Number of contacts

Contact materials

Silver-nickel (AgNi) and silver-tin oxide (AgSnO₂) are used as standard contact materials for all models. Other contact materials are available on request.

Gold Flash

For relays that are intended to be stored or remain unoperated for any length of time, a 0,2µ layer of gold protects the contacts from oxidisation.

Gold Plating

A 10µ plate of gold increases the operational reliability. They should be used for switching low level currents.

Contact Resistance

Contact resistance is dependent on contact material, contact pressure and contact contamination.

High contact resistance raises the temperature of the contacts, therefore reducing their working life.

Typical contact resistance of the MR-C and QR-C relays is 50 mΩ.

Contacts gap

Contact gap and opening speed of the contacts have an influence on the length and the duration of the arc.

In the case of AC, a gap of 0,5 mm is sufficient to quench the arc which occurs automatically at the "zero point" of the cycle.

In the case of DC, the arc only quenches when the contact gap is sufficient for the voltage and current applied.

Please see tables of "Max. DC current".

Maximum Intensity

The "Max. switching current" indicated in every model, refers to the maximum stable current which should be possible in permanent conduction (I_{TH}).

In the case of AC, the "Max. switching-current" that the relay can support is the same for all the values of voltages ≤ of the "Max. switching voltage" specified in every model.

The product of the intensity and the voltage applied should not be higher than the values specified as "Max. AC load".

In the case of DC, the "Max. switching current" must be less than the current that causes the continuous arcing.

The tables of "Max. DC current" show the possible values of intensity in relation to the applied voltage.

Maximum Voltage

The maximum voltage on the contacts depends on the insulation between each contact (pole to pole) and between all contacts and the coil.

The EN60947 and VDE 0110 standards set out the maximum voltage values, taking into consideration the quality of the insulation materials, pollution degree as well as the shape and dimensions of the contact barriers (creepage distance).

Contacts in series

The connection of two or more contacts in series is equivalent to multiplying the contact gap by that amount. By using this method, a greater break capacity is achieved for DC switching.

Contacts in parallel

The connection of two or more contacts in parallel does not mean that it is possible to switch a greater load. However, the stable current and the operational reliability of the relay is increased.

Double make contacts

The double make contact arrangement is equivalent to two contacts connected in series.

The maximum intensity supported corresponds to only one contact. This system allows for higher DC operating voltages.

Bifurcated (twin) contacts

The contact blade is divided into two parts, each with its own contact. Both contacts press down each on their own independent fixed contacts.

This system is particularly good for reliably switching at very low levels.

Contact protection

The electrical life of contacts can be prolonged by components which eliminate or reduce the back EMF transients.

These voltages are generated by the reactive component of the load on disconnection, which increases the duration and the temperature of the arc.

For AC, RC suppressors or varistors can be connected in parallel with the load or the contacts.

For DC with an inductive load, the best method is to connect a diode in parallel with the load.

Coil Materials

Coils bobbins are moulded in polybutylene with fibreglass (130° C). Enamelled wires of Class F specification are used (155° C).

They are wound on automatic precision winding machines, with the number of turns and wire tension accurately regulated and monitored.

Tolerances

Coil resistance is measured at 20° C and is regulated within ± 10% of specified value.

Standard Windings

The coil voltages indicated in the catalogue refer to standard windings.

Other coil voltages are available, including products for series connection and amperometric applications.

Please consult your distributor for details.

Minimum working voltage (pull in)

This is the minimum voltage that must be supplied to the coil to ensure that the relay energises, the contacts change over and are positively held in place without any vibration.

The values of voltage specified are those at or below which the relay must pull in.

working at:	50 Hz	60 Hz
AC 50 Hz Relays	0,8xU _N	0,85xU _N
AC 60 Hz Relays	0,75xU _N	0,8xU _N
DC Relays		0,8xU _N

Maximum release voltage (drop out)

This is the voltage at which the relay de-energises, the contacts change over and are positively held in place without any vibration.

The values of voltage specified are those at or above which the relay must drop out.

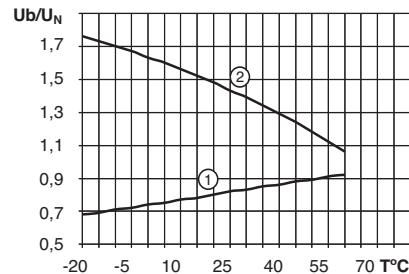

DC relays ≥ 10% U_N
AC relays ≥ 15% U_N

Ambient temperature

The ambient temperature has an influence on the coil resistance and on its thermal dissipation capacity.

Curve 1 represents the variations of the pull in voltage (% U_N) in relation with the ambient temperature (T).

Curve 2 indicates the maximum values of the voltage applied (U_b) to the coil in relation with the nominal voltage (U_N) at the ambient temperature (T).

A General purpose relays

They are used for most general applications, like as automation, pneumatic, heating appliances, signaling, as an input or output interface, etc.

R Remanence relays

A high remanence magnetic circuit allows the relay to latch positively when the current applied flows through the coil in a direction and delatches if the current flows in the opposite direction.

Electronic circuitry is added inside the relay to control this action and also protects against transient voltages.

There is one winding for AC coils and two windings for DC coils.

All coils withstand permanent connection. The relay can be operated with pulses of 50 ms., minimum, at nominal voltage.

X Double make relays

These relays are designed to switch high DC loads at voltages of 110 and 220 Vdc.

They consist of one normally open contact with a gap >3 mm so that the arc length is divided by two.

Isolation between contacts: >2000 Vrms
The max. DC load is shown in the tables.
X versions are available in MR-C and QR-C type housing.

Protection against transients

When the coil is disconnected from an electromagnet, peaks of inverse voltage appear at the terminals which can reach very high values. These pulses can be transmitted down the line associated with the coil and could possibly affect other components.

In the case of a relay being operated by such devices as transistors, triacs, etc; it may be necessary to protect against transients.

Transients carried in the line

High voltage surges can be carried in the supply line to the relay coil. These may appear in the form of peaks or bursts and are generated by the connection and disconnection of electric motors, transformers, capacitors etc.

Normally a relay is unaffected by these pulses, but if a diode is connected in association with the coil, it must be capable of withstanding an inverse voltage higher than those of the incoming peaks.

Protection circuits

A protection circuit must efficiently cope with pulses generated by the coil as well as incoming line surges (surges $U_{1,2/50\mu s}$). Releco relays are available with integrated protection circuits or with modules plugged into sockets S3-MP or S3-MS.

Specifications

The data referred to in the specifications for each model refers to typical values of "new" relays at 20° C.

Tables

The tables of electrical life and the tables of maximum DC current show the typical result of exhaustive tests performed at an ambient temperature of 20° C, operating frequency of 1200 operations / hour, and under permanent connection.

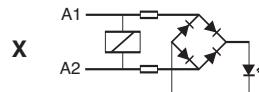

The switching current ratings specified in the catalogue refer to a minimum electrical life of 100.000 operations.

Margin of over-voltage

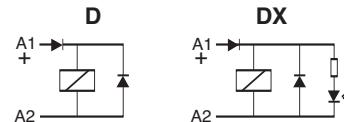

Coils withstand, on permanent connection, a maximum over-voltage of 110% U_N , with rated current through the contacts at an ambient temperature of 60° C.

Custom relays

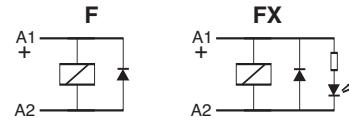

Relays with special specifications can be supplied after consultation with an official Releco distributor.

Specifications

Time accuracy:

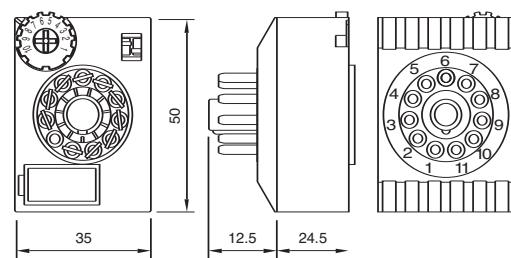

Repetition	+ 0,5% / 20 ms.
Supply voltage	1 ms / volt.
Ambient temperature	-0,25% / K
Reset time (types E, W, B)	< 150 ms.
Reset time (types A, K)	< 200 ms.
Triggering time: AC	80 ms ; DC, 50 ms.
Ambient temperature	-10°C ... +60°C
Transient protection	IEC 255.4
Housing material:	Noryl SE1 (UL94V-1)
Protection class (DIN 40050)	IP40
Weight avg.	35 grs.

Time range setting

Range 30	Dip - Sw
0,2 - 3 s	
2 - 30 s	
0,2 - 3 min	
2 - 30 min	

Dimensions

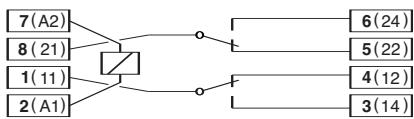

S2-B One level. Coding ring
Integrated clip and marking label

Accepts the exclusive Releco coding ring for coding both the relay and base. DIN rail or panel mountable. Removable label. EN/DIN and sequential numbering.
According to EN60947

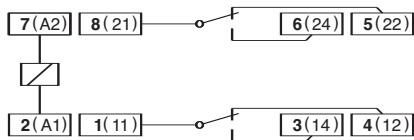

Wiring diagram

S2-S Two level. Coding ring
Integrated clip and marking label

Accepts the exclusive Releco coding ring for coding both the relay and base. DIN rail or panel mountable. Removable label. EN/DIN and sequential numbering.
According to EN60947

Wiring diagram

Specifications

Nominal load	10A / 300V
Dielectric strength (adjacent screws)	2,5 KV
Dielectric strength (screws / rail)	2,5 KV
Max. screw torque	1,2 Nm
Screw dimensions	M3, Pozi
Wire in-lets capacity:	
Solid wire	4 mm ² or 2 x 2,25 mm ²
Multi-core	22 - 14 AWG

Specifications

Nominal load	10A / 300V

Specifications

Nominal load	10 A / 250 V
Dielectric strength (adjacent pin)	2,5 KV
Hard brass, tin-plated terminals	

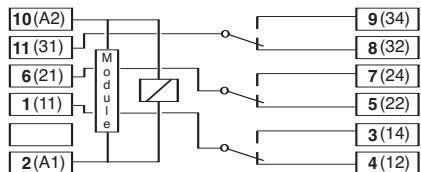

S3-MP One level, screws in line Logic wiring and Modules

Accepts the plug-in modules M3P in parallel with the relay coil.
Integrated hold-down clip and removable marking label. DIN rail or panel mountable. EN/DIN and sequential numbering.

Wiring diagram

Specifications

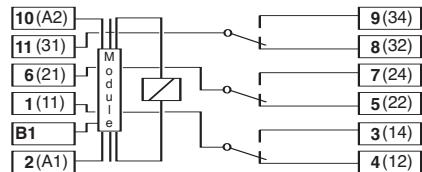

Nominal load	10 A / 250 V
Dielectric strength (adjacent screws)	2,5 KV
Dielectric strength (screws / rail)	2,5 KV
Max. screw torque	1,2 Nm
