

The right tool
for every application
TOOL fox

dialog with customers and partners worldwide

Phoenix Contact is a globally present, company-based market leader. Our group of companies is synonym for future-oriented components, systems, and solutions in the fields of electrical engineering, electronics, and automation. Our global network across more than 100 countries, and 15,000 employees, is close proximity to our customers, which we believe is particularly important. The wide variety of our innovative products makes it easy for our customers to find customer-oriented solutions for different applications and industries. We especially focus on the fields of energy, infrastructure, process and factory automation.

TOOL fox – The right tool for every application

As a manufacturer of professional processing and measuring tools, Phoenix Contact is your competent partner for all electrical engineering applications. The TOOL fox tool program offers products for cutting, stripping, crimping, mounting and testing. It impresses with its convenient handling and the highest quality. Cutting, stripping, and crimping devices can also be used to automate work steps.

Professional tools are a prerequisite for very good results. Our tools are about quality, precision, durability, and effectiveness.

TOOL fox offers a complete portfolio of hand tools and automatic devices for industrial use, thereby ensuring that all tasks in the process chain are performed professionally.

Quality and tool expertise from DOL FOX

Professional tools feature reliability and high performance. We produce our tools in specialized manufacturing processes in accordance with applicable standards, directives, and legal regulations.

At our manufacturing site in Sweden, we produce in a resource-saving and sustainable manner while being aware at all times of our responsibility towards the environment.

Phoenix Contact tools impress with their innovative solutions, precision, and reliability.

conductors and cables

ductors, cables, and wires serve the purpose to carry electrical signals and energy. In everyday conversation, wires are often equated to wires, as many versions generally consist of several conductors that are isolated from each other. Cables, however, have increased mechanical resistance, which allows them in the ground, underwater or even protected outside.

A conductor (also called wire) consists of a conductive core of copper or aluminum, in addition to insulation. Copper is preferred, due to its excellent electrotechnical properties.

The IEC/DIN EN 60228 (VDE 0295) divides conductors into 4 classes of flexibility, which classifies the basic flexibility of the conductors. The criteria for this are the individual wire diameters and the number of individual wires. A further influence on the inherent stability is the twist pitch. The twist pitch refers to the length of an individual wire that is required for a 360° rotation. The lower the twist pitch, the more rigid and compact the conductor is, and this also increases the external diameter.

In the IEC/DIN EN 60228 (VDE 0295) standard, the conductor cross sections are defined by the electric conductance or resistance values. These values are the basis for determining the maximum current carrying capacity. Geometrical data, in particular cross section tolerances, are not determined here. As a result, the actual cross section can deviate substantially from the nominal cross sections. By using copper, which today has a purity of up to 99.99%, the manufacturer is in a position to replace the actual copper cross section with one of more than 10% less. This circumstance poses a challenge in the area of crimping.

The insulation serves as a permanent divider between the individual conductors as well as a protective casing against external influences. The basic requirement from the insulation material is the greatest possible electrical resistance; however, the corresponding resulting warmth can detract from this. Today, the choice of insulation is above all plastic, in all its versions. The type and properties of the plastic decide the later possibility of use for the conductors, cables, and wires. A further criterion is the strength of the insulation. This measure has direct influence on the mechanical and electrical loading capacity. The condition of the insulation (such as hardness, durability, thickness) is furthermore decisive when choosing the right stripping tool.

class 1: single-strand

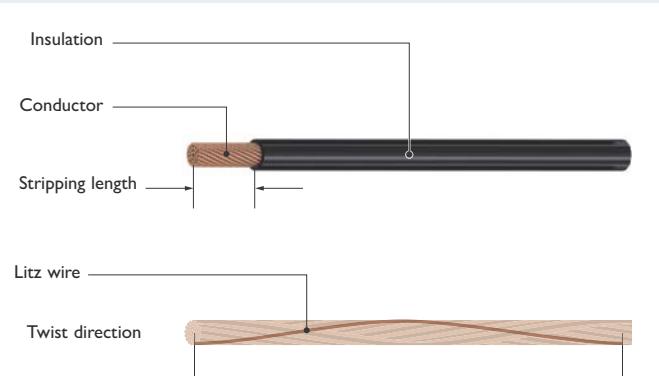

class 2: multi-strand

class 5: fine-strand

class 6: extra-fine-strand

rules

sleeve is a useful tool in conductor splicing and wiring. Using sleeves for potential splicing of the individual conductors which allows for effective, and reliable processing. In DIN 46228-4 the ferrule is defined as between 0.50 mm². This standard can be divided into four parts:

blank shape without plastic sleeve
crimping with and without crimping

conductor surrounded without crimping

blank shape with plastic sleeve
according to the geometrical dimensions, materials and the coloring dependent sections are the test basis of the standard. Furthermore, the requirements for sleeves, and conductors of section 4, 5, and 6 must be picked up. The conductor cross sections are determined via the electrical resistance levels as is the case with sleeves, geometric dimensions. Larger variations in the cross sections are not possible (also refer to the DIN 46228-4). Due to this there is a certain discrepancy between the sleeve and the conductor. Contact crimping tools are overwhelmingly designed to even out the difference in capacity. In addition

to DIN, there is a French standard for ferrules, NF C 63-023. With the exclusion of coloring in some cross sections (refer to matrix), the NF is based on DIN.

UL 486 F as well as the Canadian C22.2 NO. 291-14 are new to the field of legal provisions for ferrules. These harmonized standards are also based on the DIN. However, they deal with testing and specific requirements (among others, refer to the table of extraction values). In UL 486 F, for the first time, special sleeves such as the TWIN are fixed in the standard for the two-wire connection. For certification according to the standards mentioned above, UL and CSA, comprehensive testing by the respective organization is necessary. It is not only the sleeves that are tested and certified; the entire system based on crimping tools and ferrules undergoes this process.

The most important advantages of the ferrules:

- Increased, long-term operational and contact reliability
- Time-saving further processing (especially with Push-in terminal blocks)
- Reliable connection, even with repeated re-wiring
- Reduction in cable breakages
- Easy cross section detection
- Increased vibration resistance
- Permanently low contact resistances
- Individual wires are protected (particularly for screw terminal blocks)
- Consistent clamping of screw connections

Now UL-certified

Phoenix Contact was one of the first tool manufacturers to have ferrules in combination with crimping tools and crimping devices, such as the CF Crimphandy, certified in accordance with the new UL 486 F standard. Together with conformity with DIN 46228 (1-4), this allows us to fulfill global market requirements in the areas of quality, safety and compatibility.

Connectors

Crimp connections have been tested millions of times in all areas of industry; automotive technology, air travel, the sport industry, and in medical devices. Connectors are also known as crimp contacts. They are available in a wide range of versions and designs.

They are divided into two main groups: large, turned connectors or contacts referred to as closed; the punched, rolled connectors or contacts are called open.

In the electrical installation, these crimp connections fall under the heading solder-free electrical connections. The scope of service as well as test specifications are described in the European standard DIN EN 60352-2.

Crimping is a joining process to permanently connect one or more conductors with a contact. A stripped conductor is inserted into the crimp zone of the contact and connected by means of a specific crimping process. This results in a durable, fixed and reliable connection that cannot be detached.

The following key groups make up the current connector types, with a large range of dimensions and conductor cross sections:

Punched, rolled contacts, hard-soldered crimped cable lugs, tubular and compression cable lugs, butt connectors, insulated crimped cable lugs, pin cable lugs, non-insulated and insulated ring cable lugs, non-insulated fork-type cable lugs, non-insulated and insulated slip-on sleeves and coaxial CATV connectors.

Crimp profiles

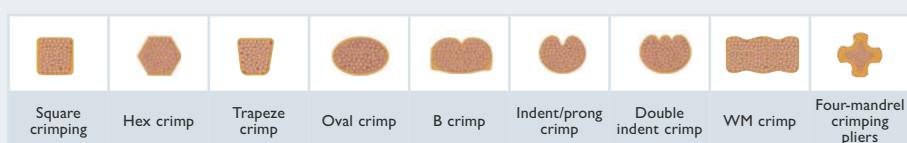

The B crimp profile is mainly used as a crimping profile for punched, rolled contacts.

Large rotated connectors or contacts mainly exhibit the following profiles in four-mandrel crimping (4/8 indent), square, oval, mandrel crimping, twin mandrel crimping, WM pressing, hexagonal (hex) with mandrel crimping, and B crimp.

Mechanical crimping pliers with a ratchet system or hydraulically actuated tools with different die sizes and crimp profiles process cross sections larger than 10 mm². In electrical, pneumatic, and electropneumatic crimping machines, depending on the machine type, square and four-mandrel profiles of up to 10 mm² are installed. For larger cross sections, such as for the charging plug, the B crimping profile is also used. Other

profiles, such as VM crimp, O crimp, indent crimp, and double indent crimp, are used for processing ferrules, tubular and compression cable lugs, and connectors up to 300 mm². The DIN 46230, DIN 46234 and DIN 46235 are used as a reference for the standard.

This time-saving, cost-effective connection method has been proven over many decades, millions of times. Getting the right version however, is a very complex task. For crimp connections in line with standards, the right interplay of the cross section of the litz wire, crimp contact, crimping tool and correct tool settings is crucial. Selecting the crimp profile depends on various parameters, such as the connector or crimp contact, the standard applicable, the area of use, and the specific connector type.

Overview crimp profiles

Conductor pull-out test

points can be affected by forces during wiring or operation. Therefore, properly crimped connectors must offer a high degree of mechanical safety. To test the tensile load capacity of a crimped conductor, a crimped conductor is exposed to a defined, cross-sectional tensile force for a period of 60 seconds, and must withstand this load. The tensile force exerts stress on the conductor at the crimping point. Damages to the crimp point must not be a result of this. Moreover, even the maximum tensile force is tolerated, until the connection is destroyed.

Gas tightness in crimp connections

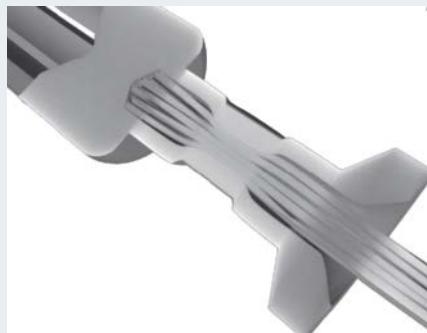

A gas-tight crimp connection is the result of a defined crimping procedure. The wire strands in one or more conductors and a connector are joined into a largely homogeneous structure, with no air spaces. This results in a durable, reliable connection that cannot be breached. In addition to the mechanical and electrical properties to be tested, a visual observation of the connection provides key information on the quality of the connection. To this end, grinding patterns or acquisitions are created by means of computer tomography. The porosity, breaking elongation, and the formation of the individual wire strands are assessed in this way.

A correctly executed crimp procedure is fully protected from gases such as sulfur-dioxide containing industrial environments, oxygen, salt spray, or other aggressive media. This prevents gases causing corrosion during the service life of individual wire strands such that the electrical properties deteriorate as a result. The crimp connections of ferrules cannot be compared directly with connectors or cable lugs. They must be considered differently. Ferrules are used as a protection for class 2, 5, and 6 copper wires, that are flexible and highly reliable. The copper sleeve of the ferrule has a material thickness of 0.15 to 0.2 mm. It is significantly thinner than that of cable lugs, for example. If the copper sleeve of a ferrule with a conductor cross section of 2.5 mm² has a material thickness of 0.3 mm, the material thickness of a comparable cable lug is 0.5 mm. DIN 46228 (parts 1-4) describes the mechanical testing and the envelope tension check as of 2.5 mm² for class 5 copper wires in accordance with DIN 46228 for the crimping of ferrules. The electrical properties are evaluated together with the later application of the connection, e.g. within a terminal block. In harsh environments, corrosion-free contact areas are a real prerequisite for reliability and therefore high-performance connections. For this reason, the secure positioning of the connection at the terminal point must be ensured. The impact of aggressive media on the

DIN EN 60947-7-1 must not exceed a value of 3.2 mV before or after the test, nor must it exceed 1.5 times the value measured at the start of the test.

In a gas-tight connection, it is assumed that the test object fulfills requirements of a test in a condensation changing climate with an atmosphere containing sulfur dioxide in accordance with DIN 50018 (AHT 2.0 S). This test consists of storage in a condensation changing climate with changing air humidity and temperatures. In the first test section, the test object is exposed to an SO₂ volume concentration of 0.67% at a temperature of 40°C and a humidity of approx. 100% for 8 hours. After this test, the test objects are left to dry for 16 hours with the door open. This cycle is executed twice before the test objects are assessed.

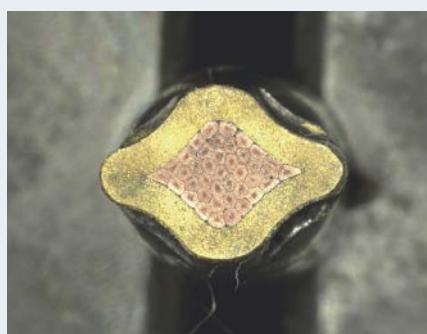

When used correctly at contact points, Phoenix Contact crimping tools, ferrules, and connectors achieve a permanent gas-tight connection that cannot be impaired even by aggressive substances. Even aggressive media do not impact this connection.

V tests in accordance with EN 60900

strict safety regulations for working parts up to 1000 V AC and 1500 V DC, VDE-insulated tools take on board in addition to general safety requirements. The IEC 60900 international standard places the highest requirements on insulated tools. In addition to the specifications in terms of geometry and dimensions, the properties of the insulation material are above all defined by comprehensive tests complete the

test the condition of the insulation. Inscriptions undergo a visual test. Next test checks the resistance of the insulation layer against impacts. Flaking, flaking or cracks cannot occur at lower temperatures (depending on category, from -25°C or -40°C). Indentation test (semi-sphere 1 mm diameter), the insulation is heated to 70°C with 20 N for 2 hours. Finally, the test point must not show any electrical disruptive discharge, arcing or sparkover over a period of 5 minutes while a voltage of 5 kV is applied (r.m.s. value).

In dielectric tests, pre-conditioned tools (water bath or humidor storage) are exposed to a voltage test. A voltage of 10 kV is applied for three minutes. The discharge current must be less than 1 mA per 200 mm coating length of the hand tool.

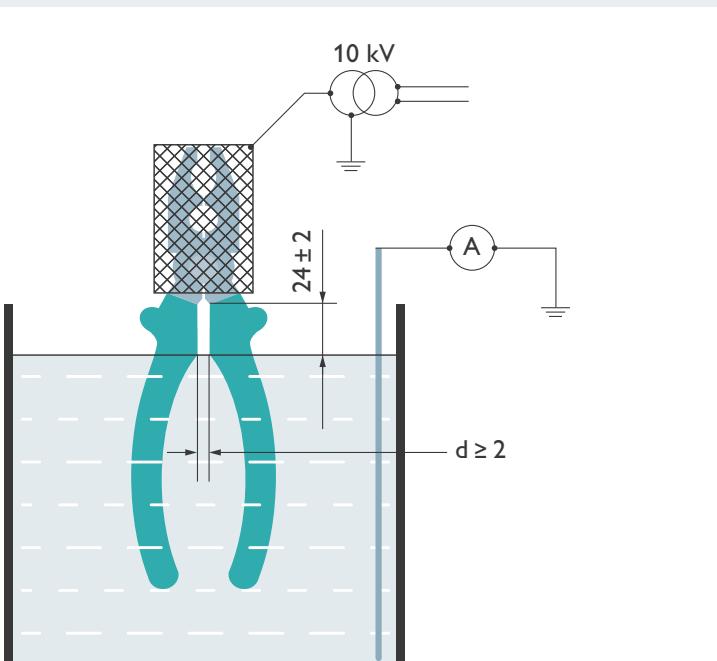

Further tests are based on the adhesion strength of the insulation coating, the inscriptions' resistance to chemicals, and the combustion behavior. The positive outcome of the type proofing of a tool forms the basis for using the VDE logo, in conjunction with IEC 60900. Regular checks on the production sites and test points are also made through the respective VDE approval point. As part of these, among other things: Random product samples are taken from ongoing production and assessed.

The manufacturer carries out comprehensive testing during production that ensures that all of the requirements of the IEC 60900 are adhered to. The last hurdle is the test for electric strength. Each tool is tested at 10,000 V AC. Only after passing this test can a tool be referred to as VDE-certified and released for sale.

Marking of a VDE tool. The letter "C" indicates the possible use at low temperatures

The VDE-insulated and correspondingly marketed tools from Phoenix Contact provide the user with high quality and the greatest possible degree of safety when working with live parts up to 1000 V AC and 1500 V DC.

Cutting

Cable processing starts with the trimming or cutting of the conductor cable.

Conductors and cables in a wide range of sizes, shapes, and insulation can only be processed professionally and permanently with quality tools. Optimum leverage means that you only need to apply low axial force to generate maximum force in the cutting area.

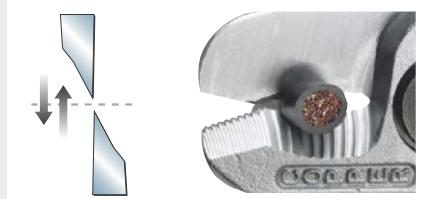

When it comes to cutting conductors and cables in the upper cross section range up to 400 mm², ratchet-driven cable cutters are the solution. Here, the finely stepped gear drives also keep the required manual force to a minimum.

In versions, with direct and indirect cable transmission, feature special cutting geometries which help to ensure ease of movement and can be relied upon to produce burr-free right-angle cuts.idental deformation of the conductor is thereby prevented. The cutting method described above, which is also known as "crimp cutting", is listed under the generic term "splitting" in DIN 8588. The two

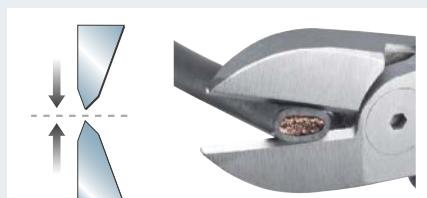

blades move toward and past one another and cut (shear) the material without burring.

Bite cutting involves two wedge-shaped blades which move toward one another to cut the material. The wedge angle set for the blades is deliberately large and therefore stable. In addition to the hardening of the entire tool, the cutting area is subsequently hardened again inductively. This makes it possible to sever even extremely hard materials such as piano wire and spring steel with a tensile strength of up to 2300 N/mm² without damaging the tool. Bite cutting is suitable only to a limited extent for cutting through cables and lines.

When used appropriately, the CUTFOX cutting tools from Phoenix Contact can be relied upon for long-term stability and permanently consistent results.

Shear cutting

Bite cutting

Stripping

Stripping is the next step in the manufacturing process for creating a reliable crimp connection. In this case, a distinction is made between stripping and dismantling.

Stripping is used as a generic term as well to describe the removal of insulation from conductors up to 16 mm². Dismantling describes the stripping process for large conductor cross sections and multi-strand or multi-layered conductors and cables.

Insulation can be removed professionally and quickly using the right stripping or dismantling tool. The length of insulation to be removed varies depending on the terminal point and connector. This is set by means of adjustable limit stops and ensures consistent stripping lengths.

When insulation is removed, ensure that neither the single wires inside nor the braided shield are damaged. The remaining

and color changes in the insulation material are permitted. Further faults that need to be prevented are stipulated in DIN IEC 60352-2.

Blade geometries suitable for the application in question are used to process special insulation materials. V blades are used for both hard (e.g. Teflon/RADOX®) and soft rubber insulations (silicone). In contrast to the straight blade geometry, V blades cut the insulation all the way around, thereby reducing the tear-off force.

Phoenix Contact provides a wide range of dismantling and stripping tools for convenient, safe processing of different conductors, cables, and wire types.

Correctly stripped conductor in accordance with DIN IEC 60352-2

Single wires damaged or off-center in the jacket

Crimping, pressing, crushing

Crimping describes the joining of the contact and conductor mechanically.

In addition to crimping, two further terms are used, based on standards. The type of crimping process plays a decisive role here. Depending on the type of contact, a distinction is made between:

Pressing, for insulated cable lugs
Crushing, for ferrules, non-insulated cable lugs, and similar enclosed components.

When blade connectors are being processed, for example, this is called

crushing.

For a number of important points to establish a reliable connection between contact and conductor:

- The conductor must be processed correctly
- The conductor and the contact must be compatible
- The conductor must be positioned correctly in the contact
- Select the correct crimping tool
- The conductor and contact are placed in the designated die nest of the pliers

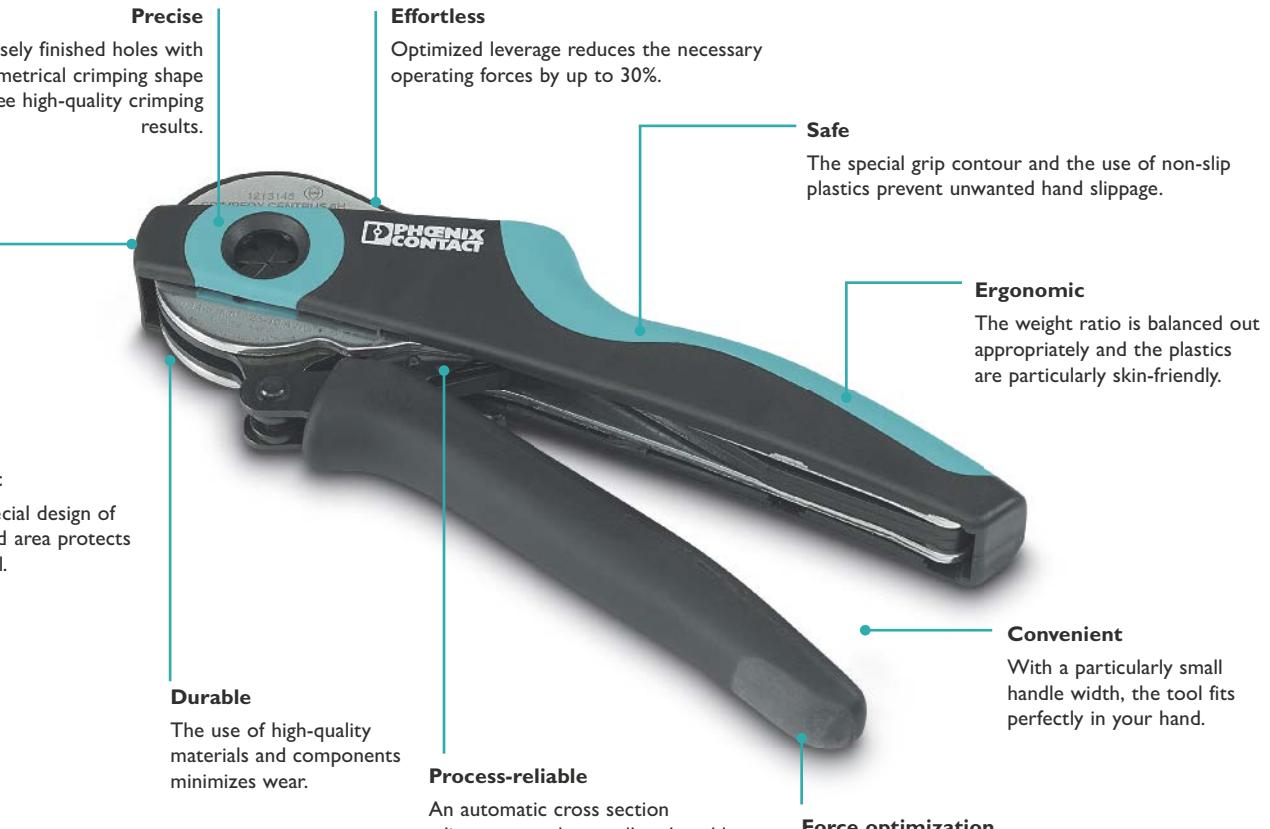

Professional crimping pliers are always equipped with a releasing pressure lock. They unlock as soon as the required crimping pressure is attained. This rules out the possibility of too little pressure. This guarantees the user a constant crimping result with maximum pull-out values.

Automatic or semi-automatic crimping machines are often used when large numbers of contacts need to be processed.

The DIN EN 60352-2 and DIN EN 60999-1 standards are among the references used to subsequently assess crimping results. In addition to a variety of electrical and mechanical tests, conductor pull-out tests are the decisive criterion.

All tools in the CRIMPFOX series from Phoenix Contact are adjusted and tested according to the applicable standards. These tools ensure long-term stable, gas-tight crimping.

We recommend checking the crimp quality every 5000 cycles or once per year, using suitable, calibrated test equipment.

Cutting and universal tools CUTFOX/UNIFOX

In the CUTFOX range, Phoenix Contact offers the perfect cable cutter for every application. You receive different versions for processing cables up to 100 mm in diameter.

The UNIFOX range covers a wide variety of tools for different applications: from universal tools, which combine several functions, and cable binder tools to cable cutters - we offer a whole host of applications.

Inconvenient and easy

The tools of the CUTFOX and UNIFOX product ranges feature comfortable handling and the highest quality:

Durable, thanks to specially hardened and tempered blades

Minimum effort, thanks to optimum leverage and cutting geometry

versatile use due to a wide range of products and multifunctionality

force transmission

stripping tools

WIREFOX

The WIREFOX product range provides the right tool for every form of stripping. WIREFOX precision tools impress with ergonomic design and specially designed blades with special geometries.

Fast, safe, and clean stripping
Process all types of conductor with standard or special insulation quickly and safely.
Broad field of application, thanks to multifunctional design
Ergonomic and fatigue-free handling, thanks to the ergonomic handle design
Durable, thanks to high-quality components and materials

Safe stripping

OX stripping tools can strip and cables with standard or

Easy blade replacement

The construction of the pliers allows the blade cassettes to be replaced with ease.

Multi-stage stripping

The CUTFOX-D CX stripping tools enable multi-stage stripping of coaxial cables in a

WIREFOX stripping tools

Stripping pliers for conductors and cables

WIREFOX stripping pliers feature an automatic adjustment system for a wide range of different types of insulation and conductor diameters. Particularly useful are the integrated wire cutter and the flexibly adjustable limit stop for the stripping length.

WIREFOX stripping tools

Stripping tools for dismantling

WIREFOX-D 13 stripping tool, round cables
Cables of $3 \times 1.5 \text{ mm}^2$ up to $5 \times 2.5 \text{ mm}^2$
can be stripped quickly and easily. The shape of the tool
is designed for application directly in the distribution and
connection areas. The tool is equipped with a longitudinal and round
sheath as well as with a stripping range for
cable cross-sections from 0.2 to 4 mm^2 . It also has a sliding knife.

WIREFOX-D 16 stripping tool, round cables
Cables with standard and special
cross-sections and diameter range from 4 to 16 or
more can be stripped precisely with these tools. The
WIREFOX-D 16 is mainly used for processing FO cables.

WIREFOX-D 40 stripping tool, round cables
Cables of up to 40 mm. The swivel blade can
make round, longitudinal, and spiral cuts. The
ergonomics and the special operating principle
allow for safe and easy use and make the tool a problem
solver for stripping insulation.

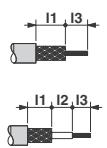

WIREFOX-D 40/SB stripping tool, round cables
Cable thickness: 4.5 mm
Blade thickness: 4.5 mm

Stripping tools for multi-stage dismantling of coaxial cables

WIREFOX-D CX ... stripping tools allow you to
perform multi-stage stripping of coaxial cables with
a cable outer diameter of 4.5 to 7.5 mm in a single step. The cable
is stripped in three stages, thanks to the central fine adjustment
of the three-blade cassette. The blade cassettes are compatible
with all WIREFOX-D stripping tools and are therefore interchangeable.

portable crimping device CRIMPHANDY

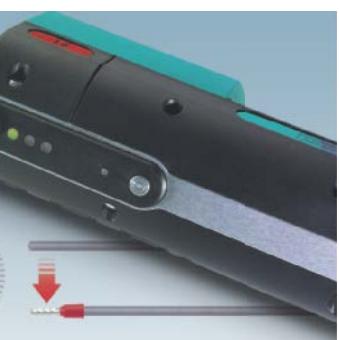

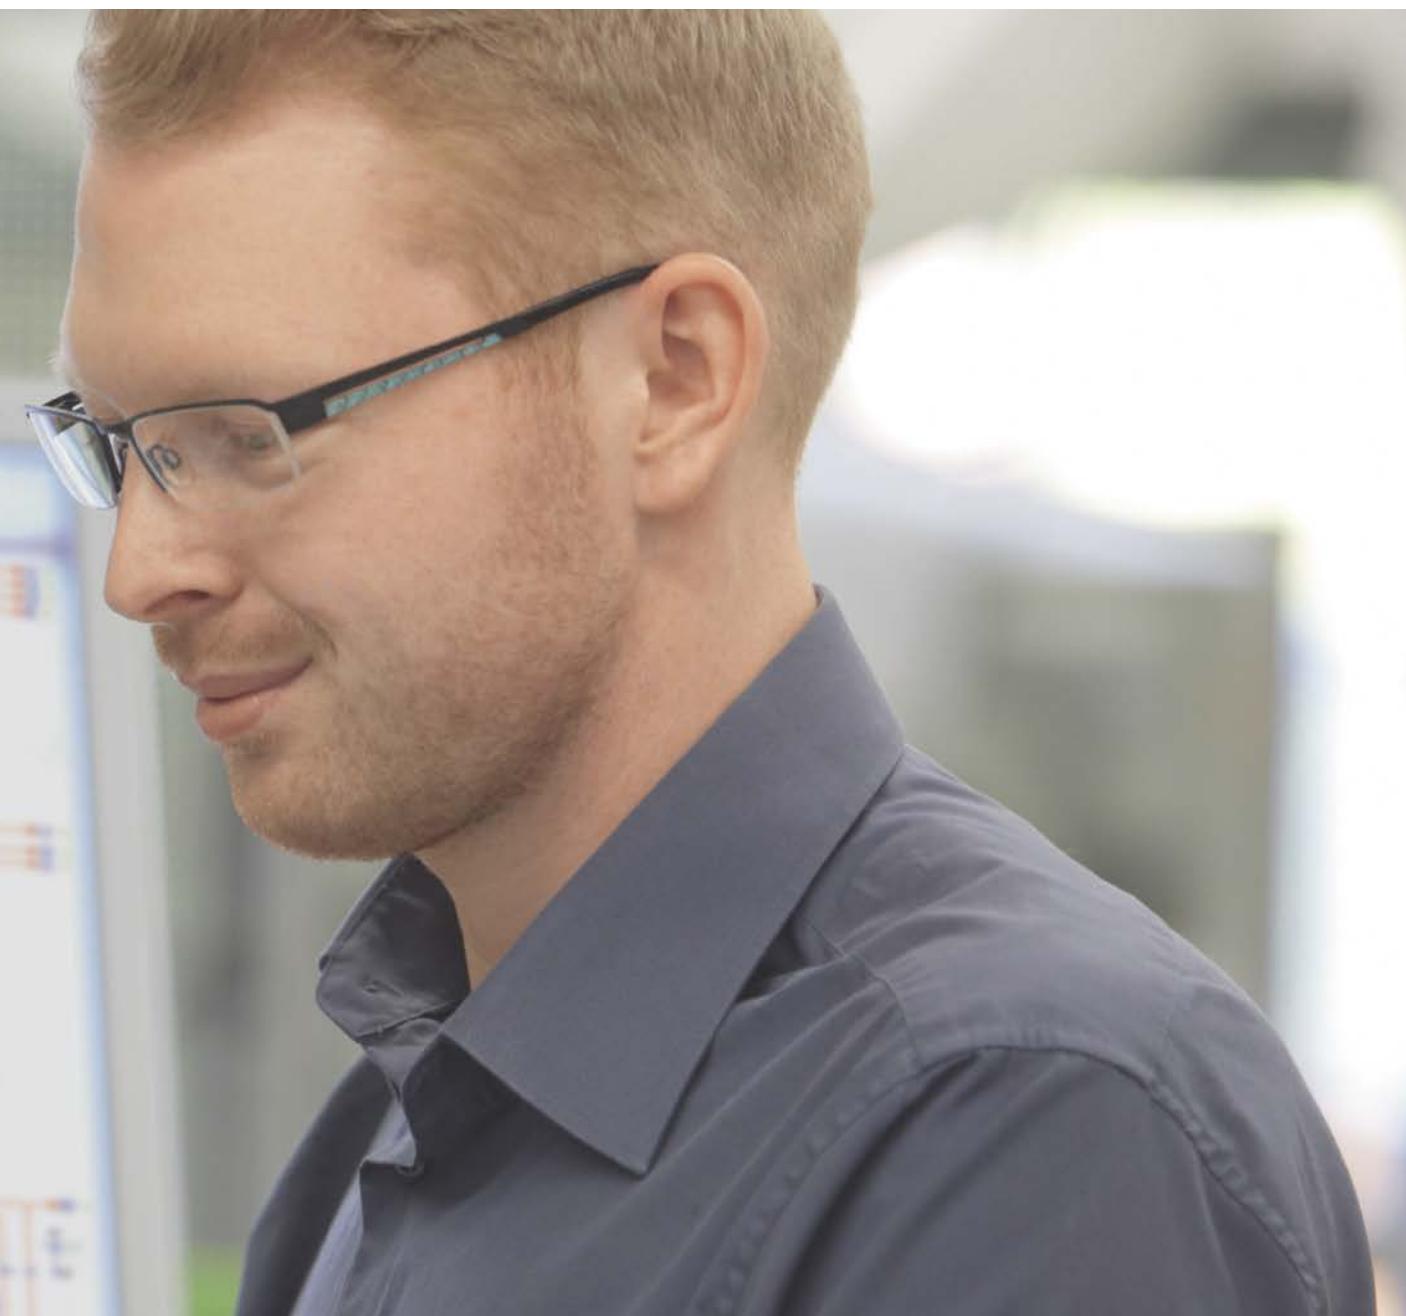

ditional conductor preparation involves four work steps, two tools and a lot of effort. The CRIMPHANDY from Phoenix Contact revolutionizes this process: Only one tool, one work step and time savings of around 75%.

CRIMPHANDY is a portable hand-held device for stripping conductors and crimping ferrules in one step, which takes less than two seconds. Automatic crimping functions ensure optimum, high-quality crimping every time.

UL-certified

Phoenix Contact was one of the first tool manufacturers to have ferrules in combination with stripping tools and crimping devices, such as the CRIMPHANDY, certified in accordance with the UL 486F standard. Together with conformity DIN 46228 (1-4), this allows us to fulfill global market requirements in the areas of quality, safety and compatibility.

MPHANDY portable crimping device

CRIMPHANDY

CRIMPHANDY represents innovation for switchgear manufacturing. You can strip and crimp your conductors in just two seconds using this portable hand-held device. It takes 5% less time than before. The CRIMPHANDY comes with its easy, effortless handling, which helps protect your joints, muscles and tendons. Its compact, lightweight design is ideal for mobile use in the field. Up to 2000 crimping operations can be performed, thanks to the high-performance lithium-ion polymer battery. Automatic cross section monitoring prevents faulty crimping as a result of incorrect conductor sizes. An attachable waste receptacle catches the discarded insulation. It thereby helps to ensure a clean working environment.

are not UL certified.

MPFOX – corresponding connectors for the CRIMPFOX series

Rules with insulating collar

	The ferrules with plastic sleeve are made from soft tin-plated electrolytic copper. The insulation reliability of close connections is increased and the splicing of wires is prevented. The conically shaped, "Easy Entry" insulating collar ensures easy and correct conductor insertion.	UL and CSA-certified, material/coating: E-CU/tin-plated, material plastic sleeve: polypropylene/halogen-free, long-term/short-term temperature: +105°C/+120°C. These ferrules correspond to the dimension requirements of DIN 46228-4: 1990-09 and UL 486F.
Refer to the overview list starting on page 86 for the suitable tools for crimping according to UL.

with enlarged insulating collar (AWG/Multinorm)

Comments provide a suggested

Increased diameter of the ferrule provides a practical solution for conductors with increased diameters. This type of ferrule is used on G and Multinorm cables. The ferrule is conically shaped, "Easy Fit" collar ensures easy and quick installation.

FOX – corresponding connectors for the CRIMPFOX series

cable lugs, insulated

The insulated ring cable lugs with plastic sleeves feature the "Easy Entry" system. The sleeves are conically tapered to facilitate easy and correct insertion of the conductor. The hard-soldered crimping area guarantees the best mechanical properties and permits horizontal or even vertical crimpings.

Material: copper/tin-plated
Flange material: PA/halogen-free
Temperature range: -20°C ... +105°C
Flammability rating: V2

The C-RCEI series is equipped with an additional crimp zone for conductor insulation. Refer to the overview on page 32/33 for suitable tools.

screwdrivers and torque screwdrivers REWFOX

Phoenix Contact screwdrivers are tailored to a wide variety of different screws.

It is particularly true of the products in the terminal block range. Ergonomically designed handles mean that the required torque is transferred with a reasonable amount of force. Adjustable torque and torqueless screwdrivers complete the product range.

Economic and durable

Whether bits, screwdrivers with a wide range of drives and sizes, cordless screwdrivers or dual torque screwdrivers – Phoenix Contact has the right screwdriver tool for you.

Durable, thanks to specially hardened and tempered blades

High torque transmission, thanks to the special two-component handle geometry

Solid, thanks to high-quality components and new materials

force transmission

component and ergonomically designed
ensure an optimum grip and support

Precise torque

The finely adjustable torque enables optimum
adaptation to various screw sizes and ensures

Cordless screwdrivers

The SF-ASD 21 high-precision cordless
torque screwdriver is the ideal one-hand tool

REWFOX screwdriver tools

Screwdrivers

screwdriver tools are equipped with ergonomic two-component handles. This makes effortless working, while transmitting maximum power and thereby providing a secure hold. Optimum blade shapes guarantee a secure hold in the hand and prevent slipping. The hexagon on the handle prevents rolling away.

Insulated screwdriver tools are unit-tested and offer high security when working with live parts up to 1000 V AC/1500 V DC.

The S-VDE versions has insulation that runs into the shaft. Since there is no insulation on the shaft, even deeper lying screws can be reached with ease.

SLIC... screwdriver tools are supplied with an impact cap and a torque wrench aid.

KWFOX screwdriver tools

Screwdrivers for actuating spring-cage and fast connection terminal blocks

In their standard application, these screwdrivers are particularly suited to actuating terminal blocks from the PT..., ST... and QTC... series. The defined tip allows you to move the spring terminal block as far as possible without leaving any damage.

The curved versions are ideal for use in narrow spaces.

measuring and test devices TESTFOX

TESTFOX multimeters, current
clamps, and voltage testers are a range of
high-quality measuring tools, which have
been tested and approved in accordance
with applicable national and international
standards. They support the measurement
of standard parameters and are the ideal
solution for all applications in industry,
electrical installation, and services.

Itifunctional and robust

TESTFOX measuring and test devices ensure
the safety of your systems and devices.

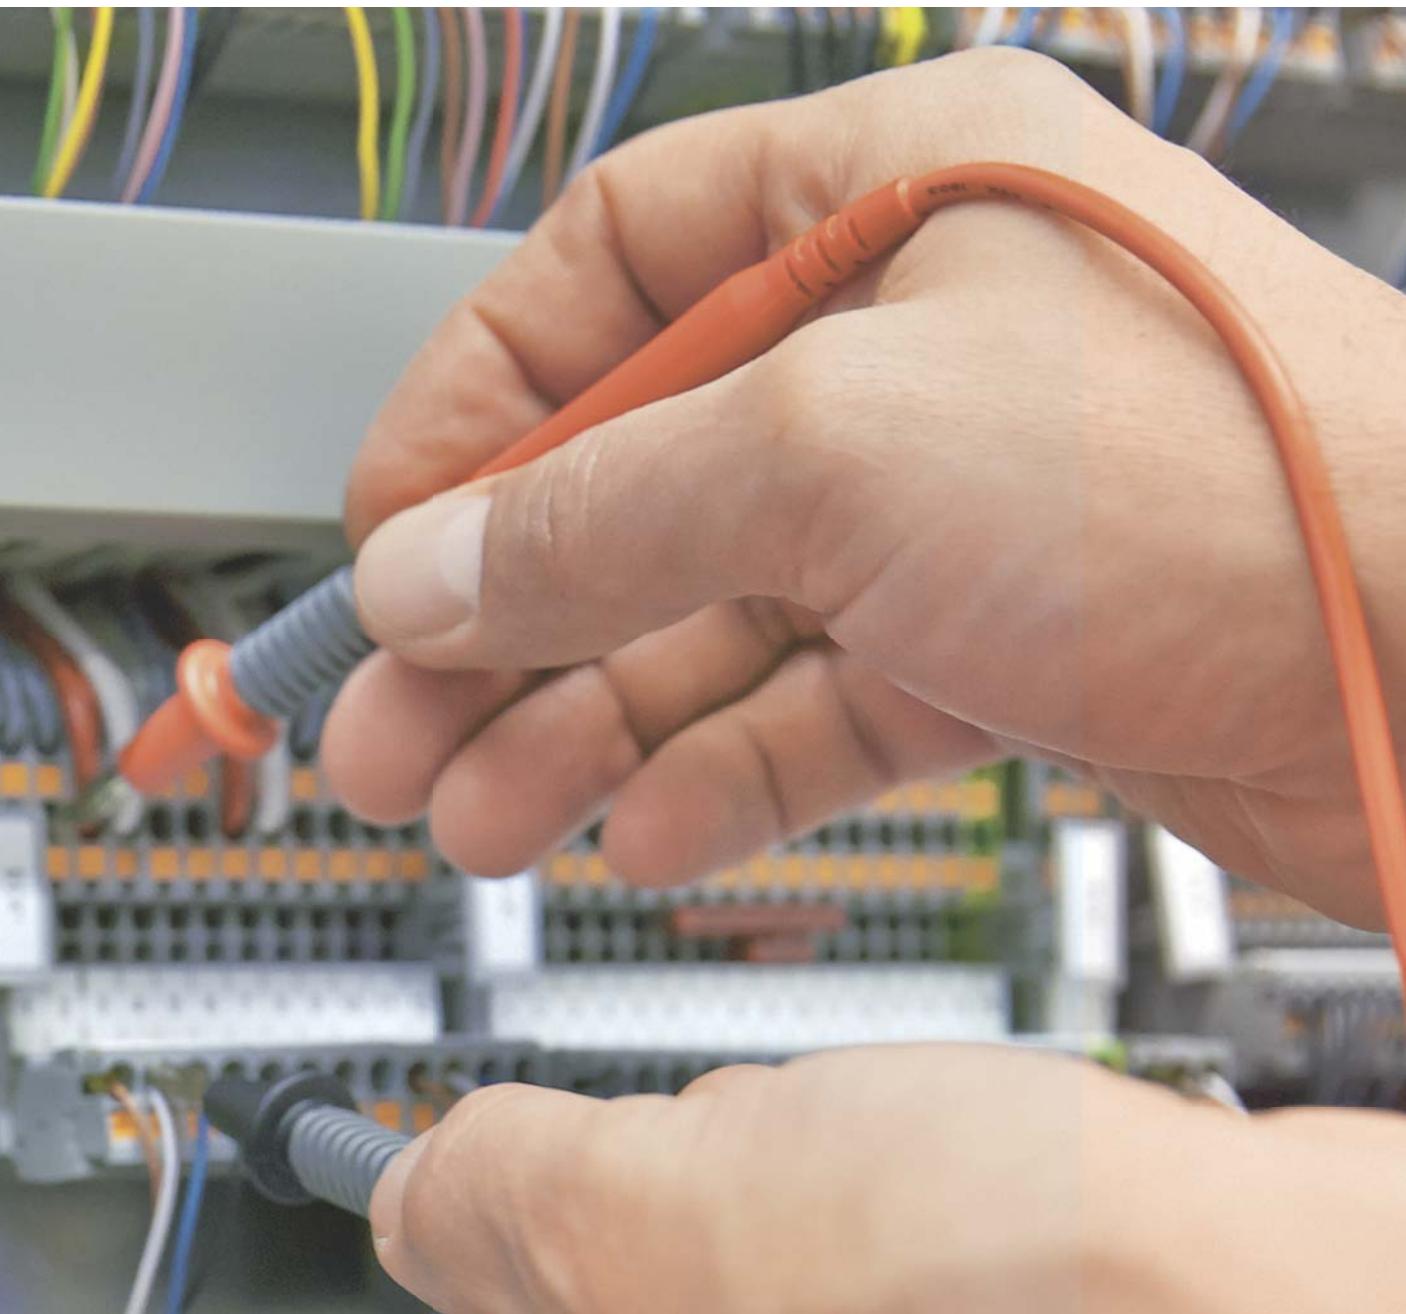

robust and durable, thanks to special shock-
proof plastic materials

high level of functionality: all standard
measuring tasks in a single compact device

versatile use: also ideal for use in
photovoltaics

reliable results: elimination of inaccurate
measurements due to reactive voltage

Range of functions

The OX M-1 supports all standard methods and temperature

Versatile use

The TESTFOX CC-1 also allows you to measure small AC/DC currents from 10 mA

Error-free measurement

A load can be connected via two pushbuttons in order to rule out inaccurate

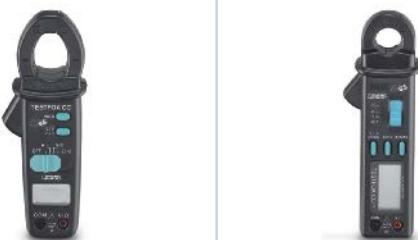

TESTFOX test and measuring devices

DUSPOL EXPERT voltage and continuity tester
The following:
position test of the outer conductor (phase)
ring point lighting
visual and optical continuity test
connection via pushbutton
alarm for safe voltage detection
voltage category CAT IV 500 V in accordance with
EN 61243-3

electronics pliers CROFOX

CROFOX is the range of pliers for all work in electronics and electromechanical engineering. It is ideal for working on hard-to-reach areas such as PCB components.

Micro pliers feature ergonomically designed two-component handles. This provides a secure grip and makes effortless work easier. To protect sensitive electronic components, we recommend the ESD versions with special handles. These handle charge the electrostatic charges in a controlled manner in accordance with the relevant standards and regulations.

Precise and convenient

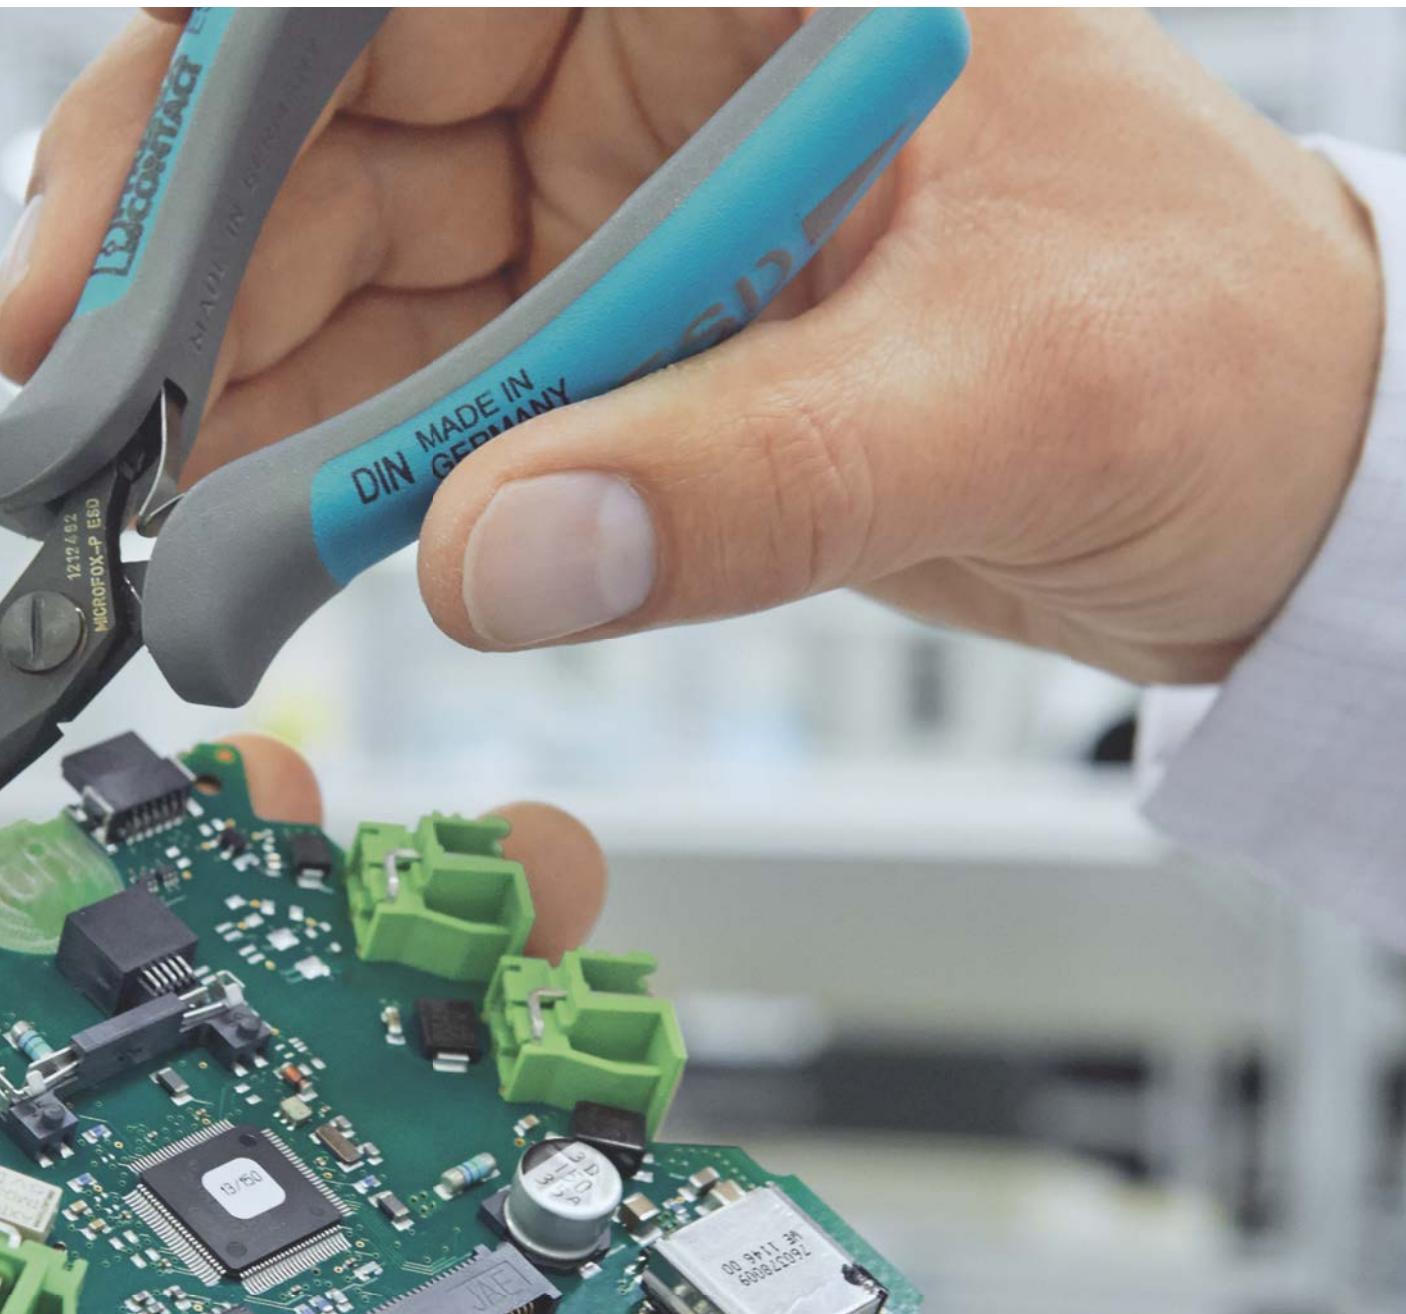

State-of-the-art tools for all precise tasks in the field of electronics.

Protect electronic components, thanks to the ESD design

Automatic devices

Cutting, stripping, and crimping devices

Phoenix Contact has a comprehensive range of innovative automatic devices for the automation of fast and flexible processing of conductors and cables. A combination of functionality, quality, and short setup times guarantees high levels of reliability while ensuring high-quality results every time.

Flexible and fast

Cutting, stripping and crimping: Increase your efficiency by automating these three substeps. Easy startup and high process reliability in any application

Intuitive operation via display, knobs or numerical keys

Durable and low-maintenance, thanks to the robust design and the use of low-wear components

Automatic devices

The CUTFOX 10 automatic cutting device can cut solid conductors and cables up to 10 mm^2 . Stranded conductors can be cut with millimeter precision. The number of cuts are entered via a user-friendly display. The CUTFOX 10 automatically adapts to the diameter when a change in material.

The WF 1000 stripping machine can be used to automatically strip conductors with a cross section of up to 6 mm^2 or cables up to $6 \text{ mm} \varnothing$, and also offers the option of partial stripping. The stripping dimensions are set individually via knobs and shown on the display.

The ZAP crimping pliers are pneumatic pliers for ferrules with a cross section range from 0.25 to 10 mm^2 . The crimping process is activated by a foot valve or a manual trigger, depending on the version. Two integrated recesses allow quick access to the ferrules.

The CF 500 is characterized by a high press force in a compact design. The dies can be replaced quickly and easily, which makes it ideal for processing a variety of contact types up to 10 mm^2 .

The Crimphandy is a portable hand-held device for stripping and crimping in one step – in less than 2 seconds. Automatic monitoring functions ensure optimum, high-quality crimping every time.

The CF 3000-2,5 automatic stripping and crimping device processes taped ferrules with insulating collars in accordance with DIN 46228-4. This device allows conductors with a cross section range from 0.25 to 2.5 mm^2 to be stripped and fitted with ferrules in a single step. The automatic device can be adapted to various cross sections in under a minute.

Automatic devices

CUTFOX 10 automatic cutting device

CUTFOX 10 automatic cutting device cuts conductors and cables up to 10 mm². Solid and stranded conductors can be cut to length with millimeter precision. The length and number of cuts are entered directly via the keypad. The CUTFOX 10 automatically adapts to the diameter when there is a change in material.

Automatic devices

Automatic stripping and crimping device

The automatic stripping and crimping device processes taped ferrules with insulating collars according to DIN 46228-4. This device allows conductors with a cross section range from 0.25 to 2.5 mm² to be stripped and fitted with ferrules in a single step. The automatic device can be adapted to different conductor cross sections in under a minute. Color coding in accordance with ferrule standard DIN 46228-4 ensures the assignment of modification components really clear. Due to its compact and light design, the device can be used at different workstations.

omatic devices

000 crimping device

omatic CF 1000-1,5 and CF 1000-10 stripping and crimping devices process conductors and sleeves from 0.25 to 10 mm². Switching the cross section and sleeve length is particularly fast and requires a few steps. Thanks to its maintenance and wear-free components, the device offers high reliability and durability. Even special sleeves such as Al... GB can be used for conductors with thicker insulation by using extension kits and components.

Automatic devices

Crimping device

The CF 500 crimping device is characterized by its high press capacity and the ease with which it can be used. The number of available dies allows for universal use. The crimping process is controlled via a foot pedal. As such, both hands are free to assemble the conductor using the contacts. The dies can be positioned precisely before the crimping procedure via an additional two-stage adjustment. This makes it easier to process crimp contacts and prevents incorrect crimping.

Order No.

CF 500 crimping device, 230 V version, with foot switch	CF 500-230 V	1208348
CF 500 crimping device, 120 V version, with foot switch	CF 500-120 V	1208351

up-to-date, always available to you. Here you'll find everything on our products, solutions and service:

phoenixcontact.com

Product range

Wires and wires
Cabling technology for E-Mobility
Relays
Controllers
Electronics housings
Electronic switchgear and
Power control
Bus components and systems
Industrial safety
and industrial PCs

- I/O systems
- Industrial cloud computing
- Industrial communication technology
- Installation and mounting material
- Lighting and signaling
- Marking and labeling
- Measurement and control technology
- Monitoring
- PCB terminal blocks and
PCB connectors
- Power supply units and UPS
- Protective devices
- Relay modules
- Sensor/actuator cabling
- Software
- Surge protection and interference filters
- System cabling for controllers
- Terminal blocks
- Tools

X-ON Electronics

Largest Supplier of Electrical and Electronic Components
