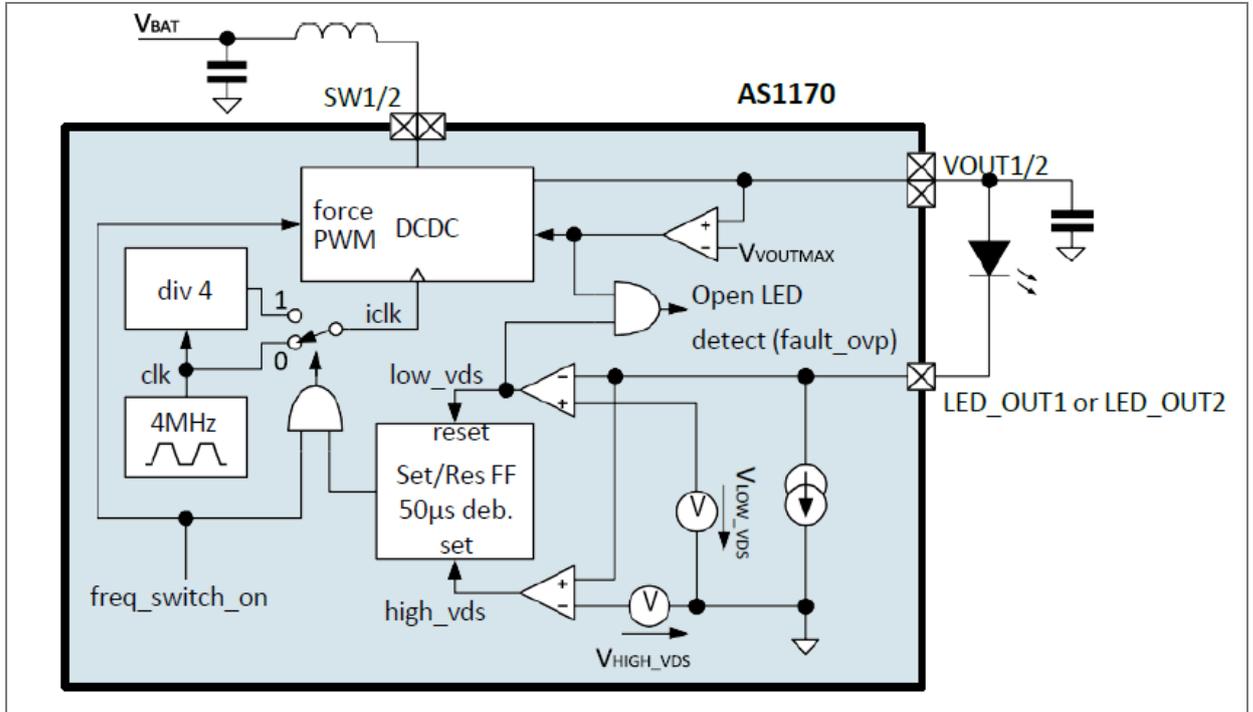

## 7.2 4 MHz / 1 MHz operating mode switching

If `freq_switch_on=1` and in flash and assist light mode (indicator mode or low current mode using PWM mode -see `mode_setting` - always will use `pulseskip`) if `led_current1`  $\geq 40h$  and `led_current2`  $\geq 40h$  and `current_boost=0`, the DCDC converter always operates in PWM mode (exception: PFM mode is allowed during startup) to reduce EMI in EMI sensitive systems. For flash and assist light mode and high duty cycles close to 100% on-time (maximum duty cycle) of the PMOS, the DCDC converter can switch into a 1 MHz operating mode and maximum duty cycle to improve efficiency for this load condition<sup>4</sup>. The DCDC converter returns back to its normal 4 MHz operating frequency when load or supply conditions change. Due to this switching between two fixed frequencies the noise spectrum of the system is exactly defined and predictable. If improved efficiency is required, the fixed switching between 1 MHz / 4 MHz can be disabled by `freq_switch_on=0`. In this case `pulseskip` will be used.

<sup>3</sup> The actual value of the LED current setting can be readout by the register `led_current_actual` to allow the camera processor to adopt to the actual operating conditions.

<sup>4</sup> Efficiency compared to a 4 MHz only DCDC converter forced to operate with minimum duty cycle.

Figure 17: Internal circuit of 4 MHz / 1 MHz selection

(1) For simplicity Figure 17 shows only a single current sink.

### 7.3 Protection and fault detection functions

The protection functions protect the AS1170 and the LED(s) against physical damage. In most cases a fault register bit is set, which can be readout by the I<sup>2</sup>C interface. The fault bits are automatically cleared by an I<sup>2</sup>C readout of the fault register. Additionally the DCDC is stopped and the current sinks are disabled<sup>5</sup> by resetting out\_on=0, mode\_setting=00.

### 7.4 Overvoltage protection

In case of no or a broken LED(s) at the pin LED\_OUT1/2 and an enabled DCDC converter, the voltage on VOUT1/2 rises until it reaches V<sub>VOUTMAX</sub> (overvoltage condition) and the voltage

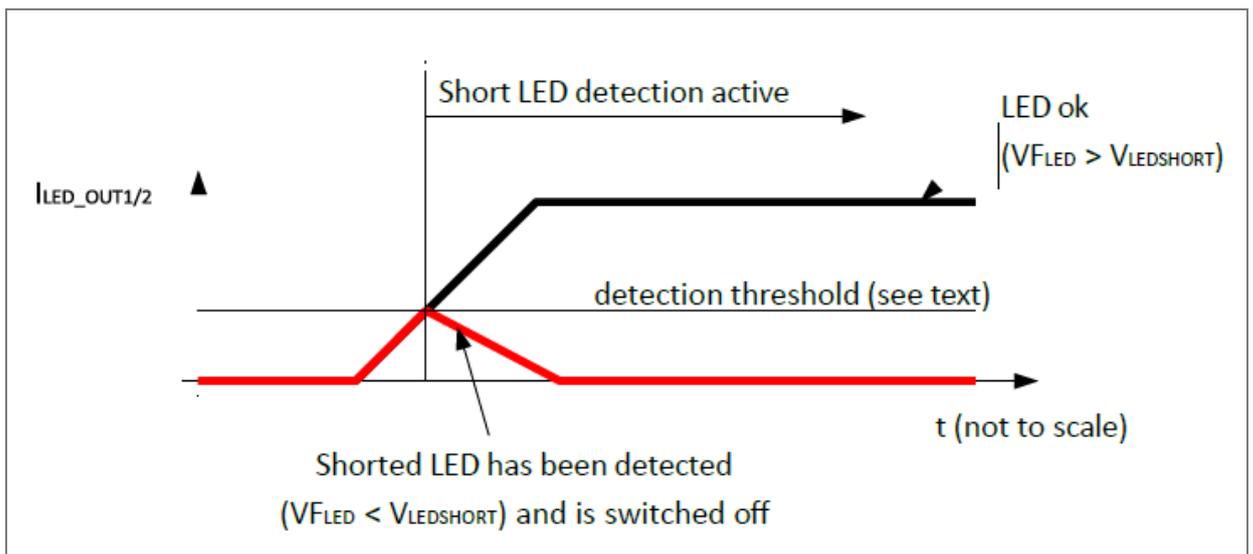

<sup>5</sup> Applies for all faults.

across the current source is below  $low\_vds^6$ , the DCDC converter is stopped, the current sources are disabled and the bit  $fault\_ovp$  is set<sup>7</sup>.

## 7.5 Short circuit protection

After the startup of the DCDC converter, the voltage on LED\_OUT1/2 is continuously monitored and compared against  $V_{LED\_SHORT}$  if the LED current is above 14 mA<sup>8</sup> ( $current\_boost=0$ ), 15.6 mA ( $current\_boost=1$ )<sup>9</sup>. If the voltage across the LED ( $V_{F_{LED}} = V_{OUT1/2} - LED\_OUT1/2$ ) stays below  $V_{LED\_SHORT}$ , the DCDC is stopped (as a shorted LED is assumed), the current sinks are disabled and the bit  $fault\_led\_short$  is set. In a dual LED configuration for the AS1170, if a single shorted LED is detected, this LED is disabled and the device continues operation with the other LED.

Figure 18: Short LED detection

<sup>6</sup> If overvoltage is reached, but none of the  $low\_vds$  comparator(s) triggers,  $V_{OUT1/2}$  is still regulated below  $V_{VOUTMAX}$ .

<sup>7</sup> In constant voltage mode (5V generation, register bit  $const\_v\_mode=1$ ) this fault is disabled.

<sup>8</sup> Measured for each LED\_OUT1/2 pin.

<sup>9</sup> To avoid errors in short LED detection for LEDs with a high leakage current.

### 7.5.1 Over temperature protection

The junction temperature of the AS1170 is continuously monitored. If the temperature exceeds  $T_{OVTEMP}$ , the DCDC is stopped, the current sinks are disabled (instantaneous) and the bit `fault_overtemp` is set. The driver is automatically re-enabled<sup>10</sup> once the junction temperature drops below  $T_{OVTEMP}-T_{OVTEMPHYST}$ .

### 7.5.2 Flash timeout

If the flash is started a timeout timer is started in parallel. If the flash duration defined by the STROBE input (`strobe_on = 1` and `strobe_type = 1`) exceeds  $t_{FLASHTIMEOUT}$  (adjustable by register), the DCDC is stopped and the flash current sinks (on pin LED\_OUT1/2) are disabled and `fault_timeout` is set.

If the flash duration is defined by the timeout timer itself (`strobe_on = 0`), the register `fault_timeout` is set after the flash has been finished.

### 7.5.3 Supply undervoltage protection

If the voltage on the pin  $V_{IN}$  (=battery voltage) is or falls below  $V_{UVLO}$ , the AS1170 is kept in shutdown state and all registers are set to their default state.

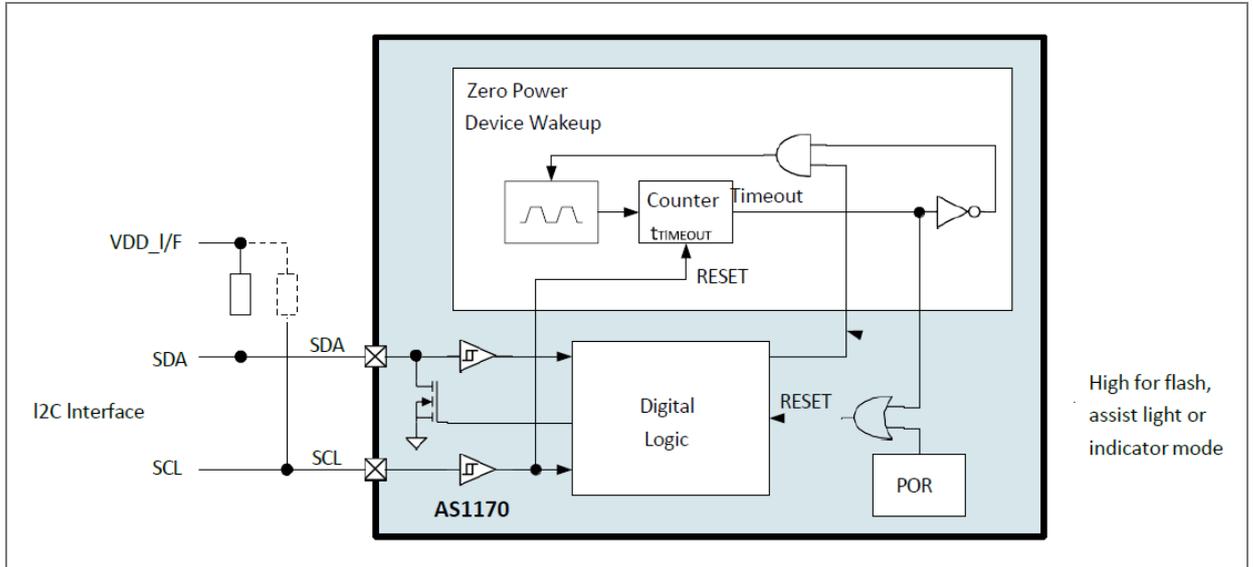

### 7.5.4 Wakeup circuit - power off detection

In flash, assist light and indicator mode (register `mode_setting=01, 10` or `11`) and `out_on=1`, if SCL is L for more than  $t_{TIMEOUT}$ , shutdown mode is automatically entered. This feature automatically detects a power-off of the controlling circuit driving SCL and SDA ( $V_{DD\_I/F}$  goes to 0 V e.g. due to a low power condition of the driving circuit).

---

<sup>10</sup> In constant voltage mode (`const_v_mode=1`) the DCDC will not be automatically re-enabled.

Figure 19: Device shutdown and wakeup

In shutdown mode once pin SCL goes high for the first time, the internal counter shown in Figure 20 is immediately reset thus releasing the internal RESET (assuming  $V_{IN}$  is above  $V_{UVLO}$ ) signal and allows instant communication on the I<sup>2</sup>C bus. Therefore, no additional action is required to leave the shutdown mode and start I<sup>2</sup>C communication.

### Purpose of this circuit

The purpose of this circuit is an additional security mechanism.

Assume the user indicator operation (there is no timeout for these operating modes) and the battery slowly drops below the undervoltage limit of the system. The processor would get a reset by the PMIC and the LDO operating  $V_{DD\_I/F}$  is switched off, but the processor might not have been able to switch-off the indicator operation of the AS1170. Due to the implemented security mechanism the AS1170 detects a power off of  $V_{DD\_I/F}$  and automatically enters shutdown.

### 7.5.5 Current consumption in standby/shutdown mode

The AS1170 is designed to draw minimum current in standby and shutdown mode. There is a small difference in current consumption between these two operating modes (typ. 300 nA) only due to the internal level shifters (see the Schmitt trigger input buffers connected to SCL and SDA for shifting up the voltage on SCL/SDA ( $V_{DD\_I/F}$  e.g. 1.8 V) to the supply voltage on  $V_{IN}$  (e.g. 3.7 V). If the AS1170 is driven with digital levels close to 0  $V/V_{IN}$ , the current consumption for standby mode is identical to shutdown mode.

### 7.5.6 Operating mode and currents

The output currents and operating mode are selected according to the following table:

Table 6: Operating mode and current settings

Operating mode and currents						
SCL and SDA	STROBE	mode_setting	out_on	Condition	Mode	LED_OUT1/2 output current
SCL low for $t_{\text{TIMEOUT}}^{(1)}$	X	X	X	If previous operating mode was indicator, assist light or flash mode	Shutdown all registers are reset to their default values	0
	X	10, 01 or 11	0		Standby	0
I <sup>2</sup> C commands are accepted	X	01	1		Indicator mode or low current pwm mode <sup>(3)</sup>	LED current is defined by the 6LSB bits (bits 5...0) of led_current1 and led_current2 pwm modulated with 31.25 kHz defined by register inct_pwm (1/ 16...4/16)
	X	10	1		Assist light mode	LED current is defined by the 7LSB <sup>(2)</sup> bits (6...0) of led_current1 and led_current2
	X			strobe_on = 0	Flash mode; Flash duration defined by flash_timeout	LED current is defined by led_current1 and led_current2 - the current can be reduced during flash, see Flash current reductions below
	0->1			strobe_on = 1 and strobe_type = 0		
	1	11	1	strobe_on = 1 and strobe_type = 1	Flash mode; Flash duration defined by strobe input; timeout defined by flash_timeout	

- (1) SCL low for  $t_{\text{TIMEOUT}}$  and operating mode is indicator, assist or flash mode then shutdown mode is entered.
- (2) The MSB bit of this register not used to protect the LED; therefore the maximum assist light current = half the maximum flash current.
- (3) The low current mode is a general purpose PWM mode to drive less current through the LED in average, but keep the actual pulsed current in a range where the light output from the LED is still specified. As only the 6 LSBs of led\_current1 and led\_current2 are used the maximum current is limited to 1/4 of the maximum flash current.

## 7.5.7 Flash current reductions

### Current reduction by $V_{IN}$ measurements in flash mode

Due to the high load of the flash driver and the ESR of the battery (especially critical at low temperatures), the voltage on the battery drops. If the voltage drops below the reset threshold of the system would reset. To prevent this condition the AS1170 monitors the battery voltage and keeps it above `vin_low_v_run` as follows:

Before a flash is started the voltage on  $V_{IN}$  is measured. If the voltage is below the setting of `vin_low_v` the `fault_uvlo` is set and the flash is disabled (driver stays in shutdown) if `vin_low_v_shutdown=1`.

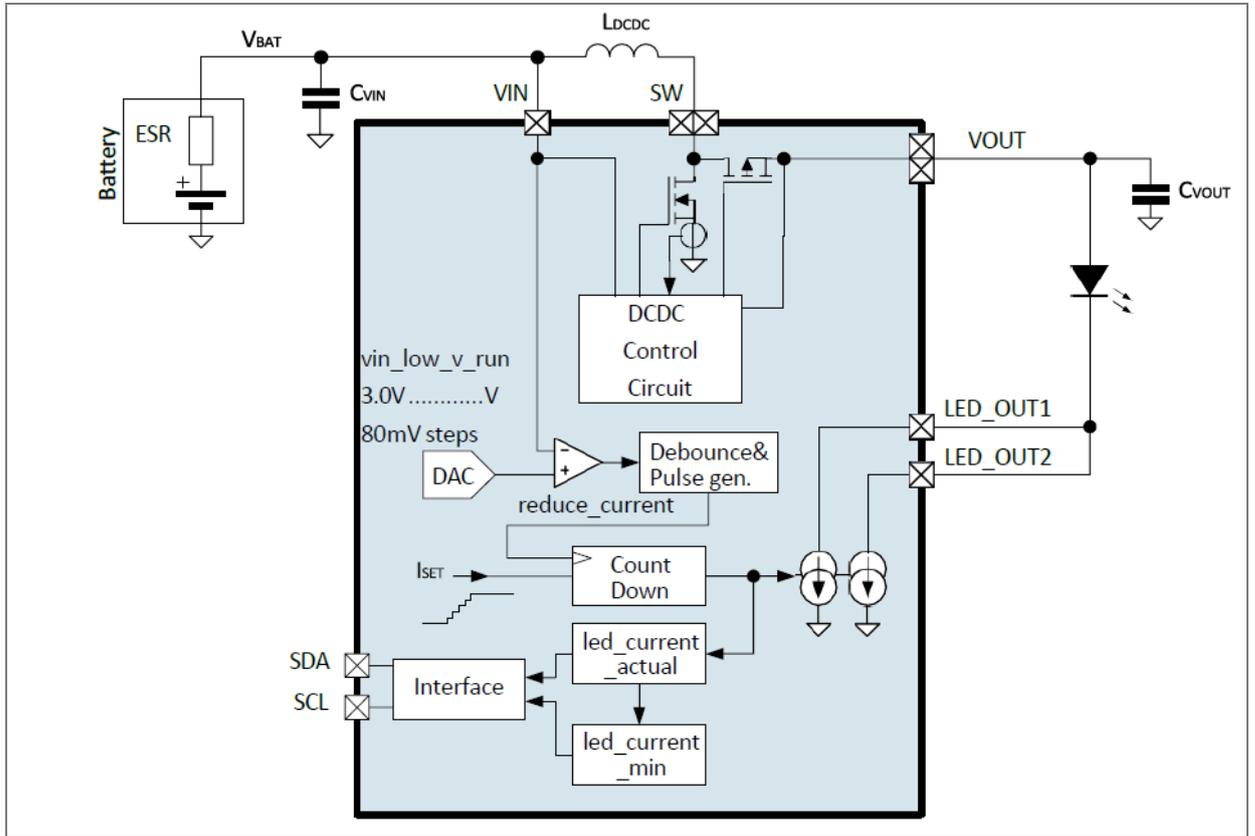

During flash, if the voltage on  $V_{IN}$  drops below the threshold defined by `vin_low_v_run`, the flash current is reduced (or ramping of the current is stopped during flash current startup) and `fault_uvlo` is set. The timing for the reduction of the current is 8  $\mu\text{s}/\text{LSB}$  current change.

During the flash pulse the actual used current can be readout by the register `led_current_actual`.

After the flash pulse the minimum current can be readout by the register `led_current_min` - this allows to adjust the camera sensitivity (gain or iso-settings) for the subsequent flash pulse (e.g. when using a pre-flash and a main flash pulse).

The internal circuit for low voltage current reductions are shown in Figure 20.

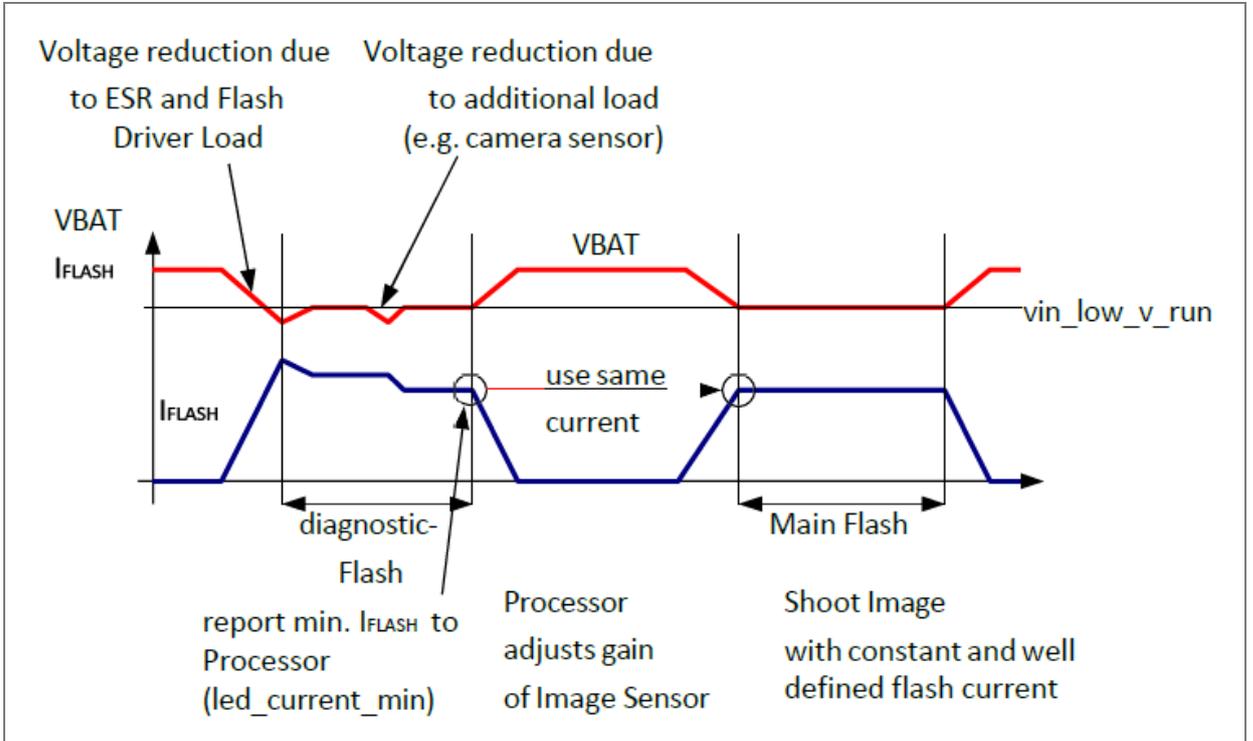

Figure 20: Low voltage current reduction internal circuit

A mobile phone camera flash system can trigger a diagnostic flash and a main-flash:

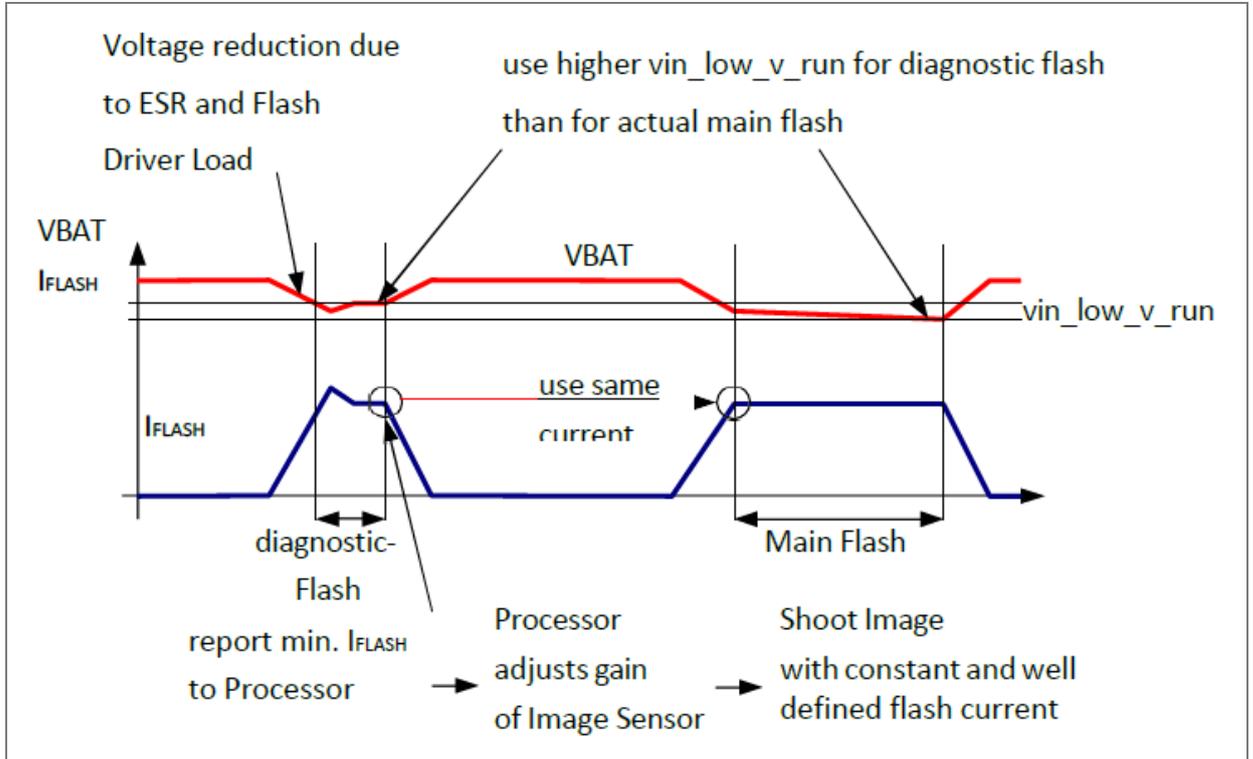

The diagnostic flash is initiated by the processor. After this diagnostic flash, the determined maximum flash current can be read back through the I<sup>2</sup>C interface from register led\_current\_min and used for the setting for the main flash. Therefore the current in the main-flash is constant and additionally the camera system can use this current for picture quality adjustments.

Figure 21: Low voltage current reduction waveform with diagnostic-flash and main-flash phase

If the diagnostic flash should be short (e.g. 10 ms) it is recommended to operate this diagnostic flash at slightly higher `vin_low_v_run` setting compared to the main flash.

Figure 22: Low voltage current reduction waveform with short diagnostic-flash and main-flash phase

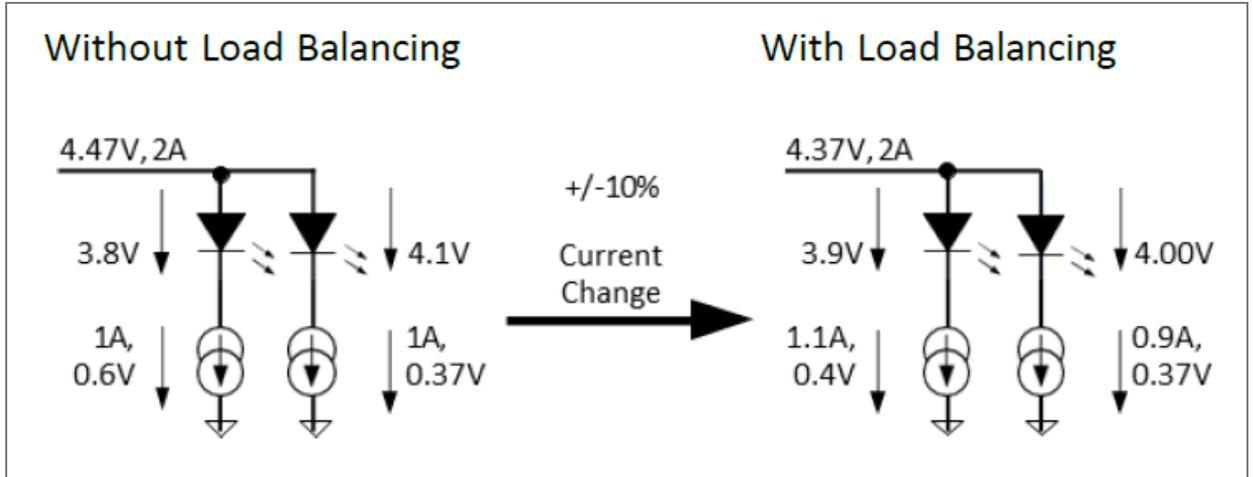

The different settings for  $vin\_low\_v\_run$  allow a constant main flash current without dropping  $V_{IN}$  below  $vin\_low\_v\_run$ .

### 7.5.8 Load balancing

To improve the efficiency of the AS1170 for LEDs with unmatched forward voltage and reduce the internal power dissipation of the AS1170, set the bit `load_balance_on=1`. This bit can change the currents through the LEDs by up to  $\pm 15\%$  (up to 115%/85% of set current between LED\_OUT1 to LED\_OUT2) to match the forward voltage of the LED better.

Figure 23: Load balancing

### 7.5.9 Flash strobe timings

The flash timing are defined as follows:

1. Flash duration defined by register flash\_timeout and flash is started immediately when this mode is selected by the I<sup>2</sup>C command: set strobe\_on = 0, start the flash by setting out\_on = 1
2. Flash duration defined by register flash\_timeout and flash started with a rising edge on pin STROBE: set strobe\_on = 1 and strobe\_type = 0
3. Flash start and timing defined by the pin STROBE; the flash duration is limited by the timeout timer defined by flash\_timeout: set strobe\_on = 1 and strobe\_type = 1

Figure 24: AS1170 flash duration defined by flash\_timeout without using STROBE input

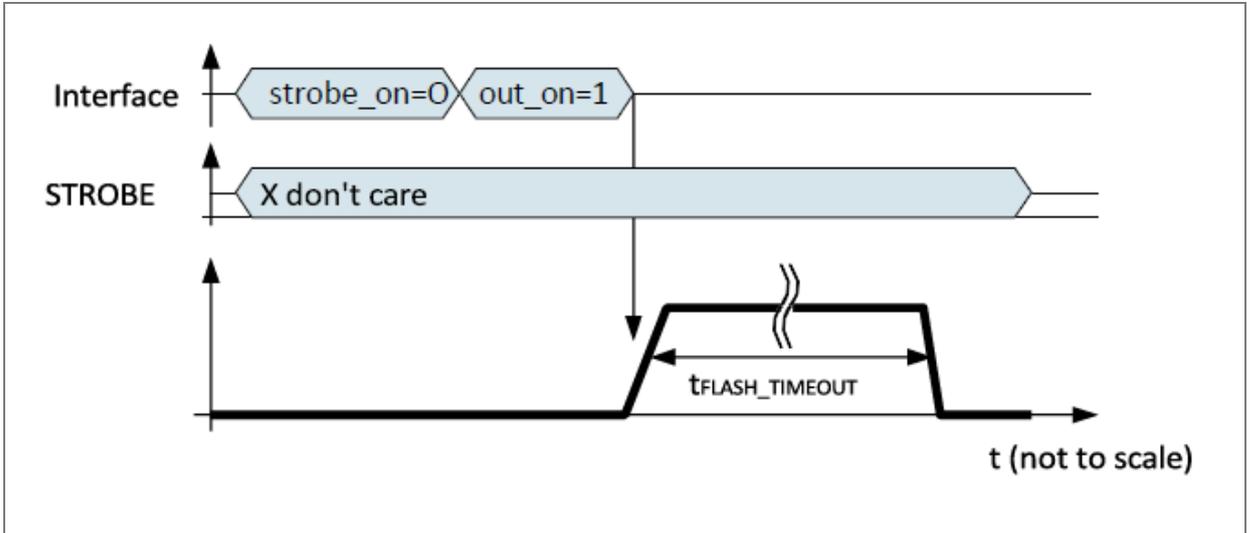

Figure 25: AS1170 flash duration defined by flash\_timeout, starting with STROBE rising edge

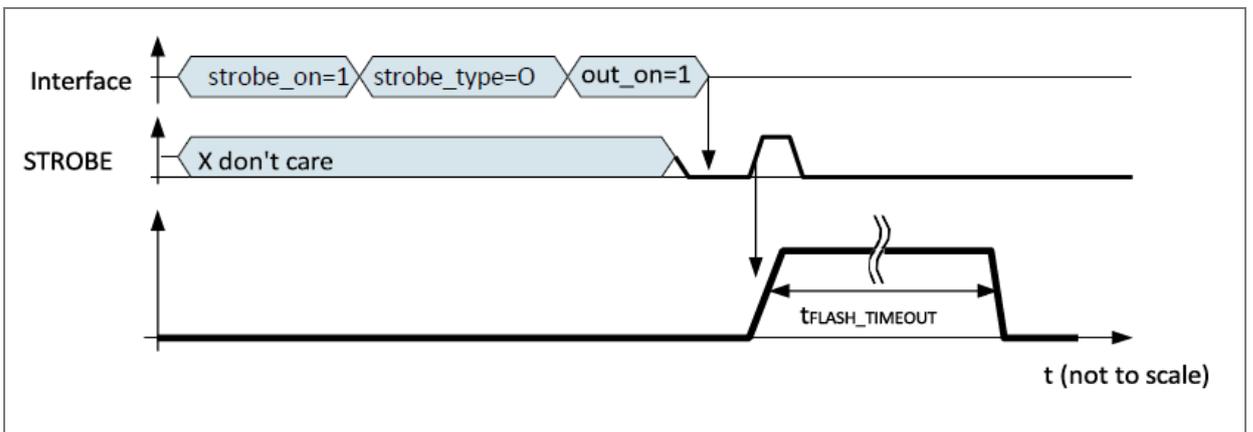

Figure 26: AS1170 flash duration & STROBE defined start, limited by flash\_timeout; timer not expired

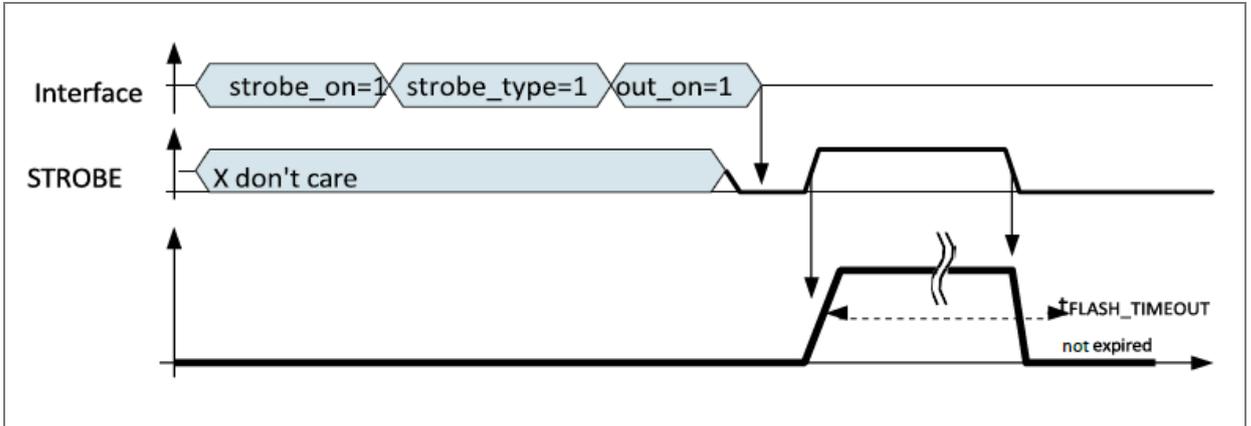

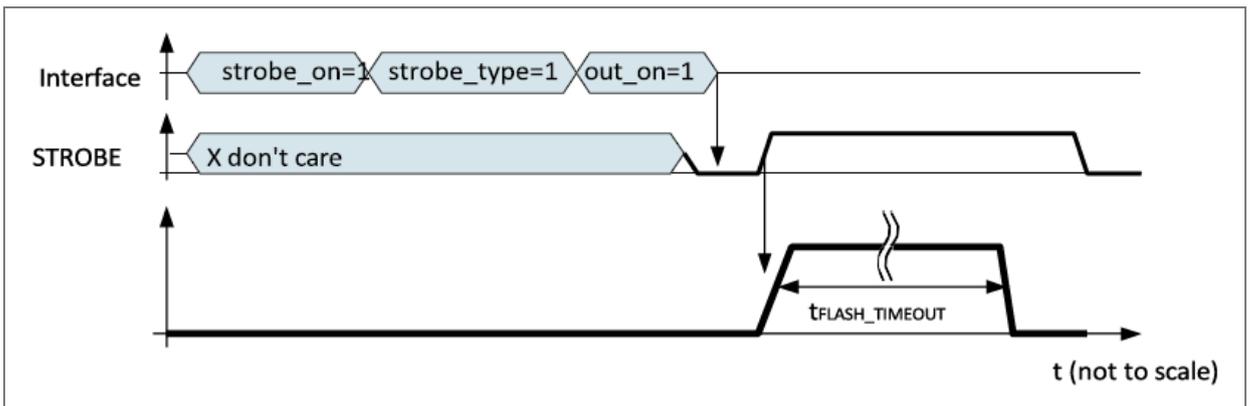

Figure 27: AS1170 flash duration and start defined by STROBE, flash\_timeout; timer expired

### 7.5.10 I<sup>2</sup>C serial data bus

The AS1170 supports the I<sup>2</sup>C bus protocol. A device that sends data onto the bus is defined as a transmitter and a device receiving data as a receiver. The device that controls the message is called a master. The devices that are controlled by the master are referred to as slaves. A master device that generates the serial clock (SCL), controls the bus access, and generates the START and STOP conditions must control the bus. The AS1170 operates as a slave on the I<sup>2</sup>C bus. Within the bus specifications a standard mode (100 kHz maximum clock rate) and a fast mode (400 kHz maximum clock rate) are defined. The AS1170 works in both modes. Connections to the bus are made through the open-drain I/O lines SDA and SCL.

The following bus protocol has been defined:

- Data transfer may be initiated only when the bus is not busy.
- During data transfer, the data line must remain stable whenever the clock line is HIGH. Changes in the data line while the clock line is HIGH are interpreted as control signals.

Accordingly, the following bus conditions have been defined:

### **Bus not busy**

Both data and clock lines remain HIGH.

### **Start data transfer**

A change in the state of the data line, from HIGH to LOW, while the clock is HIGH, defines a START condition.

### **Stop data transfer**

A change in the state of the data line, from LOW to HIGH, while the clock line is HIGH, defines the STOP condition.

### **Data valid**

The state of the data line represents valid data when, after a START condition, the data line is stable for the duration of the HIGH period of the clock signal. The data on the line must be changed during the LOW period of the clock signal. There is one clock pulse per bit of data.

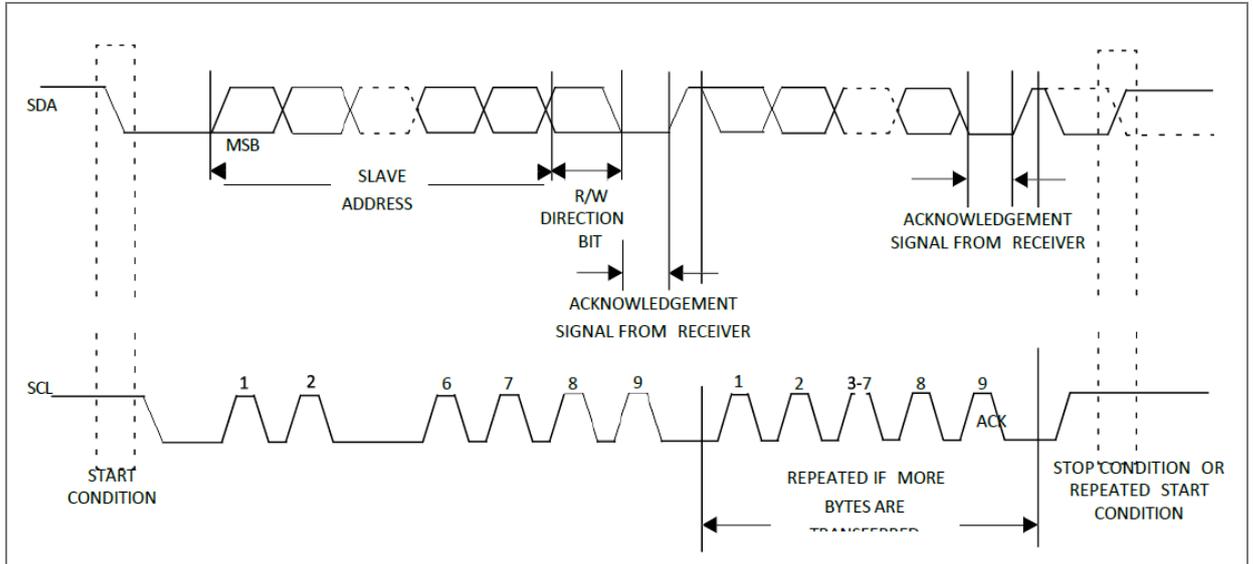

Each data transfer is initiated with a START condition and terminated with a STOP condition. The number of data bytes transferred between START and STOP conditions are not limited, and are determined by the master device. The information is transferred byte-wise and each receiver acknowledges with a ninth bit.

### **Acknowledge**

Each receiving device, when addressed, is obliged to generate an acknowledge after the reception of each byte. The master device must generate an extra clock pulse that is associated with this acknowledge bit.

A device that acknowledges must pull down the SDA line during the acknowledge clock pulse in such a way that the SDA line is stable LOW during the HIGH period of the acknowledge-related clock pulse. Of course, setup and hold times must be taken into account. A master must signal an end of data to the slave by not generating an acknowledge bit on the last byte that has been clocked out of the slave. In this case, the slave must leave the data line HIGH to enable the master to generate the STOP condition.

Figure 28: Data transfer on I<sup>2</sup>C serial bus

Depending upon the state of the R/W bit, two types of data transfer are possible:

**1. Data transfer from a master transmitter to a slave receiver:**

The first byte transmitted by the master is the slave address. Next follows a number of data bytes. The slave returns an acknowledge bit after each received byte. Data is transferred with the most significant bit (MSB) first.

**2. Data transfer from a slave transmitter to a master receiver:**

The master transmits the first byte (the slave address). The slave then returns an acknowledge bit, followed by the slave transmitting a number of data bytes. The master returns an acknowledge bit after all received bytes other than the last byte. At the end of the last received byte, a “not acknowledge” is returned. The master device generates all of the serial clock pulses and the START and STOP conditions. A transfer is ended with a STOP condition or with a repeated START condition. Since a repeated START condition is also the beginning of the next serial transfer, the bus is not released. Data is transferred with the most significant bit (MSB) first.

The AS1170 can operate in the following two modes:

**1. Slave receiver mode (write mode):**

Serial data and clock are received through SDA and SCL. After each byte is received an acknowledge bit is transmitted. START and STOP conditions are recognized as the beginning and end of a serial transfer. Address recognition is performed by hardware after reception of the slave address and direction bit. The slave address byte is the first byte received after the master generates the START condition. The slave address byte contains the 7-bit AS1170 address, which is 0x30 (or 0x32 if I<sup>2</sup>C address select pin is high), followed by the direction bit (R/W), which, for a write, is 0<sup>11</sup>. After receiving and decoding the slave address byte the device outputs an acknowledge on the SDA line. After the AS1170 acknowledges the slave address + write bit, the master transmits a register address to the AS1170. This sets the register pointer on the AS1170. The master may then transmit zero or more bytes of data, with the AS1170 acknowledging each byte received. The address pointer will increment after each data byte is transferred. The master generates a STOP condition to terminate the data write.

**2. Slave transmitter mode (read mode):**

The first byte is received and handled as in the slave receiver mode. However, in this mode, the direction bit indicates that the transfer direction is reversed. Serial data is transmitted on SDA by the AS1170 while the serial clock is input on SCL. START and STOP conditions are recognized as the beginning and end of a serial transfer. The slave address byte is the first byte received after the master generates a START condition. The slave address byte contains the 7-bit AS1170 address, which is 0x30 (or 0x32 if I<sup>2</sup>C address select pin is high), followed by the direction bit (R/W), which, for a read, is 1<sup>12</sup>. After receiving and decoding the slave address byte the device outputs an acknowledge on the SDA line. The AS1170 then begins to transmit data starting with the register address pointed to by the register pointer. If the register pointer is not written to before the initiation of a read mode the first address that is read is the last one stored in the register pointer. The AS1170 must receive a “not acknowledge” to end a read.

<sup>11</sup> The address for writing to the AS1170 is 60h = 01100000b ; or 64h if address select pin is high = 01100010b

<sup>12</sup> The address for reading from the AS1170 is 61h = 01100001b ; or 65h if address select pin is high = 01100011b

Figure 29: Data write - slave receiver mode

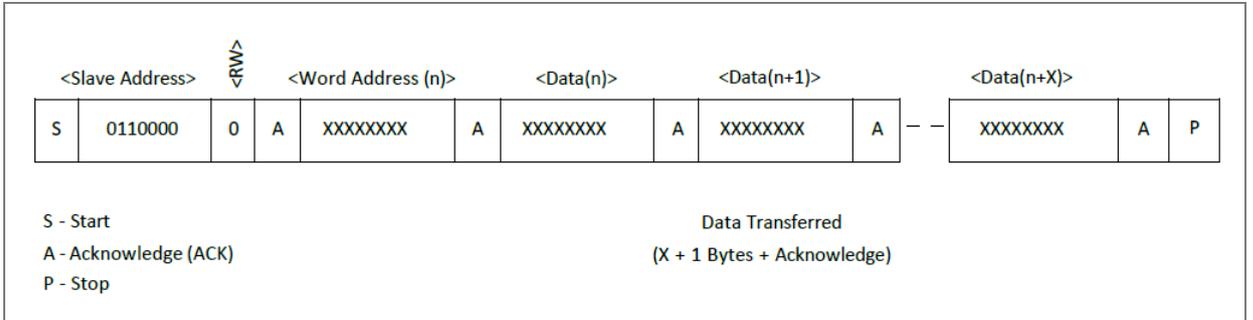

Figure 30: Data read (from current pointer location) - slave transmitter mode

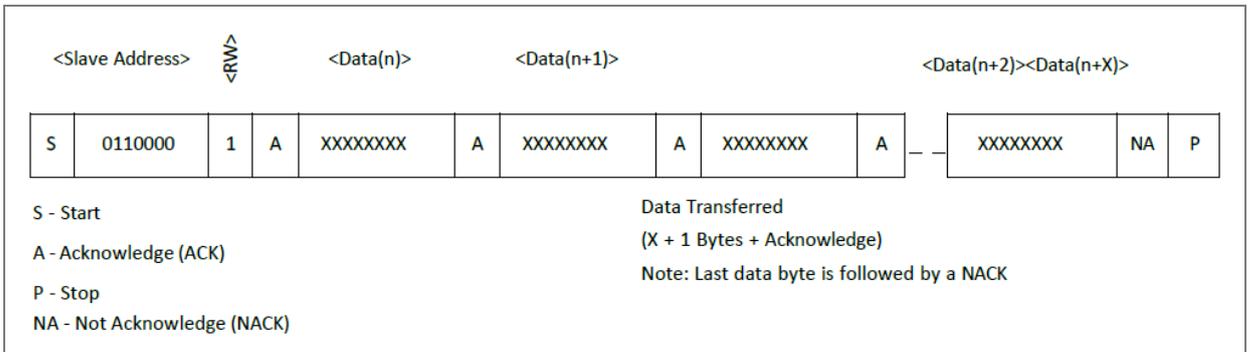

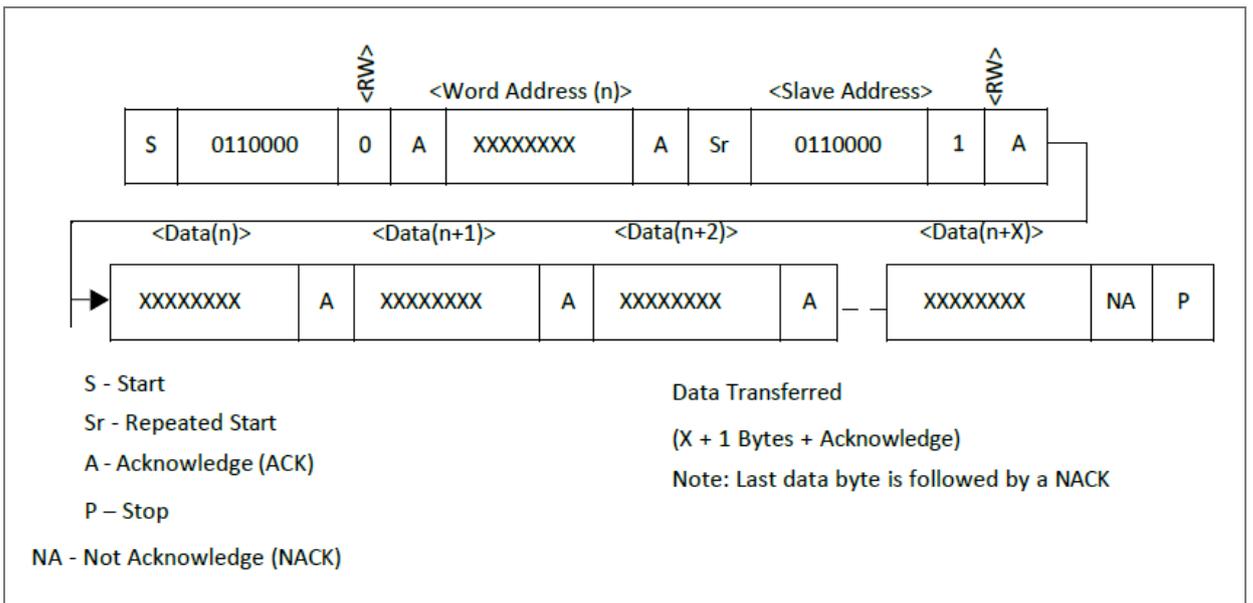

Figure 31: Data read (write pointer, then read) - slave receive and transmit

## 8 Register description

### 8.1 ChipID register

Table 7: ChipID register

Addr: 0		ChipID register		
Bit	Bit name	Default	Access	Bit description
2:0	<i>version</i>	4h	R	AS1170 chip version number.
7:3	<i>fixed_id</i>	18h	R	This is a fixed identification (e.g. to verify the I <sup>2</sup> C communication).

(1) This register has a fixed ID.

### 8.2 Current set LED1 register

Table 8: Current set LED1 register

Addr: 1		Current set LED1 register																				
Bit	Bit name	Default	Access	Bit description																		
				<p><b>Caution:</b> Define the current on pin LED_OUT1 assist mode uses bits 6:0 of this current setting (max. half of full current setting) indicator or low current pwm mode uses only 5:0 of this current setting (max. 1/4 of full current setting).</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0h</td> <td>0 mA</td> </tr> <tr> <td>1h</td> <td>3.5 mA</td> </tr> <tr> <td>2h</td> <td>7.1 mA</td> </tr> <tr> <td>...</td> <td>...</td> </tr> <tr> <td>3Fh</td> <td>222.4 mA (maximum current for indicator or low current pwm mode, mode_setting=01)</td> </tr> <tr> <td>...</td> <td>...</td> </tr> <tr> <td>7Fh</td> <td>448.2 mA (maximum current for assist light mode, mode_setting=10)</td> </tr> <tr> <td>...</td> <td>...</td> </tr> </tbody> </table>	Value	Description	0h	0 mA	1h	3.5 mA	2h	7.1 mA	...	...	3Fh	222.4 mA (maximum current for indicator or low current pwm mode, mode_setting=01)	...	...	7Fh	448.2 mA (maximum current for assist light mode, mode_setting=10)	...	...

Addr: 1		Current set LED1 register		
Bit	Bit name	Default	Access	Bit description
				9Ch 551 mA - default setting
				...
				FEh 896.5 mA (996.1 mA <sup>(2)</sup> if current_boost=1)
				FFh 900 mA (1000 mA <sup>(2)</sup> if current_boost=1)

- (1) This register defines design versions.
- (2) Do not use current\_boost=1 for currents <= 900 mA.

### 8.3 Current set LED2 register

Table 9: Current set LED2 register

Addr: 2		Current set LED2 register		
Bit	Bit name	Default	Access	Bit description
				Define the current on pin LED_OUT2 in flash mode assist mode uses bits 6:0 of this current setting (max. half of full current setting) indicator or low current pwm mode uses only 5:0 of this current setting (max. 1/4 of full current setting).
				<b>Value</b> <b>Description</b>
				0h      0 mA
				1h      3.5 mA
				2h      7.1 mA
				...
7:0	led_current2	9Ch	R/W	3Fh 222.4 mA (maximum current for indicator or low current pwm mode, mode_setting=01)
				...
				7Fh 448.2 mA (maximum current for assist light mode, mode_setting=10)
				...
				9Ch 551 mA - default
				...
				FEh 896.5 mA (996.1 mA <sup>(2)</sup> if current_boost=1)
				FFh 900 mA (1000 mA <sup>(2)</sup> if current_boost=1)

- (1) This register defines LED currents.

(2) Do not use current\_boost=1 for currents <= 900 mA

## 8.4 Low voltage register

Table 10: Low voltage register

Addr: 4		Low voltage register			
Bit	Bit name	Default	Access	Bit description	
2:0	<i>vin_low_v_run</i>	4h	R/W	Voltage level on $V_{IN}$ where current reduction triggers during operation (see Current Reduction by $V_{IN}$ measurements in flash mode - only in flash mode; if $V_{IN}$ drops below this voltage during current ramp up, the current ramp up is stopped; during operation the current is decreased until the voltage on $V_{IN}$ rises above this threshold - fault_uvlo is set.	
				<b>Value</b>	<b>Description</b>
				0h	Function is disabled
				1h	3.0 V
				2h	3.07 V
				3h	3.14 V
				4h	3.22 V - default
				5h	3.3 V
5:3	<i>vin_low_v</i>	5h	R/W	Voltage level on $V_{IN}$ where driver will change current before startup (only in flash mode) if before startup (out_on set from 0 to 1), the voltage on $V_{IN}$ is below <i>vin_low_v</i> , the current is changed to 0 = shutdown ( <i>vin_low_v_shutdown</i> =1) and fault_uvlo is set.	
				<b>Value</b>	<b>Description</b>
				0h	Function is disabled
				1h	3.0 V
				2h	3.07 V
				3h	3.14 V
				4h	3.22 V
				5h	3.3 V - default
6h	3.38 V				
7h	3.47 V				

Addr: 4		Low voltage register			
Bit	Bit name	Default	Access	Bit description	
				Enables shutdown of current reduction under low voltage conditions.	
				<b>Value</b> <b>Description</b>	
6	<i>vin_low_v_shutdown</i>	0	R/W	0	If before startup (out_on set from 0 to 1), the voltage on V <sub>IN</sub> is below vin_low_v, the current is changed to fault_uvlo is set.
				1	If before startup (out_on set from 0 to 1), the voltage on V <sub>IN</sub> is below vin_low_v, the operating mode stays in shutdown (zero LED current) and fault_uvlo is set.
				Enables constant output voltage mode.	
7	<i>const_v_mode</i>	0	R/W	<b>Value</b> <b>Description</b>	
				0	Normal operation defined by mode_setting.

(1) This register defines the operating mode with low battery voltage.

## 8.5 Flash timer register

Table 11: Flash timer register

Addr: 5		Flash timer register			
Bit	Bit name	Default	Access	Bit description	
				Define the duration of the flash timer and timeout timer.	
				<b>Value</b> <b>Description</b>	
				0h      1 ms	
				1h      2 ms	
				2h      3 ms	
7:0	<i>flash_timeout</i> <sup>(2)</sup>	23h	R/W	...	...
				23h	36 ms - default
				...	...
				7F	128 ms
				80	136 ms (now 8 ms LSB steps from here on) <sup>(3)</sup> .
				81	142 ms
				82      150 ms	

---

Addr: 5		Flash timer register		
Bit	Bit name	Default	Access	Bit description
				...
				FEh 1144 ms
				FFh 1152 ms

---

- (1) This register identifies the flash timer and timeout settings.
- (2) At maximum output current the flash duration should be limited to 120 ms (depending of  $V_F$  of the LED, thermal design and ambient temperature) to avoid overheating of the AS1170.
- (3) Internal calculation for codes above 7Fh: flash timeout [ms] = (flash\_timeout-127) \* 8 + 256 [ms]

## 8.6 Control register

Table 12: Control register

Addr: 6		Control register		
Bit	Bit name	Default	Access	Bit description
Define the AS1170 operating mode.				
<b>Value</b> <b>Description</b>				
1:0	<i>mode_setting</i>	00	R/W	00    Shutdown.
				01 <b>Indicator mode</b> (or low current mode using PWM) LED current is defined by the 6LSB bits of led_current1 and led_current2 pwm modulated with 31.25 kHz defined by register inct_pwm (1/16...4/16).
				10 <b>Assist light mode</b> Led current is defined by the 7LSB <sup>(2)</sup> bits of led_current1 and led_current2.
				11 <b>Flash mode</b> <sup>(3)</sup> Led current is defined by led_current1 and led_current2 (out_on and mode_setting are automatically cleared after a flash pulse).
2	<i>reserved</i>	X	R	Reserved - don't use, always write 0.
Enables the output current sinks (pin LED_OUT1/2).				
<b>Value</b> <b>Description</b>				
3	<i>out_on</i>	0	R/W	0    Outputs disabled.
				1    Outputs enabled (out_on and mode_setting are automatically cleared after a flash pulse).
Enables the auto trigger of flash mode with strobe pin.				
<b>Value</b> <b>Description</b>				
4	<i>auto_strobe</i>	1	R/W	0    Single flash / Strobe mode.
				1    In strobe mode, there is no need after flash timeout, the mode_setting and out_on bits are not cleared. A new pulse on STROBE pin will retrigger the flash again. There is no need to rewrite the CONTROL register with I <sup>2</sup> C command.

(1) This register identifies the operating mode and includes an all on/off bit.

(2) The MSB bit of this register not used to protect the LED; therefore, the maximum assist light current = half the maximum flash current.

(3) Default trigger is done via external pin "STROBE".

## 8.7 Strobe signaling register

Table 13: Strobe signaling register

Addr: 7		Strobe signaling register		
Bit	Bit name	Default	Access	Bit description
6	<i>strobe_type</i>	1	R/W	Defines if the STROBE input is edge or level sensitive; see also bit <i>strobe_on</i> .
				<b>Value</b> <b>Description</b>
				0            STROBE input is edge sensitive.
7	<i>strobe_on</i>	1	R/W	Enables the STROBE input.
				<b>Value</b> <b>Description</b>
				0            STROBE input disabled.
				1            STROBE input enabled in flash mode.

(1) This register defines the flash current reducing and mode for STROBE.

## 8.8 Fault register

Table 14: Fault register

Addr: 8		Fault register		
Bit	Bit name	Default	Access	Bit description
0	<i>fault_uvlo</i>	0	R/sC <sup>(2)</sup>	An undervoltage event has happened - see Current Reduction by $V_{IN}$ measurements in Flash Mode.
				<b>Value</b> <b>Description</b>
				0            No
				1            Yes
1	<i>reserved</i>	0	R	Reserved - don't use.
2	<i>reserved</i>	0	R	Reserved - don't use.
4	<i>fault_timeout</i>	0	R/sC <sup>(2)</sup>	See Flash Timeout.
				<b>Value</b> <b>Description</b>
				0            No fault.
				1            Flash timeout exceeded.
5	<i>fault_overtemp</i>	0	R/sC <sup>(2)</sup>	See Overtemperature Protection.

Addr: 8		Fault register		
Bit	Bit name	Default	Access	Bit description
				<b>Value</b> <b>Description</b>
				0            No fault.
				1            Junction temperature limit has been exceeded.
				See Short Circuit Protection.
6	<i>fault_led_short</i>	0	R/sC <sup>(2)</sup>	<b>Value</b> <b>Description</b>
				0            No fault.
				1            A shorted LED is detected (pin LED_OUT1/2).
				See Overvoltage Protection.
7	<i>fault_ovp</i>	0	R/sC <sup>(2)</sup>	<b>Value</b> <b>Description</b>
				0            No fault.
				1            An overvoltage condition is detected (pin VOUT).

- (1) This register identifies all the different fault conditions and provide information about the LED detection.  
(2) R/sC = Read, self clear; after readout the register is automatically cleared.

## 8.9 PWM and indicator register

Table 15: PWM and indicator register

Addr: 9		PWM and indicator register		
Bit	Bit name	Default	Access	Bit description
				Define the AS1170 PWM with 31.25 kHz operation for indicator or low current mode (mode_setting=01).
				<b>Value</b> <b>Description</b>
1:0	<i>inct_pwm</i>	00	R/W	00          1/16 duty cycle
				01          2/16 duty cycle
				10          3/16 duty cycle
				11          4/16 duty cycle
				Exact frequency switching between 4 MHz/1 MHz for assist and flash modes for operation close to maximum pulse width.
2	<i>freq_switch_on</i>	0	R/W	<b>Value</b> <b>Description</b>
				0            Pulseskip operation is allowed for all modes - results in better efficiency.

Addr: 9		PWM and indicator register								
Bit	Bit name	Default	Access	Bit description						
				<p>In flash and assist light mode (indicator mode or low current mode using PWM always will use pulseskip) if led_current1 &gt;= 40h and led_current2 &gt;= 40h and current_boost=0, the DCDC is running at 4 MHz or 1 MHz (pulseskip is disabled) - results in improved noise performance.</p>						
3	led_out1above2	0	R	<p>Measure the voltage difference between LED_OUT1 vs. LED_OUT2 during operation of the DCDC.</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td></td> </tr> <tr> <td>1</td> <td><math>V(\text{LED\_OUT1}) &gt; V(\text{LED\_OUT2}) + V_{\text{LED\_OUTCOMP\_HYST}}</math></td> </tr> </tbody> </table>	Value	Description	0		1	$V(\text{LED\_OUT1}) > V(\text{LED\_OUT2}) + V_{\text{LED\_OUTCOMP\_HYST}}$
Value	Description									
0										
1	$V(\text{LED\_OUT1}) > V(\text{LED\_OUT2}) + V_{\text{LED\_OUTCOMP\_HYST}}$									
4	led_out2above1	0	R	<p>Measure the voltage difference between LED_OUT1 vs. LED_OUT2 during operation of the DCDC.</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td></td> </tr> <tr> <td>1</td> <td><math>V(\text{LED\_OUT2}) &gt; V(\text{LED\_OUT1}) + V_{\text{LED\_OUTCOMP\_HYST}}</math></td> </tr> </tbody> </table>	Value	Description	0		1	$V(\text{LED\_OUT2}) > V(\text{LED\_OUT1}) + V_{\text{LED\_OUTCOMP\_HYST}}$
Value	Description									
0										
1	$V(\text{LED\_OUT2}) > V(\text{LED\_OUT1}) + V_{\text{LED\_OUTCOMP\_HYST}}$									
5	load_balance_on	0	R/W	<p>Balance the current sinks (up to +/-10% of set current) to improve application efficiency for unmatched LED forward voltages - see Load Balancing.</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Disabled.</td> </tr> <tr> <td>1</td> <td>Enabled.</td> </tr> </tbody> </table>	Value	Description	0	Disabled.	1	Enabled.
Value	Description									
0	Disabled.									
1	Enabled.									

(1) This register defines the PWM mode (e.g. for indicator) and 4/1 MHz mode switching.

## 8.10 Minimum LED current register

Table 16: Minimum LED current register

Addr: Eh		Minimum LED current register		
Bit	Bit name	Default	Access	Bit description
7:0	<i>led_current_min</i> <sup>(2)(3)(4)</sup>	00h	R	Minimum current through the current sink (only including all current reductions as described in Current Reduction by V <sub>IN</sub> measurements in Flash Mode.

- (1) This register reports the minimum LED current from the last operation cycle.
- (2) Only the current through LED\_OUT1 is reported.
- (3) As the internal change of this register is asynchronous to the readout, it is recommended to readout the register after the flash pulse. The register will store the minimum current through the LED after e.g. a previous flash. This current can be used for a subsequent flash pulse for a safe operating range.
- (4) This register is only set if an actual current reduction happens (fault\_uvlo=1) otherwise led\_current\_min=0.

## 8.11 Actual LED current register

Table 17: Actual LED current register

Addr: Fh		Actual LED current register		
Bit	Bit name	Default	Access	Bit description
7:0	<i>led_current_actual</i> <sup>(2)(3)</sup>	00h	R	Actual set current through the current sink (including all current reductions as described in Flash Current Reductions including LED current ramp up/down).

- (1) This register reports the actual set LED current.
- (2) Only the current through LED\_OUT1 is reported.
- (3) As the internal change of this register is asynchronous to the readout, it is recommended to readout the register twice and compare the results.

## 8.12 Password register

Table 18: Password register

Addr: 80h		Password register		
Bit	Bit name	Default	Access	Bit description
7:0	<i>password</i>	NA	W	Write A1h into this register to enable access to register 81h.

(1) Password protection for register current boost.

## 8.13 Current boost register

Table 19: Current boost register

Addr: 81h		Current boost register		
Bit	Bit name	Default	Access	Bit description
0	<i>current_boost</i> <sup>(2)</sup>	0	R/W	Boost all LED currents by 11%.
				<b>Value</b> <b>Description</b>
				0            All LED current are as described in the tables.
				1            All LED current are increased by 11%.

(1) Increase output current by 11%.

(2) Write A1h into register password (0x80) to enable access to this register (password unlocking is only valid for a single I<sup>2</sup>C access) - required on any read or write access to this register.

## 9 Register map

Table 20: Register map <sup>(1)</sup>

Register definition	Addr	Default	<b7>	<b6>	<b5>	<b4>	<b3>	<b2>	<b1>	<b0>
ChipID	0	Bxh	fixed_id				version			
Current set LED1	1	9Ch	led_current1							
Current set LED2	2	9Ch	led_current2

# 10 Application information

## 10.1 External components

### 10.1.1 Input capacitor $C_{VIN}$

Low ESR input capacitors reduce input switching noise and reduce the peak current drawn from the battery. Ceramic capacitors are required for input decoupling and should be located as close to the device as is practical.

Table 21: Recommended input capacitor

Part number	C	TC code	Rated voltage	Size	Manufacturer
GRM188R60J106ME47	10 $\mu$ F > 3 $\mu$ F @ 4.5 V > 2 $\mu$ F @ 5.25 V	X5R	6.3 V	0603	<a href="#">Murata</a>
LMK107BBJ106MA	10 $\mu$ F > 3 $\mu$ F @ 4.5 V	X5R	6.3 V	0603	<a href="#">Taiyo Yuden</a>

If a different input capacitor is chosen, ensure similar ESR value and at least 3  $\mu$ F capacitance at the maximum input supply voltage. Larger capacitor values (C) may be used without limitations.

Add a smaller capacitor in parallel to the input pin  $V_{IN}$  (e.g. Murata GRM155R61C104, >50 nF @ 3 V, 0402 size).

### 10.1.2 Output capacitor $C_{VOUT}$

Low ESR capacitors should be used to minimize  $V_{OUT}$  ripple. Multi-layer ceramic capacitors are recommended since they have extremely low ESR and are available in small footprints. The capacitor should be located as close to the device as is practical.

X5R dielectric material is recommended due to their ability to maintain capacitance over wide voltage and temperature range.

Table 22: Recommended output capacitor

Part number	C	TC code	Rated voltage	Size	Manufacturer
GRM219R61A116U	10 $\mu$ F $\pm$ 10% > 4.2 $\mu$ F @ 5 V	X5R	10 V	0805	Murata
GRM188R60J106ME84	10 $\mu$ F $\pm$ 20% > 4.2 $\mu$ F @ 4 V	X5R	6.3 V	0603 (1.6x0.8x0.85 mm max. 0.95 mm height)	

(1) Use only for  $V_{LED} < 3.75$  V.

If a different output capacitor is chosen, ensure similar ESR values and at least 4.2  $\mu$ F capacitance at 5 V output voltage.

### 10.1.3 Inductor $L_{DCDC}$

The fast switching frequency (4 MHz) of the AS1170 allows for the use of small SMDs for the external inductor. The saturation current  $I_{SATURATION}$  should be chosen to be above the maximum value of  $I_{LIMIT}^{13}$ . The inductor should have very low DC resistance (DCR) to reduce the  $I^2R$  power losses - high DCR values will reduce efficiency.

Table 23: Recommended inductor

Part number	L	DCR	$I_{SATURATION}$	Size	Manufacturer
C3-P1.5R	1.5 $\mu$ H	58 m $\Omega$	2.4 A @ 25°C, 2.0 A <sup>(1)</sup>	3x3x1.5 mm (height is max.)	Mitsumi
LQM32PN1R0MG0	1.0 $\mu$ H > 0.6 $\mu$ H @ 3.0 A	60 m $\Omega$	3.0 A <sup>(2)</sup>	3.2x2.5x0.9 mm max 1.0 mm height	Murata
LQM2HPN1R0MGC	1.0 $\mu$ H > 0.6 $\mu$ H @ 2.0 A	100 m $\Omega$	1.5 A (2.0 A) <sup>(3)</sup>	2.5x2.0x0.9 mm max 1.00 mm height	
CIG32W1R0MNE	1.0 $\mu$ H > 0.7 $\mu$ H @ 2.7 A > 0.6 $\mu$ H @ 3.0 A	60 m $\Omega$ $\pm$ 25%	3.0 A	3.2x2.5 mm max 1.0 mm height	Samsung Electro-Mechanics
NRH2412T1R0N	1.0 $\mu$ H > 0.6 $\mu$ H @ 2.5 A	77 m $\Omega$	2.5 A <sup>(4)</sup>	2.4x2.4x1.2 mm (height is max.)	Taiyo Yuden
CKP3225N1R0M	1.0 $\mu$ H > 0.6 $\mu$ H @ 3.0 A	<60 m $\Omega$	3.0 A	3.2x2.5x0.9 mm max 1.0 mm height	
MAMK2520T1R0M	1.0 $\mu$ H > 0.6 $\mu$ H @ 2.75 A	45 m $\Omega$	3.0 A <sup>(5)</sup>	2.5x2.0x1.2 mm height is max	

<sup>13</sup> Can be adjusted in I<sup>2</sup>C mode with register coil\_peak (see Page 24).

Part number	L	DCR	I <sub>SATURATION</sub>	Size	Manufacturer
MDMK2020T1R0M	1.0 $\mu\text{H}$ > 0.6 $\mu\text{H}$ @ 2.75 A	56 m $\Omega$	2.55 A <sup>(6)</sup>	2.0x2.0x1.2 mm height is max	
MAKK2016T1R0M	1.0 $\mu\text{H}$ > 0.6 $\mu\text{H}$ @ 2.75 A	65 m $\Omega$	2.0 A <sup>(7)</sup>	2.0x1.6x1.0 mm height is max	

- (1) Do not exceed maximum I<sub>SATURATION</sub> - can be ensured by setting coil\_peak (will limit LED current).
- (2) Flash pattern: 200 ms / 3 A, 200 ms pause, 200 ms / 3 A, 2 s then repeat again (no limit on the number of total cycles)  
Alternative pattern with 1000 ms / 1.6 A, 200 ms pause, 200 ms / 3 A, 200 ms pause, 200 ms / 3 A, 2 s then repeat again. (no limit on the number of total cycles).
- (3) Set current limit to 2 A (coil\_peak=00b) - will limit maximum output current. Flash cycle limit: 150 ms on, 500 ms off; repeat maximum 50 times.
- (4) Set current limit to 2.5 A (coil\_peak=01b) - will limit maximum output current.
- (5) Set current limit to 3.0 A (coil\_peak=10b) - can limit maximum output current.
- (6) Set current limit to 2.5 A (coil\_peak=01b) - will limit maximum output current.
- (7) Set current limit to 2 A (coil\_peak=00b) - will limit maximum output current.

If a different inductor is chosen, ensure similar DCR values and at least 0.6  $\mu\text{H}$  inductance at I<sub>LIMIT</sub>.

## 10.2 PCB layout guideline

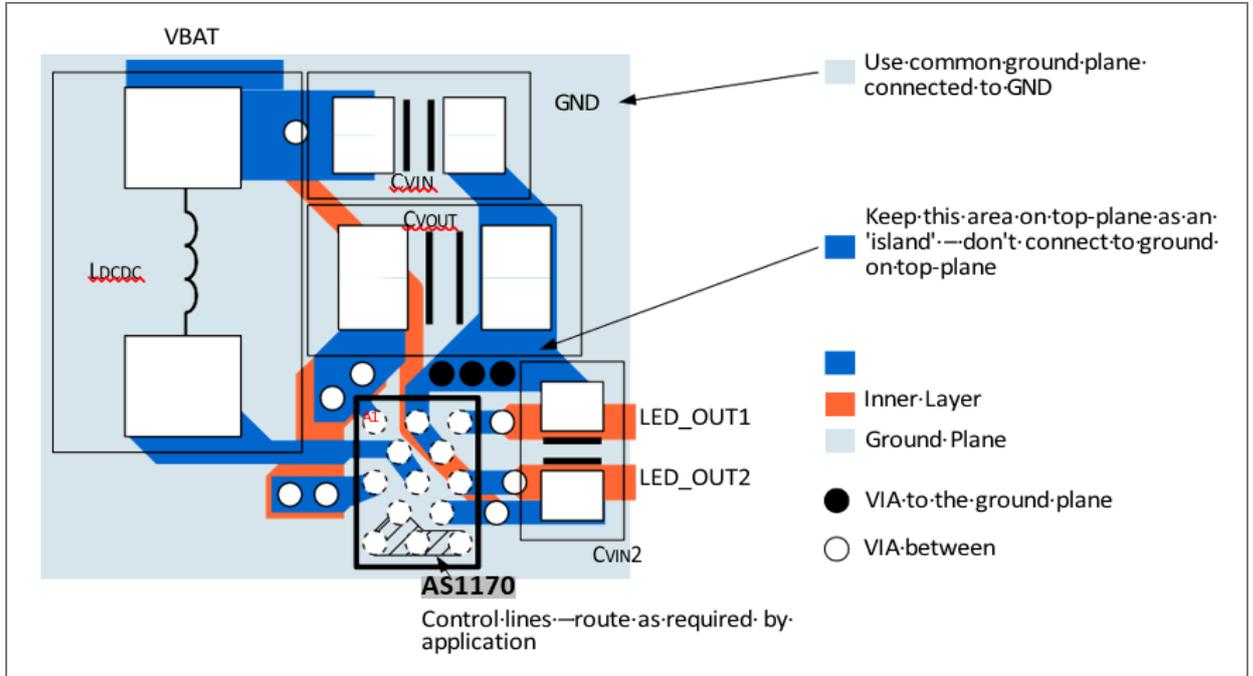

The high speed operation requires proper layout for optimum performance. Route the power traces first and try to minimize the area and wire length of the two high frequency/high current loops:

Loop1: C<sub>VIN</sub>/C<sub>VIN2</sub> - L<sub>DCDC</sub> - pin SW1/2 - pin GND - C<sub>VIN</sub>/C<sub>VIN2</sub>

Loop2: C<sub>VIN</sub>/C<sub>VIN2</sub> - L<sub>DCDC</sub> - pin SW1/2 - pin VOUT1/2 - C<sub>VOUT</sub> - pin GND - C<sub>VIN</sub>/C<sub>VIN2</sub>

At the pin GND a single via (or more vias, which are closely combined) connects to the common ground plane. This via(s) will isolate the DCDC high frequency currents from the common ground (as most high frequency current will flow between Loop1 and Loop2 and will not pass the ground plane).

Figure 32: Layout recommendation

- (1) If component placement rules allow, move all components close to the AS1170 to reduce the area and length of Loop1 and Loop2.

An additional 100 nF (e.g. Murata GRM155R61C104, > 50 nF @ 3 V, 0402 size) capacitor  $C_{VIN2}$  in parallel to  $C_{VIN}$  is recommended to filter high frequency noise for the power supply of AS1170. This capacitor should be as close as possible to the GND/ $V_{IN}$  pins of AS1170.

### 10.3 5 V operating mode

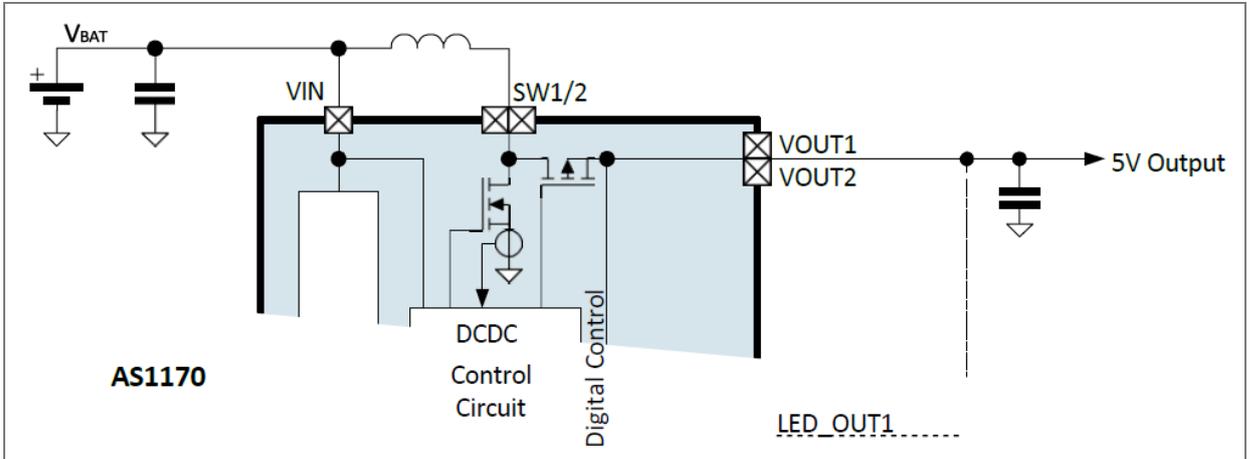

The AS1170 can be used to power a 5 V system (e.g. audio amplifier). The operating mode is selected by setting register bit `const_v_mode=1`. In this operating mode, the current sinks are disabled and cannot be switched on.

**Information:**

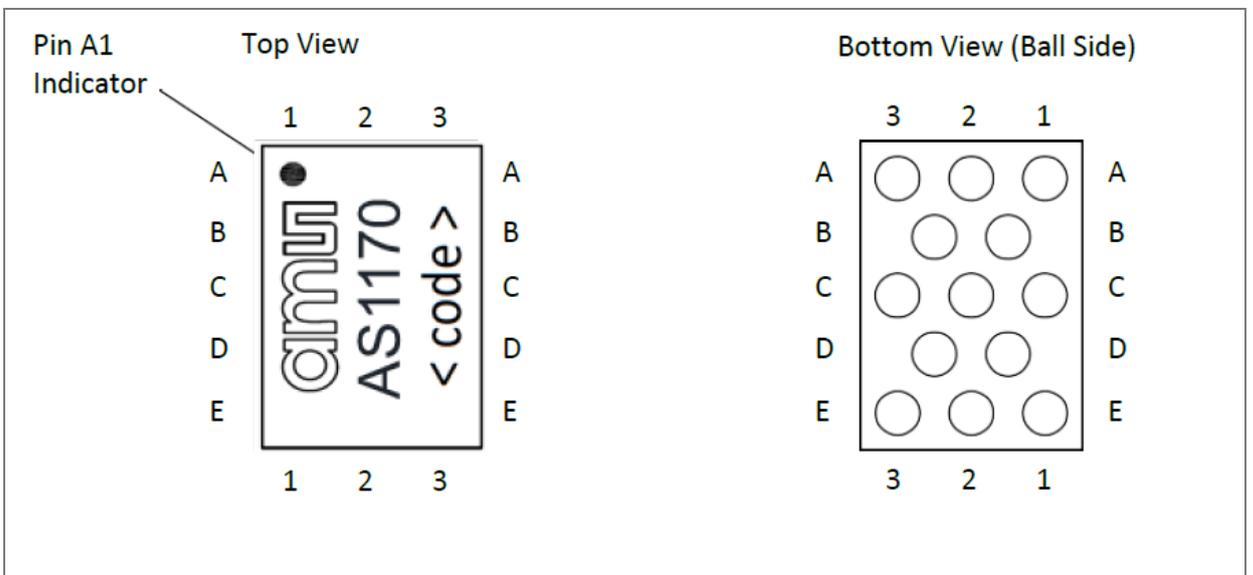

- There is always a diode between  $V_{IN}$  and  $V_{OUT1/2}$  due to the internal circuit. Therefore  $V_{OUT1/2}$  cannot be completely switched off.

Figure 33: 5V operating mode

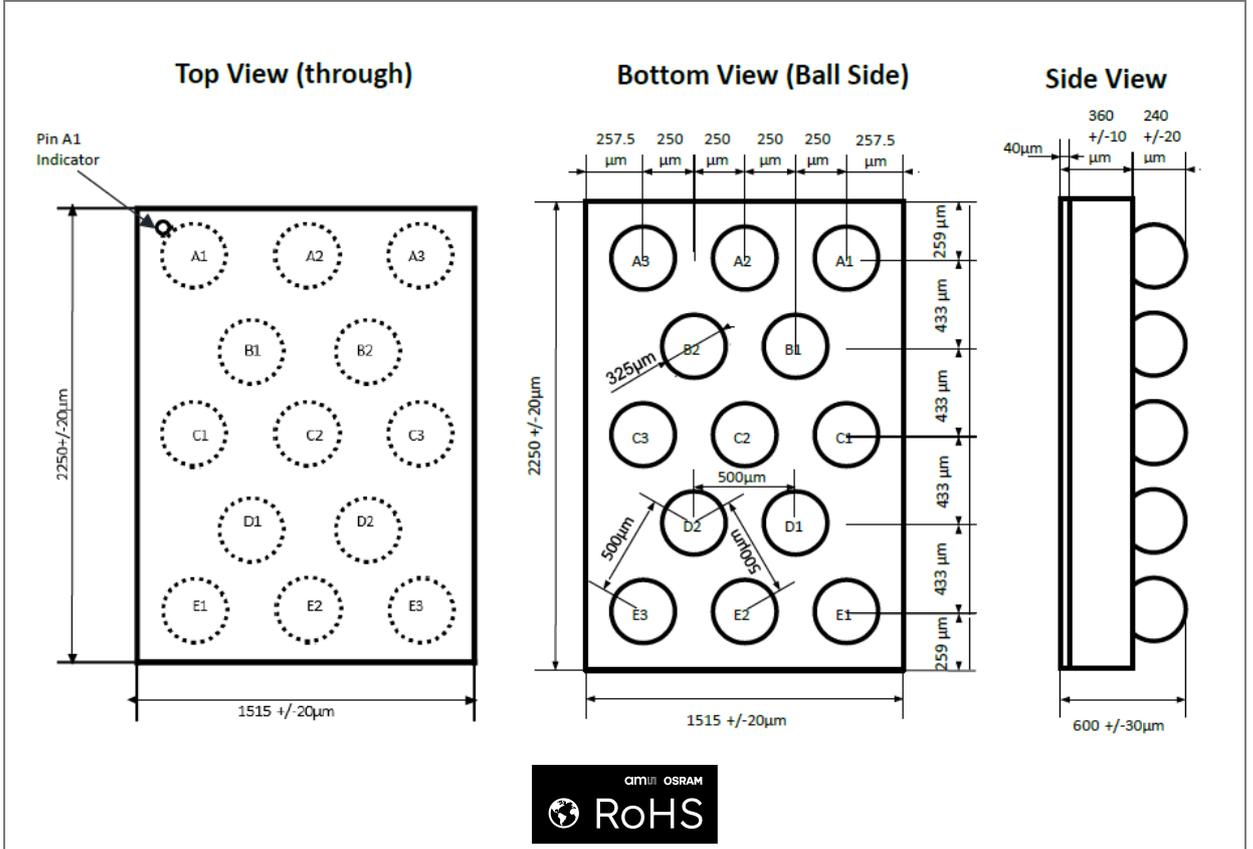

## 11 Package drawings and markings

Figure 35: WL-CSP13 package drawings and dimensions

- (1) All dimensions are in μm.
- (2) The co-planarity of the balls is 40 μm.

## 12 Revision information

Document status	Product status	Definition
Product Preview	Pre-development	Information in this datasheet is based on product ideas in the planning phase of development. All specifications are design goals without any warranty and are subject to change without notice
Preliminary Datasheet	Pre-production	Information in this datasheet is based on products in the design, validation or qualification phase of development. The performance and parameters shown in this document are preliminary without any warranty and are subject to change without notice
Datasheet	Production	Information in this datasheet is based on products in ramp-up to full production or full production which conform to specifications in accordance with the terms of ams-OSRAM AG standard warranty as given in the General Terms of Trade

### Other definitions

#### Draft / Preliminary:

The draft / preliminary status of a document indicates that the content is still under internal review and subject to change without notice. ams-OSRAM AG does not give any warranties as to the accuracy or completeness of information included in a draft / preliminary version of a document and shall have no liability for the consequences of use of such information.

#### Short datasheet:

A short datasheet is intended for quick reference only, it is an extract from a full datasheet with the same product number(s) and title. For detailed and full information always see the relevant full datasheet. In case of any inconsistency or conflict with the short datasheet, the full datasheet shall prevail.

Changes from previous version to current revision v2-00	Page

Devices sold by ams-OSRAM AG are covered by the warranty and patent indemnification provisions appearing in its General Terms of Trade. ams-OSRAM AG makes no warranty, express, statutory, implied, or by description regarding the information set forth herein. ams-OSRAM AG reserves the right to change specifications and prices at any time and without notice. Therefore, prior to designing this product into a system, it is necessary to check with ams-OSRAM AG for current information. This product is intended for use in commercial applications. Applications requiring extended temperature range, unusual environmental requirements, or high reliability applications, such as military, medical life-support or life-sustaining equipment are specifically not recommended without additional processing by ams-OSRAM AG for each application. This product is provided by ams-OSRAM AG "AS IS" and any express or implied warranties, including, but not limited to the implied warranties of merchantability and fitness for a particular purpose are disclaimed.

ams-OSRAM AG shall not be liable to recipient or any third party for any damages, including but not limited to personal injury, property damage, loss of profits, loss of use, interruption of business or indirect, special, incidental or consequential damages, of any kind, in connection with or arising out of the furnishing, performance or use of the technical data herein. No obligation or liability to recipient or any third party shall arise or flow out of ams-OSRAM AG rendering of technical or other services.

## Product and functional safety devices/applications or medical devices/applications:

ams-OSRAM AG components are not developed, constructed or tested for the application as safety relevant component or for the application in medical devices. ams-OSRAM AG products are not qualified at module and system level for such application.

In case buyer – or customer supplied by buyer – considers using ams-OSRAM AG components in product safety devices/applications or medical devices/applications, buyer and/or customer has to inform the local sales partner of ams-OSRAM AG immediately and ams-OSRAM AG and buyer and /or customer will analyze and coordinate the customer-specific request between ams-OSRAM AG and buyer and/or customer.

## ams OSRAM semiconductor RoHS compliance statement

**RoHS compliant:** The term RoHS compliant means that ams-OSRAM AG semiconductor products fully comply with current RoHS directives. Our semiconductor products do not contain any chemicals for all 6 substance categories plus additional 4 substance categories (per amendment EU 2015/863), including the requirement that lead not exceed 0.1% by weight in homogeneous materials.

**Important information:** The information provided in this statement represents ams-OSRAM AG knowledge and belief as of the date that it is provided. ams-OSRAM AG bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. ams-OSRAM AG has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. ams-OSRAM AG and ams-OSRAM AG suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.
