Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29 to 16	VCYL[13:0]	H'0000	R/W	Vertical HD Count of External Module These bits set the number of VD cycles of an external module with the number of HD inputs. The interrupt source bit IGVS in CETCR is set to 1 when the actual number of VD cycles input from the external module differs from this setting. Set these bits for detecting an illegal VD. When these bits are all cleared to 0, the interrupt source bit IGVS in CETCR is not set to 1. Though the interrupt source bit IGVS in CETCR may be set to 1 after the VDPOL bit (VD polarity) in CAMCR is changed, this interrupt should be ignored.
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13 to 0	HCYL[13:0]	H'0000	R/W	Horizontal Cycle Count of External Module These bits set the number of HD cycles of an external module. The interrupt source bit IGHS in CETCR is set to 1 when the actual number of HD cycles input from the external module differs from this setting. Set these bits for detecting an illegal HD. When these bits are all cleared to 0, the interrupt source bit IGHS in CETCR is not set to 1. Though the interrupt source bit IGHS in CETCR may be set to 1 after the HDPOL bit (HD polarity) in CAMCR is changed, this interrupt should be ignored.

46.4.5 Capture Interface Offset Register (CAMOR)

CAMOR sets the location to start capturing when capturing images.

Since the number of HD (horizontal sync signal) inputs from a VD (vertical sync signal) input to the start of a valid image period, and the number of clock cycles from an HD input to the start of a valid image period differ among external modules, these must be set in CAMOR. By setting a value greater than the valid image area, part of the image can be clipped for capture. When fetching data, the setting of this register becomes the number of cycles (HD count) up to the start of a valid data period.

This register is not used, during data enable fetch mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	—	—	—	HOFST[12:0]												
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 16	VOFST[11:0]	H'000	R/W	These bits specify the capture start location in terms of the HD count from a vertical sync signal (1-HD units). The blanking period from a vertical sync signal differs among external modules. Therefore, the vertical capture start location must be specified by these bits in terms of the HD count from a vertical sync signal so that an image can be captured from the valid image area (see Figure 46.17). Some external modules output a vertical sync signal as a data enable signal. In this case, there is no blanking period so these bits must be cleared to 0 (see Figure 46.18).
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 0	HOFST[12:0]	H'0000	R/W	These bits specify the capture start location in terms of the number of clock cycles from a horizontal sync signal (1-cycle units). The blanking period from a horizontal sync signal differs among external modules. Therefore, the horizontal capture start location must be specified by these bits in terms of external input clock cycles from a horizontal sync signal so that an image can be captured from the valid image area. This is similar in data synchronous fetch mode (see Figure 46.19). Some external modules output a horizontal sync signal as a data enable signal. In this case, there is no blanking period so these bits must be cleared to 0 (see Figure 46.20). Note: The first HD (horizontal sync signal) being input simultaneously or after the first VD (vertical sync signal) is the operating condition of the CEU. These inputs are affected by the polarities (set by the VDPOL and HDPOL bits in CAMCR).

46.4.6 Capture Interface Width Register (CAPWR)

CAPWR sets the fetch (capture) cycle width when capturing images.

The cycle width unit differs according to the interface and the data type to be captured. For each setting unit, see Table 46.6.

R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 18 17, 16	VWDTH[11:2] VWDTH[1:0]	H'000	R/W R	These bits specify the vertical capture period (4-HD units). These bits specify the number of lines (HD count) to be captured from the location specified by the VOFST bits in CAMOR. Figure 46.21 shows the timing when the vertical blanking period is 0. The CEU captures only the number of lines (HD count) specified by these bits in the vertical direction. Make a setting in the same way to obtain data synchronization. The maximum value to be set is 1,920 HD (5 megapixels).
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 1 0	HWDTH[12:1] HWDTH[0]	H'0000	R/W R	These bits specify the horizontal capture period. These bits specify the number of cycles to be captured from the location specified by the HOFST bits. Figure 46.22 shows the timing when the horizontal blanking period is 0. The CEU captures for only the number of cycles specified by these bits in the horizontal direction. Make a similar setting for data synchronous fetch. The maximum value to be set is as follows: • 8-bit interface Image capture (8-cycle units) : 5,120 cycles (2,560 pixels) Data synchronous fetch (4-cycle units) : 2,560 cycles (2,560 bytes) • 16-bit interface Image capture (4-cycle units) : 2,560 cycles (2,560 pixels) Data synchronous fetch (2-cycle units) : 1,280 cycles (2,560 bytes) Note: In data synchronous fetch mode, set CFSZR and CDWDR according to the values set in this register. For details, see the descriptions on CFSZR and CDWDR.

46.4.7 Capture Interface Input Format Register (CAIFR)

CAIFR sets the input mode (progressive or interlace) for capturing images, the images to be captured (frame, both-field, or one-field), the image from which capturing starts (top field or bottom field), etc. CAIFR is not used in data fetch mode.

Do not modify this register during operation. If this register is modified during operation, correct operation cannot be guaranteed. In addition, the IGRW bit (interrupt source) in CETCR is set to B'1.

The items set by CAIFR are listed in Table 46.7.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	IFS	0	R/W	Sets the input mode for capturing images. 0: Progressive 1: Interlace
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	CIM	0	R/W	Sets the images to be captured. Clear this bit to 0 when the input mode for image capture is progressive (frame image) or when the input mode for image capture is interlace for continuous capture of both the top and bottom fields. Set this bit to 1 when the input mode for image capture is interlace for capture of only a one-field image. 0: Capture of frame image (1 VD) or both-field image (2 VD) 1: Capture of one-field image (1 VD)
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	FCI[1:0]	00	R/W	These bits set the timing to start capturing. The timing to start capturing is set by specifying the image to be captured first. Set these bits to 00 when the input mode is progressive. 00: Capture starts from the VD input immediately after the CEU activation regardless of it being a top or bottom field 01: After the CEU activation, input of a top-field image is waited, and then capture starts from the top field 10: After the CEU activation, input of a bottom-field image is waited, and then capture starts from the bottom field 11: Setting prohibited

Table 46.7 CAIFR Setting Items

Input Mode	IFS Bit	Captured Image	CIM Bit	Image to Start Capture	FCI Bits
Progressive	0	Frame	0	Frame immediately after activation	00
Interlace	1	Both-field (2-VD capture)	0	Field immediately after activation	00
				Top field	01
				Bottom field	10
				Setting prohibited	11
		One-field (1-VD capture)	1	Field immediately after activation	00
				Top field	01
				Bottom field	10
				Setting prohibited	11

In frame image capture and one-field image capture, a one-frame capture end interrupt occurs when capture for 1 VD finishes. In both-field image capture, a one-field capture end interrupt occurs when capture for 1 VD finishes and a one-frame capture end interrupt occurs when capture for 2 VD finishes. At this time, a one-field capture end interrupt occurs simultaneously with a one-frame capture end interrupt. Figure 46.24 shows the timing of a one-frame capture end interrupt and one-field capture end interrupt in both-field image capture.

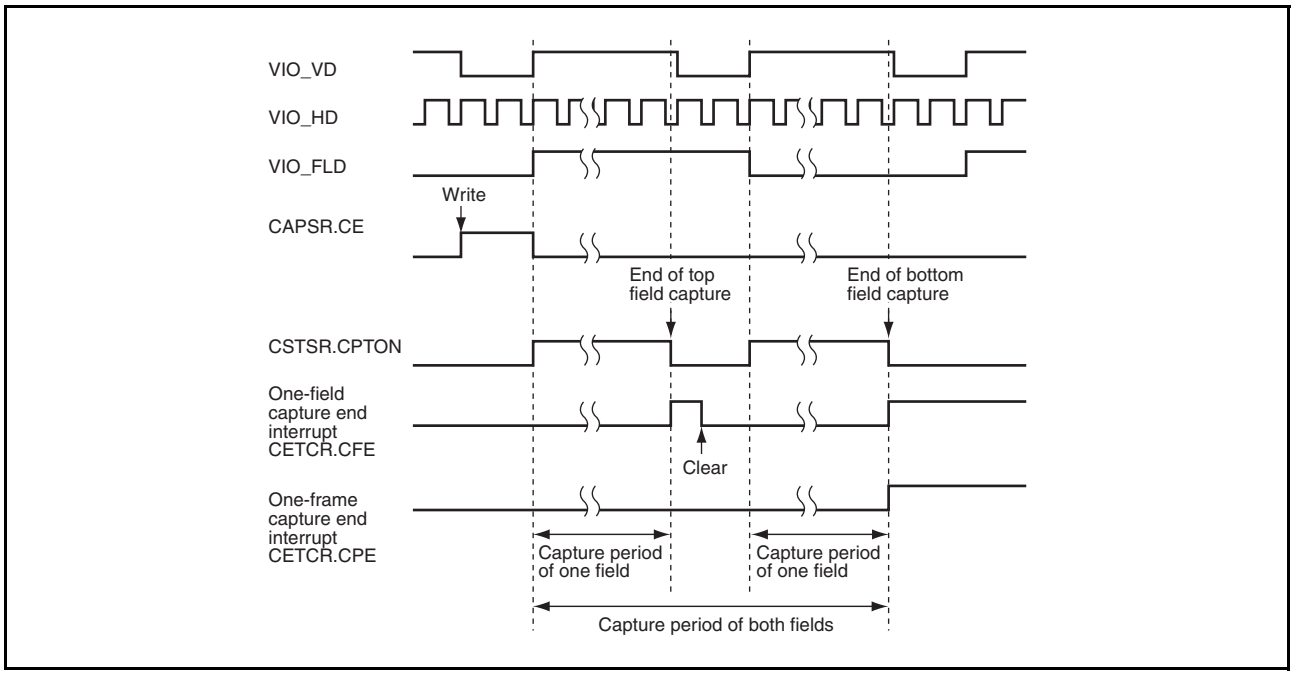

Figure 46.23 One-Frame Capture End Interrupt and One-Field Capture End Interrupt in Both-Field Image Capture

A captured frame image or captured one-field image is stored in the memory from the addresses set in CDAYR and CDACR (Figure 46.24). Captured both-field images are stored in different memory areas depending on whether it is a top-field or bottom-field image. A top-field image is stored in the memory from the addresses set in CDAYR and CDACR whereas a bottom-field image is stored in the memory from the addresses set in CDBYR and CDBCR (Figure 46.25).

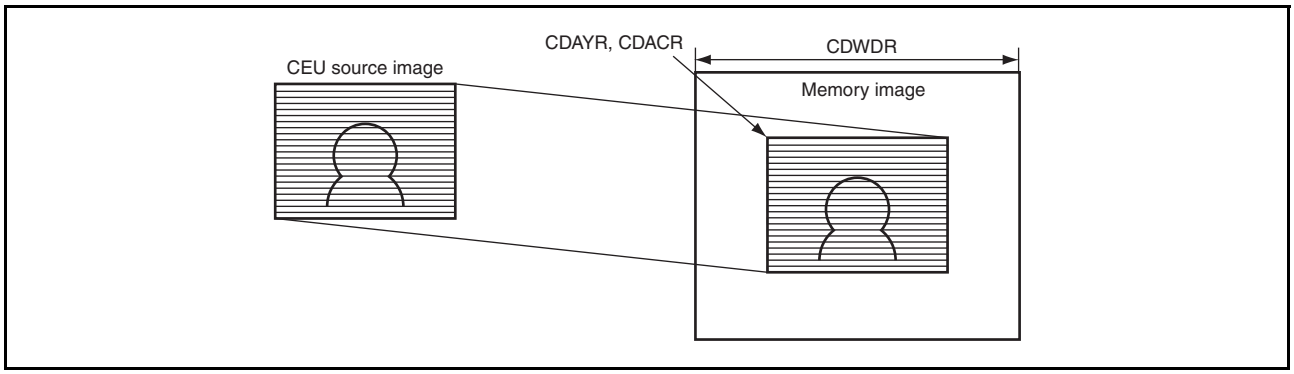

Figure 46.24 Image of Storing Captured Frame Image or Captured One-Field Image in Memory

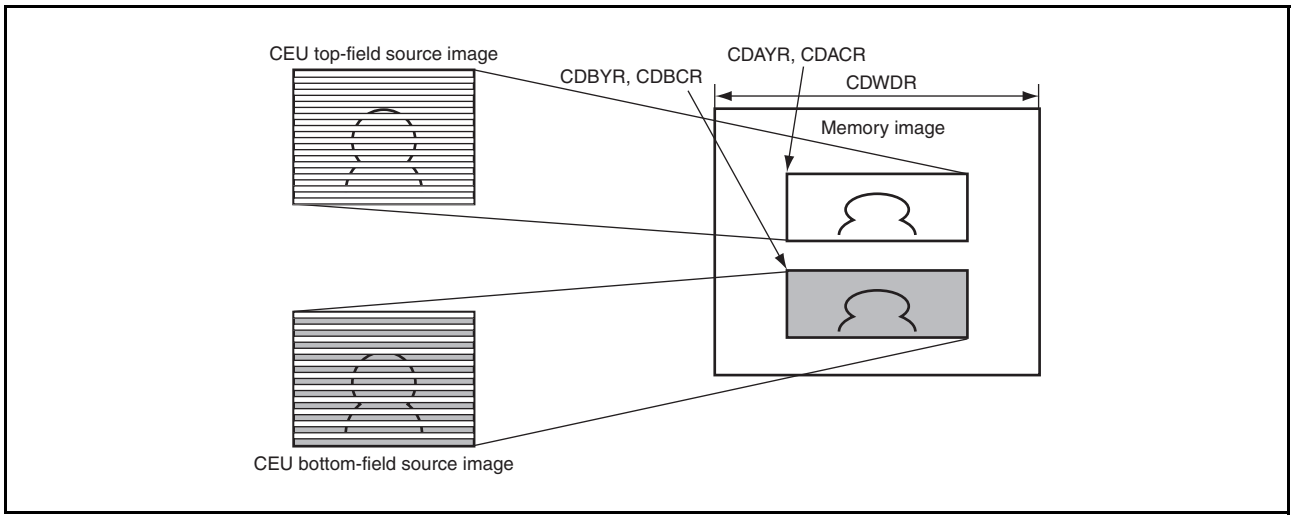

Figure 46.25 Image of Storing Captured Both-Field Images in Memory

If the FCI bits are set to B'00 for continuous capture in interlace input mode, images are continuously captured for 2 VD with the first captured field as the reference in both-field image capture (Figure 46.26). In one-field image capture, only the first captured field is continuously captured for 1 VD (Figure 46.27).

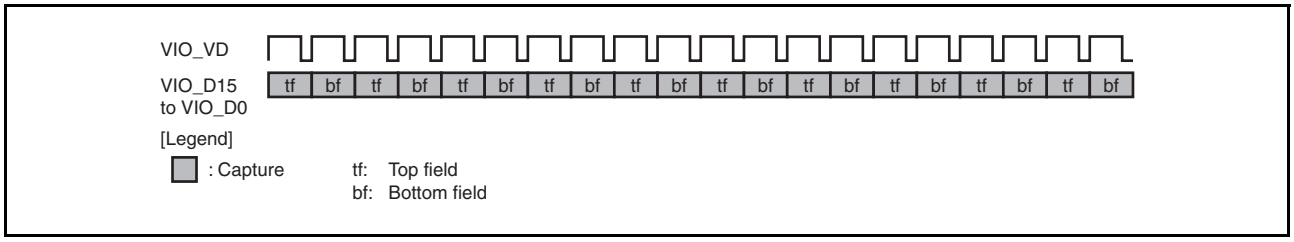

Figure 46.26 Continuous Both-Field Capture in Interlace Mode (Image Immediately after Activation is Top Field (FCI Bits = B'00))

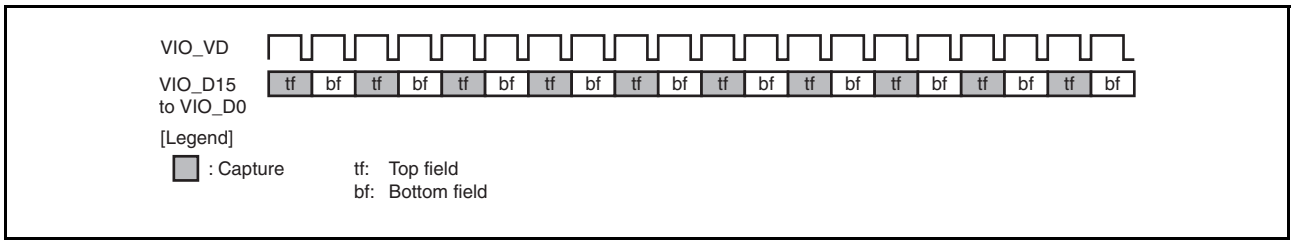

Figure 46.27 Continuous One-Field Capture in Interlace Mode (Image Immediately after Activation is Top Field (FCI Bits = B'00))

(1) Storage of Interlace Input as Frame Image

The CEU can store an interlace source image in the memory as a frame image. To store an interlace source image as a frame image, make the following register settings:

Input mode: Interlace (IFS bit = B'1)
Capture image: Both-field (CIM bit = B'0)
Image to start capture: Any setting other than the prohibited setting (FCI bits = as desired)

Figure 46.28 shows a memory image of capturing both fields of an interlace input and storing it as a frame image in the memory. Set the start addresses of the memory destination for the captured top-field image in CDAYR and CDACR, and the start addresses of the memory destination for the captured bottom-field image in CDBYR and CDBCR. When storing an interlace image as a frame image in the memory, set the horizontal image size of the memory area in CDWDR with the top-field image and bottom-field image placed next to each other as shown in Figure 46.28. In addition, set the number of captured lines of the field image in the VWDTH bits in CAPWR.

A memory image of folding the horizontal image size of the memory area in Figure 46.28 at CDWDR/2 is shown in Figure 46.29. Setting the registers to form the image in Figure 46.28 enables an interlace image to be stored as a frame image in the memory as shown in Figure 46.29.

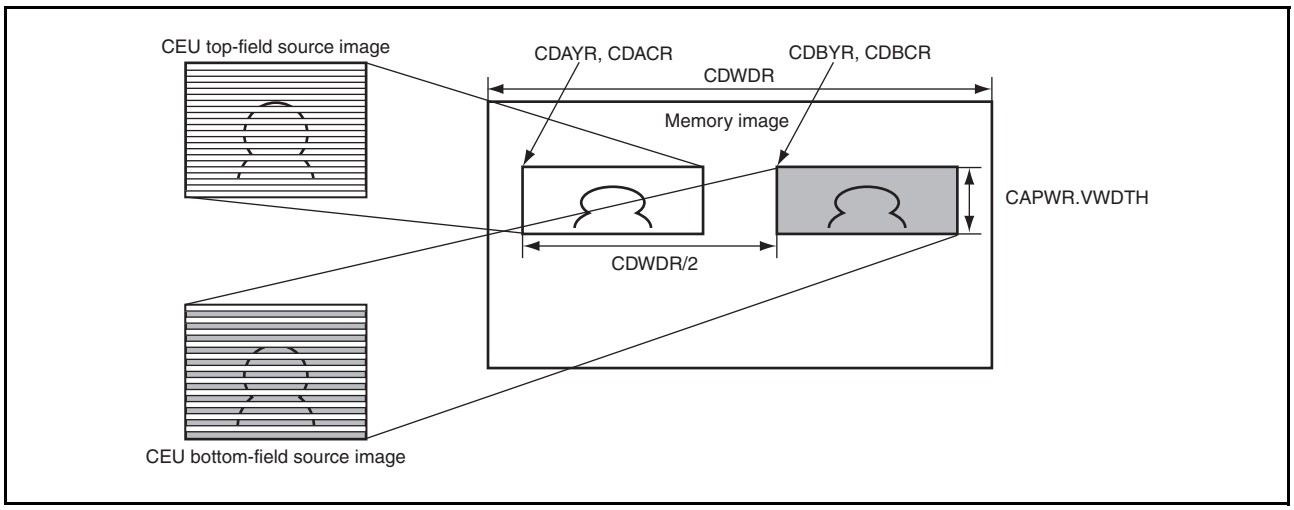

Figure 46.28 Image of Storing Captured Both-Fields of Interlace Input in Memory

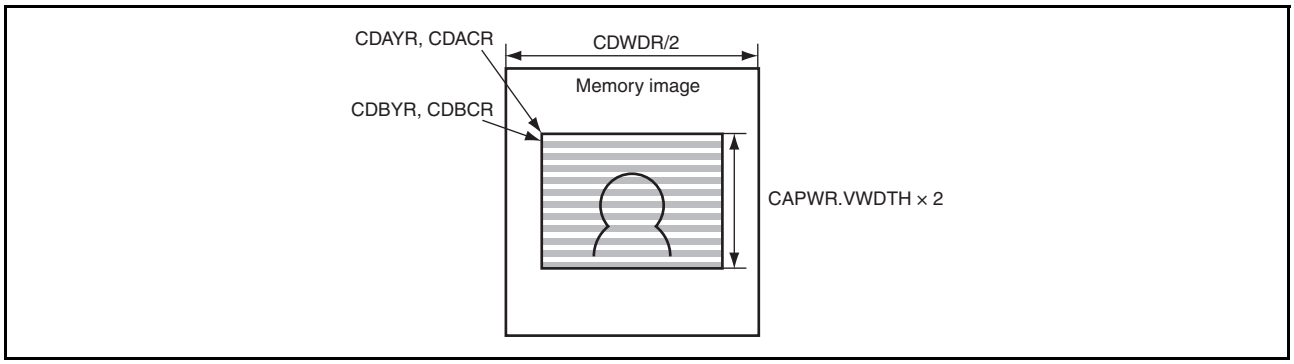

Figure 46.29 Image of Storing Interlace Input as Frame Image in Memory

46.4.8 CEU Register Control Register (CRCNTR)

CRCNTR controls switching of the planes of registers with a 2-plane configuration.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	RVS	0	R/W	Sets the timing to switch the register plane in both-field capture. The setting of this bit is valid only when the RC bit is 1 in both-field capture. 0: Switches the register plane every 2 VD 1: Switches the register plane every 1 VD
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	RS	0	R/W	Specifies which register plane is used by the CEU in synchronization with VD. The setting of this bit is valid only when the RC bit is 0. 0: Uses plane A of the register 1: Uses plane B of the register
0	RC	0	R/W	Specifies switching of the register plane used by the CEU in synchronization with VD. If the register plane is not switched, the register plane specified by the RS bit is used. 0: Uses the specified register plane in synchronization with VD 1: Switches the register plane in synchronization with VD

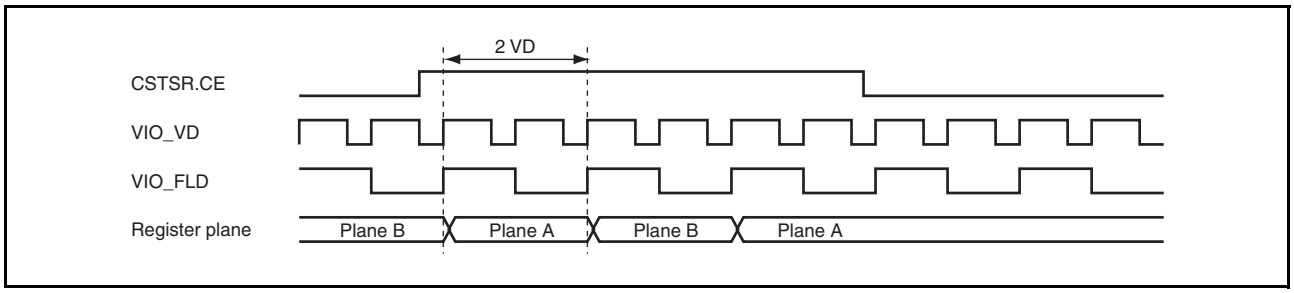

Figure 46.30 Timing for Register Plane Switching when RVS Bit is B'0

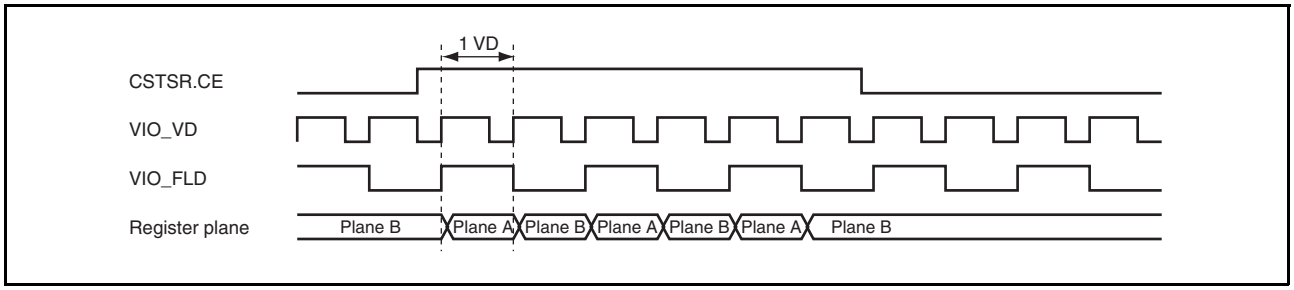

Figure 46.31 Timing for Register Plane Switching when RVS Bit is B'1

46.4.9 CEU Register Forcible Control Register (CRCMPR)

CRCMPR forcibly controls switching of the planes of registers with a 2-plane configuration. Setting this register enables direct control of register plane switching.

Do not modify this register during operation. If this register is modified during operation, correct operation cannot be guaranteed. In addition, the IGRW bit (interrupt source) in CETCR is set to B'1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RA
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	RA	0	R/W	Indicates the register plane currently specified. This register value automatically changes in synchronization with VD for starting capture. To start capture with plane A of the register when a setting to switch the register plane in synchronization with VD has been made (RC bit in CRCNTR is 1), specify plane B of the register using this bit. 0: Specifies plane A of the register 1: Specifies plane B of the register

46.4.10 Capture Filter Control Register (CFLCR)

CFLCR sets the scale-down factor for the filter to scale images down.

The CEU has an image scale-down filter which can be used to scale down the captured images before storing them in the memory. Set CFLCR to 0 when not performing scale-down (same size output). If a value other than 0 is set in CFLCR, scale-down is performed. In data fetch mode, set CFLCR to 0.

When handling an interlace source image as a frame image, set CFLCR to 0 not to use the filter.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	VMANT[3:0]				VFRAC[11:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	VMANT[3:0]	H'0	R/W	Mantissa Part of Vertical Scale-Down Factor The specifiable range is H'0 to H'F. When H'0 is set for the VMANT bits and H'000 is set for the VFRAC bits, the scale-down filter is not used.
27 to 19 18 to 16	VFRAC[11:3] VFRAC[2:0]	H'000	R/W R	Fraction Part of Vertical Scale-Down Factor The specifiable range is H'000 to H'FF8. The fraction of the scale-down factor that cannot be set with only the VMANT bits must be set with these bits.
15 to 12	HMANT[3:0]	H'0	R/W	Mantissa Part of Horizontal Scale-Down Factor The specifiable range is H'0 to H'F. When H'0 is set for the HMANT bits and H'000 is set for the HFRAC bits, the scale-down filter is not used.
11 to 3 2 to 0	HFRAC[11:3] HFRAC[2:0]	H'000	R/W R	Fraction Part of Horizontal Scale-Down Factor The specifiable range is H'000 to H'FF8. The fraction of the scale-down factor that cannot be set with only the HMANT bits must be specified with these bits.

An image scale-down filter is installed in the CEU, and the captured images can be scaled down and stored in the memory.

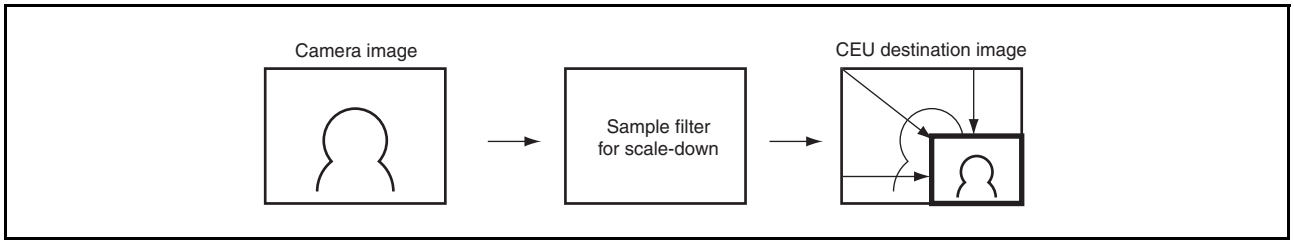

Figure 46.32 Scale-Down of Captured Image

The formulas for obtaining the MANT (VMANT or HMANT) and FRAC (VFRAC or HFRAC) values from the input pixel count and output pixel count of the filter are shown below. Set the MANT and FRAC bits in order to obtain the desired output pixel count from the number of pixels input to the CEU.

First, calculate preliminary MANT and FRAC values. The parameters needed for calculation are defined as follows:

$$\alpha = MANT \times 4096 + FRAC \quad \text{. . . Formula 1}$$

$$SCL \text{ (scaling factor)} = \frac{4096}{\alpha} \quad \text{. . . Formula 2}$$

Assuming an operator $\lfloor x \rfloor$ which discards fractions of an integer x, the MANT and FRAC values can be temporarily set as follows, according to formula 1 and formula 2.

$$MANT = \left\lfloor \frac{1}{SCL} \right\rfloor, \quad FRAC = \left\lfloor 512 \times \left(\frac{1}{SCL} - MANT \right) \right\rfloor \times 8$$

Here, the scaled-down filter output size ($SIZE_D$) can be calculated using the input image size S_{in} (8-bit interface: half of the CAPWR setting, 16-bit interface: CAPWR setting) in the following formula.

$$SIZE_D = \left\lfloor 1 + \left(\left\lfloor \frac{1}{2} + \frac{S_{in} - 1}{MANT_{pre}} \right\rfloor - 1 \right) \times \frac{MANT_{pre} \times 4096}{\alpha} \right\rfloor \quad \text{. . . Formula 3}$$

$$\begin{bmatrix} MANT_{pre} = 1 \longrightarrow (0 \le MANT < 2) \\ MANT_{pre} = 2 \longrightarrow (2 \le MANT < 4) \\ MANT_{pre} = 4 \longrightarrow (4 \le MANT < 8) \\ MANT_{pre} = 8 \longrightarrow (8 \le MANT\ ) \end{bmatrix}$$

The number of output pixels can be obtained by substituting the temporarily calculated MANT, FRAC, and input image size into these formulas. If the calculated number of output pixels is smaller than the number of output pixels used to obtain the preliminary MANT and FRAC values, recalculate with a smaller FRAC (α) value, and set the MANT and FRAC values in this register so that a pixel value greater than the desired number of output pixels can be obtained.

Example: Scale down 640 pixels to 480 pixels

SCL = 480/640 = 3/4, and the preliminary settings of MANT = 1, $MANT_{pre}$ = 1, and FRAC = H'550 are made. Substituting these in the following formula results in an output pixel count of 479.

$$SIZE_D = \left\lfloor 1 + \left(\left\lfloor \frac{1}{2} + \frac{S_{in} - 1}{MANT_{pre}} \right\rfloor - 1 \right) \times \frac{MANT_{pre} \times 4096}{\alpha} \right\rfloor \quad \text{. . . Formula 3}$$

Since this output pixel count is smaller than the desired output pixel count of 480, the formula is recalculated with a FRAC value of H'548, a value eight less than the previous time. The obtained result of output pixel count = 480 is equal to the desired output pixel count of 480, so this register is set as MANT = 1 and FRAC = H'548.

Table 46.8 Setting Examples for Each Scale-Down Filter Factor

Scale-Down Factor	FRAC		MANT	Input Pixel Count	Output Pixel Count	Clipping Size (CFSZR)
	Decimal	Hexadecimal				
7/8	576	H'240	1	640	560	560
3/4	1352	H'548	1	640	480	480
5/8	2448	H'990	1	640	400	400
1/2	0	H'0	2	640	320	320
3/8	2728	H'AA8	2	640	240	240
1/3	0.0	H'0	3	640	213	212
1/4	0.0	H'0	4	640	160	160
1/5	0.0	H'0	5	640	128	128
1/6	0.0	H'0	6	640	107	104
1/7	0.0	H'0	7	640	91	88
1/8	0.0	H'0	8	640	80	80
1/16	4088	H'FF8	15	640	40	40

Note: This scale-down filter uses a VGA-size line memory for scale-down. Therefore, when an image larger than the VGA size is input for scale-down, settings must be made so that the output image size is equal to or larger than the SubQCIF size and equal to or smaller than the VGA size. When an image is not scaled down (same size output), this restriction does not apply.

46.4.11 Capture Filter Size Clip Register (CFSZR)

CFSZR sets the clipping size for fine adjustment of the image size output from the filter, and must be set in combination with CFLCR. When clipping the output size of the filter, set the clipping size as a number of pixels, and the setting unit should be four pixels. CFSZR must be set even when scale-down is not performed (same size output).

In data synchronous fetch mode, set CFSZR according to the setting of CAPWR.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 18 17, 16	VFCLP[11:2] VFCLP[1:0]	H'000	R/W R	These bits set the vertical clipping value of the filter output size (4-pixel units).
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 2 1, 0	HFCLP[11:2] HFCLP[1:0]	H'000	R/W R	These bits specify the horizontal clipping value of the filter output size (4-pixel units).

The scale-down filter in the CEU may output an odd number of pixels or lines depending on the settings. To adjust the output size of the filter, the CEU clips the destination image by using the number of pixels specified in CFSZR, as shown in Figure 46.33. The clipping size must be specified vertically and horizontally in 4-pixel units.

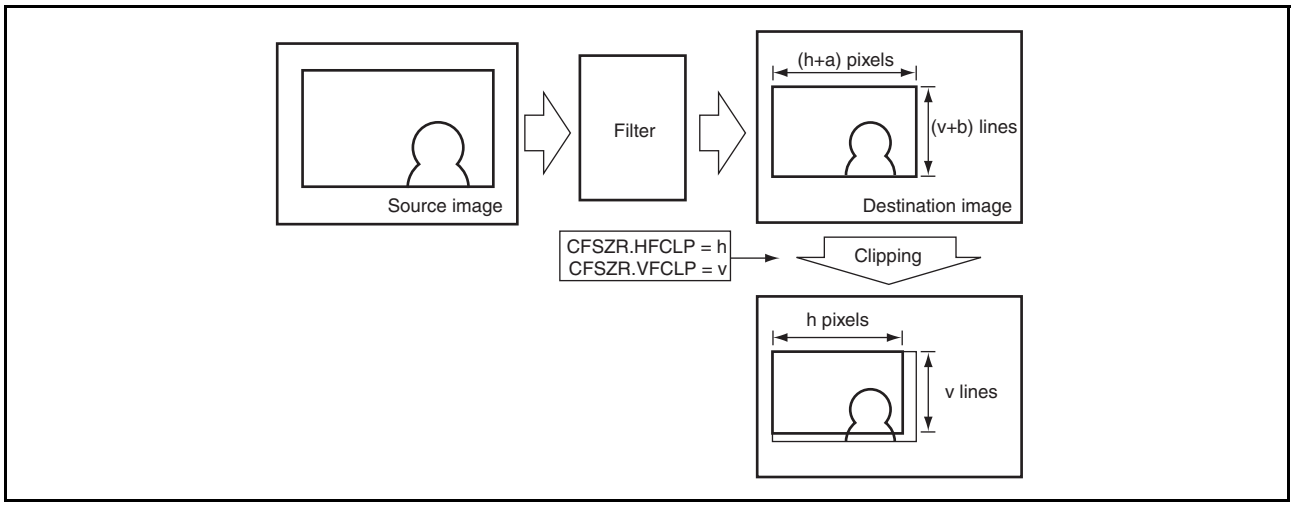

Figure 46.33 Clipping of Image Output from Filter

The pixels to be clipped are counted from the top-left corner of a display. The pixels located to the right of the specified number of pixels or below the specified number of lines are discarded by the clipping function. If the number of pixels specified in CFSZR is larger than that output from the filter, correct operation cannot be guaranteed. To avoid this, the clipping size specified in CFSZR must be equal to or smaller than the number of pixels output from the filter.

Note: In data synchronous fetch mode, the following settings are required. Data cannot be fetched correctly unless the following settings are made.
8-bit interface: VFCLP = CAPWR.VWDTH
HFCLP = CAPWR.HWDTH/2
16-bit interface: VFCLP = CAPWR.VWDTH
HFCLP = CAPWR.HWDTH

46.4.12 Capture Destination Width Register (CDWDR)

CDWDR sets the horizontal image size in the memory area where the captured image is to be output in 4-byte units (4-pixel units).

In data synchronous fetch mode, set CDWDR according to the setting of CAPWR.

This register is not used, during data enable fetch mode.

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 2 1, 0	CHDW[12:2] CHDW[1:0]	H'0000	R/W R	These bits specify the horizontal image size in the memory area where the captured image is to be stored (4-byte units). The image data captured by the CEU is stored in the memory. If the right end of the captured image does not match the horizontal image size in the memory area as shown in Figure 46.34, some addresses must be skipped at the right end of the image when storing the captured image. Therefore, the horizontal image size in the memory area where the captured image is to be stored must be set in these bits. The maximum value to be set is 8188 bytes (8188 pixels). In data synchronous fetch mode, set as follows: 8-bit interface: CHDW = CAPWR.HWDTH 16-bit interface: CHDW = CAPWR.HWDTH × 2

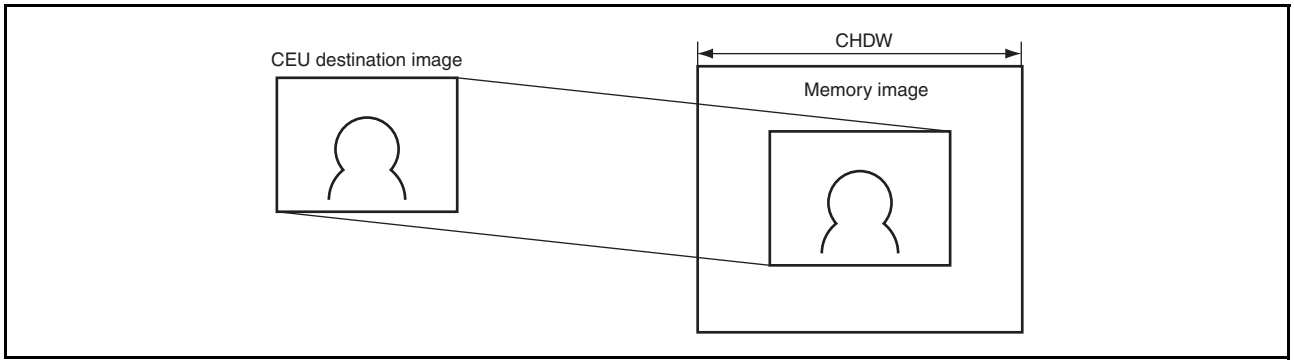

Figure 46.34 Captured Image and Memory Area Image

46.4.13 Capture Data Address Y Register (CDAYR)

CDAYR specifies the address where the luminance (Y) component of the captured data is to be stored in frame image capture or one-field image capture, the address where the luminance (Y) component of the captured top field is to be stored in both-field image capture, and the address where the fetched data is to be stored in data fetch. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. In frame image capture or one-field image capture, set the start address of the memory area where the Y (luminance) component of the captured data is to be stored by CDAYR. In both-field image capture, set the start address of the memory area where the Y (luminance) component of the captured top-field image is to be stored by CDAYR. In data fetch, set the start address of the memory area where data is to be stored by CDAYR.

Because the address must be specified in 32 bits, the address set by CDAYR must be in longword units. As the setting is in 4-pixel units for image capture and 4-byte units for data fetch, the lower two bits are always fixed to 0.

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	CAYR[31:2]	H'0000 0000	R/W	• Frame image capture: These bits set the address for storing the Y (luminance) component data of the captured data (4-pixel units). • One-field image capture: These bits set the address for storing the Y (luminance) component data of the captured data (4-pixel units). • Both-field image capture: These bits set the address for storing the Y (luminance) component data of the captured top-field data (4-pixel units). • Data fetch: These bits set the address for storing data (4-byte units). • Data enable fetch bundle write: These bits set the address for storing data (32-byte units).
1, 0	CAYR[1:0]		R	

Set the address of the starting point of the memory area where the fetched data is to be stored in this register, as shown in Figure 46.35.

- Frame image capture: Set the address of the starting point of the memory area where the Y component of the captured image is to be stored.
- One-field image capture: Set the address of the starting point of the memory area where the Y component of the captured image is to be stored.
- Both-field image capture: Set the address of the starting point of the memory area where the Y component of the captured top-field image is to be stored.
- Data fetch: Set the address of the starting point of the memory area where the fetched data is to be stored. In data fetch mode, the data is simply stuffed in order from the start address so the end address becomes as follows:

  End address = CDAYR + number of fetched bytes

- Data enable fetch bundle write: Set the address in 32-byte units.

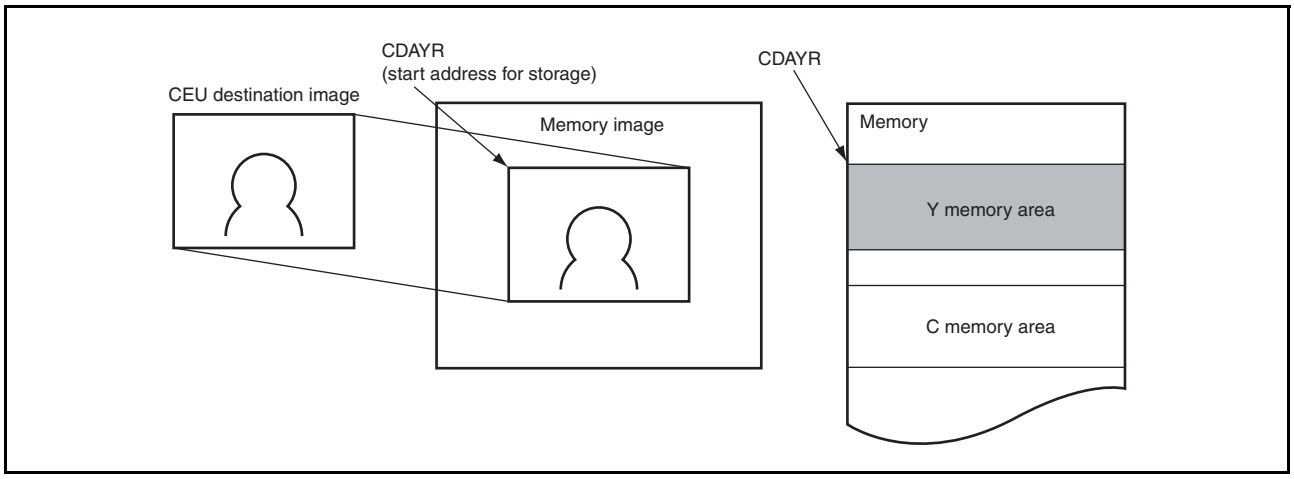

Figure 46.35 Relationship between Captured Image and Y Component Memory Area

46.4.14 Capture Data Address C Register (CDACR)

CDACR specifies the address where the chrominance (C) component of the captured data is to be stored in frame image capture or one-field image capture, and the address where the chrominance (C) component of the captured top field is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. In frame image capture or one-field image capture, set the start address of the memory area where the C (chrominance) component of the captured data is to be stored by CDACR. In both-field image capture, set the start address of the memory area where the C (chrominance) component of the captured top-field image is to be stored by CDACR. CDACR is not used in data fetch.

Because the address must be specified in 32 bits, the address set by CDACR must be in longword units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

31 to 2	CACR[31:2]	H'0000 0000	R/W	• Frame image capture: These bits set the address for storing the C (chrominance) component data of the captured data (4-pixel units). • One-field image capture: These bits set the address for storing the C (chrominance) component data of the captured data (4-pixel units). • Both-field image capture: These bits set the address for storing the C (chrominance) component data of the captured top-field data (4-pixel units).
1, 0	CACR[1:0]		R	

Set the address of the starting point of the memory area where the C component of the captured image is to be stored in this register, as shown in Figure 46.36. The C component has an output data format like that in Figure 46.37, and is

saved in the memory in this format.

- Frame image capture: Set the address of the starting point of the memory area where the C component of the captured image is to be stored.
- One-field image capture: Set the address of the starting point of the memory area where the C component of the captured image is to be stored.
- Both-field image capture: Set the address of the starting point of the memory area where the C component of the captured top-field image is to be stored.

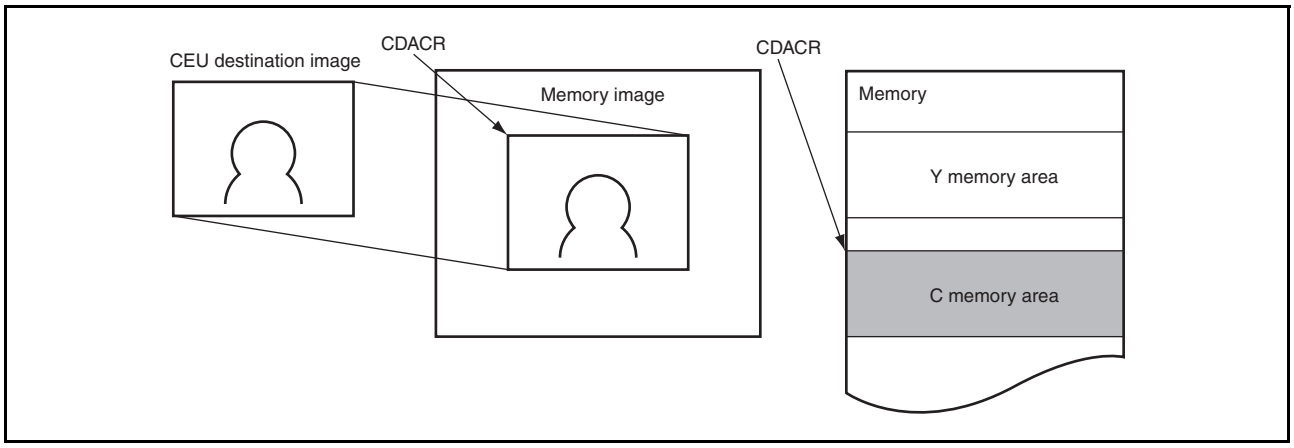

Figure 46.36 Relationship between Captured Image and C Component Memory Area

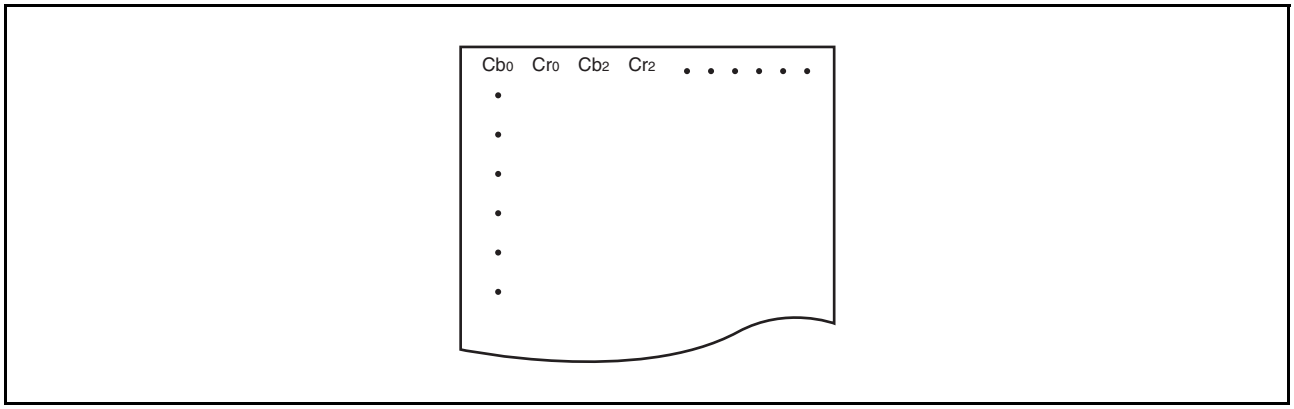

Figure 46.37 Image of Storing C Components in Memory

46.4.15 Capture Data Bottom-Field Address Y Register (CDBYR)

CDBYR specifies the address where the luminance (Y) component of the captured bottom-field data is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. Set the start address of the memory area where the Y (luminance) component of the captured bottom-field image is to be stored by CDBYR. CDBYR is not used in frame image capture, one-field image capture, or data fetch.

Because the address must be specified in 32 bits, the address set by CDBYR must be in longword units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

Set the address of the starting point of the memory area where the Y component of the captured bottom-field image is to be stored in this register, as shown in Figure 46.38.

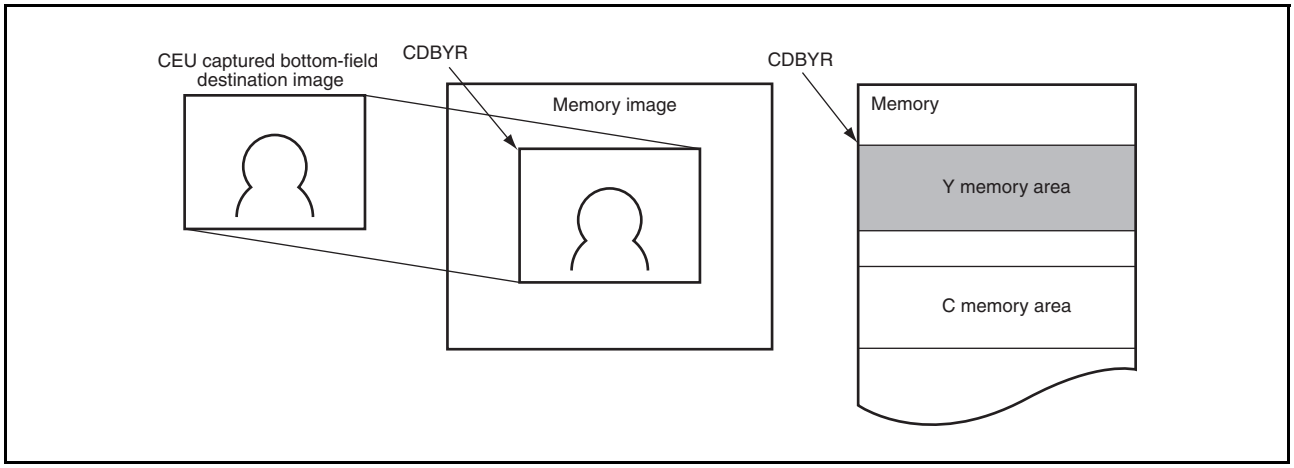

Figure 46.38 Relationship between Captured Bottom-Field Image and Y Component Memory Area

46.4.16 Capture Data Bottom-Field Address C Register (CDBCR)

CDBCR specifies the address where the chrominance (C) component of the captured bottom-field data is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. Set the start address of the memory area where the C (chrominance) component of the captured bottom-field image is to be stored by CDBCR. CDBCR is not used in frame image capture, one-field image capture, or data fetch.

Because the address must be specified in 32 bits, the address set by CDBCR must be in longword units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

1, 0	CBCR[1:0]		R	

Set the address of the starting point of the memory area where the C component of the captured bottom-field image is to be stored in this register, as shown in Figure 46.39. The C component has an output data format like that in Figure 46.40, and is saved in the memory in this format.

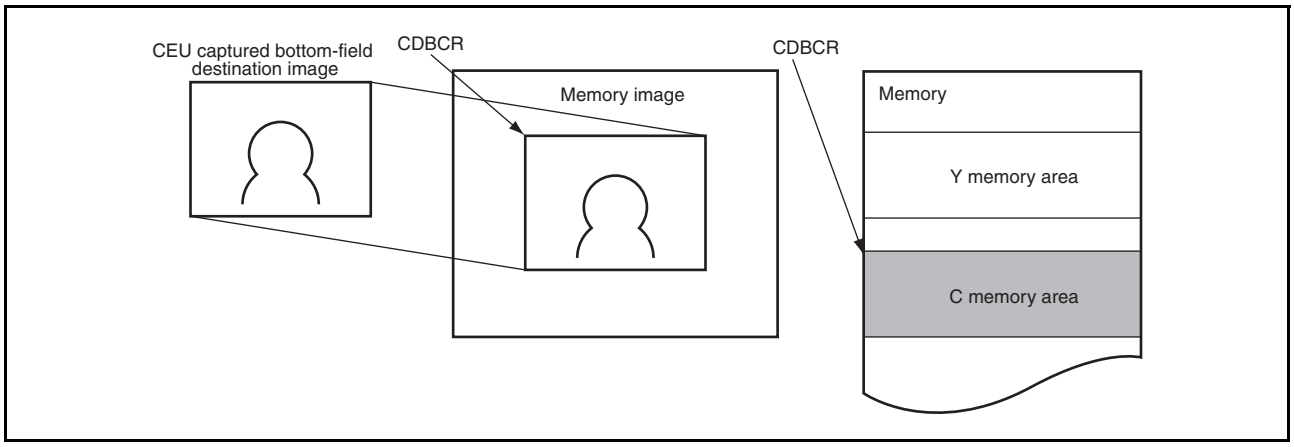

Figure 46.39 Relationship between Captured Bottom-Field Image and C Component Memory Area

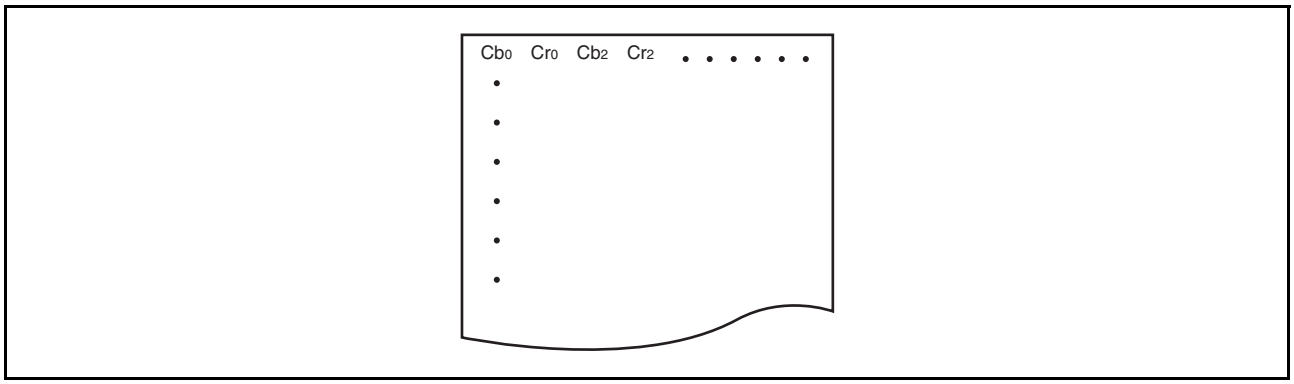

Figure 46.40 Image of Storing C Components in Memory

46.4.17 Capture Bundle Destination Size Register (CBDSR)

CBDSR sets the size of output to memory in a bundle write. The number of output lines should be specified for image capture or data synchronous fetch. The number of bytes should be specified for data enable fetch.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	CBVS[22:16]

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	CBVS[22:3] CBVS[2:0]	H'000	R/W R	These bits select the number of lines or number of bytes for output to the memory in a bundle write. Image capture and data synchronous fetch: Number of lines for output to the memory in a bundle write. Unit: 8 lines, min.: 8 lines, max.: 1,920 lines (H'780) Data enable fetch: Number of bytes for output to the memory in a bundle write. Unit: 32 bytes, min.: 512 bytes, max.: 6291456 lines (H'600000)

(a) Image capture and data synchronous fetch

Set the number of lines of captured data to be written to the memory by a bundle write as a multiple of eight. This register is valid only when the CBE bit in CDOCR is 1. When the CBE bit in CDOCR is 1 and this register cleared to H'0, this module operates with the number of lines of captured data to be written to the memory as eight. The maximum number of lines that can be set is 1,920 (H'780). Only bits CBVS[11:3] are valid.

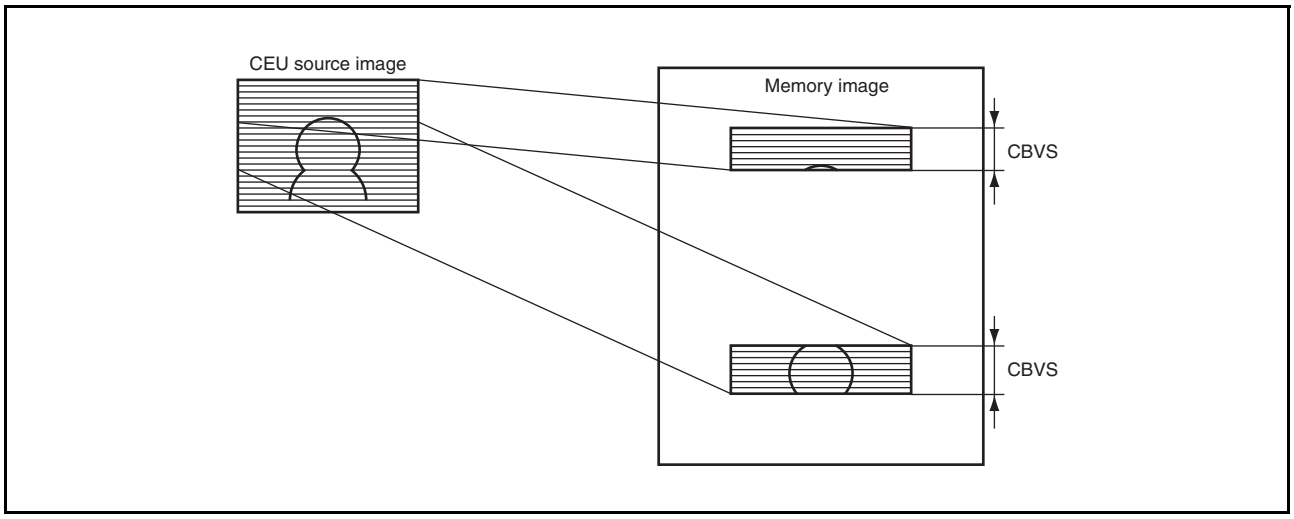

Figure 46.41 Image of Storing Captured Image in Memory by Bundle Write

(b) Data enable fetch

Set the number of bytes of captured data to be written to the memory by a bundle write as a multiple of 32. This register is valid only when the CBE bit in CDOCR is 1. The minimum settable size is 512 bytes. When a number smaller than 512 bytes is specified, operation is not guaranteed.

46.4.18 Capture Low-Pass Filter Control Register (CLFCR)

CLFCR specifies whether or not to operate the low-pass filter. In data fetch mode, clear the LPF bit to B'0.

The characteristic of the low-pass filter installed in the CEU causes the phase location of the image processed by the low-pass filter to be shifted right by one pixel compared to the raw image.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	LPF	0	R/W	Enables or disables operation of the low-pass filter. The low-pass filter removes high-frequency components from the destination image in the horizontal direction. Clear this bit to 0 in data fetch mode. 0: Low-pass filter not used 1: Low-pass filter used (only in the horizontal direction)

46.4.19 Firewall Operation Control Register (CFWCR)

CFWCR specifies the upper limit of the write addresses in data enable fetch. When the VD input from an external module dose not go low and end notification is not given, this register can prevent writing to memory from being out of control.

This register is enabled only in data enable fetch.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
16	CBE	0	R/W	Controls the number of lines of captured data to be written to the memory. • Image capture This bit controls the number of lines of captured data to be written to the memory. When bundle write is set by this register, captured data is written in line units specified by CBDSR to the addresses specified by CDAYR and CDACR, and CDAYR2 and CDACR2 (CDBYR and CDBCR, and CDBYR2 and CDBCR2 for the bottom field in both-field capture) alternately (Figure 46.42). When captured data has been written for the number of lines set by CBDSR, a write end interrupt corresponding to each address setting register occurs. However, after write for one-frame (one-field) capture ends, a bundle write end interrupt does not occur even when bundle write has finished.
16	CBE	0	R/W	• Data synchronous fetch This bit controls the number of lines of captured data to be written to the memory. When bundle write is set by this register, captured data is written in line units specified by CBDSR to the addresses specified by CDAYR and CDAYR2 alternately. When captured data has been written for the number of lines set by CBDSR, a write end interrupt corresponding to each address setting register occurs. However, after write for one-frame capture ends, a bundle write end interrupt does not occur even when bundle write has finished. • Data enable fetch This bit controls the number of bytes of captured data to be written to the memory. When bundle write is set by this register, captured data is written in byte units specified by CBDSR to the addresses specified by CDAYR and CDAYR2 alternately. When captured data has been written for the number of bytes set by CBDSR, a write end interrupt corresponding to each address setting register occurs. Also, only in data enable fetch, a bundle write end interrupt occurs when bundle write has finished after write for one-frame capture ends. Table 46.9 shows the correspondence between address setting registers and write end interrupt sources. Figure 46.43 shows the timing of write end interrupts in image capture and data synchronous fetch. Figure 46.44 shows the timing of write end interrupts in data enable fetch. 0: Normal write 1: Bundle write
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	CDS	0	R/W	Sets the image format when outputting the image data captured in the YCbCr422 format to the memory. When 0 is written to this bit, only the luminance component (Y) is output and no chrominance components (Cb and Cr) are output for the odd-numbered lines. With an interlace source image, similarly only the luminance component (Y) is output and no chrominance components (Cb and Cr) are output for the odd-numbered lines of the field. In data fetch mode, set this bit to 1. 0: Converts the YCbCr422 format to the YCbCr420 format before outputting data to the memory 1: Outputs data in the YCbCr422 format to the memory without conversion
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2	COLS	0	R/W	Controls swapping in 32-bit units for data output from the CEU. 0: Data is not swapped in 32-bit units 1: Data is swapped in 32-bit units
1	COWS	0	R/W	Controls swapping in 16-bit units for data output from the CEU. 0: Data is not swapped in 16-bit units 1: Data is swapped in 16-bit units
0	COBS	0	R/W	Controls swapping in 8-bit units for data output from the CEU. 0: Data is not swapped in 8-bit units 1: Data is swapped in 8-bit units

Address Setting Registers	Bundle Write End Interrupt Source
CDAYR, CDACR	CPBE1 bit in CETCR
CDAYR2, CDACR2	CPBE2 bit in CETCR
CDBYR, CDBCR	CPBE3 bit in CETCR
CDBYR2, CDBCR2	CPBE4 bit in CETCR

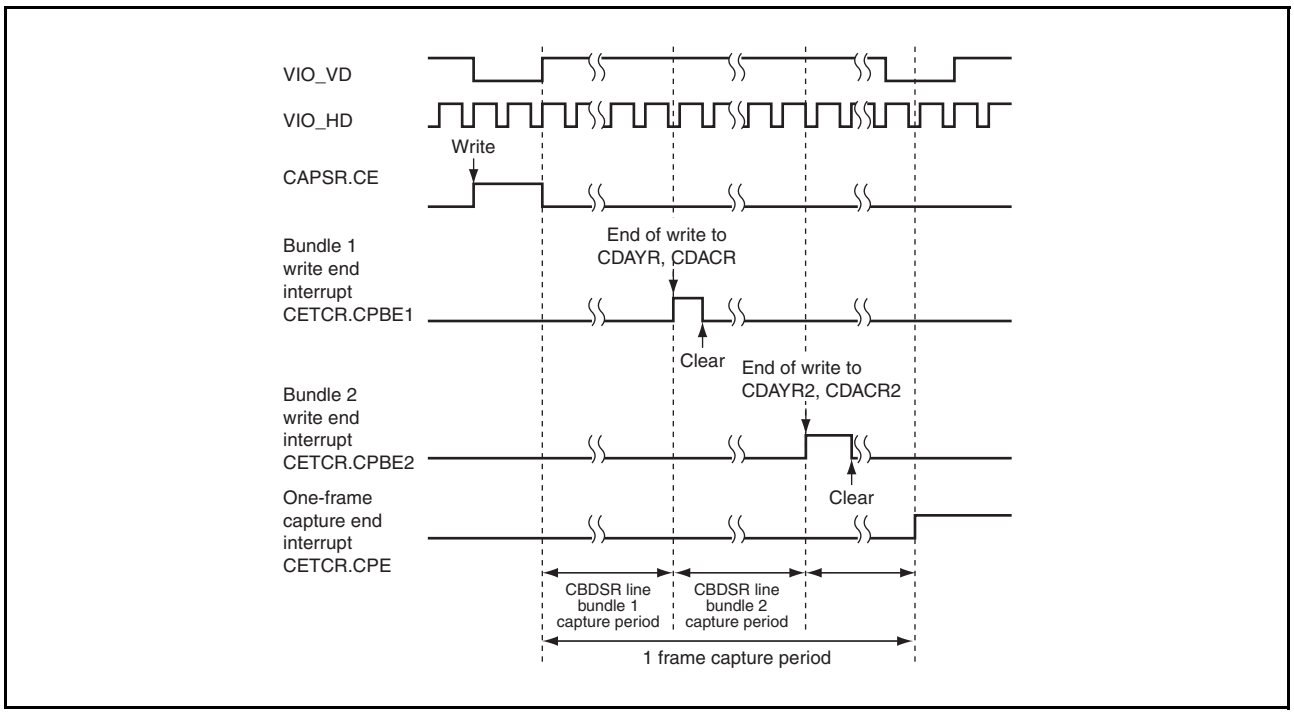

Figure 46.43 Timing of Write End Interrupts (Image Capture, Data Synchronous Fetch)

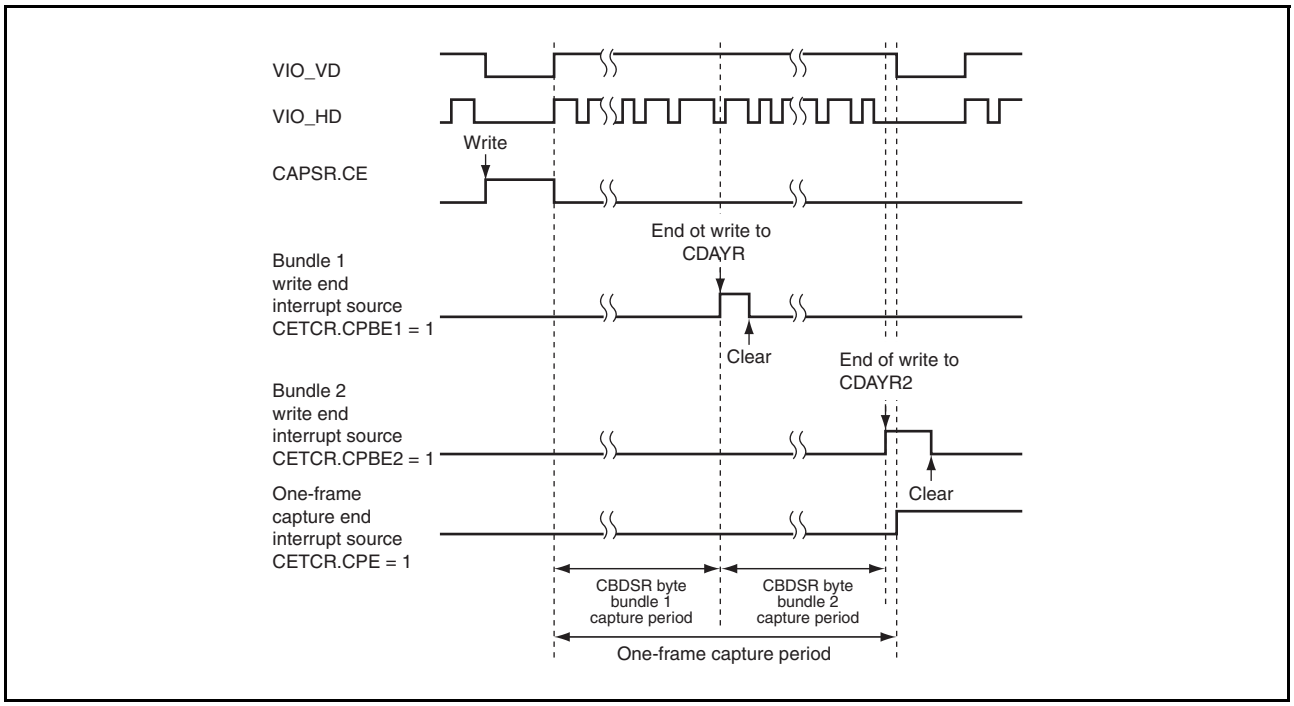

Figure 46.44 Timing of Write End Interrupts (Data Enable Fetch)

For data output from the CEU, the COLS, COWS, and COBS bits control swapping in 32-bit, 16-bit, and 8-bit units, respectively. Set these bits when data is misaligned because of a difference in endian. The data swapping bits are shown below. These bits can be set similarly in data fetch mode.

Data can be swapped in 8-bit, 16-bit, 32-bit units, or in 32 bits, 16 bits and 8 bits, as shown in Figure 46.45. To enable data swapping, set the corresponding control bit to B'1.

46.4.22 Capture Event Flag Clear Register (CETCR)

CETCR notifies the CPU of the source of an interrupt that is generated in the CEU. The flags of CETCR can be used as interrupt signals. When the corresponding interrupt is enabled, an interrupt is generated. To clear the interrupt, clear the bit corresponding to the interrupt source to 0. After several cycles have passed after modifying the bit, the interrupt is cleared.

To clear the bit corresponding to the interrupt source to be cleared to 0 and retain that state, write 1 to that bit. For example, to clear only the CPE bit to 0, write H'FFFF FFFE to CETCR.

In CETCR, only bits to which 0 is written are cleared. Bits to which 1 is written retain their current values. To clear an interrupt source, write 0 only to the bit corresponding to the interrupt source to be cleared, and 1 to the other bits.

Note: Since the CETCR value becomes undefined in the following cases, clear all bits in CETCR to 0.

- VD and HD bits immediately after power-on reset or the deep-standby mode is entered
- All bits after the software standby or module standby mode is entered
- VD and HD bits after the polarities of the capture interface sync signals are changed

R/W:	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25	NVD	0	R/W	This bit is used for an interrupt indicating that no VD was input. A non-VD interrupt occurs when the 14-bit internal counter becomes full. Accordingly, this bit is set to 1 when no VD has been input for at least 16,383 lines since the last VD was input.

Bit	Bit Name	Initial Value	R/W	Description
24	NHD	0	R/W	This bit is used for an interrupt indicating that no HD was input. The timing for a non-HD interrupt to occur differs depending on the bit width of the digital image input pins. 8-bit digital image input pins: Occurs when the 11-bit internal counter that is incremented every eight cycles becomes full. Accordingly, this bit is set to 1 when no HD has been input for at least 16,376 cycles since the last HD was input. 16-bit digital image input pins: Occurs when the 12-bit internal counter that is incremented every four cycles becomes full. Accordingly, this bit is set to 1 when no HD has been input for at least 16,380 cycles since the last HD was input. When connecting a camera whose HD is fixed low when VD is low, this bit may be set to 1. Ignore this interrupt during data enable fetch.
23	FWF	0	R/W	The interrupt is generated when data is written to the address that exceeds the value specified with CFWCR.FMV. This bit is set to 1 when data is written to the address that exceeds the value specified with CFWCR.FMV while CFWCR.FWE = 1.
22, 21	—	0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	VBP	0	R/W	This bit is used for an interrupt indicating that VD has been input while the CEU holds data (insufficient vertical-sync front porch). The conditions for a VBP interrupt to occur are as follows: • Condition 1 VD is input when there is captured data within the CEU • Condition 2 The last transfer data cannot be internally detected due to a write buffer overflow or an illegal HD so that the end timing is unclear until the next VD (By generating a VBP interrupt at the VD input timing, capture fail can be announced.) When a VBP interrupt occurs, a capture end interrupt (CPE bit in CETCR) does not occur and the image of that frame is not captured correctly. Though a capture end interrupt (CPE bit) will occur on rare occasions, it should be ignored in this case. Capturing cannot be performed until the next VD (even if the CE bit (capture reservation signal) in CAPSR is 1, capturing does not start). In the case of condition 2, instead of waiting for a VBP interrupt to occur, execute a software reset (CPKIL bit in CAPSR) to stop capturing and then restart capturing. In this case, since capture operation is terminated without waiting for the next VD, a VBP interrupt does not occur and capturing can be performed from the next VD.
19	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
18	IGVS	0	R/W	This bit is used for an interrupt generated when the number of VD cycles set in CMCYR differ from the number of VD cycles input from an external module. This bit is set to 1 when there is an illegal VD input from an external module. This bit is set to 1 when the number of HD cycles for the VD input to the CEU differs from the value set in the VCYL bits in CMCYR. Note however that when the VCYL bits are cleared to 0, this interrupt does not occur.
17	IGHS	0	R/W	This bit is used for an interrupt generated when the number of HD cycles set in CMCYR differ from the number of HD cycles input from an external module. This bit is set to 1 when there is an illegal HD input from an external module. This bit is set to 1 when the number of clock cycles for the HD input to the CEU differs from the value set in the HCYL bits in CMCYR. Note however that when the HCYL bits are cleared to 0, this interrupt does not occur.
16	CDTOF	0	R/W	This bit is used for an interrupt indicating that data overflowed in the CRAM of the write buffer. Since data is input at realtime from an external module in capture operations, the frame image is overwritten unless the captured data is transferred from the CEU internal buffer to the memory at a certain or higher transfer rate. This bit is set to 1 when writing the data in the CRAM of the CEU internal write buffer to the bus is not performed within time and data has overflowed.

Bit	Bit Name	Initial Value	R/W	Description
15	CPBE4	0	R/W	This bit is used for an interrupt indicating that writing to CDBYR2 and CDBCR2 in a bundle write has finished. This interrupt is output when the last captured data has been transferred and the end notification received, regardless of the next HD input. This bit is set to 1 when data for the number of lines set in CBDSR has been captured and the last data transfer to the bus has completed. However, this interrupt does not occur when the last captured data in a bundle write is the last captured data of a frame (field).
14	CPBE3	0	R/W	This bit is used for an interrupt indicating that writing to CDBYR and CDBCR in a bundle write has finished. This interrupt is output when the last captured data has been transferred and the end notification received, regardless of the next HD input. This bit is set to 1 when data for the number of lines set in CBDSR has been captured and the last data transfer to the bus has completed. However, this interrupt does not occur when the last captured data in a bundle write is the last captured data of a frame (field).
13	CPBE2	0	R/W	This bit is used for an interrupt indicating that writing to CDAYR2 and CDACR2 in a bundle write has finished. This interrupt is output when the last captured data has been transferred and the end notification received, regardless of the next HD input. This bit is set to 1 when data for the number of lines (number of bytes in data enable fetch) set in CBDSR has been captured and the last data transfer to the bus has completed. However, in image capture or data synchronous fetch, this interrupt does not occur when the last captured data in a bundle write is the last captured data of a frame (field).
12	CPBE1	0	R/W	This bit is used for an interrupt indicating that writing to CDAYR and CDACR in a bundle write has finished. This interrupt is output when the last captured data has been transferred and the end notification received, regardless of the next HD input. This bit is set to 1 when data for the number of lines (number of bytes in data enable fetch) set in CBDSR has been captured and the last data transfer to the bus has completed. However, in image capture or data synchronous fetch, this interrupt does not occur when the last captured data in a bundle write is the last captured data of a frame (field).
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	VD	Undefined	R/W	This bit is used for an interrupt indicating that VD (vertical sync signal) was input from an external module. In data enable fetch mode, this bit is set to 1 when a VD input from an external module is detected. In image capture mode and data synchronous fetch mode, this module generates a VD interrupt in response to the first detection of the active level of HD following detection of the active level of VD from an external module. Note that, when VD and HD are asserted and detected at the same time, this module generates a VD interrupt at that time. Immediately after the VDPOL bit in CAMCR is modified, a pseudo VD is input and this bit is set to 1. The VD interrupt after the VDPOL bit is modified should be ignored.
8	HD	Undefined	R/W	This bit is used for an interrupt indicating that HD (horizontal sync signal) was input from an external module. This bit is set to 1 when an HD input from an external module is detected. Immediately after the HDPOL bit in CAMCR is modified, a pseudo HD is input and this bit is set to 1. The HD interrupt after the HDPOL bit is modified should be ignored.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	IGRW	0	R/W	This bit is used for an interrupt indicating that during capturing, access was attempted to a register to which writing during operation is prohibited. Among the CEU registers, writing during capturing is prohibited for some registers. Table 46.10 shows which registers can/cannot be written to during capturing. This bit is set to 1 when a register to which writing during capturing is prohibited has been written to.

Bit	Bit Name	Initial Value	R/W	Description
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	CFE	0	R/W	This bit is used for an interrupt indicating that capturing of one field from an external module has finished. This interrupt is output when the last captured data has been transferred and the end notification received, regardless of the next VD input (see Figure 46.46). This interrupt occurs only in both-field capture mode.
0	CPE	0	R/W	This bit is used for an interrupt indicating that capturing of one frame from an external module has finished. This interrupt is output when the last captured data has been transferred and the end notification received, regardless of the next VD input. This interrupt indicates that capturing of one frame has finished. This bit is set to 1 when the image of the size set in CAPWR is captured and the last data transfer to the bus finished (see Figure 46.47).

46.4.23 Capture Status Register (CSTSR)

CSTSR indicates the internal status of the CEU. CSTSR differs from CETCR in that no interrupt is generated for the events indicated in CSTSR.

The CEU operating/halt state can be confirmed using CSTSR. To confirm the halt state of the CEU, make sure that the status bit (bit 0) indicating that the CEU is operating is cleared to 0 for sure.

	CDSS[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CDSS[31:0]	H'0000 0000	R	Indicate the size of data written to the memory in data enable fetch. In a bundle write, size of data written to the selected address at the end of one-frame capture is indicated. In a bundle write, as soon as the number of bytes specified by CBDSR is transferred to the bus, address to which data is written is switched. Therefore, if one-frame capture is completed at the same time as a bundle write is completed, this register indicates H'0000 0000. Figure 46.49 and Figure 46.50 show the overall timing of the CDSSR operation in a bundle write.

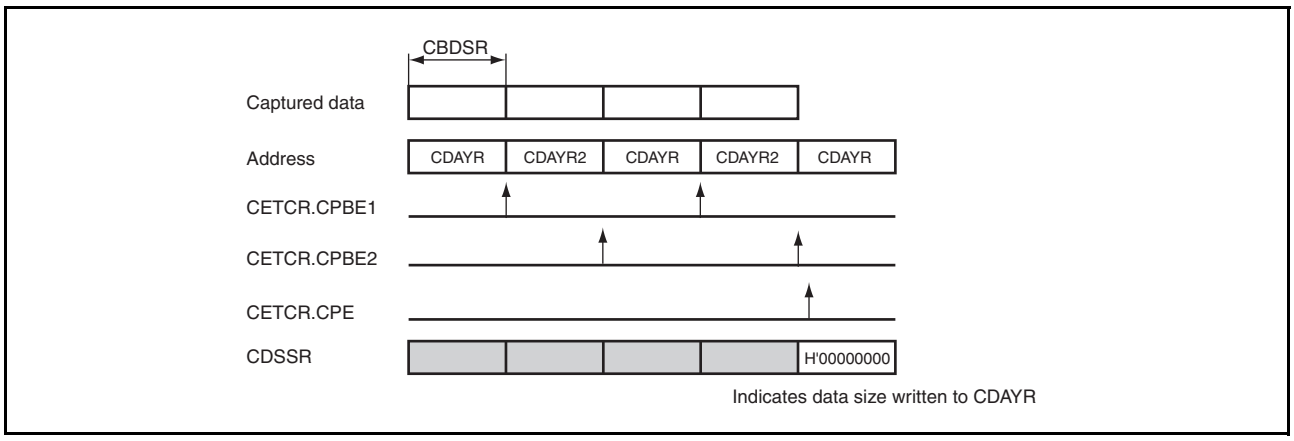

Figure 46.49 Overall Timing of CDSSR Operation in Bundle Write (When Bundle Write End and Capture End Coincide)

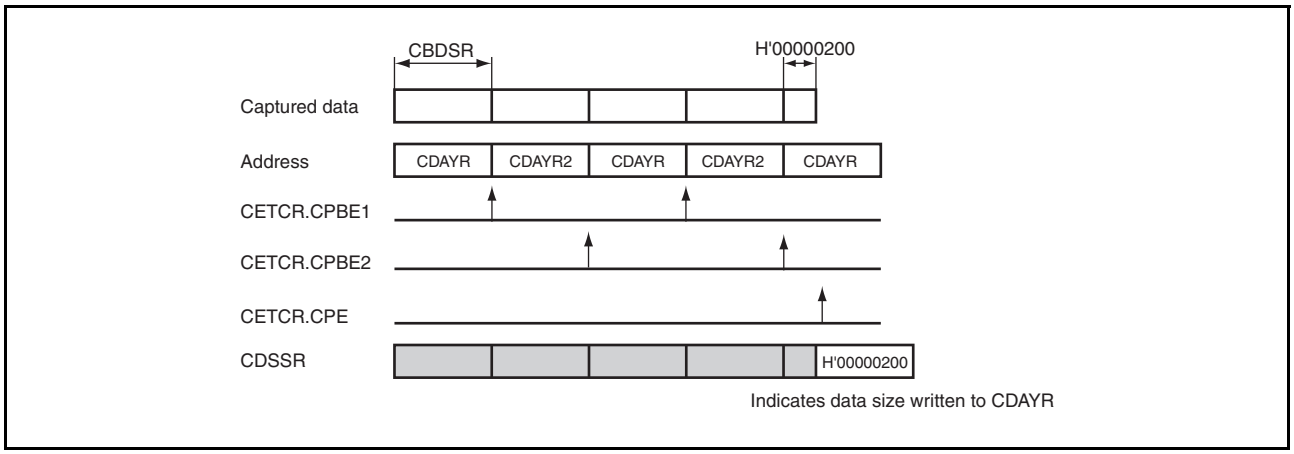

Figure 46.50 Overall Timing of CDSSR Operation in Bundle Write (When Bundle Write End and Capture End Do Not Coincide)

46.4.25 Capture Data Address Y Register 2 (CDAYR2)

CDAYR2 specifies the address for the luminance (Y) component used in a bundle write and the address for data storage in a bundle write in data fetch. CDAYR2 is used only in a bundle write.

CDAYR2 specifies the address where the Y component of the captured data is to be stored in frame image capture or one-field image capture, the address where the Y component of the captured top field is to be stored in both-field image capture, and the address where data is to be stored in data fetch. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. In frame image capture or one-field image capture, set the start address of the memory area where the Y component of the captured data is to be stored by CDAYR2. In both-field image capture, set the start address of the memory area where the Y component of the captured top-field image is to be stored by CDAYR2. In data fetch, set the start address of the memory area to be used for data storage.

The address specified by this register must be in 32-bit units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	CAYR2[31:2]	H'0000 0000	R/W	• Frame image capture: These bits set the address for storing the Y component data of the captured data (4-pixel units). • One-field image capture: These bits set the address for storing the Y component data of the captured data (4-pixel units). • Both-field image capture: These bits set the address for storing the Y component data of the captured top-field data (4-pixel units). • Data synchronous fetch: These bits set the address for storing data (4-byte units). • Dana enable fetch: These bits set the address for storing data (32-byte units).
1, 0	CAYR2[1:0]		R	

Set the address of the starting point of the memory area where the Y component of the captured image is to be stored in this register, as shown in Figure 46.51.

- Frame image capture: Set the address of the starting point of the memory area where the Y component of the captured image is to be stored.
- One-field image capture: Set the address of the starting point of the memory area where the Y component of the captured image is to be stored.
- Both-field image capture: Set the address of the starting point of the memory area where the Y component of the captured top-field image is to be stored.

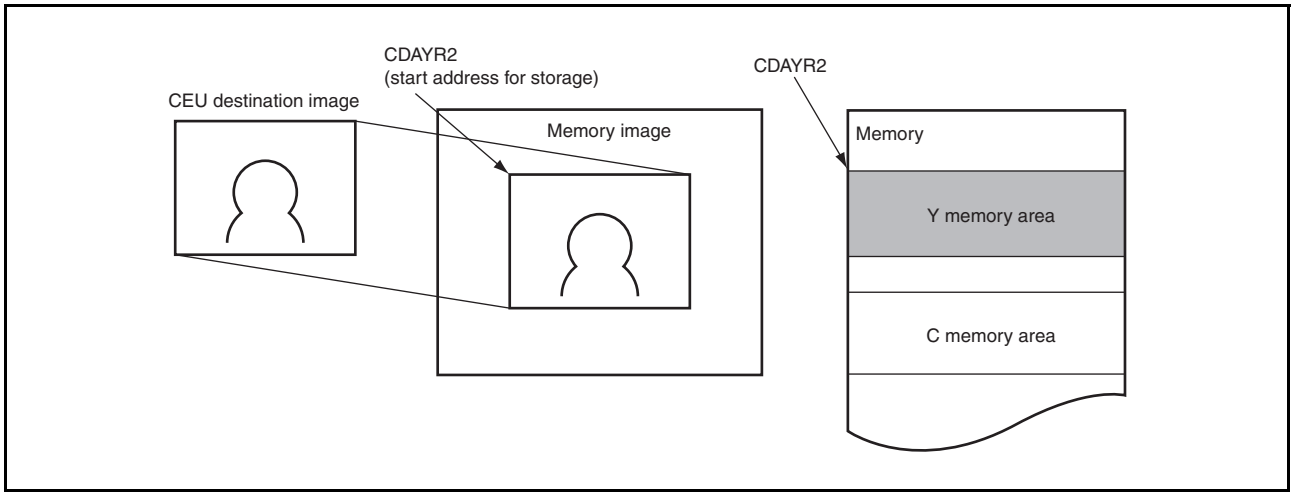

Figure 46.51 Relationship between Captured Image and Y Component Memory Area

46.4.26 Capture Data Address C Register 2 (CDACR2)

CDACR2 specifies the address for the chrominance (C) component used in a bundle write. CDACR2 is used only in a bundle write.

CDACR2 specifies the address where the C component of the captured data is to be stored in frame image capture or one-field image capture, and the address where the C component of the captured top field is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. In frame image capture or one-field image capture, set the start address of the memory area where the C component of the captured data is to be stored by CDACR2. In both-field image capture, set the start address of the memory area where the C component of the captured top-field image is to be stored by CDACR2. CDACR2 is not used in data fetch.

The address specified by this register must be in 32-bit units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	CACR2[31:2]	H'0000 0000	R/W	• Frame image capture: These bits set the address for storing the C component data of the captured data (4-pixel units). • One-field image capture: These bits set the address for storing the C component data of the captured data (4-pixel units). • Both-field image capture: These bits set the address for storing the C component data of the captured top-field data (4-pixel units).
1, 0	CACR2[1:0]		R	

In this register, set the address of the starting point of the memory area where the captured data is to be stored in a bundle write, as shown in Figure 46.52. The C component has an output data format as shown in Figure 46.53, and is saved in the memory in this format.

- Frame image capture: Set the address of the starting point of the memory area where the C component of the captured image is to be stored.
- One-field image capture: Set the address of the starting point of the memory area where the C component of the captured image is to be stored.
- Both-field image capture: Set the address of the starting point of the memory area where the C component of the captured top-field image is to be stored.

The C component has an output data format as shown in Figure 46.52, and is saved in the memory in this format.

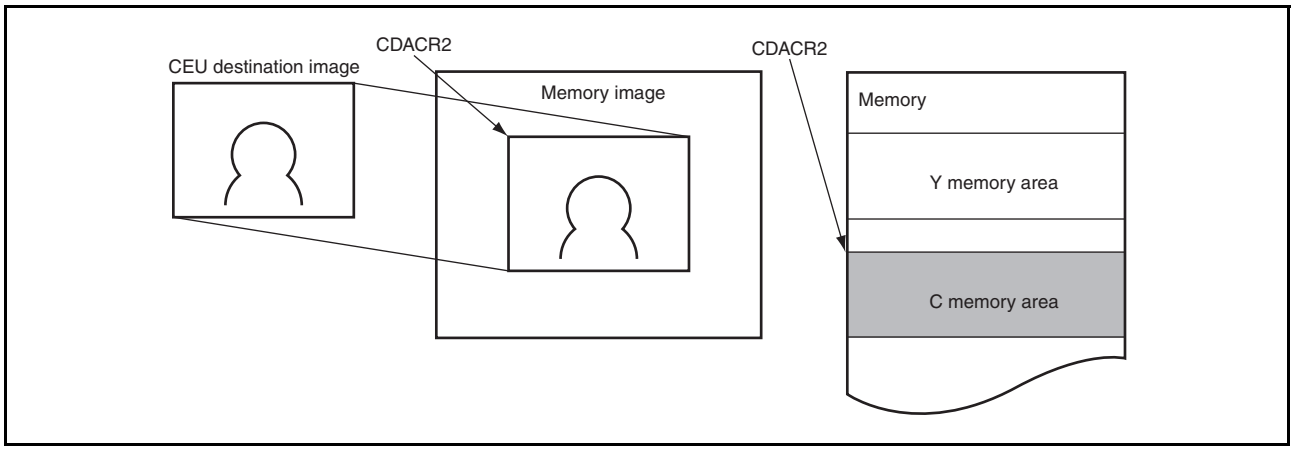

Figure 46.52 Relationship between Captured Image and C Component Memory Area

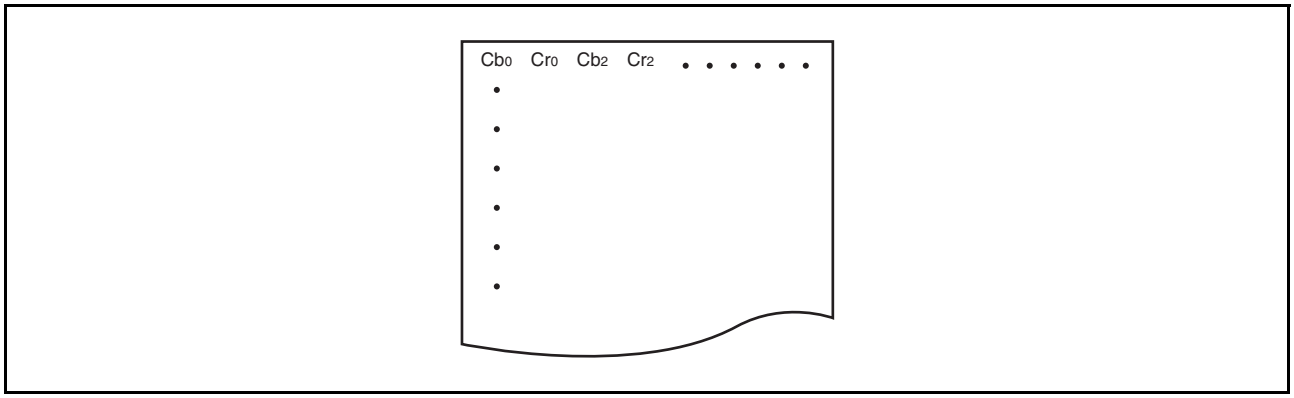

Figure 46.53 Image of Storing C Components in Memory

46.4.27 Capture Data Bottom-Field Address Y Register 2 (CDBYR2)

CDBYR2 specifies the address for the luminance (Y) component of the bottom field used in a bundle write. CDBYR2 is used only in a bundle write.

CDBYR2 specifies the address where the Y component of the captured bottom-field data is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. Set the start address of the memory area where the Y component of the bottom-field image captured in both-field image capture is to be stored by CDBYR2. CDBYR2 is not used in frame image capture, one-field image capture, or data fetch.

The address specified by this register must be in 32-bit units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	CBYR2[31:2]	H'0000 0000	R/W	These bits set the address for storing the Y component data of the captured bottom-field data (4-pixel units).
1, 0	CBYR2[1:0]		R	

In this register, set the address of the starting point of the memory area where the Y component of the captured bottom-field image is to be stored in a bundle write, as shown in Figure 46.54.

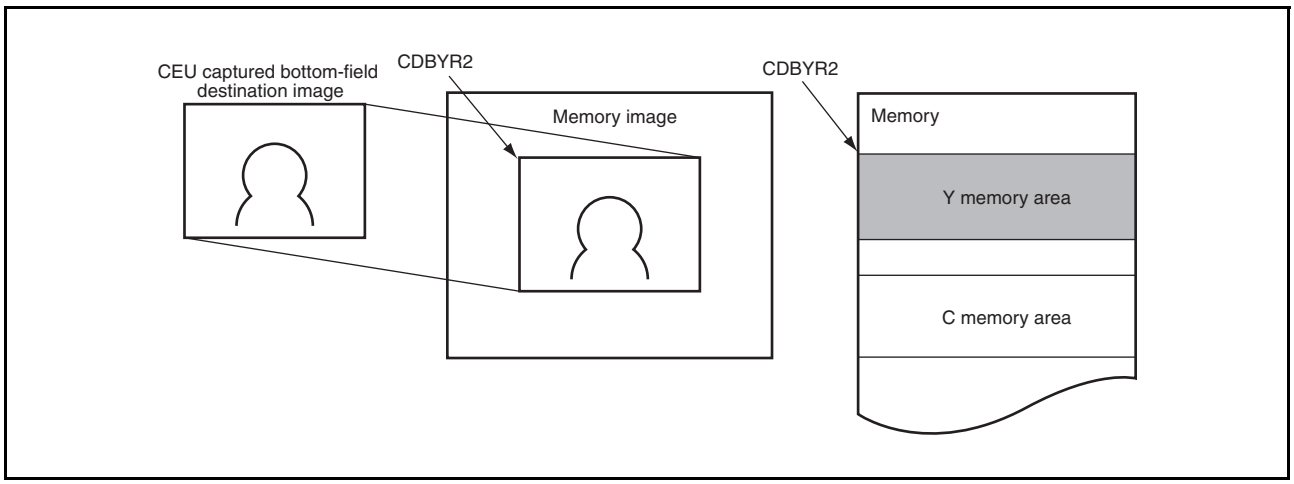

Figure 46.54 Relationship between Captured Bottom-Field Image and Y Component Memory Area

46.4.28 Capture Data Bottom-Field Address C Register 2 (CDBCR2)

CDBCR2 specifies the address for the chrominance (C) component of the bottom field used in a bundle write. CDBCR2 is used only in a bundle write.

CDBCR2 specifies the address where the C component of the captured bottom-field data is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. Set the start address of the memory area where the C component of the bottom-field image captured in both-field image capture is to be stored by CDBCR2. CDBCR2 is not used in frame image capture, one-field image capture, or data fetch.

The address specified by this register must be in 32-bit units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	CBCR2[31:2]	H'0000 0000	R/W	These bits set the address for storing the C component data of the captured bottom-field data (4-pixel units).
1, 0	CBCR2[1:0]		R	

In this register, set the address of the starting point of the memory area where the C component of the captured bottom-field image is to be stored in a bundle write, as shown in Figure 46.55. The C component has an output data format as shown in Figure 46.56, and is saved in the memory in this format.

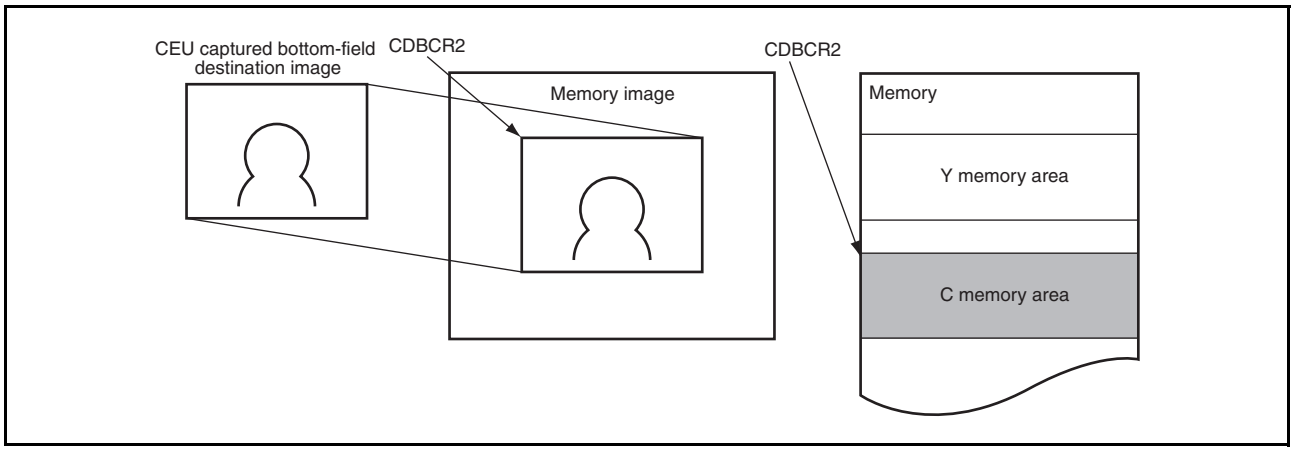

Figure 46.55 Relationship between Captured Bottom-Field Image and C Component Memory Area

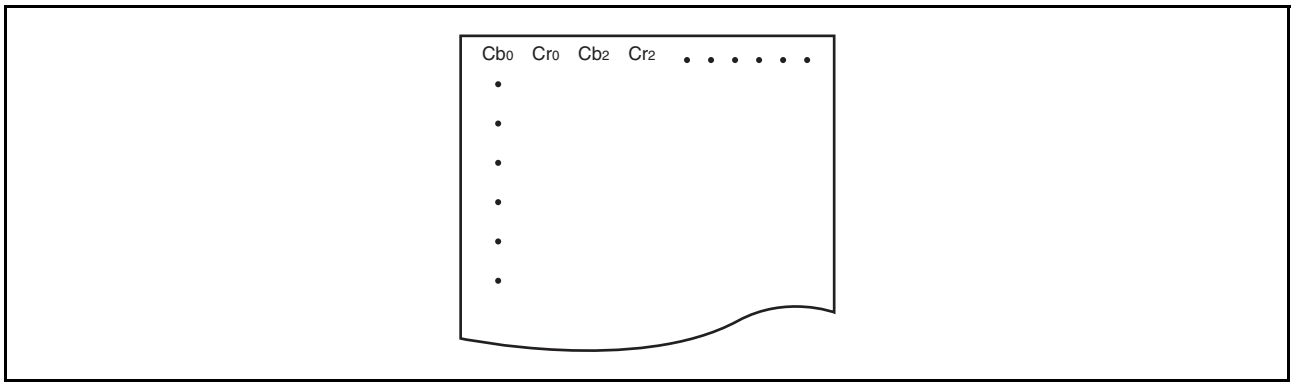

Figure 46.56 Image of Storing C Components in Memory

46.5 Usage Notes for CEU

46.5.1 Conditions for Connection to an External Module

(1) Clock Frequency

The external input clock should have a frequency at most the same as the CEU operating clock frequency (Bφ), with jitter on both sides included.

CEU operating clock frequency (Bφ) ≥ External input clock frequency

(2) Blanking Period

The period from the last valid pixel in each line to the next horizontal sync signal HD must be at least 20 cycles.

(3) Fixed Period of Field Identification Signal

The field identification signal FLD should be fixed for at least 1-HD period since a VD input

46.5.2 Restrictions on Input/Output Functions

Table 46.11 lists the restrictions regarding the CEU input/output functions.

Table 46.11 Restrictions on CEU Input/Output Functions

Item	Restrictions
External module interface	The operating clock of the external module (VIO_CLK) should always have a frequency at most the same as that of the CEU operating clock (Bφ), with jitter on both sides included.
	Selecting the interface, or modifying the frequency of the external module operating clock or HD/VD polarity must be done when capture operations are halted for sure.
	The capture horizontal size in image capture must be specified as follows: 8-bit interface: 8-cycle units 16-bit interface: 4-cycle units
	The capture horizontal size in data fetch must be specified as follows: 8-bit interface: 4-cycle units 16-bit interface: 2-cycle units
	The capture vertical size must be specified in 4-line units.
	The maximum number of cycles in the horizontal sync signal period should be 16,375 cycles of external input clock for 8-bit digital image input pins, or 16,379 cycles of external input clock for 16-bit digital image input pins.
	The maximum number of lines (HD count) in the vertical sync signal should be 16,382 lines.
	The minimum number of captured pixels should be sub-QCIF (128 × 96).
	The maximum number of captured pixels should be 5 megapixels (2,560 × 1,920).
	Captured size in data enable fetch Maximum: 6 Mbytes (2,048 × 1,536 × 2) Minimum: 16 bytes
Memory output	The output address must be specified in 32-bit units.
	The horizontal size of the destination image (memory) must be specified in 4-pixel units.
	The number of horizontal output pixels (= horizontal clipping size) must be specified in 4-pixel units.
	The number of vertical output lines (HD) (= vertical clipping size) must be specified in 4-line (HD) units.
	In data enable fetch bundle write, the output address must be specified in 32-byte units.
Internal processing	The filter clipping size must be specified as a value equal to or lower than the actual output size of the filter.

46.5.3 Cooperation with Video Display Controller 5

Since the input data are written to the memory separately as Y data and CbCr data in image capture mode, the captured data cannot be displayed in the video display controller 5.

46.5.4 Software Reset

For transitions to the software reset state by the CPKIL bit in the CAPSR register, see section 55.3.6, Software Reset. However, where the procedure refers to the SRST bit, read this as the CPKIL bit in the CAPSR register.

47. Pixel Format Converter

The pixel format converter has a color matrix that is used to adjust offsets and nine-axis gain for image data in the YCbCr or RGB format. This enables brightness adjustment, gain adjustment, and YCbCr and RGB mutual conversion. This LSI incorporates two channels of pixel format converters.

47.1 Features

- Input pixel data
  [RGB] RGB888 and RGB565
  [YCbCr] YCbCr422
- Output pixel data
  [RGB] ARGB888 and RGB565
  [YCbCr] YCbCr422
- Input buffer: 32-byte FIFO buffer configuration
- Output buffer: 32-byte FIFO buffer configuration
- Interrupt sources: Three
  Input FIFO empty, output FIFO full, and PFV error (input FIFO overflow and output FIFO underflow)
- The input FIFO empty and output FIFO full interrupts can activate the direct memory access controller (DMAC) to transfer data.
- When this module is not used, it can be stopped to reduce power consumption by stopping the clock supply to this module.

Figure 47.1 shows a block diagram of this module.

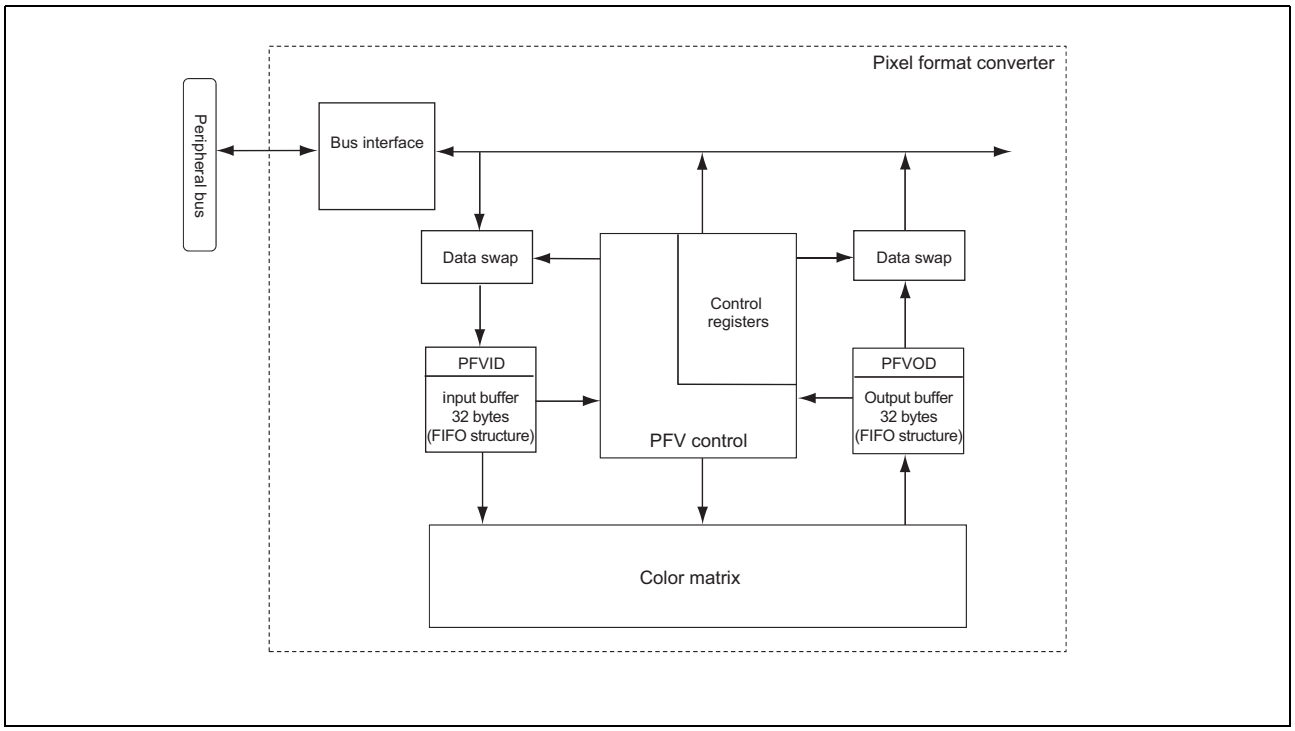

Figure 47.1 Block Diagram

47.2 Register Descriptions

This module has the following registers.

Table 47.1 Register Configuration

Channel	Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
0	PFV control register	PFVCR	R/W	H'0000_0000	H'E820_5000	32

R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	PFVE	0	R/W	PFV Enable Setting this bit to 1 starts operation of this module. When this bit is cleared to 0 during operation, this module stops operation and the valid data in the input and output FIFOs and the operating blocks in this module are initialized. 0: This module is stopped. 1: This module is ready for operation.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	DTH_ON	0	R/W	RGB565 Bit Reduction Setting Specifies bit reduction from RGB888 to RGB565 for output data. 0: Round-off mode 1: 2 x 2 pattern dither (the PFVSZR register should also be set up)
11, 10	IFMT[1:0]	00	R/W	Pixel Format Setting for Input Data Specifies the pixel format for input data. 00: RGB888 01: RGB565 10: Setting prohibited 11: YCbCr422
9, 8	OFMT[1:0]	00	R/W	Pixel Format Setting for Output Data Specifies the pixel format for output data. 00: ARGB8888 01: RGB565 10: Setting prohibited 11: YCbCr422
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3, 2	DINSWAP32[1:0]	00	R/W	Swap Setting for Input Data Specifies the swap operation for input data. This setting is valid only for 32-bit access. 00: (1) (2) (3) (4) 01: (2) (1) (4) (3) [Byte swap] 10: (3) (4) (1) (2) [Word swap] 11: (4) (3) (2) (1) [Word-byte swap]
1, 0	DOUT SWAP32[1:0]	00	R/W	Swap Setting for Output Data Specifies the swap operation for output data. This setting is valid only for 32-bit access. 00: (1) (2) (3) (4) 01: (2) (1) (4) (3) [Byte swap] 10: (3) (4) (1) (2) [Word swap] 11: (4) (3) (2) (1) [Word-byte swap]

47.2.2 PFV Interrupt Control Register (PFVICR)

This register enables various interrupt requests.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	PFV EEN	IFEN	OFEN	IDTRG[1:0]		ODTRG[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6	PFVEEN	0	R/W	PFV Error Interrupt Enable Enables or disables the PFV error interrupt request (PFVEI) to be issued when the input FIFO overflow interrupt source flag or output FIFO underflow interrupt source flag is set to 1. 0: PFV error interrupt is disabled. 1: PFV error interrupt is enabled
5	IFEN	0	R/W	Input FIFO Empty Interrupt Enable Enables or disables the input FIFO empty interrupt request (IFEI) to be issued when the input FIFO empty interrupt source flag is set to 1. 0: Input FIFO empty interrupt is disabled. 1: Input FIFO empty interrupt is enabled
4	OFEN	0	R/W	Output FIFO Full Interrupt Enable Enables or disables the output FIFO full interrupt request (OFFI) to be issued when the output FIFO full interrupt source flag is set to 1. 0: Output FIFO full interrupt is disabled. 1: Output FIFO full interrupt is enabled
3, 2	IDTRG[1:0]	All 0	R/W	Input FIFO Byte Count Trigger These bits specify the number of bytes in the input FIFO to be used as the trigger for setting the input FIFO empty interrupt source flag to 1. When the amount of valid data in the input FIFO becomes no larger than the specified trigger count, the input FIFO empty interrupt source flag is set to 1. 00: 30 bytes (2-byte empty space in the input FIFO) 01: 28 bytes (4-byte empty space in the input FIFO) 10: 16 bytes (16-byte empty space in the input FIFO) 11: 0 bytes (32-byte empty space in the input FIFO)
1, 0	ODTRG[1:0]	All 0	R/W	Output FIFO Byte Count Trigger These bits specify the number of bytes in the output FIFO to be used as the trigger for setting the output FIFO full interrupt source flag to 1. When the amount of valid data in the output FIFO becomes no less than the specified trigger count, the output FIFO full interrupt source flag is set to 1. 00:2 bytes (30-byte empty space in the output FIFO) 01: 4 bytes (28-byte empty space in the output FIFO) 10: 16 bytes (16-byte empty space in the output FIFO) 11: 32 bytes (0-byte empty space in the output FIFO)

47.2.3 PFV Interrupt Status Register (PFVISR)

This register is used to check various interrupt source flags.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	IFOVF	OFUDF	IFEMP	OFFUL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	IFOVF	0	R/W	Input FIFO Overflow Interrupt Source Flag Indicates that more data than the amount of empty space has been written to the input FIFO. 0: Indicates that no data has been written to PFVID while the input FIFO does not have enough empty space. [Clearing conditions] • Power-on reset • When PFVE = 0 • When IFOVF = 1 is read and then 0 is written to IFOVF 1: Indicates that data has been written to PFVID while the input FIFO does not have enough empty space. [Setting condition] • When data is written to PFVID while the input FIFO does not have enough empty space.
2	OFUDF	0	R/W	Output FIFO Underflow Interrupt Source Flag Indicates that more data than the amount of valid data has been read from the output FIFO. 0: Indicates that no data has been read from PFVOD while the output FIFO does not have enough valid data. [Clearing conditions] • Power-on reset • When PFVE = 0 • When OFUDF = 1 is read and then 0 is written to OFUDF 1: Indicates that data has been read from PFVOD while the output FIFO does not have enough valid data. [Setting condition] • When data is read from PFVOD while the output FIFO does not have enough valid data.
1	IFEMP	1	R	Input FIFO Empty Interrupt Source Flag Indicates that the amount of valid data in the input FIFO has become equal to or less than the input FIFO trigger count specified in the IDTRG[1:0] bits. 0: Indicates that the amount of valid data in the input FIFO is larger than the specified input FIFO trigger count. [Clearing conditions] • When data is written to the input FIFO and the amount of valid data exceeds the specified input FIFO trigger count. 1: Indicates that the amount of valid data in the input FIFO is no larger than the specified input FIFO trigger count. [Setting conditions] • Power-on reset • When PFVE = 0 • When the amount of valid data in the input FIFO becomes less than the specified input FIFO trigger count.

Bit	Bit Name	Initial Value	R/W	Description
0	OFFUL	0	R	Output FIFO Full Interrupt Source Flag Indicates that the amount of valid data in the output FIFO has become equal to or larger than the output FIFO trigger count specified in the ODTRG[1:0] bits. 0: Indicates that the amount of valid data in the output FIFO is less than the specified output FIFO trigger count. [Clearing conditions] • Power-on reset • When PFVE = 0 • When data is read from the output FIFO until the remaining data becomes less than the specified output FIFO trigger count. 1: Indicates that the amount of valid data in the output FIFO is no less than the specified output FIFO trigger count. [Setting condition] • When the amount of valid data in the output FIFO is larger than the specified output FIFO trigger count.

47.2.4 PFV Input Buffer Register (PFVID)

PFVID is 32-byte buffer memory that stores pixel data to be converted. The buffer memory has a FIFO structure (FIFO buffer). If an attempt is made to write data to the input buffer while it does not have empty space, the input FIFO overflow interrupt flag is set to 1; the written data is ignored in this case.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

47.2.5 PFV Output Buffer Register (PFVOD)

PFVOD is 32-byte buffer memory that stores the converted pixel data. The buffer memory has a FIFO structure (FIFO buffer). If an attempt is made to read data from the output buffer while it does not have valid data, the output FIFO underflow interrupt flag is set to 1; the read data is undefined in this case.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OD[31:16]															
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OD[15:0]															
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

47.2.6 PFV Input FIFO Status Register (PFVIFSR)

This register is used to check the number of valid bytes in the input FIFO.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	IFVD[5:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	IFVD[5:0]	All 0	R	Valid Byte Count in Input FIFO These bits indicate the number of valid bytes stored in the input FIFO. H'00 indicates that no input data is stored, and H'20 indicates that the input FIFO is full of data.

47.2.7 PFV Output FIFO Status Register (PFVOFSR)

This register is used to check the number of valid bytes in the output FIFO.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	OFVD[5:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	OFVD[5:0]	All 0	R	Valid Byte Count in Output FIFO These bits indicate the number of valid bytes stored in the output FIFO. H'00 indicates that no output data is stored, and H'20 indicates that the output FIFO is full of data.

47.2.8 PFV α Setting Register (PFVACR)

This register specifies the A value used for output in the ARGB8888 format.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W (compress):	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
R/W (decompress):	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	ALPHA[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W (compress):	R	R	R	R	R	R	R	R	Ignored	Ignored	Ignored	Ignored	Ignored	Ignored	Ignored	Ignored
R/W (decompress):	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W: Compression	R/W: De-compression	Description
31 to 8	—	All 0	R		Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	ALPHA[7:0]	H'00	Ignored	R/W	These bits specify the A value used for output in the ARGB8888 format.

47.2.9 PFV Matrix Mode Register (PFV_MTX_MODE)

This register specifies the operation of the color matrix.
Make appropriate settings in this register according to the pixel format of the input/output data.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PFV_MTX_MD[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	PFV_MTX_MD [1:0]	00	R/W	Operating Mode These bits specify the operation of the color matrix. Make appropriate settings according to the pixel format (IFMT and OFMT bit settings in PFVCR) of the input/output data. 00: GBR → GBR 01: GBR → YCbCr 10: YCbCr → GBR 11: YCbCr → YCbCr

47.2.10 PFV Matrix YG Adjustment Register 0 (PFV_MTX_YG_ADJ0)

This register specifies offset and gain adjustment for output Y/G data.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	PFV_MTX_YG[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	PFV_MTX_GG[10:0]										
Initial value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	PFV_MTX_YG [7:0]	128	R/W	Offset (DC) Adjustment for Output Y/G Data Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	PFV_MTX_GG [10:0]	256	R/W	Input Y/G Data Gain Adjustment for Output Y/G Data Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

47.2.11 PFV Matrix YG Adjustment Register 1 (PFV_MTX_YG_ADJ1)

This register specifies offset and gain adjustment for output Y/G data.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	PFV_MTX_GB[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	PFV_MTX_GR[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	PFV_MTX_GB [10:0]	0	R/W	Input Cb/B Data Gain Adjustment for Output Y/G Data Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	PFV_MTX_GR [10:0]	0	R/W	Input Cr/R Data Gain Adjustment for Output Y/G Data Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

47.2.12 PFV Matrix CBB Adjustment Register 0 (PFV_MTX_CBB_ADJ0)

This register specifies offset and gain adjustment for output Cb/B data.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	PFV_MTX_B[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	PFV_MTX_BG[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	PFV_MTX_B [7:0]	128	R/W	Offset (DC) Adjustment for Output Cb/B Data Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	PFV_MTX_BG [10:0]	0	R/W	Input Y/G Data Gain Adjustment for Output Cb/B Data Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

47.2.13 PFV Matrix CBB Adjustment Register 1 (PFV_MTX_CBB_ADJ1)

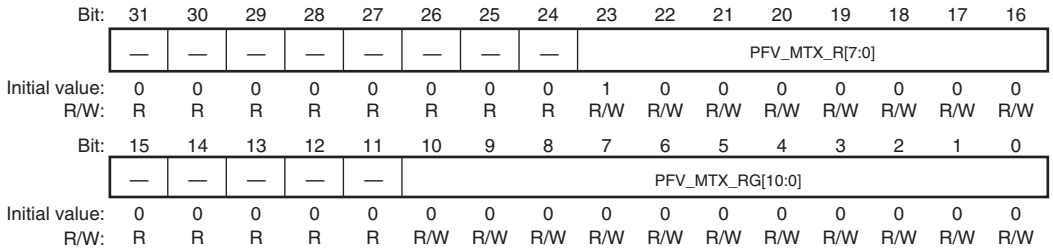
This register specifies offset and gain adjustment for output Cb/B data.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	PFV_MTX_BB[10:0]										
Initial value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	PFV_MTX_BR[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	PFV_MTX_BB [10:0]	256	R/W	Input Cb/B Data Gain Adjustment for Output Cb/B Data Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	PFV_MTX_BR [10:0]	0	R/W	Input Cr/R Data Gain Adjustment for Output Cb/B Data Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

47.2.14 PFV Matrix CRR Adjustment Register 0 (PFV_MTX_CRR_ADJ0)

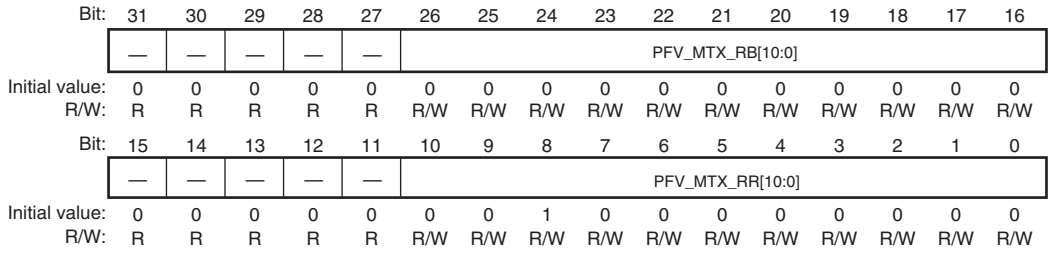
This register specifies offset and gain adjustment for output Cr/R data.



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	PFV_MTX_R [7:0]	128	R/W	Offset (DC) Adjustment for Output Cr/R Data Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	PFV_MTX_RG [10:0]	0	R/W	Input Y/G Data Gain Adjustment for Output Cr/R Data Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

47.2.15 PFV Matrix CRR Adjustment Register 1 (PFV_MTX_CRR_ADJ1)

This register specifies offset and gain adjustment for output Cr/R data.

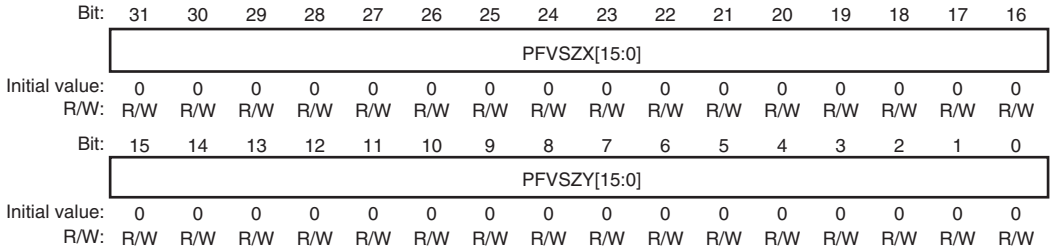


Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	PFV_MTX_RB [10:0]	0	R/W	Input Cb/B Data Gain Adjustment for Output Cr/R Data Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	PFV_MTX_RR [10:0]	256	R/W	Input Cr/R Data Gain Adjustment for Output Cr/R Data Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

47.2.16 PFV Image Size Setting Register (PFVSZR)

This register specifies the horizontal and vertical sizes of an image.

Be sure to set up this register when the output pixel format is RGB565 and 2 × 2 pattern dither is used for bit reduction.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	PFVSZX[15:0]	H'0000	R/W	Horizontal Size These bits specify the horizontal size.
15 to 0	PFVSZY[15:0]	H'0000	R/W	Vertical Size These bits specify the vertical size.

47.3 Operation

47.3.1 Overview

This module uses a color matrix for offset and nine-axis gain adjustment to apply brightness adjustment, gain adjustment, and YCbCr and RGB mutual conversion for image data in the YCbCr or RGB format.

47.3.2 Input/Output Data Format

This module allows selection of input and output data formats from RGB888 (ARGB8888 for output), RGB565, and YCbCr422. When the input and output FIFOs are accessed in 32 bits, data allocation can be modified through the DINSWAP32 and DOUTSWAP32 bit settings in PFVCR as shown below.

(1) RGB888 (ARGB8888) 32 bits/pixel

[DINSWAP32 and DOUTSWAP32 = 00 is specified]

b31 b24	b23 b16	b15 b8	b7 b0
Alpha* 8 bits	Red 8 bits	Green 8 bits	Blue 8 bits

[DINSWAP32 and DOUTSWAP32 = 01 is specified]

b31 b24	b23 b16	b15 b8	b7 b0
Red 8 bits	Alpha* 8 bits	Blue 8 bits	Green 8 bits

[DINSWAP32 and DOUTSWAP32 = 10 is specified]

b31 b24	b23 b16	b15 b8	b7 b0
Green 8 bits	Blue 8 bits	Alpha* 8 bits	Red 8 bits

[DINSWAP32 and DOUTSWAP32 = 11 is specified]

b31 b24	b23 b16	b15 b8	b7 b0
Blue 8 bits	Green 8 bits	Red 8 bits	Alpha* 8 bits

Note: * Alpha is used only for output and it is the value specified in the ALPHA bits in PFVACR.

(2) RGB565 16 bits/pixel

[DINSWAP32 and DOUTSWAP32 = 00 is specified]

b31 b24	b23 b16	b15 b8	b7 b0
RGB565 0 pixels		RGB565 1 pixel	

[DINSWAP32 and DOUTSWAP32 = 01 is prohibited]

[DINSWAP32 and DOUTSWAP32 = 10 is specified]

b31 b24	b23 b16	b15 b8	b7 b0
RGB565 1 pixel		RGB565 0 pixels	

[DINSWAP32 and DOUTSWAP32 = 11 is prohibited]

(3) YCbCr422 32bits/pixel

[DINSWAP32 and DOUTSWAP32 = 00 is specified]

b31 b24	b23 b16	b15 b8	b7 b0
Cb 8 bits	Y0 8 bits	Cr 8 bits	Y1 8 bits

[DINSWAP32 and DOUTSWAP32 = 01 is specified]

b31 b24	b23 b16	b15 b8	b7 b0
Y0 8 bits	Cb 8 bits	Y1 8 bits	Cr 8 bits

[DINSWAP32 and DOUTSWAP32 = 10 is specified]

b31 b24	b23 b16	b15 b8	b7 b0
Cr 8 bits	Y1 8 bits	Cb 8 bits	Y0 8 bits

[DINSWAP32 and DOUTSWAP32 = 11 is specified]

b31 b24	b23 b16	b15 b8	b7 b0
Y1 8 bits	Cr 8 bits	Y0 8 bits	Cb 8 bits

47.3.3 Color Matrix

By using a color matrix, input data offsets and nine-axis gain can be adjusted. This enables brightness adjustment, gain adjustment, and YCbCr and GBR mutual conversion.

(1) GBR to GBR Conversion

YGIN_A = YGIN + PFV_MTX_YG – 128
CBBIN_A = CBBIN + PFV_MTX_B – 128
CRRIN_A = CRRIN + PFV_MTX_R – 128
YGOUT = (PFV_MTX_GG × YGIN_A + PFV_MTX_GB × CBBIN_A + PFV_MTX_GR × CRRIN_A) ÷ 256
CBBOUT = (PFV_MTX_BG × YGIN_A + PFV_MTX_BB × CBBIN_A + PFV_MTX_BR × CRRIN_A) ÷ 256
CRROUT = (PFV_MTX_RG × YGIN_A + PFV_MTX_RB × CBBIN_A + PFV_MTX_RR × CRRIN_A) ÷ 256

(2) GBR to YCbCr Conversion

YGIN_A = YGIN + PFV_MTX_YG – 128
CBBIN_A = CBBIN + PFV_MTX_B – 128
CRRIN_A = CRRIN + PFV_MTX_R – 128
YGOUT = (PFV_MTX_GG × YGIN_A + PFV_MTX_GB × CBBIN_A + PFV_MTX_GR × CRRIN_A) ÷ 256
CBBOUT = (PFV_MTX_BG × YGIN_A + PFV_MTX_BB × CBBIN_A + PFV_MTX_BR × CRRIN_A) ÷ 256 + 128
CRROUT = (PFV_MTX_RG × YGIN_A + PFV_MTX_RB × CBBIN_A + PFV_MTX_RR × CRRIN_A) ÷ 256 + 128

Table 47.2 Matrix Coefficient (Typical Value) for SMPTE 293M

	YGIN		CBBIN		CRRIN	
	Coefficient	Set Value	Coefficient	Set Value	Coefficient	Set Value
YGOUT	0.587	PFV_MTX_GG= 150	0.114	PFV_MTX_GB= 29	0.299	PFV_MTX_GR= 77
CBBOUT	–0.331	PFV_MTX_BG= 1963	0.500	PFV_MTX_BB= 128	–0.169	PFV_MTX_BR= 2005
CRROUT	–0.419	PFV_MTX_RG= 1941	–0.081	PFV_MTX_RB= 2027	0.500	PFV_MTX_RR= 128

(3) YCbCr to GBR Conversion

YGIN_A = YGIN + PFV_MTX_YG – 128
CBBIN_A = CBBIN – 128
CRRIN_A = CRRIN – 128
YGOUT = (PFV_MTX_GG × YGIN_A + PFV_MTX_GB × CBBIN_A + PFV_MTX_GR × CRRIN_A) ÷ 256
CBBOUT = (PFV_MTX_BG × YGIN_A + PFV_MTX_BB × CBBIN_A + PFV_MTX_BR × CRRIN_A) ÷ 256
CRROUT = (PFV_MTX_RG × YGIN_A + PFV_MTX_RB × CBBIN_A + PFV_MTX_RR × CRRIN_A) ÷ 256

Table 47.3 Matrix Coefficient (Typical Value) for SMPTE 293M

	YGIN		CBBIN		CRRIN	
	Coefficient	**Set Value**	**Coefficient**	**Set Value**	**Coefficient**	**Set Value**
YGOUT	1.000	PFV_MTX_GG= 256	–0.344	PFV_MTX_GB= 1960	–0.714	PFV_MTX_GR= 1865
CBBOUT	1.000	PFV_MTX_BG= 256	1.772	PFV_MTX_BB= 454	0.000	PFV_MTX_BR= 0
CRROUT	1.000	PFV_MTX_RG= 256	0.000	PFV_MTX_RB= 0	1.402	PFV_MTX_RR= 359

(4) YCbCr to YCbCr Conversion

YGIN_A = YGIN + PFV_MTX_YG – 128
CBBIN_A = CBBIN – 128
CRRIN_A = CRRIN – 128
YGOUT = (PFV_MTX_GG × YGIN_A + PFV_MTX_GB × CBBIN_A + PFV_MTX_GR × CRRIN_A) ÷ 256
CBBOUT = (PFV_MTX_BG × YGIN_A + PFV_MTX_BB × CBBIN_A + PFV_MTX_BR × CRRIN_A) ÷ 256 + 128
CRROUT = (PFV_MTX_RG × YGIN_A + PFV_MTX_RB × CBBIN_A + PFV_MTX_RR × CRRIN_A) ÷ 256 + 128

47.3.4 Bit Reduction

For RGB565 output, the number of RGB data bits is reduced from eight bits to six or five bits. The operation mode can be selected from round-off mode and 2 × 2 pattern dither mode through the DTH_ON bit in PFVCR. When selecting 2 × 2 pattern dither mode, be sure to set up the PFVSZX and PFVSZY bits in PFVSZR.
From the values set in the PFVSZX and PFVSZY bits in PFVSZR, this module generates horizontal and vertical sync signals.
The following shows the specifications of 2 × 2 pattern dither operation.

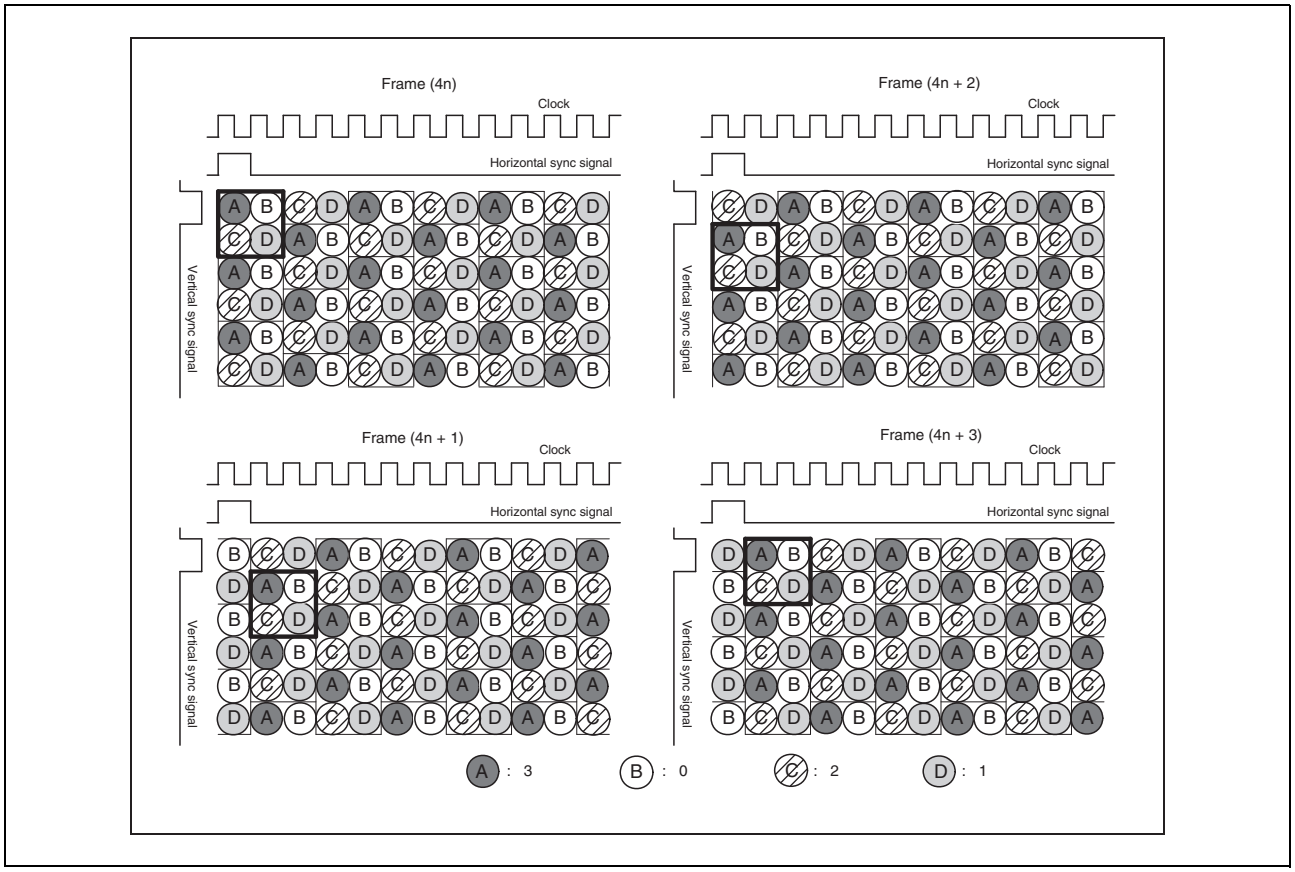


Figure 47.2 Specifications of 2 × 2 Pattern Dither Operation

The conversion equations are as follows.

- Round-off mode

1. 8 bits to 6 bits
   Output RGB data[7:2] = Input RGB data[7:0] ÷ 4 (round off to an integer)
2. 8 bits to 5 bits
   Output RGB data[7:3] = Input RGB data[7:0] ÷ 8 (round off to an integer)

- 2 × 2 pattern dither

1. 8 bits to 6 bits
   Output RGB data[7:2] = Input RGB data[7:0] ÷ 4 + pattern value at the first decimal place (truncate the number below the decimal point after addition)
2. 8 bits to 5 bits
   Output RGB data[7:3] = Input RGB data[7:0] ÷ 32 + pattern value at the first decimal place (truncate the number below the decimal point after addition)

47.3.5 Operating Procedures

(1) Initial Setting

Figure 47.3 is a sample flowchart for initial setting.

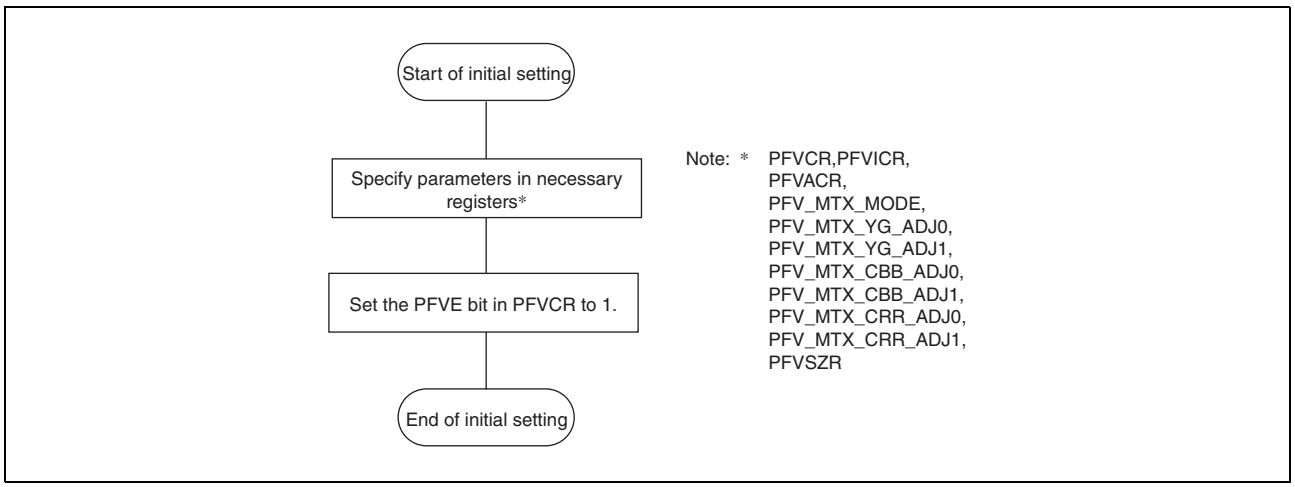

Figure 47.3 Sample Flowchart for Initial Setting

(2) Data Input

Figure 47.4 is a sample flowchart for data input.

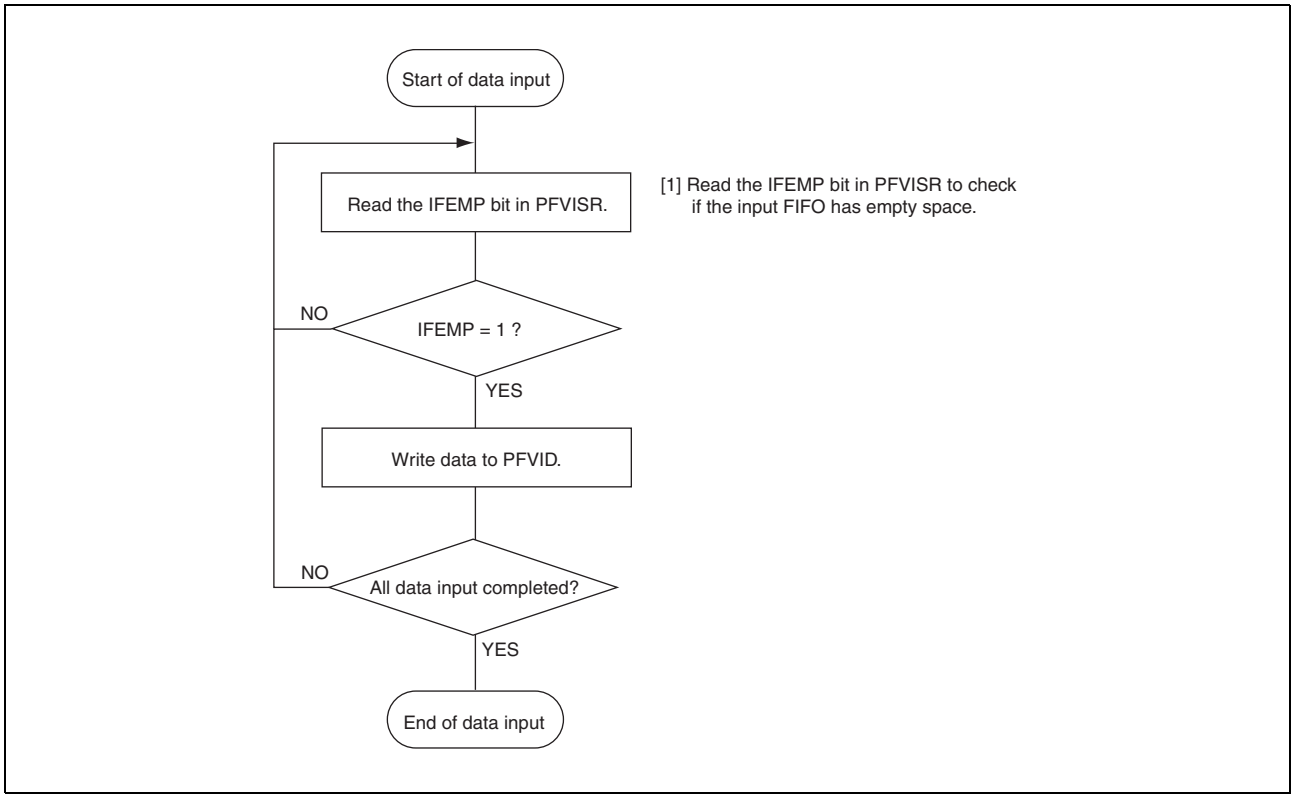

Figure 47.4 Sample Flowchart for Data Input

(3) Data Output

Figure 47.5 is a sample flowchart for data output.

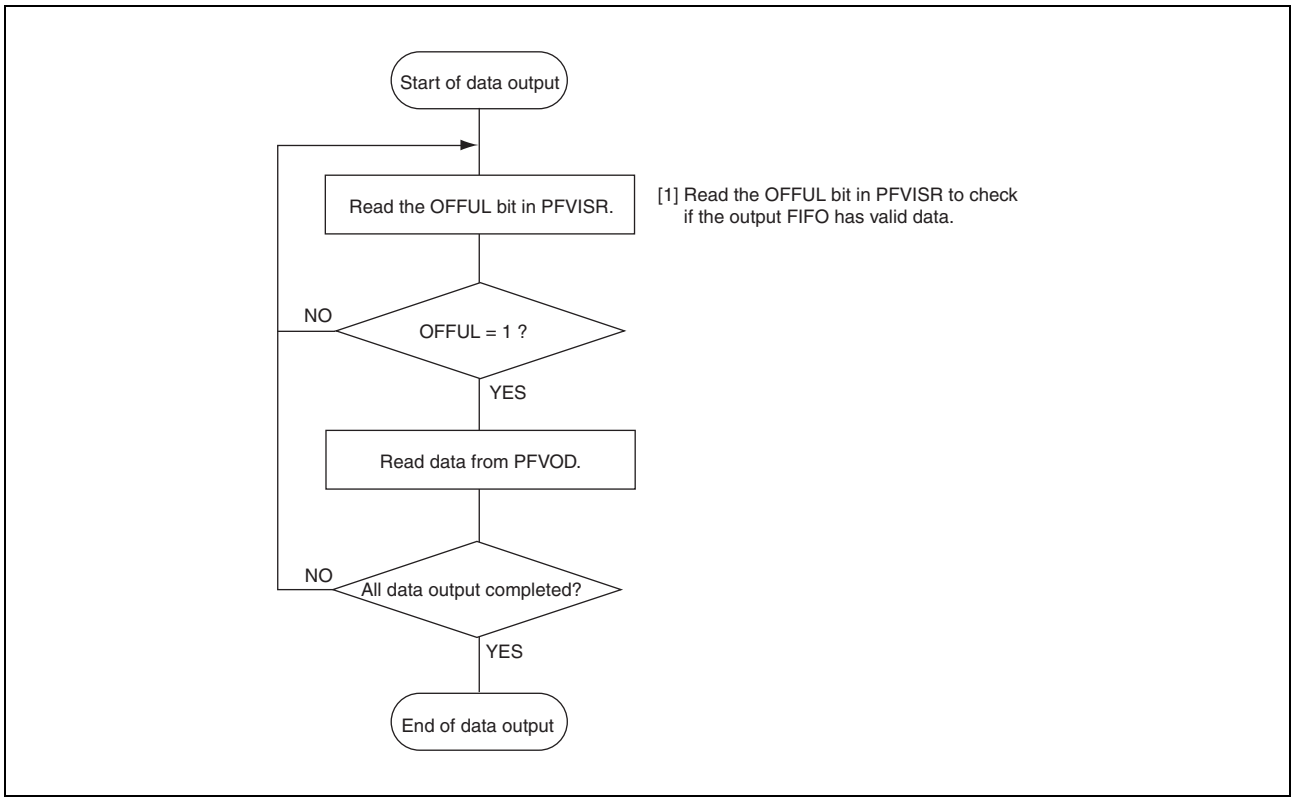

Figure 47.5 Sample Flowchart for Data Output

47.4 Interrupt Requests

This module has three interrupt requests: input FIFO empty, output FIFO full, and PFV error. Table 47.4 summarizes the interrupt requests.

Table 47.4 List of Interrupt Requests

Interrupt Request	Abbreviation	Interrupt Request Condition	DMAC Activation
Input FIFO empty	IFEI	(PFVISR.IFEMP = 1) & (PFVICR.IFEN = 1)	Possible
Output FIFO full	OFFI	(PFVISR.OFFUL = 1) & (PFVICR.OFEN = 1)	Possible
PFV error	PFVEI	((PFVISR.IFOVF=1) | (PFVISR.OFUDF=1)) & (PFVICR.PFVEEN=1)	Not possible

When an interrupt condition shown in Table 47.4 becomes 1, this module sends an interrupt request. The input FIFO empty and output FIFO full interrupt requests can activate the direct memory access controller when the direct memory access controller is set to allow this. In this case, the interrupts from this module are not sent to the CPU.

48. SCUX

The SCUX consists of sampling converters, digital volume units, and a mixer. It is connected to the SSIF module to have an interface with external modules.

48.1 Features

(1) [SRC] Sampling Rate Conversion

- Asynchronous or synchronous sampling rate conversion is possible*1
- Sampling rate (synchronous mode)*2
  Input [KHz]: 8, 11.025, 12, 16, 22.05, 24, 32, 44.1, 48, 64, 88.2, or 96 is selectable
  Output [KHz]: 8, 16, 24, 32, 44.1, 48, or 96 is selectable
- Sampling rate (asynchronous mode)*2
  Input/output [KHz]: 1 to 96
- Supported bit sizes are 16 bits and 24 bits
- Sound quality: −132 dB or less*3
- 1, 2, 4, 6, or 8 channels are supported*4
- DMA transfer with on-chip memory or external memory and direct transfer with the SSIF module are possible

Note 1. The synchronous mode can be selected only when the SCUX is connected to the FFD and FFU modules. For details, refer to section 48.4.5.
Note 2. The selectable sampling rates depend on the number of used channels and rate ratio. For details, refer to section 48.3.22 and section 48.4.7.
Note 3. The data format is a 24-bit value.
Note 4. The number of selectable channels depends on the sampling rate and route. For details, refer to section 48.4.7.

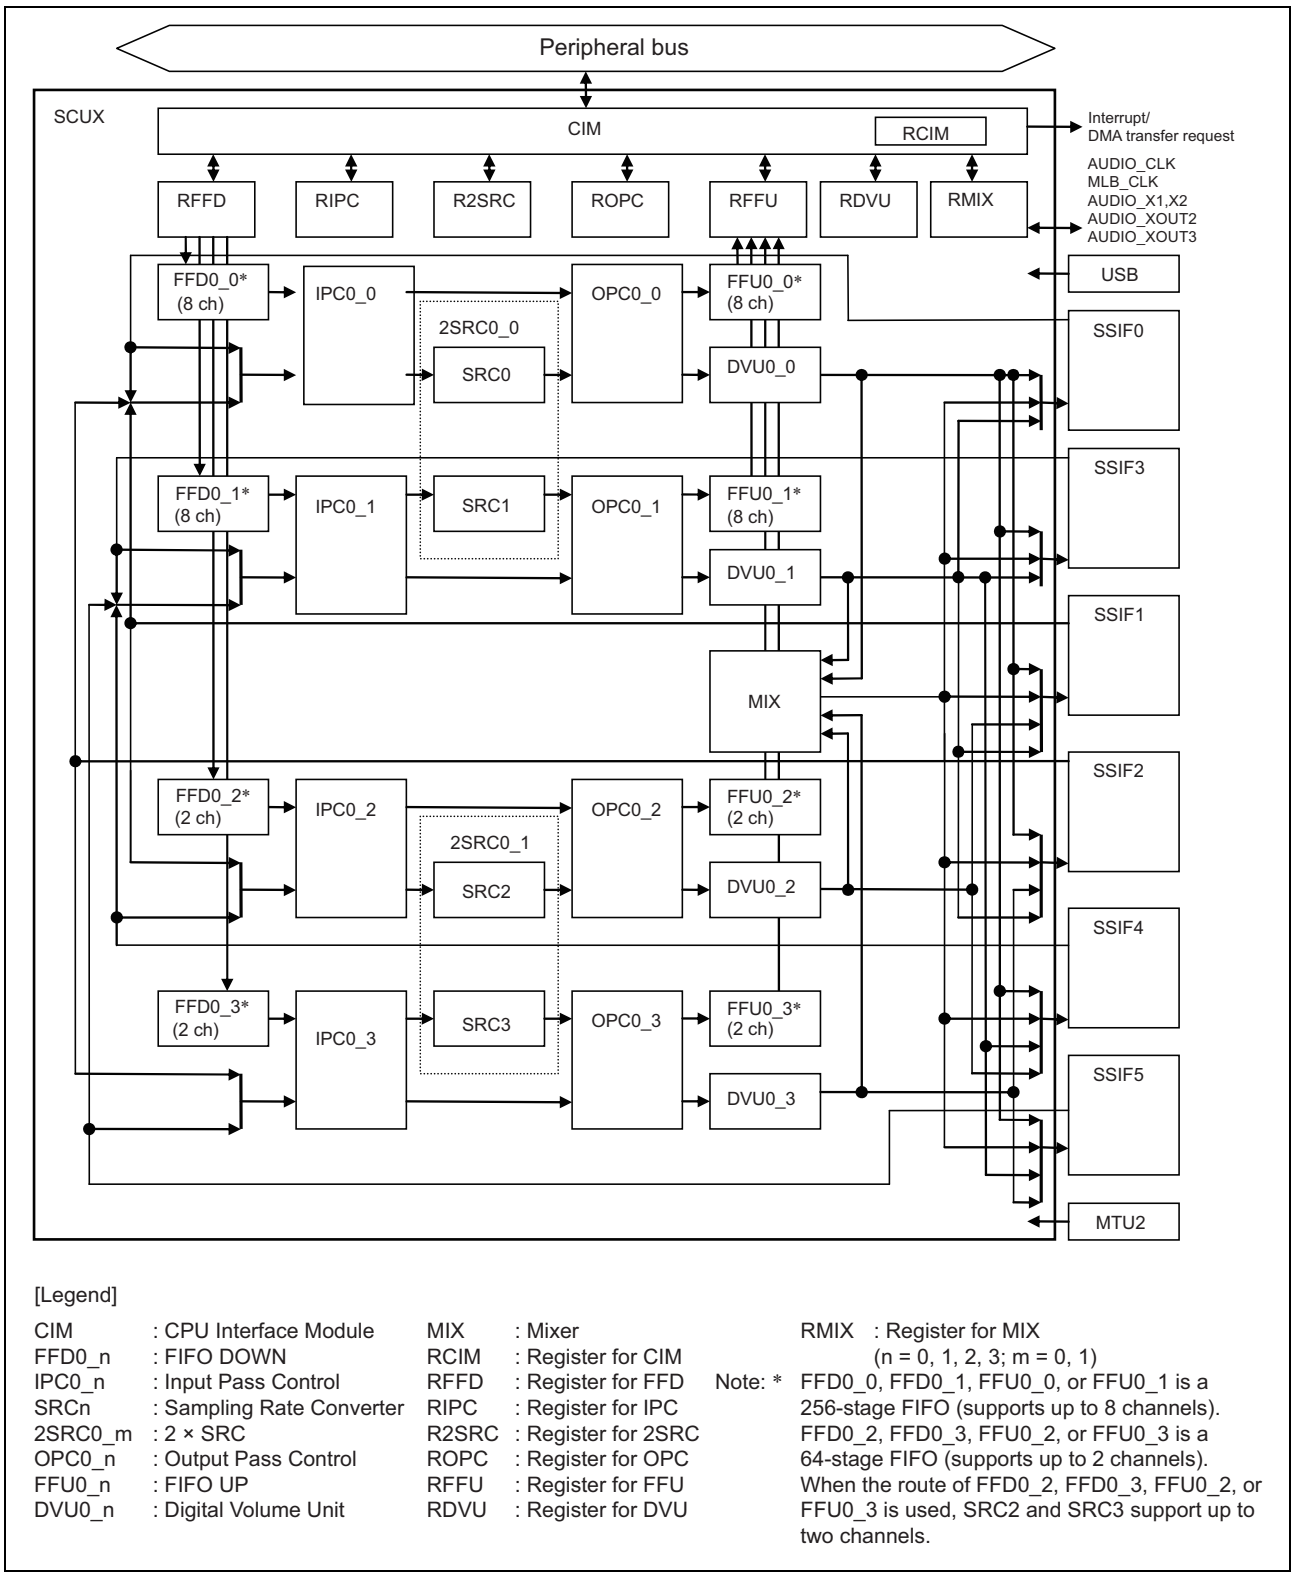
(2) [DVU] Digital Volume and Mute Functions

- Digital volume, volume ramp, and zero cross mute are provided as functions to adjust the volume
- The digital volume is set as a 24-bit fixed-point value within the range from a multiple of 0 to 8 (mute, −120 to 18 dB)
- Volume ramp can be used to perform soft mute, fade in, fade out, and volume change as desired
- The ramp time of volume ramp can be changed and set within the sampling range of 2^0 to 2^{23}
- Zero cross mute turns the sound mute at the zero cross point of audio data
- Direct transfer with the SSIF module and transfer with the mixer are possible

(3) [MIX] Mixer

- Data of two to four source systems can be mixed (added together) into one system
- The ratio to add the sources can be set
- The ratio can be changed dynamically
- Volume ramp enables mixing to be performed (ramp time is variable)
- Only direct transfer with the SSIF module is possible

Figure 48.1 shows a block diagram of the SCUX.



[Legend]

CIM	: CPU Interface Module	MIX	: Mixer		RMIX : Register for MIX (n = 0, 1, 2, 3; m = 0, 1)
FFD0_n	: FIFO DOWN	RCIM	: Register for CIM		
IPC0_n	: Input Pass Control	RFFD	: Register for FFD	Note: *	FFD0_0, FFD0_1, FFU0_0, or FFU0_1 is a 256-stage FIFO (supports up to 8 channels). FFD0_2, FFD0_3, FFU0_2, or FFU0_3 is a 64-stage FIFO (supports up to 2 channels). When the route of FFD0_2, FFD0_3, FFU0_2, or FFU0_3 is used, SRC2 and SRC3 support up to two channels.
SRCn	: Sampling Rate Converter	RIPC	: Register for IPC		
2SRC0_m	: 2 × SRC	R2SRC	: Register for 2SRC		
OPC0_n	: Output Pass Control	ROPC	: Register for OPC		
FFU0_n	: FIFO UP	RFFU	: Register for FFU		
DVU0_n	: Digital Volume Unit	RDVU	: Register for DVU

48.2 Input/Output Pins

Table 48.1 Pin Configuration

Name	I/O	Function
AUDIO_CLK	Input	External clock for audio Can be used in generating the sampling timing.
MLB_CLK	Input	External clock for MLB Can be used in generating the sampling timing.
AUDIO_X1	Input	Crystal resonator/external clock for audio Can be used in generating the sampling timing.
AUDIO_X2	Output	
AUDIO_XOUT2	Output	Output clock of AUDIO_X1 divided into two (Output is toggled once per cycle of the AUDIO_X1 clock.)
AUDIO_XOUT3	Output	Output clock of AUDIO_X1 divided into three (Output is toggled once every 1.5 cycles of the AUDIO_X1 clock.)

48.3 Register Descriptions

Table 48.2 shows the register configuration.

Table 48.2 Register Configuration

Block Name	Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
IPC0_0	IPC0_0 initialization register	IPCIR_IPC0_0	R/W	H'00000001	H'E8208000	32

Note 1. Only 0 can be written to clear the flag. Writing 0 is ignored.
Note 2. Address H'E8209708 can be accessed in only 16-bit or 32-bit units.
Note 3. Address H'E820970C can be accessed in only 16-bit or 32-bit units.
Note 4. Address H'E8209710 can be accessed in only 16-bit or 32-bit units.
Note 5. Address H'E8209714 can be accessed in only 16-bit or 32-bit units.
Note 6. Address H'E8209718 can be accessed in only 16-bit or 32-bit units.
Note 7. Address H'E820971C can be accessed in only 16-bit or 32-bit units.
Note 8. Address H'E8209720 can be accessed in only 16-bit or 32-bit units.
Note 9. Address H'E8209724 can be accessed in only 16-bit or 32-bit units.

48.3.1 IPC0_n Initialization Register (IPCIR_IPC0_n) (n = 0, 1, 2, 3)

IPCIR_IPC0_n is a 32-bit readable/writable register that initializes the IPC internal circuit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INIT	1	R/W	Initialization When this bit is set to 1, the IPC internal circuit is initialized. To cancel the initialization, set this bit to 0 with it set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers)

48.3.2 IPC0_n Pass Select Register (IPSLR_IPC0_n) (n = 0, 1, 2, 3)

IPSLR_IPC0_n is a 32-bit readable/writable register that selects the input source and output destination of the input timing signal and audio data.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	IPC_PASS_SEL		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	IPC_ PASS_SEL	0	R/W	IPC Pass Select These bits select the pass. 000: No operation 001: Input Timing Signal/Input Audio Data : EXTERNAL (SSIF) → IPC → SRC (Async mode) 010: Reserved 011: Input Timing Signal : EXTERNAL → IPC → FFD/SRC Input Audio Data : FFD → IPC → SRC (Async mode) 100: Input Timing Signal/Input Audio Data : FFD → IPC → SRC (Sync mode) 101 to 111: No operation

48.3.3 OPC0_n Initialization Register (OPCIR_OPC0_n) (n = 0, 1, 2, 3)

OPCIR_OPC0_n is a 32-bit readable/writable register that initializes the OPC internal circuit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INIT	1	R/W	Initialization When this bit is set to 1, the OPC internal circuit is initialized. To cancel the initialization, set this bit to 0 with it set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers)

48.3.4 OPC0_n Pass Select Register (OPSLR_OPC0_n) (n = 0, 1, 2, 3)

OPSLR_OPC0_n is a 32-bit readable/writable register that selects the input source and output destination of the output timing signal and audio data.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	OPC_PASS_SEL		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	OPC_ PASS_ SEL	0	R/W	OPC Pass Select These bits select the pass. 000: No operation 001: Output Timing Signal : EXTERNAL → OPC → SRC/DVU Output Audio Data : SRC (Async mode) → OPC → DVU 010: Reserved 011: Output Timing Signal : EXTERNAL → OPC → FFU/SRC Output Audio Data : SRC (Async mode) → OPC → FFU 100: Output Timing Signal : FFU → OPC → SRC Output Audio Data : SRC (Sync mode) → OPC → FFU 101 to 111: No operation

48.3.5 FFD0_n FIFO Download Initialization Register (FFDIR_FFD0_n) (n = 0, 1, 2, 3)

FFDIR_FFD0_n is a 32-bit readable/writable register that initializes the FFD internal circuit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INIT	1	R/W	Initialization When this bit is set to 1, the FFD internal circuit is initialized. To cancel the initialization, set this bit to 0 with it set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers)

48.3.6 FFD0_n FIFO Download Audio Information Register (FDAIR_FFD0_n) (n = 0, 1, 2, 3)

FDAIR_FFD0_n is a 32-bit readable/writable register that sets the number of FFD data channels.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	CHNUM			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	CHNUM	All 0	R/W	Number of Channels These bits set the number of channels. 0000: Zero (None) 0001: 1 channel 0010: 2 channels 0011: Reserved 0100: 4 channels* 0101: Reserved 0110: 6 channels* 0111: Reserved 1000: 8 channels* 1001 to 1111: Reserved Note: * These bits are only settable for FFD0_0 and FFD0_1. Setting these bits in the registers for FFD0_2 and FFD0_3 is prohibited.

48.3.7 FFD0_n FIFO Download Request Size Register (DRQSR_FFD0_n) (n = 0, 1, 2, 3)

DRQSR_FFD0_n is a 32-bit readable/writable register that sets the request size of data transfer requests.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	SIZE			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	SIZE	All 0	R/W	Request Size These bits set the PCM data size per request. The size must be less than the FIFO size. 0000: 256 data. (FFD0_0,FFD0_1), 64 data. (FFD0_2,FFD0_3) *1 0001: 128 data. (FFD0_0,FFD0_1), 32 data. (FFD0_2,FFD0_3) 0010: 64 data. (FFD0_0,FFD0_1), 16 data. (FFD0_2,FFD0_3) 0011: 32 data. (FFD0_0,FFD0_1), 8 data. (FFD0_2,FFD0_3) 0100: 16 data. (FFD0_0,FFD0_1), 4 data. (FFD0_2,FFD0_3) 0101: 8 data. (FFD0_0,FFD0_1), 2 data. (FFD0_2,FFD0_3) 0110: 4 data. (FFD0_0,FFD0_1), 1 data. (FFD0_2,FFD0_3) 0111: 2 data. (FFD0_0,FFD0_1)*2 1000: 1 data. (FFD0_0,FFD0_1)*2 1001 to 1111: Reserved. Notes: 1. If the request size equals the FIFO size, the request size must be a multiple of the number of channels so that the operation is correct. For example, the request size and FIFO size are 256, the number of channels can be set to 1, 2, 4, or 8. If the number of channels is not set to any of the numbers, FIFO overflow may occur. 2. These bits are only settable for FFD0_0 and FFD0_1. Setting these bits in the registers for FFD0_2 and FFD0_3 is prohibited.

48.3.8 FFD0_n FIFO Download Pass Register (FFDPR_FFD0_n) (n = 0, 1, 2, 3)

FFDPR_FFD0_n is a 32-bit readable/writable register that sets the input/output route of audio data.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	PASS	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	PASS	All 0	R/W	Data Pass Select These bits set the data pass of audio data. 00: No pass selected 01: CIM → FFD → IPC (Async Mode) *1 10: CIM → FFD → IPC (Sync Mode) *2 11: Reserved Notes: 1.- Async mode: The FFD use external timing. 2.- Sync mode: The FFD use the request which is generated by SRC module. Set Sync mode in SRC.

48.3.9 FFD0_n FIFO Download Boot Register (FFDBR_FFD0_n) (n = 0, 1, 2, 3)

FFDBR_FFD0_n is a 32-bit readable/writable register that controls the starting and stopping of data requests sent to RFFD.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	BOOT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	BOOT	0	R/W	Data Request Start/Stop This bit controls the start/stop of data request. This bit can be set when the PASS bits in the FFDPR register are set to B'01 or B'10. This bit must be set after setting the FFD register. 0: Stops the data request. 1: Starts the data request.

48.3.10 FFD0_n FIFO Download Event Mask Register (DEVMR_FFD0_n) (n = 0, 1, 2, 3)

DEVMR_FFD0_n is a 32-bit readable/writable register that controls SCUFDIn interrupt requests.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DEVMUF	DEVMOF	DEVMOL	DEVMIUF	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DEVMRQ	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	DEVMUF	0	R/W	FFD Underflow Mask This bit sets whether to mask the interrupt request from the DEVCUF bit in the DEVCR register. 0: Disables interrupts. 1: Enables interrupts.
30	DEVMOF	0	R/W	FFD Overflow Mask This bit sets whether to mask the interrupt request from the DEVCOF bit in the DEVCR register. 0: Disables interrupts. 1: Enables interrupts.
29	DEVMOL	0	R/W	FFD Overlap Mask This bit sets whether to mask the interrupt request from the DEVCOL bit in the DEVCR register. 0: Disables interrupts. 1: Enables interrupts.
28	DEVMIUF	0	R/W	FFD Initialization Underflow Mask This bit sets whether to mask the interrupt request from the DEVCIUF bit in the DEVCR register. 0: Disables interrupts. 1: Enables interrupts.
27 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	DEVMRQ	0	R/W	FFD Request Packet Mask This bit sets whether to mask the interrupt request from the DEVCRQ bit in the DEVCR register. 0: Disables interrupts. 1: Enables interrupts.
14 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

48.3.11 FFD0_n FIFO Download Event Clear Register (DEVCR_FFD0_n) (n = 0, 1, 2, 3)

DEVCR_FFD0_n is a 32-bit readable/writable register that clears SCUFDIn interrupt requests. When an interrupt event is generated, the relevant bit in this register is automatically set to 1 and 1 is retained until 0 is written to that bit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DEVCUF	DEVCOF	DEVCOL	DEVCIUF	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/(W)*1	R/(W)*1	R/(W)*1	R/(W)*1	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DEVCRQ	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/(W)*1	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	DEVCUF	0	R/(W)*1	FFD Underflow Clear This is an interrupt flag to indicate whether DPRAM underflow occurs. When it occurs and the first packet has already been written to DPRAM, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
30	DEVCOF	0	R/(W)*1	FFD Overflow Clear This is an interrupt flag to indicate whether DPRAM overflow occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
29	DEVCOL	0	R/(W)*1	FFD Overlap Clear This is an interrupt flag to indicate whether FFD overlap occurs. When the next read request occurs while FFD reads data from DPRAM upon the previous read request, the overflow occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
28	DEVCIUF	0	R/(W)*1	FFD Initialization Underflow Clear This is an interrupt flag to indicate whether DPRAM initialization underflow occurs. When it occurs and the first packet has not been written to DPRAM, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
27 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	DEVCRQ	0	R/(W)*1	FFD Request Packet Clear This is an interrupt flag to send a request to write one packet in FFD, to the CPU. When the request occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
14 to 0	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.

Note 1. Readable/writable. When 0 is written, the bit is initialized. Writing 1 to the bit is ignored. Write 0 only to each bit corresponding to the interrupt source to be cleared; write 1 to other bits.

48.3.12 FFU0_n FIFO Upload Initialization Register (FFUIR_FFU0_n) (n = 0, 1, 2, 3)

FFUIR_FFU0_n is a 32-bit readable/writable register that initializes the FFU internal circuit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INIT	1	R/W	Initialization When this bit is set to 1, the FFU internal circuit is initialized. To cancel the initialization, set this bit to 0 with it set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers)

48.3.13 FFU0_n FIFO Upload Audio Information Register (FUAIR_FFU0_n) (n = 0, 1, 2, 3)

FUAIR_FFU0_n is a 32-bit readable/writable register that sets the number of FFU data channels.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	CHNUM			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	CHNUM	All 0	R/W	Number of Channels These bits set the number of channels. For details, see below. 0000: Zero (None) 0001: 1 channel 0010: 2 channels 0011: Reserved 0100: 4 channels* 0101: Reserved 0110: 6 channels* 0111: Reserved 1000: 8 channels* 1001 to 1111: Reserved Note: * These bits are only settable for FFU0_0 and FFU0_1. Setting these bits in the registers for FFU0_2 and FFU0_3 is prohibited.

48.3.14 FFU0_n FIFO Upload Request Size Register (URQSR_FFU0_n) (n = 0, 1, 2, 3)

URQSR_FFU0_n is a 32-bit readable/writable register that sets the request size of data transfer requests.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	SIZE			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	SIZE	All 0	R/W	Request Size These bits set the PCM data size per request. The size must be less than the FIFO size. 0000: 256 data. (FFU0_0,FFU0_1), 64 data. (FFU0_2,FFU0_3) *1 0001: 128 data. (FFU0_0,FFU0_1), 32 data. (FFU0_2,FFU0_3) 0010: 64 data. (FFU0_0,FFU0_1), 16 data. (FFU0_2,FFU0_3) 0011: 32 data. (FFU0_0,FFU0_1), 8 data. (FFU0_2,FFU0_3) 0100: 16 data. (FFU0_0,FFU0_1), 4 data. (FFU0_2,FFU0_3) 0101: 8 data. (FFU0_0,FFU0_1), 2 data. (FFU0_2,FFU0_3) 0110: 4 data. (FFU0_0,FFU0_1), 1 data. (FFU0_2,FFU0_3) 0111: 2 data. (FFU0_0,FFU0_1)*2 1000: 1 data. (FFU0_0,FFU0_1)*2 1001 to 1111: Reserved. Notes: 1. If the request size equals the FIFO size, the request size must be a multiple of the number of channels so that the operation is correct. For example, the request size and FIFO size are 256, the number of channels can be set to 1, 2, 4, or 8. If the number of channels is not set to any of the numbers, FIFO overflow may occur. 2. These bits are only settable for FFU0_0 and FFU0_1. Setting these bits in the registers for FFU0_2 and FFU0_3 is prohibited.

48.3.15 FFU0_n FIFO Upload Pass Register (FFUPR_FFU0_n) (n = 0, 1, 2, 3)

FFUPR_FFU0_n is a 32-bit readable/writable register that sets the input/output route of audio data.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	PASS	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	PASS	All 0	R/W	Data Pass Select These bits set the data pass of audio data. 00: No pass selected 01: CIM ← FFU ← OPC (Async Mode) *1 10: CIM ← FFU ← OPC (Sync Mode) *2 11: Reserved Notes: 1. Async mode: The FFU use external timing. 2. Sync mode: The FFU use the request which is generated by SRC module. Set Sync mode in SRC.

48.3.16 FFU0_n FIFO Upload Event Mask Register (UEVMR_FFU0_n) (n = 0, 1, 2, 3)

UEVMR_FFU0_n is a 32-bit readable/writable register that controls SCUFUIn interrupt requests.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	UEVMUF	UEVMOF	UEVMOL	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	UEVMRQ	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	UEVMUF	0	R/W	FFU Underflow Mask This bit sets whether to mask the interrupt request from the UEVCUF bit in the UEVCR register. 0: Disables interrupts. 1: Enables interrupts.
30	UEVMOF	0	R/W	FFU Overflow Mask This bit sets whether to mask the interrupt request from the UEVCOF bit in the UEVCR register. 0: Disables interrupts. 1: Enables interrupts.
29	UEVMOL	0	R/W	FFU Overlap Mask This bit sets whether to mask the interrupt request from the UEVCOL bit in the UEVCR register. 0: Disables interrupts. 1: Enables interrupts.
28 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	UEVMRQ	0	R/W	FFU Request Packet Mask This bit sets whether to mask the interrupt request from the UEVCRQ bit in the UEVCR register. 0: Disables interrupts. 1: Enables interrupts.
14 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

48.3.17 FFU0_n FIFO Upload Event Clear Register (UEVCR_FFU0_n) (n = 0, 1, 2, 3)

UEVCR_FFU0_n is a 32-bit readable/writable register that clears SCUFUIn interrupt requests. When an interrupt event is generated, the relevant bit in this register is automatically set to 1 and 1 is retained until 0 is written to that bit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	UEVCUF	UEVCOF	UEVCOL	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/(W)*1	R/(W)*1	R/(W)*1	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	UEVCRQ	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/(W)*1	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	UEVCUF	0	R/(W)*1	FFU Underflow Clear This is an interrupt flag to indicate whether DPRAM underflow occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
30	UEVCOF	0	R/(W)*1	FFU Overflow Clear This is an interrupt flag to indicate whether DPRAM overflow occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
29	UEVCOL	0	R/(W)*1	FFU Overlap Clear This is an interrupt flag to indicate whether DPRAM overlap occurs. When the next write request occurs while FFU writes data upon the previous write request, the overlap occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
28 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	UEVCRQ	0	R/(W)*1	FFU Request Packet Clear This is an interrupt flag to send a request to read one packet from FFU, to the CPU. When the request occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
14 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note 1. Readable/writable. When 0 is written, the bit is initialized. Writing 1 to the bit is ignored. Write 0 only to each bit corresponding to the interrupt source to be cleared; write 1 to other bits.

48.3.18 2SRC0_m Initialization Register p (SRCIRp_2SRC0_m) (m = 0, 1; p = 0, 1)

SRCIRp_2SRC0_m is a 32-bit readable/writable register that initializes the SRC internal circuit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INIT	1	R/W	Initialization When this bit is set to 1, the SRC internal circuit is initialized. To cancel the initialization, set this bit to 0 with it set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers)

48.3.19 2SRC0_m Audio Information Register p (SADIRp_2SRC0_m) (m = 0, 1; p = 0, 1)

SADIRp_2SRC0_m is a 32-bit readable/writable register that sets the bit length of data and the number of channels.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	OTBL				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	CHNUM			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20 to 16	OTBL	All 0	R/W	Bit Length of Output Audio Data 00000: 24 bits 00001 to 00111: Reserved 01000: 16 bits 01001 to 11111: Reserved
15 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	CHNUM	All 0	R/W	Number of Channels These bits set the number of channels. 0000: Zero (None) 0001: 1 channel 0010: 2 channels 0011: Reserved 0100: 4 channels 0101: Reserved 0110: 6 channels 0111: Reserved 1000: 8 channels 1001 to 1111: Reserved

48.3.20 2SRC0_m Bypass Register p (SRCBRp_2SRC0_m) (m = 0, 1; p = 0, 1)

SRCBRp_2SRC0_m is a 32-bit readable/writable register that sets the bypass mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	BY PASS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	BYPASS	0	R/W	Bypass Mode This bit controls the data pass of SRC. The bypass function is only used in asynchronous SRC mode. Therefore, this bit must be set to 0 when synchronous SRC mode is used (bit SRCMD in SRCCRp_2SRC0_m register is 1). 0: SRC function is used. Input data is processed by SRC and then the result data is connected to output data. 1: SRC function is not used (bypass mode). Input data is directly connected to output data.

48.3.21 2SRC0_m IFS Control Register p (IFSCRp_2SRC0_m) (m = 0, 1; p = 0, 1)

IFSCRp_2SRC0_m is a 32-bit readable/writable register that enables or disables usage of the initial value set by INTIFS.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INT IFSEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INTIFSEN	0	R/W	INTIFS Value Enable This bit is enabled only in asynchronous SRC mode (bit SRCMD in SRCCRp_2SRC0_m register is 0). 0: Disables initial value setting in IFSVR register. 1: Enables initial value setting in IFSVR register.

48.3.22 2SRC0_m IFS Value Setting Register p (IFSVRp_2SRC0_m) (m = 0, 1; p = 0, 1)

IFSVRp_2SRC0_m is a 32-bit readable/writable register that sets the INTIFS value.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	INTIFS											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	INTIFS															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 0	INTIFS	All 0	R/W	Initial Value of FSI These bits set initial value of FSI. Set the input sampling rate and output sampling rate within the restricted range determined by the number of channels. Example: Fin = 32 kHz Fout = 44.1 kHz FSI = 2^{22} * 32000/44100 = 3043485 = 0x02E709D

When using the SRC in asynchronous mode, INTIFS is given as the initial value of FSI, which is the sampling conversion function. Therefore, after setting the INTIFSEN bit in IFSCRp_2SRC0_m to 1, set the INTIFS bits to the desired value. The SRC automatically detects the input sampling frequency and output sampling frequency. Based on this, the FSI value is calculated so that the following equation is satisfied.

$$\frac{Fin}{Fout} \approx \frac{FSI}{FSO}$$

[Legend]
Fin: Input sampling frequency
Fout: Output sampling frequency
FSI: Input sampling rate
FSO: Output sampling rate (fixed value: 2^{22} = 0x0400000)

When using the SRC in synchronous mode, the value set in INTIFS is used as the FSI value from beginning to end. The value set in INITFS is shown in Table 48.3 to Table 48.8.

Table 48.3 INITFS Setting (Delay Mode: Normal, Number of Channels: 1 or 2)

Input Sampling Rate [KHz]	Output Sampling Rate [KHz]						
	8	16	24	32	44.1	48	96

Note 1. This is because the setting is outside the specification of the SRC module. For details, see Table 48.22.

48.3.23 2SRC0_m Control Register p (SRCCRp_2SRC0_m) (m = 0, 1; p = 0, 1)

SRCCRp_2SRC0_m is a 32-bit readable/writable register that selects the low delay mode, and synchronous or asynchronous mode of the SRC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	WATMD	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	BUFMD	-	-	-	-	-	-	-	-	-	-	-	SRCMD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	WATMD	0	R/W	Wait Time Control of SRC 0: Disables wait time control. 1: Enables wait time control.
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	—	0	R/W	The write value should always be 1.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	BUFMD	0	R/W	Low Delay Mode 0: Disables low delay mode. 1: Enables low delay mode.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	—	0	R/W	The write value should always be 1.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	—	0	R/W	The write value should always be 1.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SRCMD	0	R/W	SRC Mode Select 0: Asynchronous SRC 1: Synchronous SRC

48.3.24 2SRC0_m Minimum FS Setting Register p (MNFSRp_2SRC0_m) (m = 0, 1; p = 0, 1)

MNFSRp_2SRC0_m is a 32-bit readable/writable register that sets the minimum value of FS.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	MINFS											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MINFS															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 0	MINFS	All 0	R/W	Minimum Value of FS Ratio These bits set the FS ratio to start fading out the output data to mute under the situation that the input timing stops during SRC processing. This setting value should be less than the value of IFSVRp_2SRC0_m register. Example: Fin = 32 kHz Fout = 44.1 kHz FSI = 2^{22} * 32000/44100 = 3043485 = 0x02E709D MINFS = FSI * 98% = 2982615 = 0x02D82D7 Set the ratio which is out of the range of the jitter. (The recommended value is from 90 to 98 percent.)

48.3.25 2SRC0_m Buffer Size Setting Register p (BFSSRp_2SRC0_m) (m = 0, 1; p = 0, 1)

BFSSRp_2SRC0_m is a 32-bit readable/writable register that sets the buffer size. This register setting is valid only when SRCCRp_2SRC0_m.BUFMD = 1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	BUFDATA									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	BUFIN			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25 to 16	BUFDATA	All 0	R/W	Set the buffer size of 1 channel in DATA RAM. Sets 0x80 for low delay mode 1. Sets 0x40 for low delay mode 2.
15 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	BUFIN	All 0	R/W	Set the buffer size of 1 channel in INDATA RAM. Sets 0x5 for low delay mode.

48.3.26 2SRC0_m SCU2 Status Register p (SC2SRp_2SRC0_m) (m = 0, 1; p = 0, 1)

SC2SRp_2SRC0_m is a 32-bit read-only register that indicates the status of the SRC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SRCWSTS	SC2MUTE	SC2STS		SC2FSI											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC2FSI															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	SRCWSTS	0	R	Status of Wait Time Operation of SRC 0: Wait for count up to wait time 1: Reached to wait time
30	SC2MUTE	0	R	SRC Mute Status This bit is only used for debug. 0: SRC output data is not fixed and it should be muted. This happens when SRC cannot synchronize the input sampling rate and output sampling rate. 1: SRC output data is fixed.
29, 28	SC2STS	All 0	R	Status of SRC 00: SRC is reset. 01: SRC is initialized. 10: SRC is processing. 11: Reserved
27 to 0	SC2FSI	All 0	R	Latest value of FSI which is calculated by SRC

48.3.27 2SRC0_m Wait Time Setting Register p (WATSRp_2SRC0_m) (m = 0, 1; p = 0, 1)

WATSRp_2SRC0_m is a 32-bit readable/writable register that sets the wait time for data input to the SRC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	WTIME							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	WTIME															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	WTIME	All 0	R/W	These bits set the wait time when WATMD bit of SRCCRp_2SRC0_m register is 1. After the INIT bit of SRCIRp_2SRC0_m register is set to 0, 0 data is stored into the SRC until the number of input data reaches to the setting value of these bits. The data input before the INIT bit is set to 0 is discarded. After the number of input data reaches to the setting value, input data is stored into the SRC.

48.3.28 2SRC0_m Event Mask Register p (SEVMRp_2SRC0_m) (m = 0, 1; p = 0, 1)

SEVMRp_2SRC0_m is a 32-bit readable/writable register that enables or disables SCUAIm interrupt requests. The name of the interrupt source corresponding to the interrupt request from SEVMRp_2SRC0_0 is SCUAI0 and that corresponding to the interrupt request from SEVMRp_2SRC0_1 is SCUAI1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	EVMUF	EVMOF	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	EVM WAIT	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	EVMUF	0	R/W	SRC Underflow Mask This bit sets whether to mask the interrupt request from the EVCUF bit in the SEVCRp_2SRC0_m register. 0: Disables interrupts. 1: Enables interrupts.
30	EVMOF	0	R/W	SRC Overflow Mask This bit sets whether to mask the EVCOF bit in the SEVCRp_2SRC0_m register. 0: Disables interrupts. 1: Enables interrupts.
29 to 15	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
14	EVMWAIT	0	R/W	SRC Wait Time Mask This bit sets whether to mask the interrupt request from the EVCWAIT bit of SEVCRp_2SRC0_m register. 0: Disables interrupts. 1: Enables interrupts.
13 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

48.3.29 2SRC0_m Event Clear Register p (SEVCRp_2SRC0_m) (m = 0, 1; p = 0, 1)

SEVCRp_2SRC0_m is a 32-bit readable/writable register that clears SCUAIm interrupt requests. When an interrupt event is generated, the relevant bit in this register is automatically set to 1 and 1 is retained until 0 is written to that bit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	EVCUF	EVCOF	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/(W)*1	R/(W)*1	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	EVC WAIT	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/(W)*1	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	EVCUF	0	R/(W)*1	SRC Underflow Clear This is an interrupt flag to indicate whether INDATA RAM underflow occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
30	EVCOF	0	R/(W)*1	SRC Overflow Clear This is an interrupt flag to indicate whether INDATA RAM overflow occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
29 to 15	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
14	EVCWAIT	0	R/(W)*1	SRC Wait Time Clear This is an interrupt flag to indicate whether SRC has started processing after the wait time. 0: Clears the flag. 1: Retains the flag.
13 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note 1. Readable/writable. When 0 is written, the bit is initialized. Writing 1 to the bit is ignored. Write 0 only to each bit corresponding to the interrupt source to be cleared; write 1 to other bits.

48.3.30 2SRC0_m Initialization Register RIF (SRCIRR_2SRC0_m) (m = 0, 1)

SRCIRR_2SRC0_m is a 32-bit readable/writable register that initializes COEF-ROMIF which is mounted on 2SRC0_m.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INIT	1	R/W	Initialization When this bit is set to 1, the COEF-ROMIF internal circuit is initialized. To cancel the initialization, set this bit to 0 with it set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers)

48.3.31 DVU0_n Initialization Register (DVUIR_DVU0_n) (n = 0, 1, 2, 3)

DVUIR_DVU0_n is a 32-bit readable/writable register that initializes the DVU internal circuit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INIT	1	R/W	Initialization When this bit is set to 1, the DVU internal circuit is initialized. To cancel the initialization, set this bit to 0 with it set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers)

48.3.32 DVU0_n Audio Information Register (VADIR_DVU0_n) (n = 0, 1, 2, 3)

VADIR_DVU0_n is a 32-bit readable/writable register that sets the bit length of data and the number of channels.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	OTBL				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	CHNUM			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20 to 16	OTBL	All 0	R/W	Bit Length of Output Audio Data 00000: 24 bits 00001 to 00111: Reserved 01000: 16 bits 01001 to 11111: Reserved
15 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	CHNUM	All 0	R/W	Number of Channels These bits set the number of channels. 0000: Zero (None) 0001: 1 channel 0010: 2 channels 0011: Reserved 0100: 4 channels 0101: Reserved 0110: 6 channels 0111: Reserved 1000: 8 channels 1001 to 1111: Reserved

48.3.33 DVU0_n Bypass Register (DVUBR_DVU0_n) (n = 0, 1, 2, 3)

DVUBR_DVU0_n is a 32-bit readable/writable register that sets the bypass mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	BY PASS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	BYPASS	0	R/W	Bypass Mode This bit controls the data pass of DVU. 0: DVU function is used. Input data is processed by DVU and then the result data is connected to output data. 1: DVU function is not used (bypass mode). Input data is directly connected to output data.

48.3.34 DVU0_n Control Register (DVUCR_DVU0_n) (n = 0, 1, 2, 3)

DVUCR_DVU0_n is a 32-bit readable/writable register that selects the DVU mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	VVMD	-	-	-	VRMD	-	-	-	ZCMD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	VVMD	0	R/W	Digital Volume Mode Select This bit selects the digital volume function. 0: Disables the digital volume function. 1: Enables the digital volume function.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	VRMD	0	R/W	Volume Ramp Mode Select This bit selects the volume ramp function. 0: Disables the volume ramp function. 1: Enables the volume ramp function.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ZCMD	0	R/W	Zero Cross Mute Mode Select This bit selects the zero cross mute function. 0: Disables the zero cross mute function. 1: Enables the zero cross mute function.

48.3.35 DVU0_n Zero Cross Mute Control Register (ZCMCR_DVU0_n) (n = 0, 1, 2, 3)

ZCMCR_DVU0_n is a 32-bit readable/writable register that controls operation of the zero cross mute function for each channel.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	ZCEN7	ZCEN6	ZCEN5	ZCEN4	ZCEN3	ZCEN2	ZCEN1	ZCEN0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	ZCEN7	0	R/W	Zero Cross Mute Enable for Channel 7 This bit controls the operation of the zero cross mute function for channel 7. 0: Disables the operation of the zero cross mute function. 1: Enables the operation the zero cross mute function.
6	ZCEN6	0	R/W	Zero Cross Mute Enable for Channel 6 This bit controls the operation of the zero cross mute function for channel 6. 0: Disables the operation of the zero cross mute function. 1: Enables the operation the zero cross mute function.
5	ZCEN5	0	R/W	Zero Cross Mute Enable for Channel 5 This bit controls the operation of the zero cross mute function for channel 5. 0: Disables the operation of the zero cross mute function. 1: Enables the operation the zero cross mute function.
4	ZCEN4	0	R/W	Zero Cross Mute Enable for Channel 4 This bit controls the operation of the zero cross mute function for channel 4. 0: Disables the operation of the zero cross mute function. 1: Enables the operation the zero cross mute function.
3	ZCEN3	0	R/W	Zero Cross Mute Enable for Channel 3 This bit controls the operation of the zero cross mute function for channel 3. 0: Disables the operation of the zero cross mute function. 1: Enables the operation the zero cross mute function.
2	ZCEN2	0	R/W	Zero Cross Mute Enable for Channel 2 This bit controls the operation of the zero cross mute function for channel 2. 0: Disables the operation of the zero cross mute function. 1: Enables the operation the zero cross mute function.
1	ZCEN1	0	R/W	Zero Cross Mute Enable for Channel 1 This bit controls the operation of the zero cross mute function for channel 1. 0: Disables the operation of the zero cross mute function. 1: Enables the operation the zero cross mute function.
0	ZCEN0	0	R/W	Zero Cross Mute Enable for Channel 0 This bit controls the operation of the zero cross mute function for channel 0. 0: Disables the operation of the zero cross mute function. 1: Enables the operation the zero cross mute function.

48.3.36 DVU0_n Volume Ramp Control Register (VRCTR_DVU0_n) (n = 0, 1, 2, 3)

VRCTR_DVU0_n is a 32-bit readable/writable register that controls operation of the volume ramp function for each channel.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	VREN7	VREN6	VREN5	VREN4	VREN3	VREN2	VREN1	VREN0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	VREN7	0	R/W	Volume Ramp Enable for Channel 7 This bit controls the operation of the volume ramp function for channel 7. 0: Disables the operation of the volume ramp function. 1: Enables the operation of the volume ramp function.
6	VREN6	0	R/W	Volume Ramp Enable for Channel 6 This bit controls the operation of the volume ramp function for channel 6. 0: Disables the operation of the volume ramp function. 1: Enables the operation of the volume ramp function.
5	VREN5	0	R/W	Volume Ramp Enable for Channel 5 This bit controls the operation of the volume ramp function for channel 5. 0: Disables the operation of the volume ramp function. 1: Enables the operation of the volume ramp function.
4	VREN4	0	R/W	Volume Ramp Enable for Channel 4 This bit controls the operation of the volume ramp function for channel 4. 0: Disables the operation of the volume ramp function. 1: Enables the operation of the volume ramp function.
3	VREN3	0	R/W	Volume Ramp Enable for Channel 3 This bit controls the operation of the volume ramp function for channel 3. 0: Disables the operation of the volume ramp function. 1: Enables the operation of the volume ramp function.
2	VREN2	0	R/W	Volume Ramp Enable for Channel 2 This bit controls the operation of the volume ramp function for channel 2. 0: Disables the operation of the volume ramp function. 1: Enables the operation of the volume ramp function.
1	VREN1	0	R/W	Volume Ramp Enable for Channel 1 This bit controls the operation of the volume ramp function for channel 1. 0: Disables the operation of the volume ramp function. 1: Enables the operation of the volume ramp function.
0	VREN0	0	R/W	Volume Ramp Enable for Channel 0 This bit controls the operation of the volume ramp function for channel 0. 0: Disables the operation of the volume ramp function. 1: Enables the operation of the volume ramp function.

48.3.37 DVU0_n Volume Ramp Period Register (VRPDR_DVU0_n) (n = 0, 1, 2, 3)

VRPDR_DVU0_n is a 32-bit readable/writable register that sets the ramp period of volume ramp.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	VRPDUP					-	-	-	VRPDDW				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 8	VRPDUP	All 0	R/W	Volume Ramp Period for Volume Up 00000: 1 [sample] (128 dB/1 step) 00001: 2 [sample] (64 dB/1 step) 00010: 4 [sample] (32 dB/1 step) 00011: 8 [sample] (16 dB/1 step) 00100: 16 [sample] (8 dB/1 step) 00101: 32 [sample] (4 dB/1 step) 00110: 64 [sample] (2 dB/1 step) 00111: 128 [sample] (1 dB/1 step) 01000: 256 [sample] (0.5 dB/1 step) 01001: 512 [sample] (0.25 dB/1 step) 01010: 1024 [sample] (0.125 dB/1 step) 01011: 2048 [sample] (0.125 dB/2 steps) 01100: 4096 [sample] (0.125 dB/4 steps) 01101: 8192 [sample] (0.125 dB/8 steps) 01110: 16384 [sample] (0.125 dB/16 steps) 01111: 32768 [sample] (0.125 dB/32 steps) 10000: 65536 [sample] (0.125 dB/64 steps) 10001: 131072 [sample] (0.125 dB/128 steps) 10010: 262144 [sample] (0.125 dB/256 steps) 10011: 524288 [sample] (0.125 dB/512 steps) 10100: 1048576 [sample] (0.125 dB/1024 steps) 10101: 2097152 [sample] (0.125 dB/2048 steps) 10110: 4194304 [sample] (0.125 dB/4096 steps) 10111: 8388608 [sample] (0.125 dB/8192 steps) 11000 to 11111: Reserved
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
4 to 0	VRPDDW	0	R/W	Volume Ramp Period for Volume Down 00000: 1 [sample] (-128 dB/1 step) 00001: 2 [sample] (-64 dB/1 step) 00010: 4 [sample] (-32 dB/1 step) 00011: 8 [sample] (-16 dB/1 step) 00100: 16 [sample] (-8 dB/1 step) 00101: 32 [sample] (-4 dB/1 step) 00110: 64 [sample] (-2 dB/1 step) 00111: 128 [sample] (-1 dB/1 step) 01000: 256 [sample] (-0.5 dB/1 step) 01001: 512 [sample] (-0.25 dB/1 step) 01010: 1024 [sample] (-0.125 dB/1 step) 01011: 2048 [sample] (-0.125 dB/2 steps) 01100: 4096 [sample] (-0.125 dB/4 steps) 01101: 8192 [sample] (-0.125 dB/8 steps) 01110: 16384 [sample] (-0.125 dB/16 steps) 01111: 32768 [sample] (-0.125 dB/32 steps) 10000: 65536 [sample] (-0.125 dB/64 steps) 10001: 131072 [sample] (-0.125 dB/128 steps) 10010: 262144 [sample] (-0.125 dB/256 steps) 10011: 524288 [sample] (-0.125 dB/512 steps) 10100: 1048576 [sample] (-0.125 dB/1024 steps) 10101: 2097152 [sample] (-0.125 dB/2048 steps) 10110: 4194304 [sample] (-0.125 dB/4096 steps) 10111: 8388608 [sample] (-0.125 dB/8192 steps) 11000 to 11111: Reserved

48.3.38 DVU0_n Volume Ramp Decibel Register (VRDBR_DVU0_n) (n = 0, 1, 2, 3)

VRDBR_DVU0_n is a 32-bit readable/writable register that sets the gain level (decibel units) of volume ramp.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	VRDB									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	VRDB	All 0	R/W	Decibel of Volume Ramp These bits set the decibel (gain level) of volume ramp. The value can be selected from 1024 points in the range of 0 dB to -∞ dB at intervals of 0.125 dB.

Setting Value	Time	Gain[dB]	Setting Value	Time	Gain[dB]
0x000	1	0	.....	.....	.....
.....	.....	.....	0x091	0.125	-18.125
0x031	0.5	-6.125	.....	.....	.....
.....	.....	.....	0x3FE	4.1×10^{-7}	-127.75
0x061	0.25	-12.125	0x3FF	0 (Mute)	-∞

48.3.39 DVU0_n Volume Ramp Wait Time Register (VRWTR_DVU0_n) (n = 0, 1, 2, 3)

VRWTR_DVU0_n is a 32-bit readable/writable register that sets the wait time before executing the volume ramp function.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	VRWT							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VRWT															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	VRWT	All 0	R/W	Volume Ramp Wait Time These bits set the wait time before starting the volume ramp function when the setting of VRDBR register is changed. If the internal counter of the DVU logic reached to the value of these bits, the volume ramp function starts operating to change the volume to the value changed in the VRDBR register as a target.

48.3.40 DVU0_n Volume Value Setting 0 Register (VOL0R_DVU0_n) (n = 0, 1, 2, 3)

VOL0R_DVU0_n is a 32-bit readable/writable register that sets the digital volume value of channel 0.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	VOLVAL0							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VOLVAL0															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	VOLVAL0	All 0	R/W	Digital Volume Value for Channel 0 These bits set the digital volume of channel 0. The maximum value is octupled gain (18 dB) and the minimum value is 0 (-∞ dB). VOLVAL0[23] : Sign bit VOLVAL0[22:20] : Integer bits VOLVAL0[19:0] : Decimal bits

Setting Value	Time	Gain[dB]	Setting Value	Time	Gain[dB]

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	DVUEN	0	R/W	DVU Register Setting Enable This bit controls the setting of DVU registers (ZCMCR, VRCTR, VRPDR, VRDBR, VOL0R, VOL1R, VOL2R, VOL3R, VOL4R, VOL5R, VOL6R, and VOL7R). 0: Disables the setting of DVU registers. 1: Enables the setting of DVU registers.

48.3.49 DVU0_n Status Register (DVUSR_DVU0_n) (n = 0, 1, 2, 3)

DVUSR_DVU0_n is a 32-bit read-only register that indicates the status of zero cross mute and volume ramp.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	ZSTS7	ZSTS6	ZSTS5	ZSTS4	ZSTS3	ZSTS2	ZSTS1	ZSTS0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	VRSTS		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23	ZSTS7	0	R	Zero Cross Mute Status of Channel 7 This bit indicates the zero cross mute status of channel 7. 0: Not in mute status 1: Mute status
22	ZSTS6	0	R	Zero Cross Mute Status of Channel 6 This bit indicates the zero cross mute status of channel 6. 0: Not in mute status 1: Mute status
21	ZSTS5	0	R	Zero Cross Mute Status of Channel 5 This bit indicates the zero cross mute status of channel 5. 0: Not in mute status 1: Mute status
20	ZSTS4	0	R	Zero Cross Mute Status of Channel 4 This bit indicates the zero cross mute status of channel 4. 0: Not in mute status 1: Mute status
19	ZSTS3	0	R	Zero Cross Mute Status of Channel 3 This bit indicates the zero cross mute status of channel 3. 0: Not in mute status 1: Mute status
18	ZSTS2	0	R	Zero Cross Mute Status of Channel 2 This bit indicates the zero cross mute status of channel 2. 0: Not in mute status 1: Mute status
17	ZSTS1	0	R	Zero Cross Mute Status of Channel 1 This bit indicates the zero cross mute status of channel 1. 0: Not in mute status 1: Mute status
16	ZSTS0	0	R	Zero Cross Mute Status of Channel 0 This bit indicates the zero cross mute status of channel 0. 0: Not in mute status 1: Mute status
15 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	VRSTS	All 0	R	Volume Ramp Status These bits indicate the volume ramp status. 000: Mute status 001: Volume ramp down 010: Volume ramp up 011: Level of volume ramp is in the state of the value of VRDBR register 100: Volume of input data is maintained (Volume is not multiplied). 101 to 111: Reserved

48.3.50 DVU0_n Event Mask Register (VEVMR_DVU0_n) (n = 0, 1, 2, 3)

VEVMR_DVU0_n is a 32-bit readable/writable register that enables or disables SCUDVIn interrupt requests.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	VEVMZCM7	VEVMZCM6	VEVMZCM5	VEVMZCM4	VEVMZCM3	VEVMZCM2	VEVMZCM1	VEVMZCM0	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VEVMVR	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	VEVMZCM7	0	R/W	Zero Cross Mute Status Change Mask of Channel 7 This bit sets whether to mask the interrupt request from the VEVCZCM7 bit in the VEVCR_DVU0_n register. 0: Disables interrupts. 1: Enables interrupts.
30	VEVMZCM6	0	R/W	Zero Cross Mute Status Change Mask of Channel 6 This bit sets whether to mask the interrupt request from the VEVCZCM6 bit in the VEVCR_DVU0_n register. 0: Disables interrupts. 1: Enables interrupts.
29	VEVMZCM5	0	R/W	Zero Cross Mute Status Change Mask of Channel 5 This bit sets whether to mask the interrupt request from the VEVCZCM5 bit in the VEVCR_DVU0_n register. 0: Disables interrupts. 1: Enables interrupts.
28	VEVMZCM4	0	R/W	Zero Cross Mute Status Change Mask of Channel 4 This bit sets whether to mask the interrupt request from the VEVCZCM4 bit in the VEVCR_DVU0_n register. 0: Disables interrupts. 1: Enables interrupts.
27	VEVMZCM3	0	R/W	Zero Cross Mute Status Change Mask of Channel 3 This bit sets whether to mask the interrupt request from the VEVCZCM3 bit in the VEVCR_DVU0_n register. 0: Disables interrupts. 1: Enables interrupts.
26	VEVMZCM2	0	R/W	Zero Cross Mute Status Change Mask of Channel 2 This bit sets whether to mask the interrupt request from the VEVCZCM2 bit in the VEVCR_DVU0_n register. 0: Disables interrupts. 1: Enables interrupts.
25	VEVMZCM1	0	R/W	Zero Cross Mute Status Change Mask of Channel 1 This bit sets whether to mask the interrupt request from the VEVCZCM1 bit in the VEVCR_DVU0_n register. 0: Disables interrupts. 1: Enables interrupts.
24	VEVMZCM0	0	R/W	Zero Cross Mute Status Change Mask of Channel 0 This bit sets whether to mask the interrupt request from the VEVCZCM0 bit in the VEVCR_DVU0_n register. 0: Disables interrupts. 1: Enables interrupts.
23 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	VEVMVR	0	R/W	Volume Ramp Status Change This bit sets whether to mask the interrupt request from the VEVCVR bit in the VEVCR_DVU0_n register. 0: Disables interrupts. 1: Enables interrupts.

Bit	Bit Name	Initial Value	R/W	Description
14 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

48.3.51 DVU0_n Event Clear Register (VEVCR_DVU0_n) (n = 0, 1, 2, 3)

VEVCR_DVU0_n is a 32-bit readable/writable register that clears SCUDVIn interrupt requests. When an interrupt event is generated, the relevant bit in this register is automatically set to 1 and 1 is retained until 0 is written to that bit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	VEVCZCM7	VEVCZCM6	VEVCZCM5	VEVCZCM4	VEVCZCM3	VEVCZCM2	VEVCZCM1	VEVCZCM0	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/(W)*1	R/(W)*1	R/(W)*1	R/(W)*1	R/(W)*1	R/(W)*1	R/(W)*1	R/(W)*1	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VEVCVR	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/(W)*1	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	VEVCZCM7	0	R/(W)*1	Zero Cross Mute Status Change Clear of Channel 7 This is an interrupt flag to indicate whether the zero cross mute status change of channel 7 occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
30	VEVCZCM6	0	R/(W)*1	Zero Cross Mute Status Change Clear of Channel 6 This is an interrupt flag to indicate whether the zero cross mute status change of channel 6 occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
29	VEVCZCM5	0	R/(W)*1	Zero Cross Mute Status Change Clear of Channel 5 This is an interrupt flag to indicate whether the zero cross mute status change of channel 5 occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
28	VEVCZCM4	0	R/(W)*1	Zero Cross Mute Status Change Clear of Channel 4 This is an interrupt flag to indicate whether the zero cross mute status change of channel 4 occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
27	VEVCZCM3	0	R/(W)*1	Zero Cross Mute Status Change Clear of Channel 3 This is an interrupt flag to indicate whether the zero cross mute status change of channel 3 occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
26	VEVCZCM2	0	R/(W)*1	Zero Cross Mute Status Change Clear of Channel 2 This is an interrupt flag to indicate whether the zero cross mute status change of channel 2 occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
25	VEVCZCM1	0	R/(W)*1	Zero Cross Mute Status Change Clear of Channel 1 This is an interrupt flag to indicate whether the zero cross mute status change of channel 1 occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
24	VEVCZCM0	0	R/(W)*1	Zero Cross Mute Status Change Clear of Channel 0 This is an interrupt flag to indicate whether the zero cross mute status change of channel 0 occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
23 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
15	VEVCVR	0	R/(W)*1	Volume Ramp Status Change Clear This is an interrupt flag to judge volume ramp mute occurs or not. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
14 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note 1. Readable/writable. When 0 is written, the bit is initialized. Writing 1 to the bit is ignored. Write 0 only to each bit corresponding to the interrupt source to be cleared; write 1 to other bits.

48.3.52 MIX0_0 Initialization Register (MIXIR_MIX0_0)

MIXIR_MIX0_0 is a 32-bit readable/writable register that initializes the MIX internal circuit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INIT	1	R/W	Initialization When this bit is set to 1, the MIX internal circuit is initialized. To cancel the initialization, set this bit to 0 with it set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers)

48.3.53 MIX0_0 Audio Information Register (MADIR_MIX0_0)

MADIR_MIX0_0 is a 32-bit readable/writable register that sets the number of channels.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	CHNUM			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	CHNUM	All 0	R/W	Number of Channels These bits set the number of channels. 0000: Zero (None) 0001: 1 channel 0010: 2 channels 0011: Reserved 0100: 4 channels 0101: Reserved 0110: 6 channels 0111: Reserved 1000: 8 channels 1001 to 1111: Reserved

48.3.54 MIX0_0 Bypass Register (MIXBR_MIX0_0)

MIXBR_MIX0_0 is a 32-bit readable/writable register that sets the bypass mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	BPSYS	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	BY PASS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17, 16	BPSYS	All 0	R/W	Bypass System Select These bits select the input data output from the MIX module when the BYPASS bit is 1. 00: Input data of system A 01: Input data of system B 10: Input data of system C 11: Input data of system D
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	BYPASS	0	R/W	Bypass Mode This bit controls the data pass of MIX function. 0: MIX function is used. Input data is processed by MIX and then the result data is connected to output data. 1: MIX function is not used (bypass mode). Input data is connected to output data according to the BPSYS bits.

48.3.55 MIX0_0 Mode Register (MIXMR_MIX0_0)

MIXMR_MIX0_0 is a 32-bit readable/writable register that selects the MIX mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MIX MODE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	MIXMODE	0	R/W	MIX Mode This bit sets the mix mode. 0: Selects volume step mixer. 1: Selects volume ramp mixer.

48.3.56 MIX0_0 Volume Period Register (MVPDR_MIX0_0)

MVPDR_MIX0_0 is a 32-bit readable/writable register that sets the ramp period of volume ramp.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	MXPDUP				-	-	-	-	MXPDDW			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 8	MXPDUP	0	R/W	Volume Up Period These bits set the decibel which changes per sample during volume up. This setting is used when the MIXMODE bit in the MIXMR register is set to 1. 0000: 128 dB/1 sample 0001: 64 dB/1 sample 0010: 32 dB/1 sample 0011: 16 dB/1 sample 0100: 8 dB/1 sample 0101: 4 dB/1 sample 0110: 2 dB/1 sample 0111: 1 dB/1 sample 1000: 0.5 dB/1 sample 1001: 0.25 dB/1 sample 1010: 0.125 dB/1 sample 1011 to 1111: Reserved
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	MXPDDW	0	R/W	Volume Down Period These bits set the decibel which changes per sample during volume down. This setting is used when the MIXMODE bit in the MIXMR register is set to 1. 0000: -128 dB/1 sample 0001: -64 dB/1 sample 0010: -32 dB/1 sample 0011: -16 dB/1 sample 0100: -8 dB/1 sample 0101: -4 dB/1 sample 0110: -2 dB/1 sample 0111: -1 dB/1 sample 1000: -0.5 dB/1 sample 1001: -0.25 dB/1 sample 1010: -0.125 dB/1 sample 1011 to 1111: Reserved

48.3.57 MIX0_0 Decibel A Register (MDBAR_MIX0_0)

MDBAR_MIX0_0 is a 32-bit readable/writable register that sets the gain level (decibel units) of system A.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	MIXDBA									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	MIXDBA	All 0	R/W	Decibel of System A These bits set the decibel (gain level) of volume ramp. The value can be selected from 1024 points in the range of 0 dB to -∞ dB at intervals of 0.125 dB.

Setting Value	Time	Gain[dB]	Setting Value	Time	Gain[dB]
0x000	1	0	.....	.....	.....
.....	.....	.....	0x091	0.125	-18.125
0x031	0.5	-6.125	.....	.....	.....
.....	.....	.....	0x3FE	4.1×10^{-7}	-127.75
0x061	0.25	-12.125	0x3FF	0 (Mute)	-∞

48.3.58 MIX0_0 Decibel B Register (MDBBR_MIX0_0)

MDBBR_MIX0_0 is a 32-bit readable/writable register that sets the gain level (decibel units) of system B.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	MIXDBB									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
9 to 0	MIXDBB	All 0	R/W	Decibel of System B These bits set the decibel (gain level) of volume ramp. The value can be selected from 1024 points in the range of 0 dB to -∞ dB at intervals of 0.125 dB.

Setting Value	Time	Gain[dB]	Setting Value	Time	Gain[dB]
0x000	1	0	.....	.....	.....
.....	.....	.....	0x091	0.125	-18.125
0x031	0.5	-6.125	.....	.....	.....
.....	.....	.....	0x3FE	4.1×10^{-7}	-127.75
0x061	0.25	-12.125	0x3FF	0 (Mute)	-∞

48.3.59 MIX0_0 Decibel C Register (MDBCR_MIX0_0)

MDBCR_MIX0_0 is a 32-bit readable/writable register that sets the gain level (decibel units) of system C.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	MIXDBC									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	MIXDBC	All 0	R/W	Decibel of System C These bits set the decibel (gain level) of volume ramp. The value can be selected from 1024 points in the range of 0 dB to -∞ dB at intervals of 0.125 dB.

Setting Value	Time	Gain[dB]	Setting Value	Time	Gain[dB]
0x000	1	0	.....	.....	.....
.....	.....	.....	0x091	0.125	-18.125
0x031	0.5	-6.125	.....	.....	.....
.....	.....	.....	0x3FE	4.1×10^{-7}	-127.75
0x061	0.25	-12.125	0x3FF	0 (Mute)	-∞

48.3.60 MIX0_0 Decibel D Register (MDBDR_MIX0_0)

MDBDR_MIX0_0 is a 32-bit readable/writable register that sets the gain level (decibel units) of system D.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	MIXDBD									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	MIXDBD	All 0	R/W	Decibel of System D These bits set the decibel (gain level) of volume ramp. The value can be selected from 1024 points in the range of 0 dB to -∞ dB at intervals of 0.125 dB.

Setting Value	Time	Gain[dB]	Setting Value	Time	Gain[dB]
0x000	1	0	.....	.....	.....
.....	.....	.....	0x091	0.125	-18.125
0x031	0.5	-6.125	.....	.....	.....
.....	.....	.....	0x3FE	4.1×10^{-7}	-127.75
0x061	0.25	-12.125	0x3FF	0 (Mute)	-∞

48.3.61 MIX0_0 Decibel Enable Register (MDBER_MIX0_0)

MDBER_MIX0_0 is a 32-bit readable/writable register that enable or disables the MIX decibel register settings.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MIXDB EN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	MIXDBEN	0	R/W	MIX Decibel Enable This bit controls the decibel value that sets in MDBAR, MDBBR, MDBCR and MDBDR registers. 0: Disables the setting of decibel. 1: Enables the setting of decibel.

48.3.62 MIX0_0 Status Register (MIXSR_MIX0_0)

MIXSR_MIX0_0 is a 32-bit read-only register that indicates the status of the MIX.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MIXSTS	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	MIXSTS	All 0	R	MIX Status This bit specifies the status of ramp process. 00: Ramp process is unchanged. 01: Ramp down 10: Ramp up

48.3.63 Software Reset Register (SWRSR_CIM)

SWRSR_CIM is a 32-bit readable/writable register that initializes the SCUX internal circuit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SWRST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SWRST	1	R/W	Software Reset While this bit is 0, the SCUX internal circuits are put in the reset state. Registers except this register are reset. Therefore, they should be set again after the reset is canceled. 0: The SCUX is reset. 1: The SCUX is operating.

48.3.64 DMA Control Register (DMACR_CIM)

DMACR_CIM is a 32-bit readable/writable register that controls DMA execution.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	DMAM DFFU3	DMAM DFFU2	DMAM DFFU1	DMAM DFFU0	DMAM DFFD3	DMAM DFFD2	DMAM DFFD1	DMAM DFFD0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	—	All 0	R/W	Reserved The write value should always be 0.
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	DMAMDFFU3	0	R/W	FFU0_3 DMA Mode 0: Disables DMA transfer to DMATD3_CIM. 1: Enables DMA transfer to DMATD3_CIM. Note: When DMA transfer is enabled, disable packet requests sent to the interrupt controller. (Set the UEVMR_FFU0_3.UEVMRQ bit to 0.)
6	DMAMDFFU2	0	R/W	FFU0_2 DMA Mode 0: Disables DMA transfer to DMATD2_CIM. 1: Enables DMA transfer to DMATD2_CIM. Note: When DMA transfer is enabled, disable packet requests sent to the interrupt controller. (Set the UEVMR_FFU0_2.UEVMRQ bit to 0.)
5	DMAMDFFU1	0	R/W	FFU0_1 DMA Mode 0: Disables DMA transfer to DMATD1_CIM. 1: Enables DMA transfer to DMATD1_CIM. Note: When DMA transfer is enabled, disable packet requests sent to the interrupt controller. (Set the UEVMR_FFU0_1.UEVMRQ bit to 0.)
4	DMAMDFFU0	0	R/W	FFU0_0 DMA Mode 0: Disables DMA transfer to DMATD0_CIM. 1: Enables DMA transfer to DMATD0_CIM. Note: When DMA transfer is enabled, disable packet requests sent to the interrupt controller. (Set the UEVMR_FFU0_0.UEVMRQ bit to 0.)

0	DMAMDFFD0	0	R/W	FFD0_0 DMA Mode 0: Disables DMA transfer to DMATD0_CIM. 1: Enables DMA transfer to DMATD0_CIM. Note: When DMA transfer is enabled, disable packet requests sent to the interrupt controller. (Set the DEVMR_FFD0_0.DEVMRQ bit to 0.)

48.3.65 DMA Transfer Register for FFD0_n (DMATDn_CIM) (n = 0, 1, 2, 3)

DMATDn_CIM is a 32-bit register that stores the data to be transmitted to FFD0_n. The data written to DMATDn_CIM is automatically stored in FFD0_n. When the number of idle data bytes in FFD0_n becomes equal to or greater than the value set in DRQSR_FFD0_n.SIZE, a data transfer request is issued. When the DMA controller is used (DMACR_CIM.DMAMDFFDn = 1), a transfer request for the number of counts set in DRQSR_FFD0_n.SIZE is sent to the DMA controller. When the interrupt controller is used (DEVMR_FFD0_n.DEVMRQ = 1), data is written in this register for the number of counts set in DRQSR_FFD0_n.SIZE.

R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

In the SCUX internal block, audio data is handled in the 24-bit big endian format. When this register is accessed in 32-bit units, the lower eight bits are not used and only the upper 24 bits are used, as shown in Figure 48.2. When the SCUX is used in 16-bit mode, the valid data needs to be located at the MSB of audio data. Therefore, when this register is accessed in 16-bit units, the written data is located in the upper 16 bits of audio data and the lower eight bits are fixed to 0 in the CIM block. When the SCUX is used in 16-bit mode and this register is accessed in 32-bit units, since bits [15:8] of the data to be written is passed to the FFD block without change, 0 should be written to bits [15:8].

48.3.66 DMA Transfer Register for FFU0_n (DMATUn_CIM) (n = 0, 1, 2, 3)

DMATUn_CIM is a 32-bit register that stores the data received from FFU0_n. When data is read from DMATUn_CIM, the next data is automatically transferred from FFU0_n. When the number of data bytes in FFU0_n becomes equal to or greater than the value set in URQSR_FFU0_n.SIZE, a data transfer request is issued. When the DMA controller is used (DMACR_CIM.DMAMDFFUn = 1), a transfer request for the number of counts set in URQSR_FFU0_n.SIZE is sent to the DMA controller. When the interrupt controller is used (UEVMR_FFU0_n.UEVMRQ = 1), data is read from this register for the number of counts set in URQSR_FFU0_n.SIZE.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

When this register is accessed in 32-bit units, audio data is located in the upper 24 bits and the lower eight bits are always read as 0, as shown in Figure 48.3. When this register is accessed in 16-bit units, the upper 16 bits of audio data are read as valid data. When the SCUX is used in 16-bit mode and this register is accessed in 32-bit units, the lower eight bits are always read as 0 and bits [15:8] of the read data are read as a value dependent on the internal operation result in the SRC.

48.3.67 SSI Route Select Register (SSIRSEL_CIM)

SSIRSEL_CIM is a 32-bit readable/writable register that selects the SSIF channel to be connected to each SRC during direct transfer with the SSIF module. This register setting has no meaning when a route between the FFD or FFU module is selected. The IPSLR_IPC0_n and OPSLR_OPC0_n registers are used to select connection between the SSIF or FFD/FFU module. The DVUBR_DVU0_n register is used to specify whether the DVU is used or not.

R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SCKDIV	All 0	R/W	Division Ratio These bits specify the ratio for dividing the input clock specified in the SCKSEL bits to generate the timing signal. Note: Always write 0 to bit 16. (Writing 1 to bit 16 is ignored.) When all of these bits are set to 0, the division ratio is 1. Only the input clock selected by SCKSEL[3] = 0 will be divided. The WS signal selected by SCKSEL[3] = 1 will not be divided. The DIVEN bit must be set to 0 before changing these bits.
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	DIVEN	0	R/W	Division Enable Frequency division starts the moment 1 is written to this bit. 1: Starts frequency division. 0: Outputs 0.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	MTUSEL	0	R/W	MTU Select This bit selects the clock signal specified by setting the SCKSEL bits to 0101 from the multi-function timer pulse unit 2. 0: Uses TIOC3A. 1: Uses TIOC4A
3 to 0	SCKSEL	All 0	R/W	Clock Select These bits select the clock that is used in generating the timing signal. 0000: Uses AUDIO_CLK. 0001: Uses the AUDIO_X1 input. 0010: Uses MLB_CLK. 0011: Uses USB_X1. 0100: Uses the peripheral clock 1 (P1Φ) divided into 2. 0101: Uses the signal specified by the MTUSEL bit. 0110 and 0111: Setting prohibited 1000: Uses the WS signal of SSIF0. 1001: Uses the WS signal of SSIF1. 1010: Uses the WS signal of SSIF2. 1011: Uses the WS signal of SSIF3. 1100: Uses the WS signal of SSIF4. 1101: Uses the WS signal of SSIF5. 1110 and 1111: Setting prohibited Note: The DIVEN bit must be set to 0 before changing these bits.

The input timing signal selector has the configuration shown in Figure 48.4.

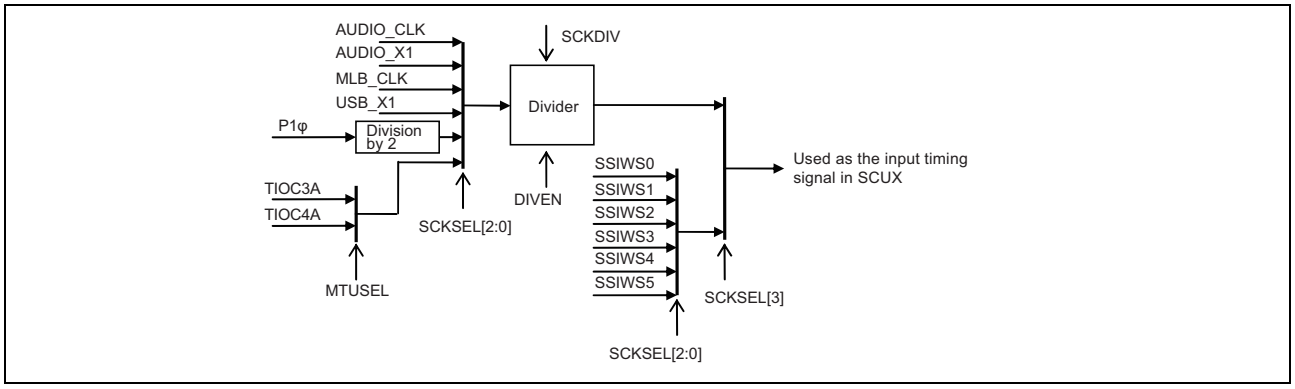

Figure 48.4 Configuration Diagram of Input Timing Signal Selector

48.3.69 FFU0_n Timing Select Register (FDTSELn_CIM) (n = 0, 1, 2, 3)

FUTSELn_CIM is a 32-bit writable register that selects the output timing signal to be used in SRCn (n = 0, 1, 2, 3) when asynchronous mode is selected. This register setting is used when the route with the FFU module is selected or when output to the MIX is selected.

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
21	SSI5CKS	0	R/W	SSIF5 Clock Select This bit selects the clock to be connected to the AUDIO_CLK pin of the SSIF5 module. 0: Selects the AUDIO_CLK input. 1: Selects the MLB_CLK input. Note: When selecting AUDIO_CLK or MLB_CLK as the oversampling clock of the SSIF5 module, SSICR5.CKS = 1 must also be set in the SSIF5 module.
20	SSI4CKS	0	R/W	SSIF4 Clock Select This bit selects the clock to be connected to the AUDIO_CLK pin of the SSIF4 module. 0: Selects the AUDIO_CLK input. 1: Selects the MLB_CLK input. Note: When selecting AUDIO_CLK or MLB_CLK as the oversampling clock of the SSIF4 module, SSICR4.CKS = 1 must also be set in the SSIF4 module.
19	SSI3CKS	0	R/W	SSIF3 Clock Select This bit selects the clock to be connected to the AUDIO_CLK pin of the SSIF3 module. 0: Selects the AUDIO_CLK input. 1: Selects the MLB_CLK input. Note: When selecting AUDIO_CLK or MLB_CLK as the oversampling clock of the SSIF3 module, SSICR3.CKS = 1 must also be set in the SSIF3 module.
18	SSI2CKS	0	R/W	SSIF2 Clock Select This bit selects the clock to be connected to the AUDIO_CLK pin of the SSIF2 module. 0: Selects the AUDIO_CLK input. 1: Selects the MLB_CLK input. Note: When selecting AUDIO_CLK or MLB_CLK as the oversampling clock of the SSIF2 module, SSICR2.CKS = 1 must also be set in the SSIF2 module.
17	SSI1CKS	0	R/W	SSIF1 Clock Select This bit selects the clock to be connected to the AUDIO_CLK pin of the SSIF1 module. 0: Selects the AUDIO_CLK input. 1: Selects the MLB_CLK input. Note: When selecting AUDIO_CLK or MLB_CLK as the oversampling clock of the SSIF1 module, SSICR1.CKS = 1 must also be set in the SSIF1 module.

Bit	Bit Name	Initial Value	R/W	Description
16	SSI0CKS	0	R/W	SSIF0 Clock Select This bit selects the clock to be connected to the AUDIO_CLK pin of the SSIF0 module. 0: Selects the AUDIO_CLK input. 1: Selects the MLB_CLK input. Note: When selecting AUDIO_CLK or MLB_CLK as the oversampling clock of the SSIF0 module, SSICR0.CKS = 1 must also be set in the SSIF0 module.
15, 14	SSI3PMD	00	R/W	SSIF3 Pin Mode These bits select connection of the SSISCK3 and SSIWS3 pins. 00: The pins are used independently. 01: The SSIF0 pins are used in common. Both SSIF0 and SSIF3 are slaves. 10: The SSIF0 pins are used in common. SSIF0 is the master and SSIF3 is the slave. 11: Setting prohibited
13	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
12	SSI345EN	0	R/W	SSIF345 Enable This bit selects whether the three modules SSIF3, SSIF4, and SSIF5 are used to provide six channels at transmission. 0: Not handled as six channels. 1: Handled as six channels. Note: This bit can be set to 1 only when the SSI4PMD and SSI5PMD bits of this register are both set to 01 or 10. Usage of six channels at reception can be specified by SSIRSEL_CIM.SISEL1.
11, 10	SSI4PMD	00	R/W	SSIF4 Pin Mode These bits select connection of the SSISCK4 and SSIWS4 pins. 00: The pins are used independently. 01: The SSIF3 pins are used in common. Both SSIF3 and SSIF4 are slaves. 10: The SSIF3 pins are used in common. SSIF3 is the master and SSIF4 is the slave. 11: Setting prohibited
9, 8	SSI5PMD	00	R/W	SSIF5 Pin Mode These bits select connection of the SSISCK5 and SSIWS5 pins. 00: The pins are used independently. 01: The SSIF3 pins are used in common. Both SSIF3 and SSIF5 are slaves. 10: The SSIF3 pins are used in common. SSIF3 is the master and SSIF5 is the slave. 11: Setting prohibited
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SSI012EN	0	R/W	SSIF012 Enable This bit selects whether the three modules SSIF0, SSIF1, and SSIF2 are used to provide six channels at transmission. 0: Not handled as six channels. 1: Handled as six channels. Note: This bit can be set to 1 only when the SSI1PMD and SSI2PMD bits of this register are both set to 01 or 10. Usage of six channels at reception can be specified by SSIRSEL_CIM.SISEL0.
3, 2	SSI2PMD	00	R/W	SSIF2 Pin Mode These bits select connection of the SSISCK2 and SSIWS2 pins. 00: The pins are used independently. 01: The SSIF0 pins are used in common. Both SSIF0 and SSIF2 are slaves. 10: The SSIF0 pins are used in common. SSIF0 is the master and SSIF2 is the slave. 11: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
1, 0	SSI1PMD	00	R/W	SSIF1 Pin Mode These bits select connection of the SSISCK1 and SSIWS1 pins. 00: The pins are used independently. 01: The SSIF0 pins are used in common. Both SSIF0 and SSIF1 are slaves. 10: The SSIF0 pins are used in common. SSIF0 is the master and SSIF1 is the slave. 11: Setting prohibited

48.3.71 SSI Control Register (SSICTRL_CIM)

SSIPCTRL_CIM is a 32-bit readable/writable register that controls connection with the SSIF module and starting and stopping of the SSIF module.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	SSI3TX	SSI4TX	SSI5TX	-	SSI3RX	SSI4RX	SSI5RX	-	-	-	-	-	-	SSI 345TEN	SSI 345REN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	-	W	W	W	-	W	W	W	-	-	-	-	-	-	W	W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	SSI0TX	SSI1TX	SSI2TX	-	SSI0RX	SSI1RX	SSI2RX	-	-	-	-	-	-	SSI 012TEN	SSI 012REN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	-	W	W	W	-	W	W	W	-	-	-	-	-	-	W	W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	—	Reserved The write value should always be 0.
30	SSI3TX	0	W	SSIF3 Direct Transmission 0: Disables direct transmission to SSIF3. 1: Enables direct transmission to SSIF3.
29	SSI4TX	0	W	SSIF4 Direct Transmission 0: Disables direct transmission to SSIF4. 1: Enables direct transmission to SSIF4.
28	SSI5TX	0	W	SSIF5 Direct Transmission 0: Disables direct transmission to SSIF5. 1: Enables direct transmission to SSIF5.
27	—	0	—	Reserved The write value should always be 0.
26	SSI3RX	0	W	SSIF3 Direct Reception 0: Disables direct reception from SSIF3. 1: Enables direct reception from SSIF3.
25	SSI4RX	0	W	SSIF4 Direct Reception 0: Disables direct reception from SSIF4. 1: Enables direct reception from SSIF4.
24	SSI5RX	0	W	SSIF5 Direct Reception 0: Disables direct reception from SSIF5. 1: Enables direct reception from SSIF5.
23 to 18	—	All 0	—	Reserved The write value should always be 0.
17	SSI345TEN	0	W	SSIF345 Transmission Enable This bit specifies transmission in three modules SSIF3, SSIF4, and SSIF5 to be started or stopped simultaneously. 0: Stops transmission in SSIF3, SSIF4, and SSIF5. 1: Starts transmission in SSIF3, SSIF4, and SSIF5. Note: This function can be used only when SSIPMD_CIM.SSI345EN = 1. When SSIPMD_CIM.SSI345EN = 0, SSIF modules should be controlled using SSICRn.TEN. This bit must be set to 0 when performing direct transmission to SSIF3, SSIF4, or SSIF5.
16	SSI345REN	0	W	SSIF345 Reception Enable This bit specifies reception in three modules SSIF3, SSIF4, and SSIF5 to be started or stopped simultaneously. 0: Stops reception in SSIF3, SSIF4, and SSIF5. 1: Starts reception in SSIF3, SSIF4, and SSIF5. Note: This function can be used only when SSIRSEL_CIM.SISEL1 = 01. When SSIRSEL_CIM.SISEL1 = 00, SSIF modules should be controlled using SSICRn.REN. This bit must be set to 0 when performing direct reception from SSIF3, SSIF4, or SSIF5.

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	—	Reserved The write value should always be 0.
14	SSI0TX	0	W	SSIF0 Direct Transmission 0: Disables direct transmission to SSIF0. 1: Enables direct transmission to SSIF0.
13	SSI1TX	0	W	SSIF1 Direct Transmission 0: Disables direct transmission to SSIF1. 1: Enables direct transmission to SSIF1.
12	SSI2TX	0	W	SSIF2 Direct Transmission 0: Disables direct transmission to SSIF2. 1: Enables direct transmission to SSIF2.
11	—	0	—	Reserved The write value should always be 0.
10	SSI0RX	0	W	SSIF0 Direct Reception 0: Disables direct reception from SSIF0. 1: Enables direct reception from SSIF0.
9	SSI1RX	0	W	SSIF1 Direct Reception 0: Disables direct reception from SSIF1. 1: Enables direct reception from SSIF1.
8	SSI2RX	0	W	SSIF2 Direct Reception 0: Disables direct reception from SSIF2. 1: Enables direct reception from SSIF2.
7 to 2	—	All 0	—	Reserved The write value should always be 0.
1	SSI012TEN	0	W	SSIF012 Transmission Enable This bit specifies transmission in three modules SSIF0, SSIF1, and SSIF2 to be started or stopped simultaneously. 0: Stops transmission in SSIF0, SSIF1, and SSIF2. 1: Starts transmission in SSIF0, SSIF1, and SSIF2. Note: This function can be used only when SSIPMD_CIM.SSI012EN = 1. When SSIPMD_CIM.SSI012EN = 0, SSIF modules should be controlled using SSICRn.TEN. This bit must be set to 0 when performing direct transmission to SSIF0, SSIF1, or SSIF2.
0	SSI012REN	0	W	SSIF012 Reception Enable This bit specifies reception in three modules SSIF0, SSIF1, and SSIF2 to be started or stopped simultaneously. 0: Stops reception in SSIF0, SSIF1, and SSIF2. 1: Starts reception in SSIF0, SSIF1, and SSIF2. Note: This function can be used only when SSIRSEL_CIM.SISEL0 = 01. When SSIRSEL_CIM.SISEL0 = 00, SSIF modules should be controlled using SSICRn.REN. This bit must be set to 0 when performing direct reception from SSIF0, SSIF1, or SSIF2.

48.3.72 SRCn Route Select Register (SRCRSELn_CIM) (n = 0, 1, 2, 3)

SRCRSEL_CIM is a 32-bit readable/writable register that sets the route for the data that is input to the SRC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	PLACE7			-	PLACE6			-	PLACE5			-	PLACE4		
Initial value:	0	1	1	1	0	1	1	0	0	1	0	1	0	1	0	0
R/W:	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	PLACE3			-	PLACE2			-	PLACE1			-	PLACE0		
Initial value:	0	0	1	1	0	0	1	0	0	0	0	1	0	0	0	0
R/W:	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 28	PLACE7	111	R/W	Place 7 Stream data is rearranged before it is input to the SRC. These bits select data on the input side to be output to place 7 on the output side. 000: Data at place 0 on the input side is output to place 7 on the output side. 001: Data at place 1 on the input side is output to place 7 on the output side. 010: Data at place 2 on the input side is output to place 7 on the output side. 011: Data at place 3 on the input side is output to place 7 on the output side. 100: Data at place 4 on the input side is output to place 7 on the output side. 101: Data at place 5 on the input side is output to place 7 on the output side. 110: Data at place 6 on the input side is output to place 7 on the output side. 111: Data at place 7 on the input side is output to place 7 on the output side. Note: This bit setting is used when eight channels are set. When six or less channels are set, set these bits to the same value as the initial value.
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
26 to 24	PLACE6	110	R/W	Place 6 Stream data is rearranged before it is input to the SRC. These bits select data on the input side to be output to place 6 on the output side. 000: Data at place 0 on the input side is output to place 6 on the output side. 001: Data at place 1 on the input side is output to place 6 on the output side. 010: Data at place 2 on the input side is output to place 6 on the output side. 011: Data at place 3 on the input side is output to place 6 on the output side. 100: Data at place 4 on the input side is output to place 6 on the output side. 101: Data at place 5 on the input side is output to place 6 on the output side. 110: Data at place 6 on the input side is output to place 6 on the output side. 111: Data at place 7 on the input side is output to place 6 on the output side. Note: This bit setting is used when eight channels are set. When six or less channels are set, set these bits to the same value as the initial value.

Bit	Bit Name	Initial Value	R/W	Description
23	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
22 to 20	PLACE5	101	R/W	Place 5 Stream data is rearranged before it is input to the SRC. These bits select data on the input side to be output to place 5 on the output side. 000: Data at place 0 on the input side is output to place 5 on the output side. 001: Data at place 1 on the input side is output to place 5 on the output side. 010: Data at place 2 on the input side is output to place 5 on the output side. 011: Data at place 3 on the input side is output to place 5 on the output side. 100: Data at place 4 on the input side is output to place 5 on the output side. 101: Data at place 5 on the input side is output to place 5 on the output side. 110: Data at place 6 on the input side is output to place 5 on the output side. 111: Data at place 7 on the input side is output to place 5 on the output side. Note: This bit setting is used when six or more channels are set. When four or less channels are set, set these bits to the same value as the initial value.
19	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
18 to 16	PLACE4	100	R/W	Place 4 Stream data is rearranged before it is input to the SRC. These bits select data on the input side to be output to place 4 on the output side. 000: Data at place 0 on the input side is output to place 4 on the output side. 001: Data at place 1 on the input side is output to place 4 on the output side. 010: Data at place 2 on the input side is output to place 4 on the output side. 011: Data at place 3 on the input side is output to place 4 on the output side. 100: Data at place 4 on the input side is output to place 4 on the output side. 101: Data at place 5 on the input side is output to place 4 on the output side. 110: Data at place 6 on the input side is output to place 4 on the output side. 111: Data at place 7 on the input side is output to place 4 on the output side. Note: This bit setting is used when six or more channels are set. When four or less channels are set, set these bits to the same value as the initial value.
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
14 to 12	PLACE3	011	R/W	Place 3 Stream data is rearranged before it is input to the SRC. These bits select data on the input side to be output to place 3 on the output side. 000: Data at place 0 on the input side is output to place 3 on the output side. 001: Data at place 1 on the input side is output to place 3 on the output side. 010: Data at place 2 on the input side is output to place 3 on the output side. 011: Data at place 3 on the input side is output to place 3 on the output side. 100: Data at place 4 on the input side is output to place 3 on the output side. 101: Data at place 5 on the input side is output to place 3 on the output side. 110: Data at place 6 on the input side is output to place 3 on the output side. 111: Data at place 7 on the input side is output to place 3 on the output side. Note: This bit setting is used when four or more channels are set. When two or less channels are set, set these bits to the same value as the initial value.
11	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
10 to 8	PLACE2	010	R/W	Place 2 Stream data is rearranged before it is input to the SRC. These bits select data on the input side to be output to place 2 on the output side. 000: Data at place 0 on the input side is output to place 2 on the output side. 001: Data at place 1 on the input side is output to place 2 on the output side. 010: Data at place 2 on the input side is output to place 2 on the output side. 011: Data at place 3 on the input side is output to place 2 on the output side. 100: Data at place 4 on the input side is output to place 2 on the output side. 101: Data at place 5 on the input side is output to place 2 on the output side. 110: Data at place 6 on the input side is output to place 2 on the output side. 111: Data at place 7 on the input side is output to place 2 on the output side. Note: This bit setting is used when four or more channels are set. When two or less channels are set, set these bits to the same value as the initial value.
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
6 to 4	PLACE1	001	R/W	Place 1 Stream data is rearranged before it is input to the SRC. These bits select data on the input side to be output to place 1 on the output side. 000: Data at place 0 on the input side is output to place 1 on the output side. 001: Data at place 1 on the input side is output to place 1 on the output side. 010: Data at place 2 on the input side is output to place 1 on the output side. 011: Data at place 3 on the input side is output to place 1 on the output side. 100: Data at place 4 on the input side is output to place 1 on the output side. 101: Data at place 5 on the input side is output to place 1 on the output side. 110: Data at place 6 on the input side is output to place 1 on the output side. 111: Data at place 7 on the input side is output to place 1 on the output side.
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	PLACE0	000	R/W	Place 0 Stream data is rearranged before it is input to the SRC. These bits select data on the input side to be output to place 0 on the output side. 000: Data at place 0 on the input side is output to place 0 on the output side. 001: Data at place 1 on the input side is output to place 0 on the output side. 010: Data at place 2 on the input side is output to place 0 on the output side. 011: Data at place 3 on the input side is output to place 0 on the output side. 100: Data at place 4 on the input side is output to place 0 on the output side. 101: Data at place 5 on the input side is output to place 0 on the output side. 110: Data at place 6 on the input side is output to place 0 on the output side. 111: Data at place 7 on the input side is output to place 0 on the output side.

48.3.73 MIX Route Select Register (MIXRSEL_CIM)

MIXRSEL_CIM is a 32-bit readable/writable register that sets the route for the data that is output from the MIX.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	PLACE7			-	PLACE6			-	PLACE5			-	PLACE4		
Initial value:	0	1	1	1	0	1	1	0	0	1	0	1	0	1	0	0
R/W:	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	PLACE3			-	PLACE2			-	PLACE1			-	PLACE0		
Initial value:	0	0	1	1	0	0	1	0	0	0	0	1	0	0	0	0
R/W:	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 28	PLACE7	111	R/W	Place 7 Stream data is rearranged after it is output from the MIX. These bits select data on the input side to be output to place 7 on the output side. 000: Data at place 0 on the input side is output to place 7 on the output side. 001: Data at place 1 on the input side is output to place 7 on the output side. 010: Data at place 2 on the input side is output to place 7 on the output side. 011: Data at place 3 on the input side is output to place 7 on the output side. 100: Data at place 4 on the input side is output to place 7 on the output side. 101: Data at place 5 on the input side is output to place 7 on the output side. 110: Data at place 6 on the input side is output to place 7 on the output side. 111: Data at place 7 on the input side is output to place 7 on the output side. Note: This bit setting is used when eight channels are set. When six or less channels are set, set these bits to the same value as the initial value.
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
26 to 24	PLACE6	110	R/W	Place 6 Stream data is rearranged after it is output from the MIX. These bits select data on the input side to be output to place 6 on the output side. 000: Data at place 0 on the input side is output to place 6 on the output side. 001: Data at place 1 on the input side is output to place 6 on the output side. 010: Data at place 2 on the input side is output to place 6 on the output side. 011: Data at place 3 on the input side is output to place 6 on the output side. 100: Data at place 4 on the input side is output to place 6 on the output side. 101: Data at place 5 on the input side is output to place 6 on the output side. 110: Data at place 6 on the input side is output to place 6 on the output side. 111: Data at place 7 on the input side is output to place 6 on the output side. Note: This bit setting is used when eight channels are set. When six or less channels are set, set these bits to the same value as the initial value.

Bit	Bit Name	Initial Value	R/W	Description
23	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
22 to 20	PLACE5	101	R/W	Place 5 Stream data is rearranged after it is output from the MIX. These bits select data on the input side to be output to place 5 on the output side. 000: Data at place 0 on the input side is output to place 5 on the output side. 001: Data at place 1 on the input side is output to place 5 on the output side. 010: Data at place 2 on the input side is output to place 5 on the output side. 011: Data at place 3 on the input side is output to place 5 on the output side. 100: Data at place 4 on the input side is output to place 5 on the output side. 101: Data at place 5 on the input side is output to place 5 on the output side. 110: Data at place 6 on the input side is output to place 5 on the output side. 111: Data at place 7 on the input side is output to place 5 on the output side. Note: This bit setting is used when six or more channels are set. When four or less channels are set, set these bits to the same value as the initial value.
19	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
18 to 16	PLACE4	100	R/W	Place 4 Stream data is rearranged after it is output from the MIX. These bits select data on the input side to be output to place 4 on the output side. 000: Data at place 0 on the input side is output to place 4 on the output side. 001: Data at place 1 on the input side is output to place 4 on the output side. 010: Data at place 2 on the input side is output to place 4 on the output side. 011: Data at place 3 on the input side is output to place 4 on the output side. 100: Data at place 4 on the input side is output to place 4 on the output side. 101: Data at place 5 on the input side is output to place 4 on the output side. 110: Data at place 6 on the input side is output to place 4 on the output side. 111: Data at place 7 on the input side is output to place 4 on the output side. Note: This bit setting is used when six or more channels are set. When four or less channels are set, set these bits to the same value as the initial value.
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
14 to 12	PLACE3	011	R/W	Place 3 Stream data is rearranged after it is output from the MIX. These bits select data on the input side to be output to place 3 on the output side. 000: Data at place 0 on the input side is output to place 3 on the output side. 001: Data at place 1 on the input side is output to place 3 on the output side. 010: Data at place 2 on the input side is output to place 3 on the output side. 011: Data at place 3 on the input side is output to place 3 on the output side. 100: Data at place 4 on the input side is output to place 3 on the output side. 101: Data at place 5 on the input side is output to place 3 on the output side. 110: Data at place 6 on the input side is output to place 3 on the output side. 111: Data at place 7 on the input side is output to place 3 on the output side. Note: This bit setting is used when four or more channels are set. When two or less channels are set, set these bits to the same value as the initial value.
11	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
10 to 8	PLACE2	010	R/W	Place 2 Stream data is rearranged after it is output from the MIX. These bits select data on the input side to be output to place 2 on the output side. 000: Data at place 0 on the input side is output to place 2 on the output side. 001: Data at place 1 on the input side is output to place 2 on the output side. 010: Data at place 2 on the input side is output to place 2 on the output side. 011: Data at place 3 on the input side is output to place 2 on the output side. 100: Data at place 4 on the input side is output to place 2 on the output side. 101: Data at place 5 on the input side is output to place 2 on the output side. 110: Data at place 6 on the input side is output to place 2 on the output side. 111: Data at place 7 on the input side is output to place 2 on the output side. Note: This bit setting is used when four or more channels are set. When two or less channels are set, set these bits to the same value as the initial value.
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
6 to 4	PLACE1	001	R/W	Place 1 Stream data is rearranged after it is output from the MIX. These bits select data on the input side to be output to place 1 on the output side. 000: Data at place 0 on the input side is output to place 1 on the output side. 001: Data at place 1 on the input side is output to place 1 on the output side. 010: Data at place 2 on the input side is output to place 1 on the output side. 011: Data at place 3 on the input side is output to place 1 on the output side. 100: Data at place 4 on the input side is output to place 1 on the output side. 101: Data at place 5 on the input side is output to place 1 on the output side. 110: Data at place 6 on the input side is output to place 1 on the output side. 111: Data at place 7 on the input side is output to place 1 on the output side.
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	PLACE0	000	R/W	Place 0 Stream data is rearranged after it is output from the MIX. These bits select data on the input side to be output to place 0 on the output side. 000: Data at place 0 on the input side is output to place 0 on the output side. 001: Data at place 1 on the input side is output to place 0 on the output side. 010: Data at place 2 on the input side is output to place 0 on the output side. 011: Data at place 3 on the input side is output to place 0 on the output side. 100: Data at place 4 on the input side is output to place 0 on the output side. 101: Data at place 5 on the input side is output to place 0 on the output side. 110: Data at place 6 on the input side is output to place 0 on the output side. 111: Data at place 7 on the input side is output to place 0 on the output side.

48.4 Operation

48.4.1 Initial Setting Procedure

Figure 48.6 to Figure 48.8 show the initial setting procedure of the SCUX. For details on register setting, refer to section 48.3, Register Descriptions.

48.4.2 Transfer Start Procedure and Stop Procedure

Figure 48.9 to Figure 48.11 show the transfer start procedure and stop procedure of the SCUX. For details on register setting, refer to section 48.3, Register Descriptions.

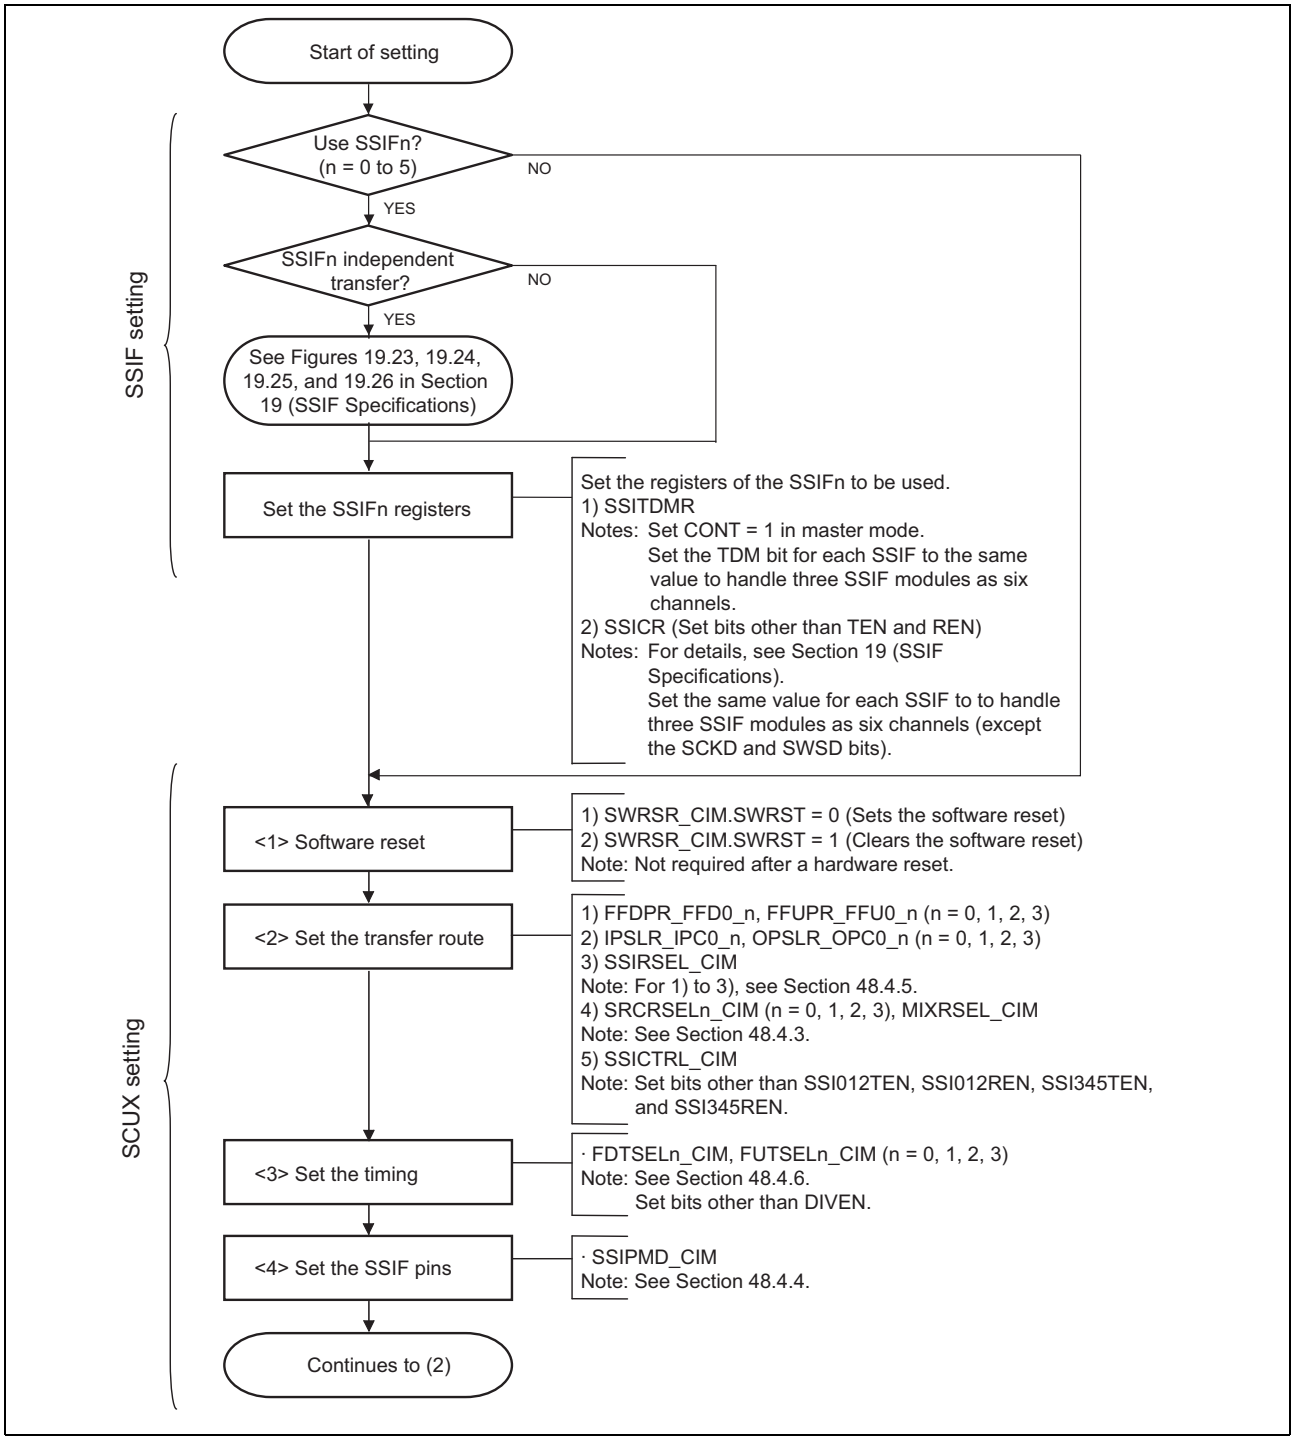

Figure 48.6 Initial Setting Procedure of SCUX (1)

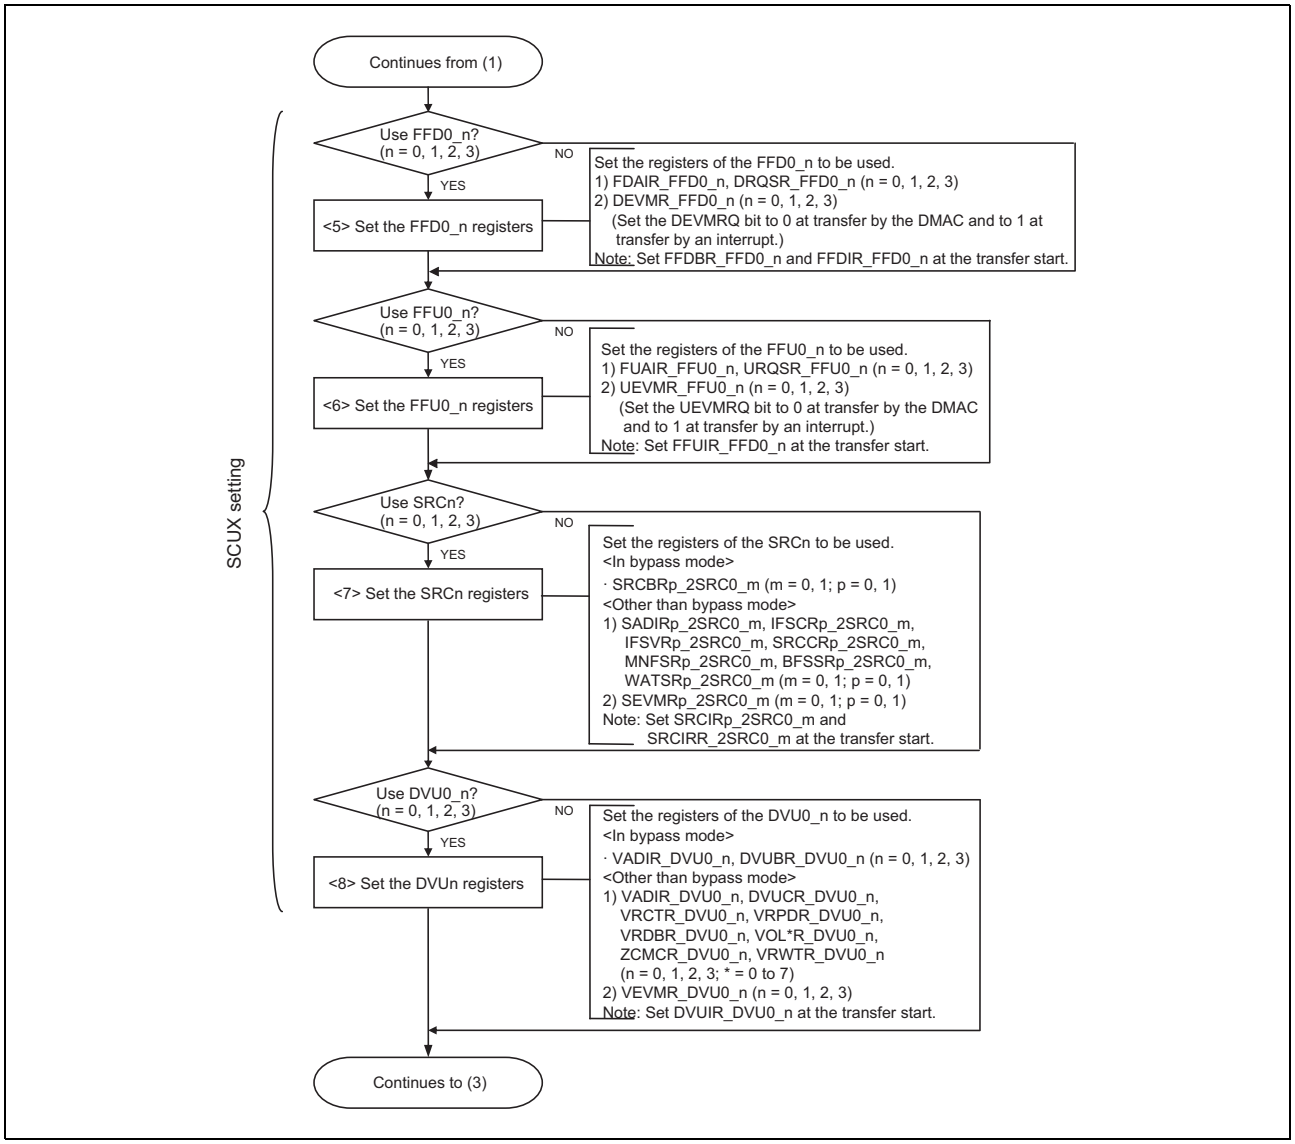

Figure 48.7 Initial Setting Procedure of SCUX (2)

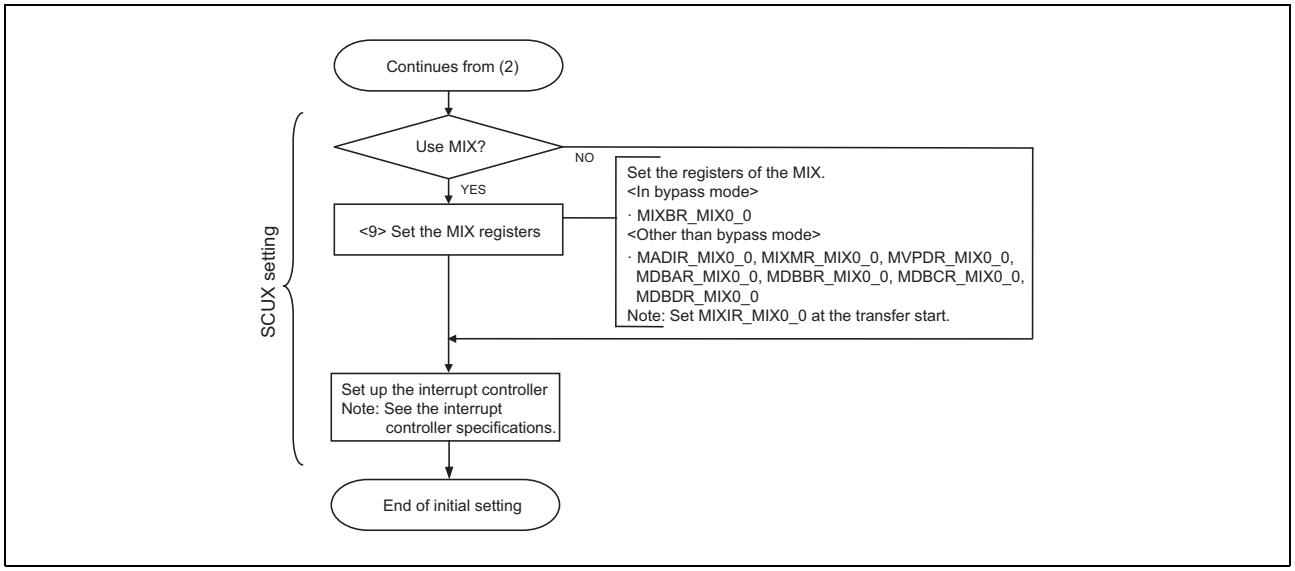

Figure 48.8 Initial Setting Procedure of SCUX (3)

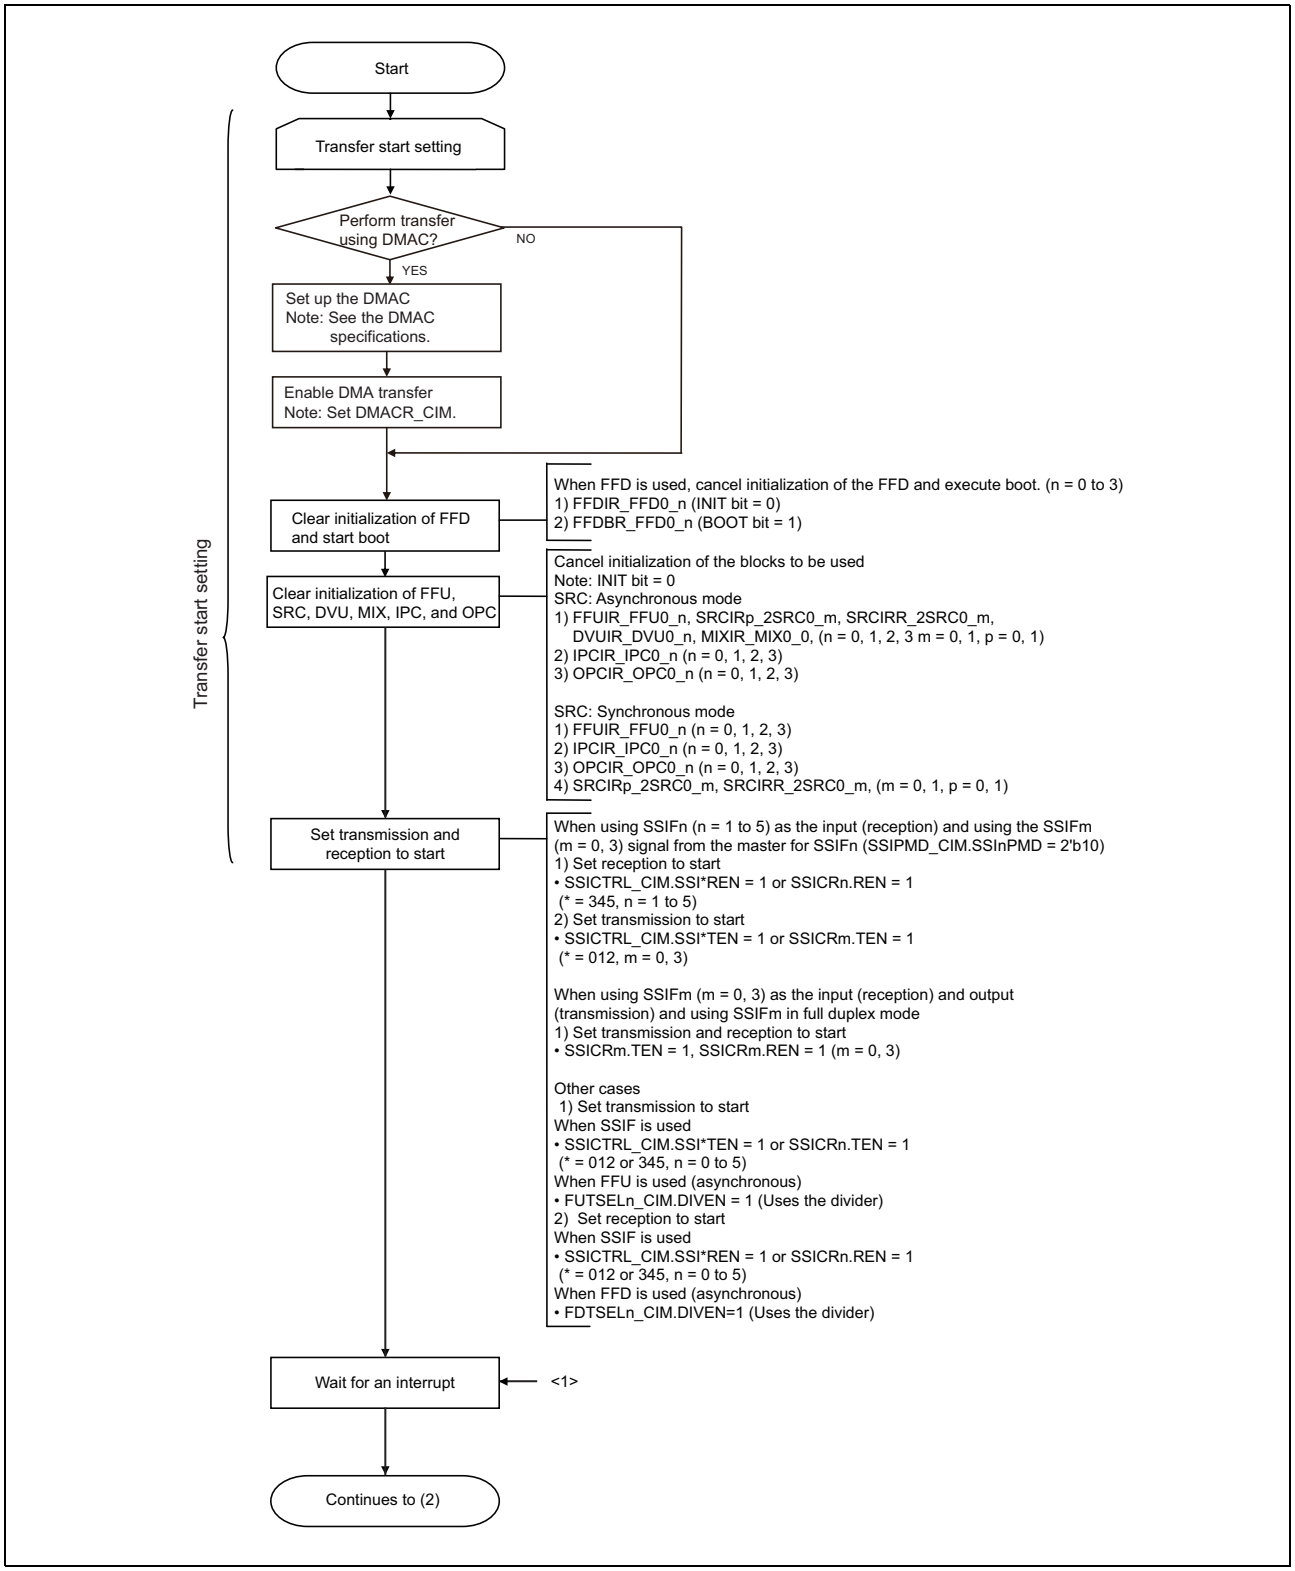

Figure 48.9 Transfer Start Procedure and Stop Procedure of SCUX (1)

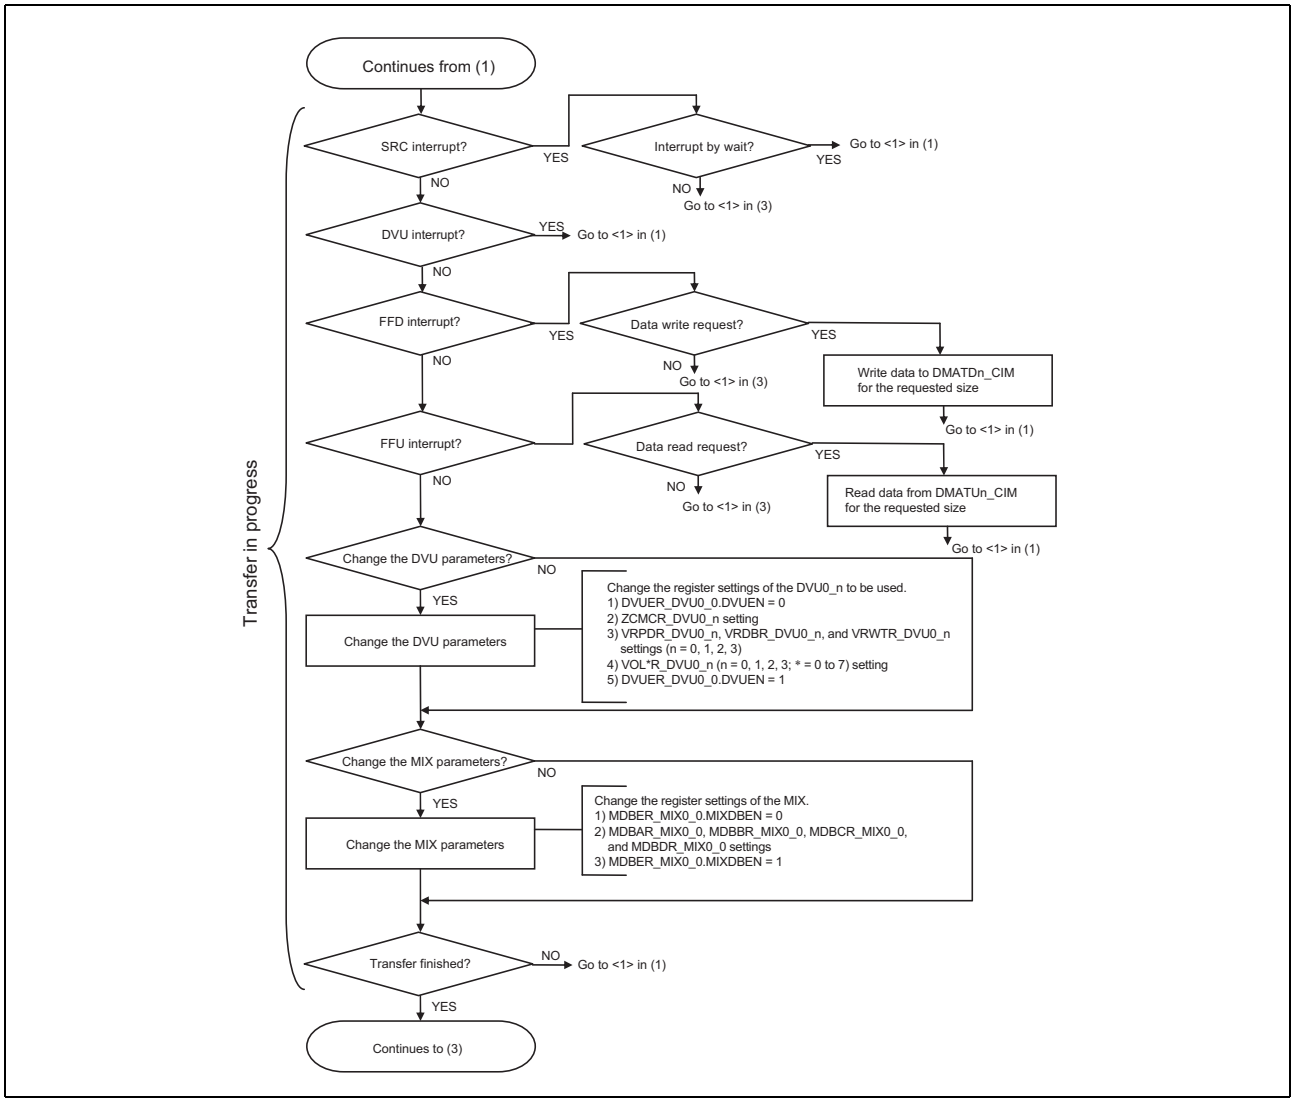

Figure 48.10 Transfer Start Procedure and Stop Procedure of SCUX (2)

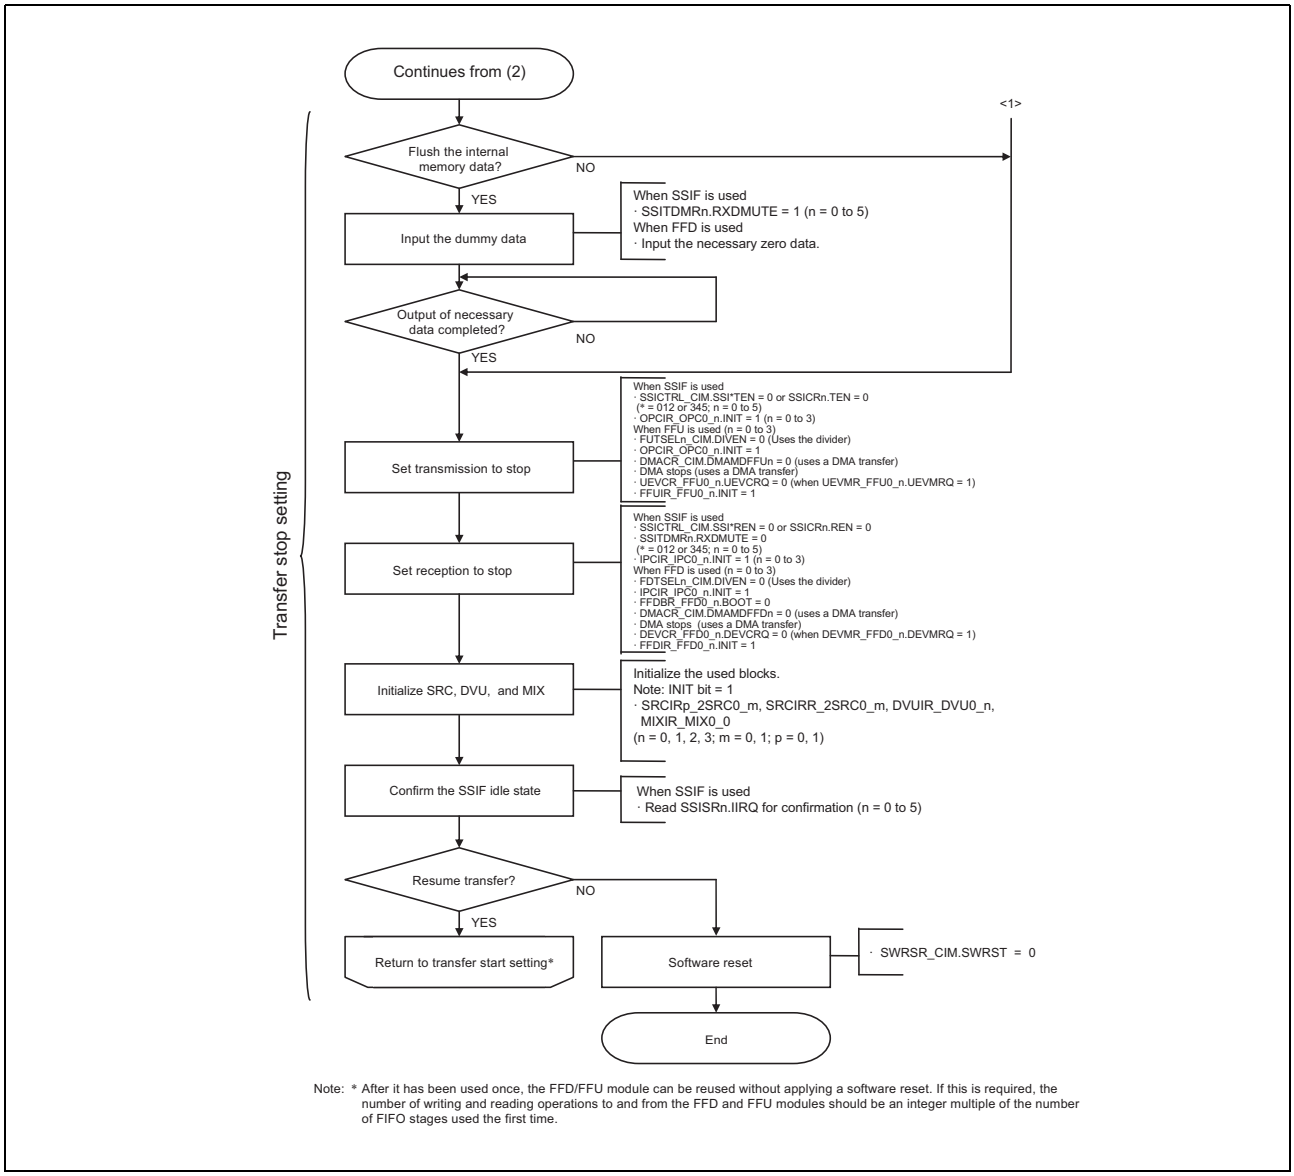

Note: * After it has been used once, the FFD/FFU module can be reused without applying a software reset. If this is required, the number of writing and reading operations to and from the FFD and FFU modules should be an integer multiple of the number of FIFO stages used the first time.

Figure 48.11 Transfer Start Procedure and Stop Procedure of SCUX (3)

48.4.3 Data Rearrangement for Each Channel

Data can be rearranged independently for each channel in the SCUX. Data rearrangement can be performed immediately before input to the SRC and immediately after output from the MIX. Table 48.9 to Table 48.11 show definition of data places. Data rearrangement immediately before the SRC is performed as described in section 48.3.72, SRCn Route Select Register (SRCRSELn_CIM) (n = 0, 1, 2, 3). Data rearrangement immediately after the MIX is performed as described in section 48.3.73, MIX Route Select Register (MIXRSEL_CIM).

48.4.4 Pin Connection Specifications of SSIF

SSIF0 to SSIF3 and SSIF3 to SSIF5 can be operated in synchronization with the same SSISCK and SSIWS signals. The AUDIO_CLK input to the SSIF can be selected between external pins AUDIO_CLK and MLB_CLK. These settings are made as described in section 48.3.70, SSI Pin Mode Register (SSIPMD_CIM). Figure 48.12 shows the pin connection specifications of each SSIF module.

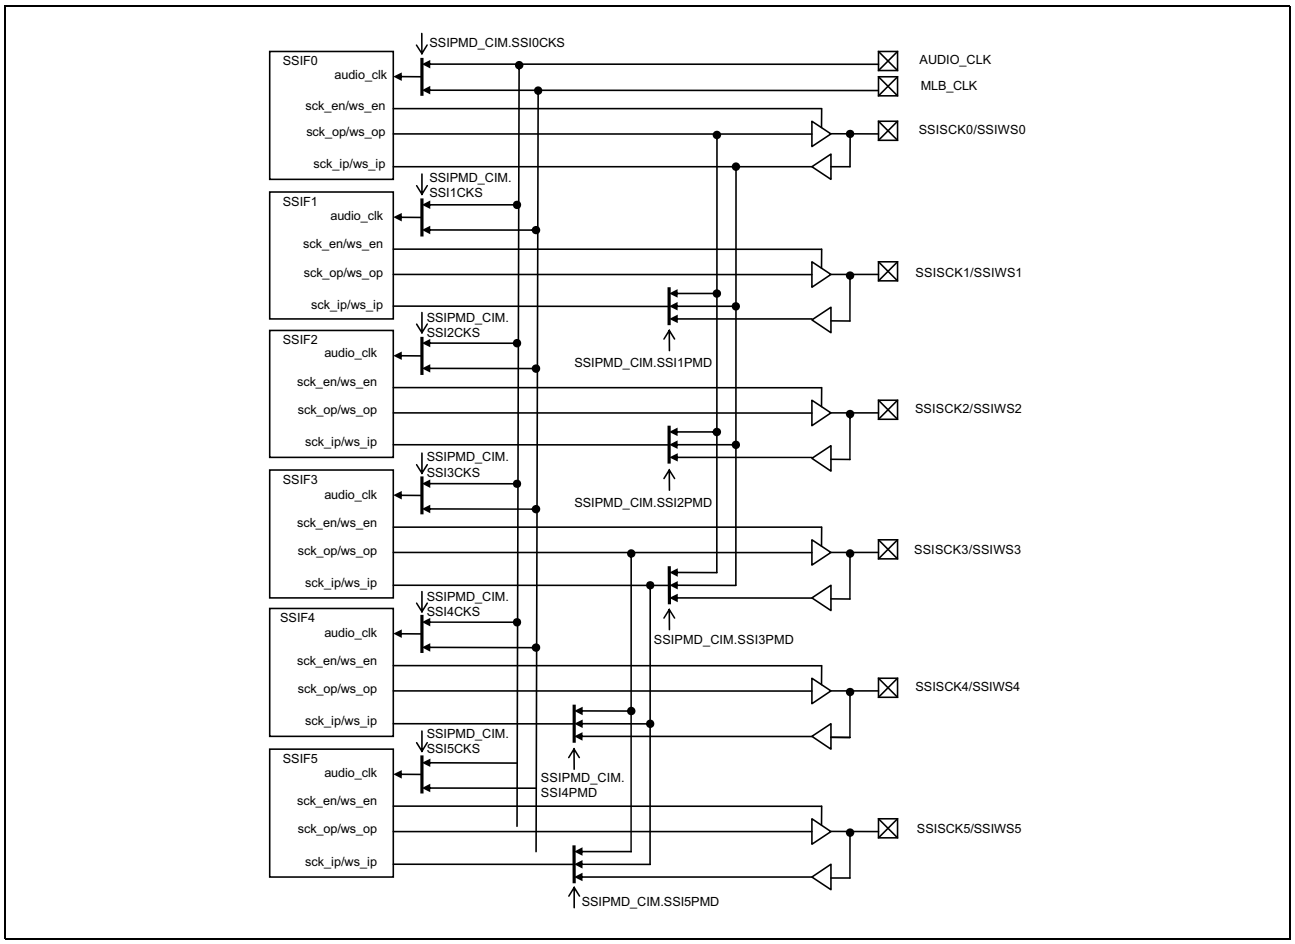

Figure 48.12 Pin Connection Specifications of SSIF

48.4.5 Data Transfer Route

Table 48.12 to Table 48.14 list the data transfer routes that can be selected by the SCUX.
Table 48.15 to Table 48.17 show the necessary register settings for selecting each transfer route.
The 2SRC0_m bypass register p and DVU0_n bypass register should be set appropriately to bypass the SRC and DVU, respectively.

Table 48.12 Data Transfer Routes (1)

Route	No.	SSIF (SRC)	FFD	SRC + DVU	MIX	SSIF (DST)	FFU
SSIF → SRC → SSIF	1	SSIF0	—	SRC0*1 + DVU0_0	—	SSIF0	—

48.4.6 Input Timing Signal and Output Timing Signal

The input timing signal and output timing signal need to be set when using the SRC or MIX. Table 48.18 to Table 48.20 show the input/output timing setting necessary for each transfer route in Table 48.12 to Table 48.14. When direct connection between the SRC and SSIF is selected, the WS signal of the relevant SSIF is automatically selected regardless of the setting of the FFD0_n/FFU0_n timing select register. When direct connection between the MIX and SSIF is selected, set the prescribed value in the FFU0_n timing select register. When connection between the FFD and SRC or connection between the SRC and FFU is selected, a desired value can be set in the FFD0_n/FFU0_n timing select register and timing signals corresponding to the setting are used.

Table 48.18 Input/Output Timing Setting (1)

Route	No.	Input Timing Setting								Output Timing Setting

Note 1. Automatically selected regardless of the FDTSELn_CIM and FUTSELn_CIM settings.
Note 2. When connection to an SRCm for a given route is not being selected by the SOSELn bits of register SSIRSEL_CIM, SSInTX may be set to 1 (m = 0 to 3; n = 0 to 5).
Note 3. When connection to SRCm and MIX for a given route is not being selected by the SOSELn bits of register SSIRSEL_CIM, SSInTX may be set to 1 (m = 0 to 3; n = 0, 3).
Note 4. When connection to a MIX for a given route is not being selected by the SOSELn bits of register SSIRSEL_CIM, SSInTX may be set to 1 (n = 0, 3).
Note 5. When input from SSIF1 is not being selected by the SISEL2 bits of register SSIRSEL_CIM, SSI1RX may be set to 1.
Note 6. When input from SSIF4 is not being selected by the SISEL2 bits of register SSIRSEL_CIM, SSI4RX may be set to 1.
Note 7. When input from SSIF2 is not being selected by the SISEL3 bits of register SSIRSEL_CIM, SSI2RX may be set to 1.
Note 8. When input from SSIF5 is not being selected by the SISEL3 bits of register SSIRSEL_CIM, SSI5RX may be set to 1.

48.4.7 2SRC (SRC) Block

The 2SRC block consists of two SRCs (Sampling Rate Converters) which implement the sampling rate conversion function. Each SRC has two modes allowing either synchronous or asynchronous sampling rate conversion to be performed.

- Asynchronous or synchronous sampling rate conversion is possible*1
- Sampling rate (synchronous mode)*2
  Input [KHz]: 8, 11.025, 12, 16, 22.05, 24, 32, 44.1, 48, 64, 88.2, or 96 is selectable
  Output [KHz]: 8, 16, 24, 32, 44.1, 48, or 96 is selectable
- Sampling rate (asynchronous mode)*2
  Input/output [KHz]: 1 to 96
- The supported number of bits is 16 bits and 24 bits
- Sound quality: −132 dB or less*3
- Supports 1, 2, 4, 6, or 8 channels*4
- DMA transfer with on-chip memory or external memory and direct transfer with the SSIF module are possible

Note 1. The synchronous mode can be selected only when the SCUX is connected to the FFD and FFU modules.
Note 2. The selectable sampling rates depend on the number of used channels and rate ratio.
Note 3. The data format is a 24-bit value.
Note 4. The number of selectable channels depends on the sampling rate and route.

Figure 48.13 shows a block diagram of the 2SRC (SRC) block. Input audio data indicates the data before executing the SRC function and output audio data indicates the data after executing the SRC function.
In synchronous SRC mode, the 2SRC (SRC) block outputs the input request signal to the FFD block and outputs the output request signal to the FFU block. In asynchronous SRC mode, the 2SRC (SRC) block receives the input timing signal and output timing signal from an external module and automatically detects the input sampling rate and output sampling rate from these timing signals.
Each SRC in the 2SRC (SRC) block can simultaneously process audio data for a maximum of eight channels. However, the maximum sampling rate that can be handled depends on the number of channels used. When SRC2 or SRC3 is used by the route from the FFD or the route to the FFU, the maximum number of processable channels is two. The number of channels is set by SADIRp_2SRC0_m.CHNUM. When not in bypass mode (SRCBRp_2SRC0_m.BYPASS = 0), unused channels always output 0 after initialization (SRCIRp_2SRC0_m.INIT = 1) unless the CHNUM setting is changed. In bypass mode, the input audio data is output one cycle later in all channels regardless of the CHNUM setting.
The bit width of output audio data can be set to 16 bits or 24 bits by SADIRp_2SRC0_m.OTBL. For input audio data, audio data with the same bit width as the OTBL bit setting in Table 48.21 should be input.

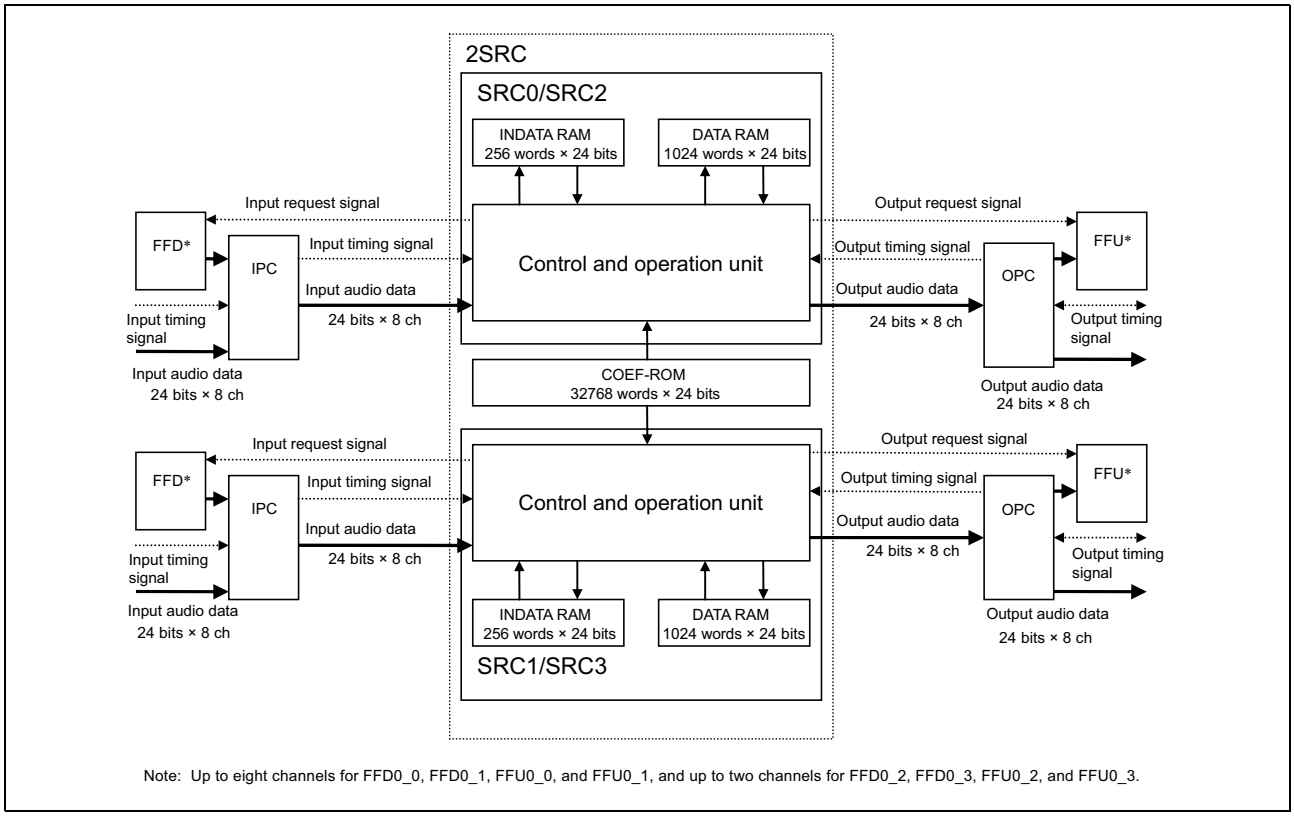

Figure 48.13 Block Diagram of 2SRC Block

Table 48.21 Combinations of Bit Width of Input/Output Audio Data

SADIRp_2SRC0_m.OTBL	Bit Width of Input Audio Data	Bit Width of Output Audio Data
00000 = 24 bits	24 bits	24 bits
01000 = 16 bits	16 bits	16 bits

Table 48.22 shows the functions of the 2SRC (SRC) block.

Table 48.22 2SRC (SRC) Block Functions

Item	Performance					
Type of SRC	Asynchronous SRC/synchronous SRC					
Operation frequency	66 MHz					
Delay mode	Normal				Low delay 1	Low delay 2
Channel number	1 or 2	4	6	8	1 or 2	1 or 2
Sampling rate of input source	8k to 96k [Hz]	8k to 96k [Hz]	8k to 66k [Hz]	8k to 49k [Hz]	8k to 96k [Hz]	8k to 96k [Hz]
Sampling rate of output source	8k to 96k [Hz]	8k to 96k [Hz]	8k to 66k [Hz]	8k to 49k [Hz]	8k to 96k [Hz]	8k to 96k [Hz]
Ratio of input and output sampling rate (FSO/FSI)	16 to 0.125 [time]	16 to 0.25 [time]	16 to 0.375 [time]	16 to 0.5 [time]	16 to 0.5 [time]	16 to 1 [time]
Sound quality	–132 dB					

Table 48.23 shows the latency of the 2SRC (SRC) block.

Table 48.23 2SRC (SRC) Block Latency

Item	Bypass	Normal					Low Delay 1		Low Delay 2	
Channel number	Any	1	2	4	6	8	1	2	1	2
Processing delay	0	641	321	161	102	81	81	81	49	49
Logic delay	1	3	3	3	3	3	3	3	3	3
Output delay	Output delay [sample] = (Processing delay) * (FSO/FSI ratio) + (Logic delay)									

48.4.8 DVU Block

The DVU block is used to control volume and mute. This block can simultaneously process data for a maximum of eight channels.

- Digital volume, volume ramp, and zero cross mute are provided as functions to adjust the volume
- The digital volume is set as a 24-bit fixed-point value within the range from a multiple of 0 to 8 (mute, −120 to 18 dB)
- Volume ramp can be used to perform soft mute, fade in, fade out, and volume change as desired
- The ramp time of volume ramp can be changed and set within the sampling range of 2^0 to 2^{23}
- Zero cross mute turns the sound mute at the zero cross point of audio data
- Direct transfer with the SSIF module and transfer with the mixer are possible

The number of channels is set by VADIR_DVU0_n.CHNUM. For unused channels, the input data that is input to the corresponding channels is output one cycle later. In bypass mode, the input data is output one cycle later in all channels regardless of the CHNUM setting.
Figure 48.14 shows the processing image of the DVU block.

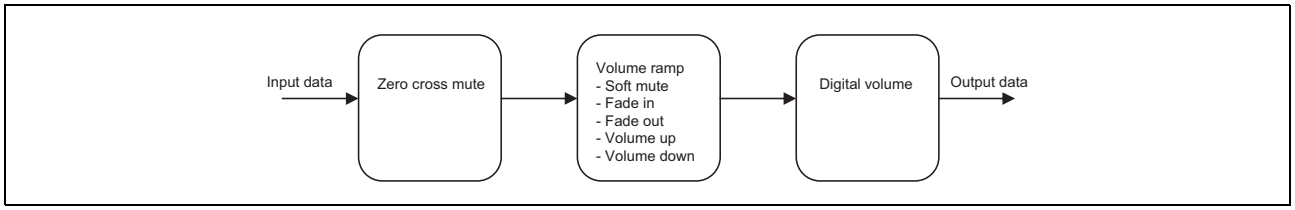

Figure 48.14 Processing Image of DVU Block

Table 48.24 shows the functions of the DVU block.

Table 48.24 DVU Block Functions

Item	Performance
Digital volume	Range: –120 dB to 18 dB (9.5 × 10^{-7}-time to 8-time)
Volume ramp	Volume ramp use for many kinds of operation (soft mute, fade in, fade out, volume change by ramp) Ramp time: 2^{0}/fso to 2^{23}/fso Example: (1/fso: –128 dB/1 step) (2/fso: –64 dB/1 step) (4/fso: –32 dB/1 step) ..... (128/fso: –1 dB/1 step) (256/fso: –0.5 dB/1 step) (512/fso: –0.25 dB/1 step) (1024/fso: –0.125 dB/1 step) (2048/fso: –0.125 dB/2 steps) (4096/fso: –0.125 dB/4 steps) ..... (8388608/fso: –0.125 dB/8192 steps)
Zero cross mute	Mute the signal at zero cross point

Figure 48.15 shows the image of digital volume operation.

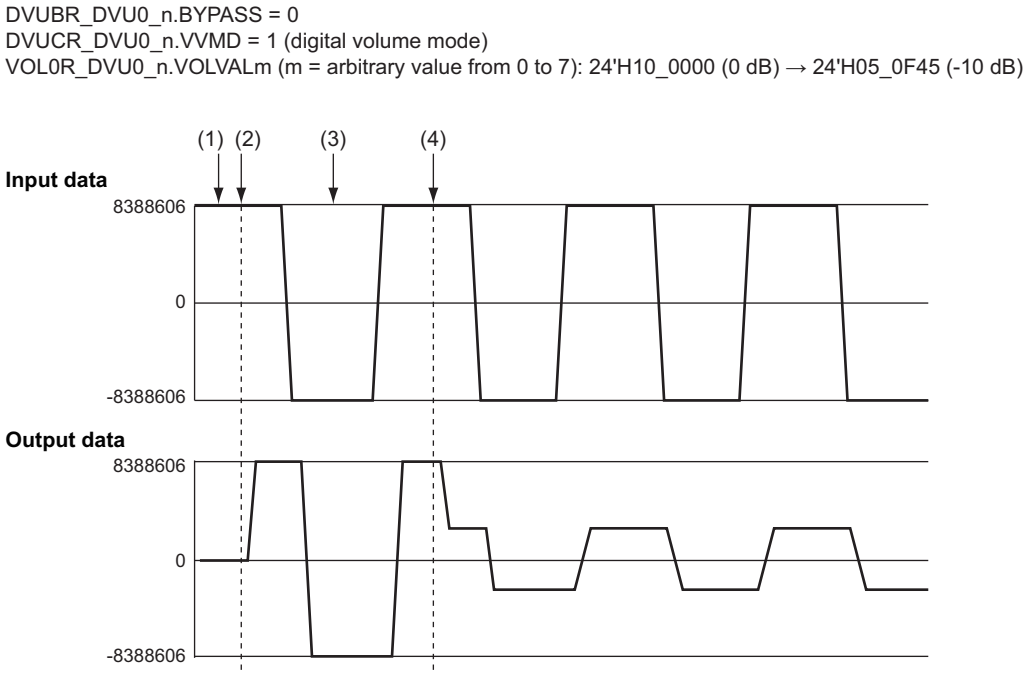

Figure 48.15 Digital Volume Operation

Operation

(1) In the initialized state (DVUIR_DVU0_n.INIT = 1), set the VVMD bit in DVUCR_DVU0_n to 1 (digital volume mode) and the VOLVALm bit in VOL0R_DVU0_n to 24'H10_0000 (0 dB). Until the initialized state is cleared, the DVU does not start operation and its output data is 0.

(2) When the initialized state is cleared (DVUIR_DVU0_n.INIT = 0), the DVU starts operation. Since the VOLVALm bit is set to 0 dB, the output data is the same size as the input data.

(3) Set the DVUEN bit in DVUER_DVU0_n to 0 and the VOLVAL0 bit in VOL0R_DVU0_n to 24'H05_0F45 (-10 dB).

(4) The setting to the VOLVAL0 bit in (3) is enabled by setting the DVUEN bit in DVUER_DVU0_n to 1. The output data is the value obtained by attenuating the input data by -10 dB.

Figure 48.16 shows the image of volume ramp operation.

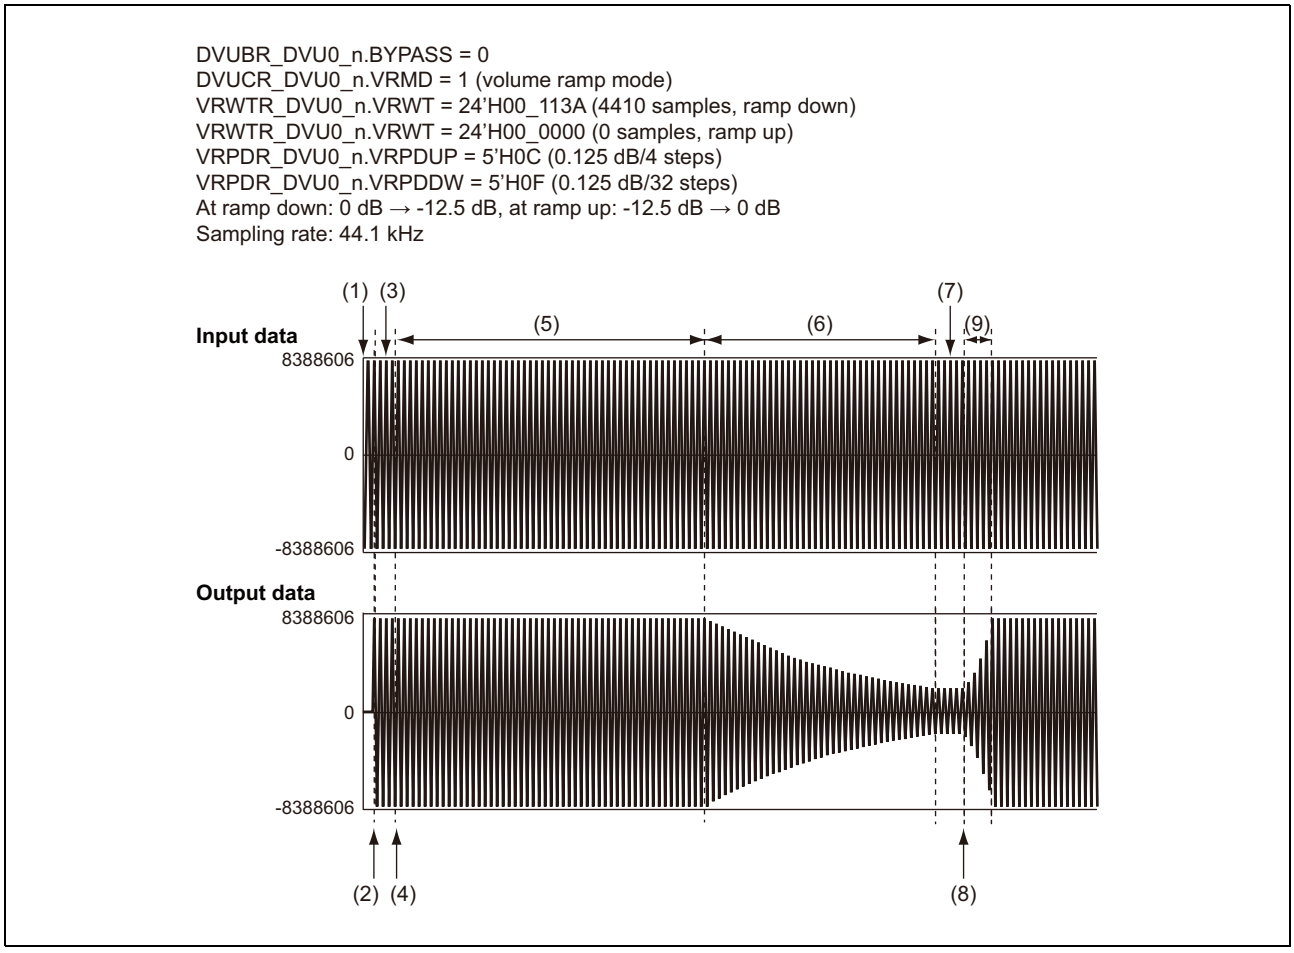

Figure 48.16 Volume Ramp Operation

Operation

(1) In the initialized state (DVUIR_DVU0_n.INIT = 1), set the VRMD bit in DVUCR_DVU0_n to 1 (volume ramp mode) and the VRENm (m: arbitrary value from 0 to 7) bit in VRCTR_DVU0_n to 1. Until the initialized state is cleared, the DVU does not start operation and its output data is 0.

(2) When the initialized state is cleared (DVUIR_DVU0_n.INIT = 0), the DVU starts operation.

Note: Changes to the settings of the VRDB bit of the VRDBR_DVU0_n register made in the INIT state rapidly become applicable on release from the INIT state (independently of the setting of VRWTR_DVU0_n and VRPDR_DVU0_n).

(3) Set the DVUEN bit in DVUER_DVU0_n to 0, the VRPDDW bit in VRPDR_DVU0_n to 5'H0F (0.125 dB/32 steps), the VRDB bit in VRDBR_DVU0_n to 10'H064 (-12.5 dB), and the VRWT bit in VRWTR_DVU0_n to 24'H00_113A (4410 samples).

(4) The setting in (3) is enabled by setting the DVUEN bit in DVUER_DVU0_n to 1.

(5) The VDU waits to start the volume ramp operation for 4410/44100 = 0.1 second because the sampling rate is set to 44.1 kHz with VRWTR_DVU0_n.VRWT = 24'H00_113A (4410 samples).

(6) The VDU starts volume ramp operation after the wait time in (5).
The output data is the value obtained by attenuating the input data by -12.5 dB after 12.5 × 32/0.125 = 3200 steps because the VRPDDW bit in VRPDR_DVU0_n is set to 5'H0F (0.125 dB/32 steps) according to 0d B to -12.5 dB ramp down.

(7) Set the DVUEN bit in DVUER_DVU0_n to 0, the VRPDUP bit in VRPDR_DVU0_n to 5'H0C (0.125 dB/4 steps), the VRDB bit in VRDBR_DVU0_n to 10'H000 (0 dB), and the VRWT bit in VRWTR_DVU0_n to 24'H00_0000 (0 sample).

(8) The setting in (7) is enabled by setting the DVUEN bit in DVUER_DVU0_n to 1.

(9) The VDU starts volume ramp operation without delay because the VRWT bit in VRWTR_DVU0_n is set to 24'H00_0000 (0 sample).
The output data is the same size as the input data after 12.5 × 4/0.125 = 400 steps because the VRPDUP bit in VRPDR_DVU0_n is set to 5'H0C (0.125 dB/4 steps) according to -12.5 dB to 0 dB ramp up.

Table 48.25 shows the latency of the DVU block.

Table 48.25 DVU Block Latency

Item	Bypass	DVU Operation
Output delay	1	2

48.4.9 MIX Block

The MIX block is used to mix (add together) the input audio data from a maximum of four systems into one system. Each system can simultaneously process data for a maximum of eight channels.

- Data of two to four source systems can be mixed (added together) into one system
- The ratio to add the sources can be set
- The ratio can be changed dynamically
- Volume ramp enables mixing to be performed (ramp time is variable)
- Only direct transfer with the SSIF module is possible

The number of channels is set by MADIR_MIX0_0.CHNUM. When not in bypass mode (MIXBR_MIX0_0.BYPASS = 0), unused channels always output 0 after initialization (MIXIR_MIX0_0.INIT = 1) unless the CHNUM setting is changed. In bypass mode, the input data is output one cycle later in all channels regardless of the CHNUM setting.
Figure 48.17 shows a block diagram of the MIX block.

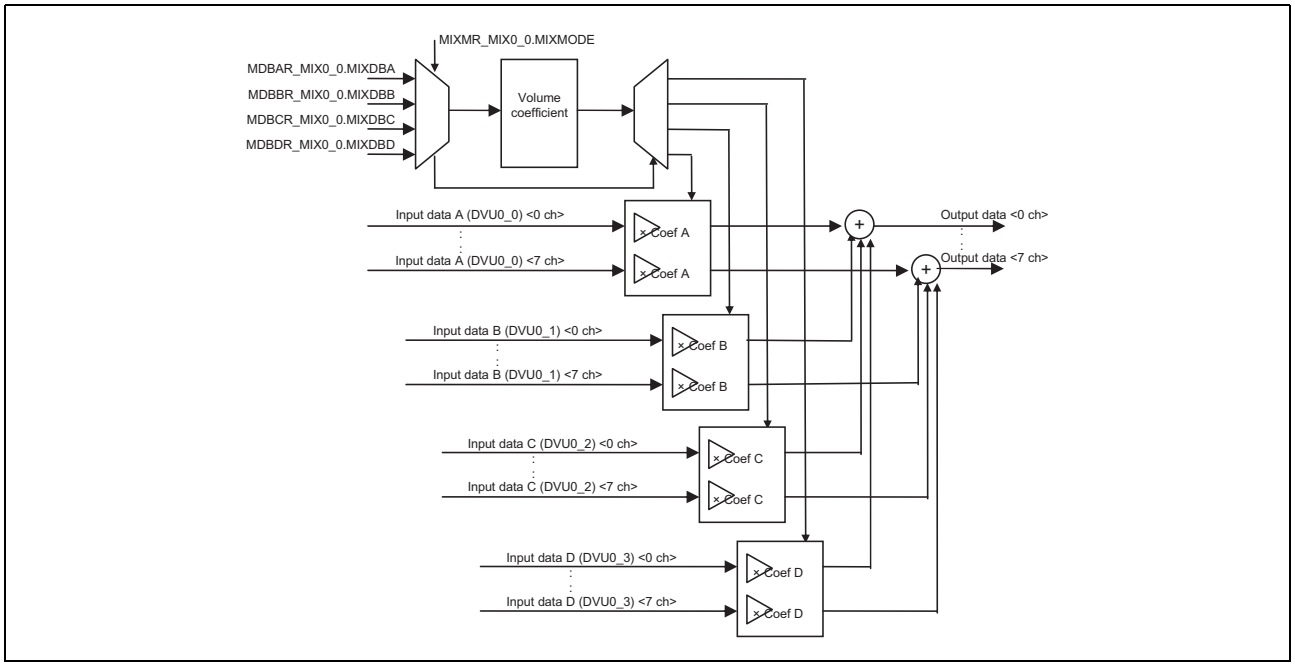

Figure 48.17 Block Diagram of MIX Block

Table 48.26 shows the functions of the MIX block.

Table 48.26 MIX Block Functions

Item	Performance
Volume step mixer	Mix the data of four systems into one system. The volume of each system can be adjusted by step change.
Volume ramp mixer	Mix the data of four systems into one system. The volume of each system can be adjusted by ramp.

Figure 48.18 shows the image of volume step operation for 1-system data. This figure explains about the operation when the volume is changed from 0 dB to −∞ dB. The volume can change the target dB for one step each. In the case of the volume step mixer, the volume of four systems can be adjusted at each step change (one sample).
Figure 48.19 shows the image of volume ramp operation for 1-system data. This figure explains about the operation when the volume is changed from 0 dB to −∞ dB. The volume can be changed by 0.125-dB/step each and it takes 1024 samples to reach −∞ dB in the maximum case for each system. In the case of the volume ramp mixer, the volume of four

systems can be adjusted at each ramp. In addition, the volume ramp mixer has a mechanism to reduce the noise. If the direction of volume is different among the four systems, it operates from the volume-down systems and after that operates on the volume-up systems automatically. In the case of the same direction, it changes the volume at the same timing.

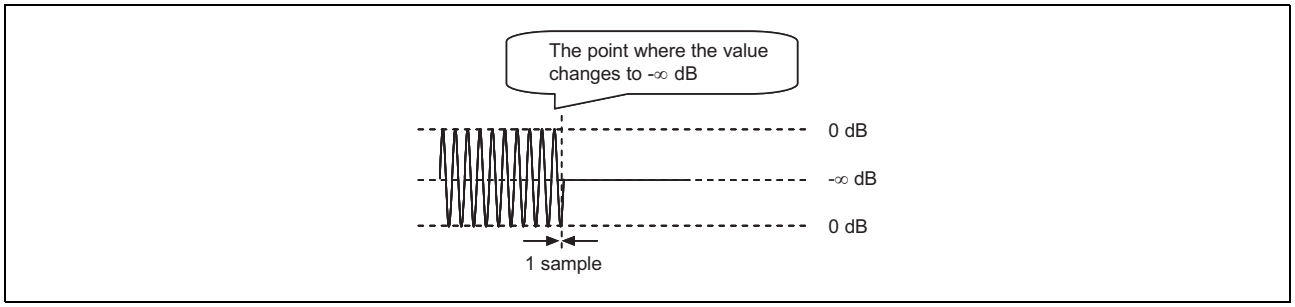

Figure 48.18 Volume Step Operation

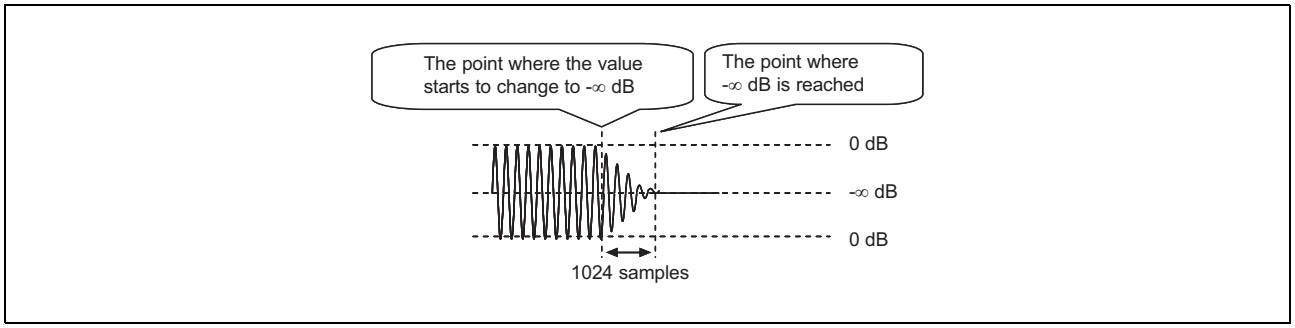

Figure 48.19 Volume Ramp Operation

Figure 48.20 shows the image of volume ramp operation for 4-system data.

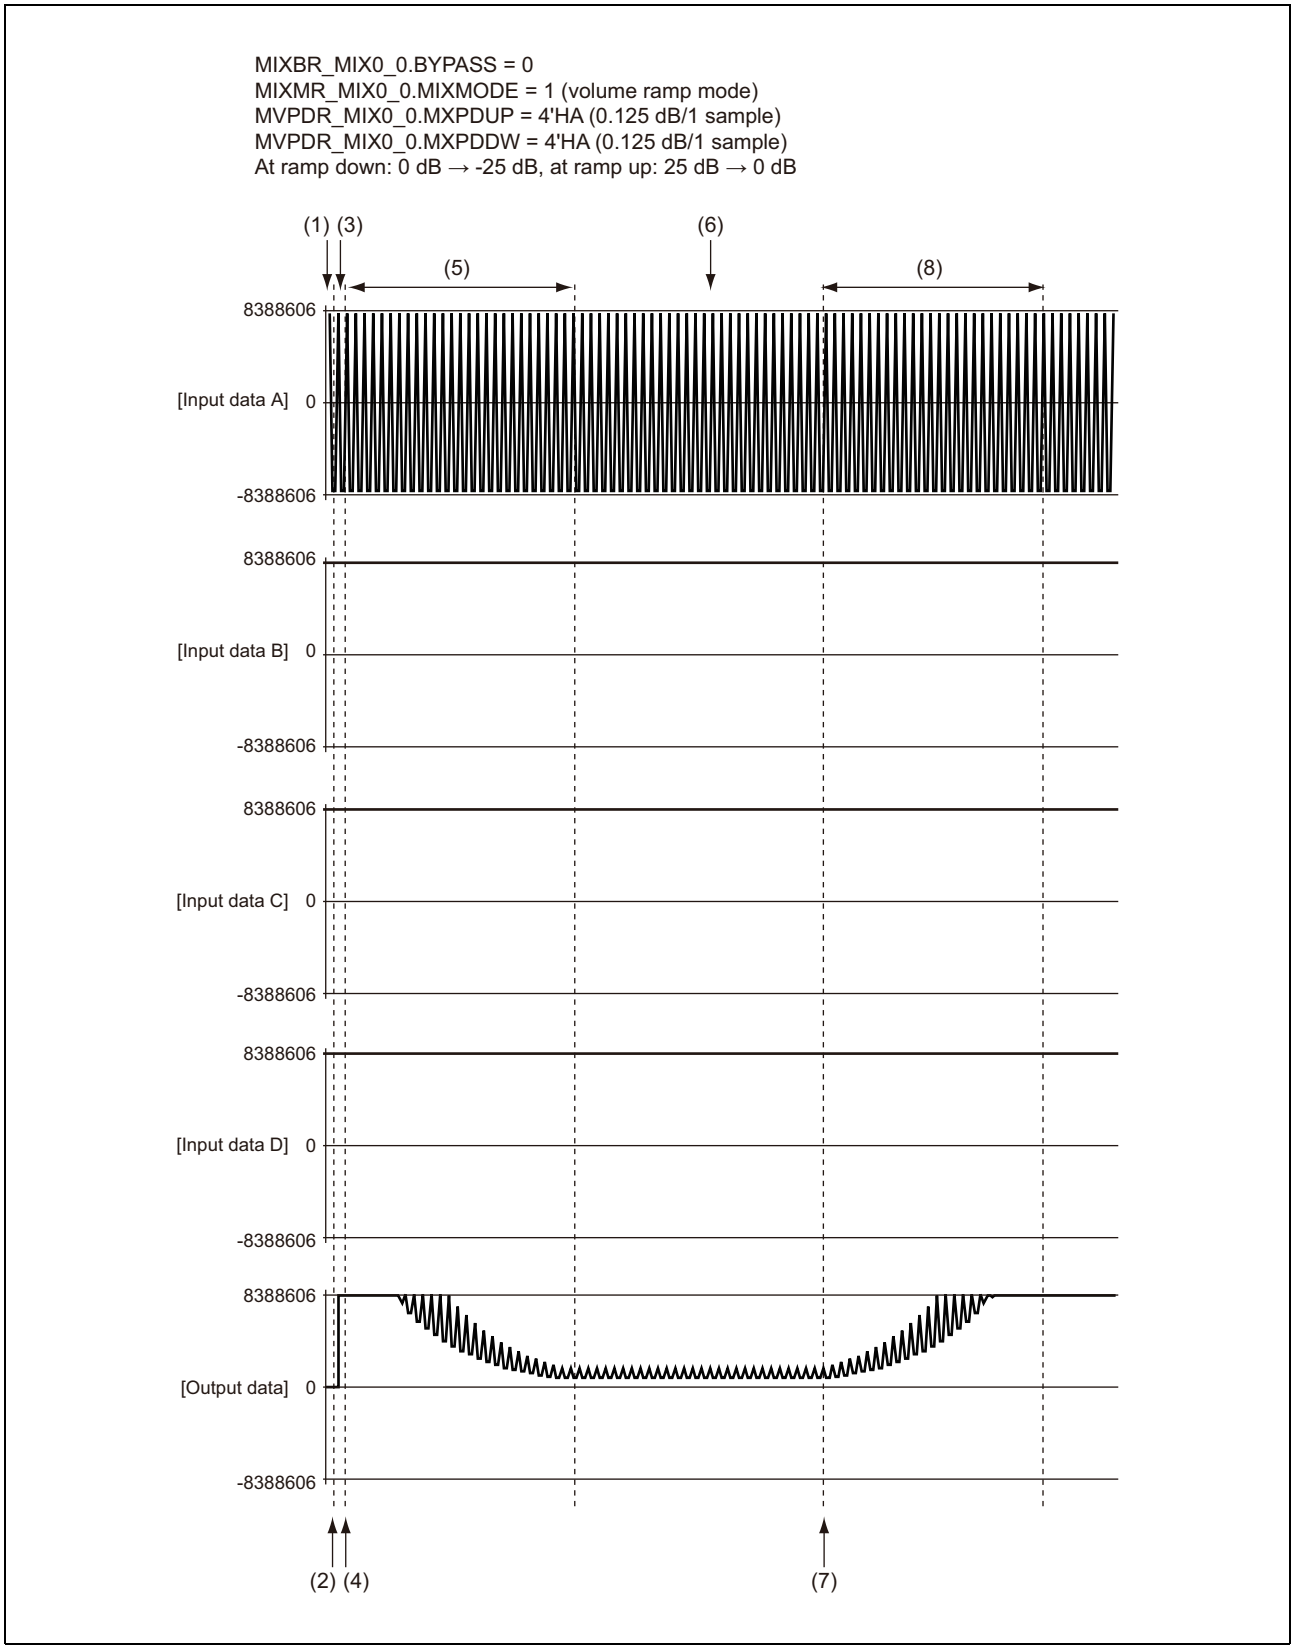

Figure 48.20 Volume Ramp Operation for 4-System Data

Operation

(1) In the initialized state (MIXIR_MIX0_0.INIT = 1), set the MIXMODE bit in MIXMR_MIX0_0 to 1 (volume ramp mode) and the MXPDDW bit in MVPDR_MIX0_0 to 4'HA (0.125 dB/1 sample).
Until the initialized state is cleared, the MIX does not start operation and its output data is 0.

(2) When the initialized state is cleared (MIXIR_MIX0_0.INIT = 0), the MIX starts operation.

Note: Changes to the settings of the MIXDBA bits of the MDBAR_MIX0_0 register, MIXDBB bits of the MDBBR_MIX0_0 register, MIXDBC bits of the MDBCR_MIX0_0 register and MIXDBD bits of the MDBDR_MIX0_0 register made in the INIT state rapidly become applicable on release from the INIT state (independently of the setting of MVPDR_MIX0_0).

(3) Set as follows:
MDBER_MIX0_0.MIXDBEN = 0
MDBAR_MIX0_0.MIXDBA = 10'H0C8 (-25 dB)
MDBBR_MIX0_0.MIXDBB = 10'H0C8 (-25 dB)
MDBCR_MIX0_0.MIXDBC = 10'H0C8 (-25 dB)
MDBDR_MIX0_0.MIXDBD = 10'H0C8 (-25 dB)

(4) The setting in (3) is enabled by setting the MIXDBEN bit in MDBER_MIX0_0 to 1.

(5) The output data is the value obtained by attenuating and mixing the input data of each system by -25 dB after 25/0.125 = 200 steps because the MXPDDW bit in MVPDR_MIX0_0 is set to 4'HA (0.125 dB/1 sample) according to 0 dB to -25 dB ramp down for each system.

(6) Set as follows:
MDBER_MIX0_0.MIXDBEN = 0
MDBAR_MIX0_0.MIXDBA = 10'H000 (0 dB)
MDBBR_MIX0_0.MIXDBB = 10'H000 (0 dB)
MDBCR_MIX0_0.MIXDBC = 10'H000 (0 dB)
MDBDR_MIX0_0.MIXDBD = 10'H000 (0 dB)

(7) The setting in (6) is enabled by setting the MIXDBEN bit in MDBER_MIX0_0 to 1.

(8) The output data is the value obtained by boosting and mixing the input data of each system by 25 dB after 25/0.125 = 200 steps because the MXPDUP bit in MVPDR_MIX0_0 is set to 4'HA (0.125 dB/1 sample) according to -25 dB to 0 dB ramp up for each system.

Table 48.27 shows the latency of the MIX block.

Table 48.27 MIX Block Latency

Item	Bypass	MIX Operation
Output delay	1	2

48.5 Usage Note

48.5.1 Software Reset

When initializing the internal circuits of this module by clearing the SWRST bit in the SWRSR_CIM register or setting the INIT bit in the IPCIR_IPC0_n, OPCIR_OPC0_n, FFDIR_FFD0_n, FFUIR_FFU0_n, SRCIRp_2SRC0_m, SRCIRR_2SRC0_m, DVUIR_DVU0_n, or MIXIR_MIX0_0 register, be sure to follow the procedures specified in section 48.4.1, Initial Setting Procedure or section 48.4.2, Transfer Start Procedure and Stop Procedure.

49. Sound Generator

This LSI has four channels of on-chip sound generator.

49.1 Features

- Capable of adjusting sound volume using 8-bit PWM output
- Selection of operating clocks
  Four types of operating clocks (P0φ/2, P0φ/4, P0φ/8, and P0φ/16) can be selected.
- Frequency settings in the 25-Hz to 20-kHz range with precision of 1% or less
- Output stop procedures can be selected
- Automatic attenuator function can be selected
- Interrupt source: one type
  Attenuation end interrupt can be requested
- Module stop mode can be set

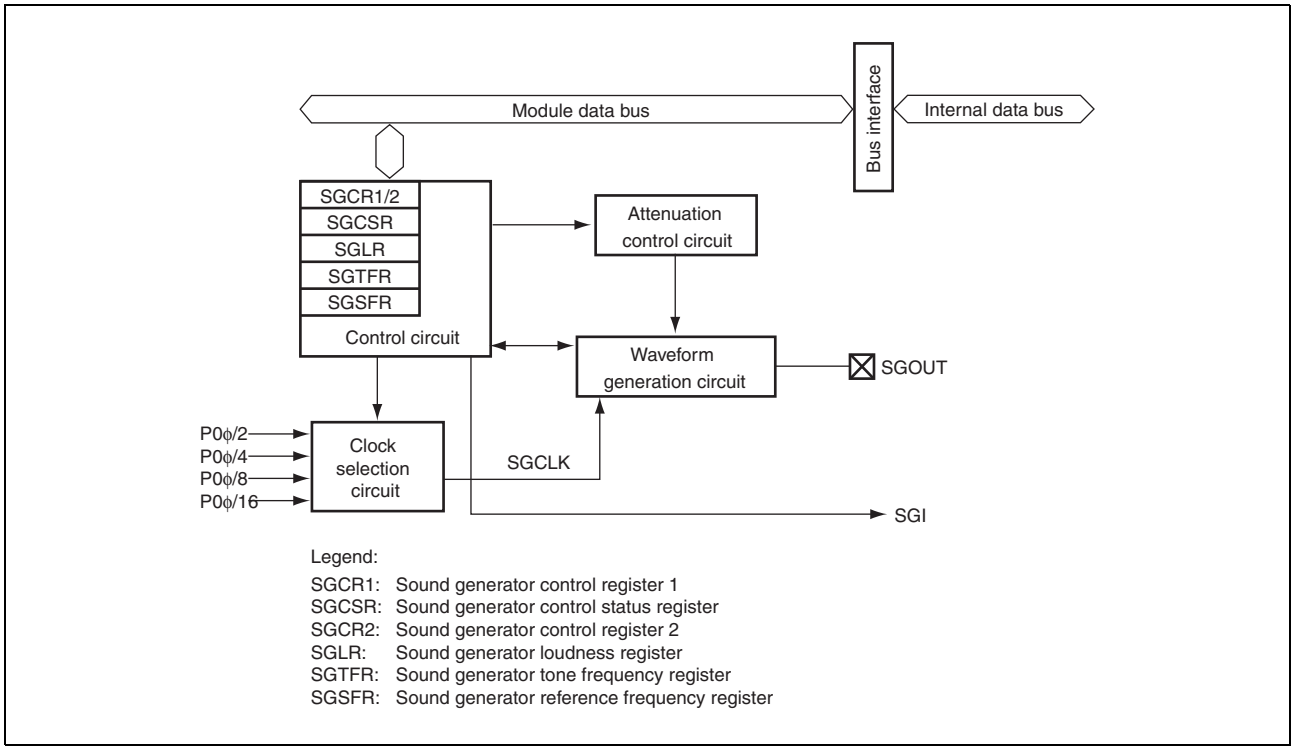

Figure 49.1 Block Diagram

49.2 Input/Output Pins

Table 49.1 shows the pin configuration.

Table 49.1 Pin Configuration

Name	Abbr.	I/O	Function
Sound generator output pin 0	SGOUT_0	Output	Channel 0 sound generator output
Sound generator output pin 1	SGOUT_1	Output	Channel 1 sound generator output
Sound generator output pin 2	SGOUT_2	Output	Channel 2 sound generator output
Sound generator output pin 3	SGOUT_3	Output	Channel 3 sound generator output

49.3 Register Descriptions

Table 49.2 shows the register configuration. Separate explanations for each channel are not given in this section.

Table 49.2 Register Configuration

Channel	Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
0	Sound generator control register 1_0	SGCR1_0	R/W	H'00	H'FCFF4800	8
	Sound generator control status register_0	SGCSR_0	R/W	H'00	H'FCFF4801	8

49.3.1 Sound Generator Control Register 1 (SGCR1)

SGCR1 controls the operation of this module.

Bit:	7	6	5	4	3	2	1	0
Bit name:	SGST	STPM	—	SGCK[1]	SGCK[0]	DPF[2]	DPF[1]	DPF[0]
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	SGST	0	R/W	Operation Start Starts/stops the operation. 0: Stops the operation 1: Starts the operation. The stop procedures differ depending on the STPM bit setting even when SGST = 1
6	STPM	0	R/W	Stop Procedure Select Selects the operation stop procedure. 0: Stops when SGST = 0 1: When the attenuator function is on, operation stops if SGST = 0 and SGDEF = 1 When the attenuator function is off, operation stops if SGST = 0 and SGEND = 1
5	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
4 3	SGCK[1:0]	H'0	R/W	Clock Select Selects the operating clock (SGCLK). 00: P0φ/2 01: P0φ/4 10: P0φ/8 11: P0φ/16
2 1 0	DPF[2:0]	H'0	R/W	Attenuator Function Select These bits turn the attenuator function on and off, and select the attenuation cycle. 000: Attenuator function is off. 001: Attenuates at the TONE frequency 010: Attenuates at the TONE frequency/2 011: Attenuates at the TONE frequency/4 100: Attenuates at the TONE frequency/8 101: Attenuates at the TONE frequency/16 110: Attenuates at the TONE frequency/32 111: Setting prohibited

49.3.2 Sound Generator Control Status Register (SGCSR)

SGCSR is a status register.

Bit:	7	6	5	4	3	2	1	0
Bit name:	SGIE	SGDEF	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/(W)*	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	SGIE	0	R/W	Interrupt Enable Enables/disables the attenuation end interrupt requests. 0: Disables interrupt requests 1: Enables interrupt requests
6	SGDEF	0	R/(W)*	Attenuation End Flag [Setting condition] • When attenuation operation ends [Clearing conditions] • When 0 is written after SGDEF = 1 is read • When SGLR is written
5 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note: * Only 0 can be written to clear the flag.

49.3.3 Sound Generator Control Register 2 (SGCR2)

SGCR2 is used for the termination of this module.

Bit:	7	6	5	4	3	2	1	0
Bit name:	SGEND	TCHG	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	SGEND	0	R/W	Stop Controls the operation of this module when the attenuator function is off and STPM = 1. 0: Continues operation 1: Stops operation When STPM = 0, the SGST bit controls operation regardless of this bit setting.
6	TCHG	0	R/W	TONE Change Protect Enables/disables writing to the TONE or SFS bits. Bits TONE and SFS can be modified when TCHG = 1. 0: Disables writing to the TONE and SFS bits 1: Enables writing to the TONE and SFS bits
5 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

49.3.4 Sound Generator Loudness Register (SGLR)

SGLR sets the SGOUT duty.

Bit:	7	6	5	4	3	2	1	0
Bit name:	LD[7]	LD[6]	LD[5]	LD[4]	LD[3]	LD[2]	LD[1]	LD[0]
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	LD[7:0]	H'00	R/W	Loudness Data These bits store the duty data for pulse output.

49.3.5 Sound Generator Tone Frequency Register (SGTFR)

SGTFR sets the tone frequency.

Bit:	7	6	5	4	3	2	1	0
Bit name:	—	TONE[6]	TONE[5]	TONE[4]	TONE[3]	TONE[2]	TONE[1]	TONE[0]
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*

Note: * These bits can be written to only when TCHG = 1.

Bit	Bit Name	Initial Value	R/W	Description
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6 to 0	TONE[6:0]	H'00	R/(W)*	Tone Frequency Setting These bits set the tone frequency based on the reference frequency specified by the SFS bits. Setting H'00 is prohibited.

Note: * These bits can be written to only when TCHG = 1.

49.3.6 Sound Generator Reference Frequency Register (SGSFR)

SGSFR sets the reference frequency.

Bit:	7	6	5	4	3	2	1	0
Bit name:	SFS[7]	SFS[6]	SFS[5]	SFS[4]	SFS[3]	SFS[2]	SFS[1]	SFS[0]
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*

Note: * These bits can be written to only when TCHG = 1.

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SFS[7:0]	H'00	R/(W)*	Reference Frequency Setting These bits set the reference frequency based on the operating clock (SGCLK) specified by the SGCK bits in SGCR1. Setting H'00 is prohibited.

Note: * These bits can be written to only when TCHG = 1.

49.4 Operation

49.4.1 Base Operation

(1) Initial Settings

Make sure that this module has stopped before setting registers.
The operation stop procedure, operating clock, and attenuator function on/off settings are specified by the STPM, SGCK, and DPF bits in SGCR1, respectively. When the attenuator function is on, the attenuation cycle is selected. The interrupt request is set by the SGIE bit in SGCSR.

(2) Activation

The operation of this module is enabled by setting the SGST bit in SGCR1 to 1 and clearing the SGEND bit in SGCR2 to 0. Set the TCHG bit in SGCR2 to 1 to cancel the write protect for SGSFR and SGTFR. Use bits SFS7 to SFS0 in SGSFR to select the reference frequency and bits TONE6 to TONE0 in SGTFR to select the tone frequency. SGLR specifies the output pulse duty. This module starts operation after writing to SGCR2, SGLR, SGTFR, and SGSFR is completed.

(3) Stopping

The operation stop procedure of this module is specified by the STPM bit in SGCR1.
When the attenuator function is off and STPM is 0, the operation is stopped by the SGST bit regardless of the SGEND bit setting. When the attenuator function is off and STPM is 1, the operation is stopped by clearing the SGST bit to 0 and setting the SGEND bit to 1.
When the attenuator function is on and STPM is 0, clearing the SGST bit to 0 stops operation even though the automatic attenuation does not end and the SGDEF bit is not set to 1. When the attenuator function is on and STPM is 1, clearing the SGST bit to 0 does not stop operation until the automatic attenuation ends and the SGDEF bit is set to 1.
The conditions for stopping this module are listed in Table 49.3 and examples of stopping operation are shown in Figure 49.2.

Table 49.3 Stop Conditions

Attenuator Function Off					Attenuator Function On				
STPM	**SGST**	**SGEND**	**SGDEF**	**Operation**	**STPM**	**SGST**	**SGEND**	**SGDEF**	**Operation**
0	0	x	x	Stopped	0	0	x	x	Stopped
0	1	x	x	Output	0	1	x	x	Output
1	0	0	x	Retained*	1	0	x	0	Retained*
1	0	1	x	Stopped	1	0	x	1	Stopped
1	1	0	x	Output	1	1	x	0	Output
1	1	1	x	Output	1	1	x	1	Output

Legend:
x: Don't care
Note: * Previous state is held.

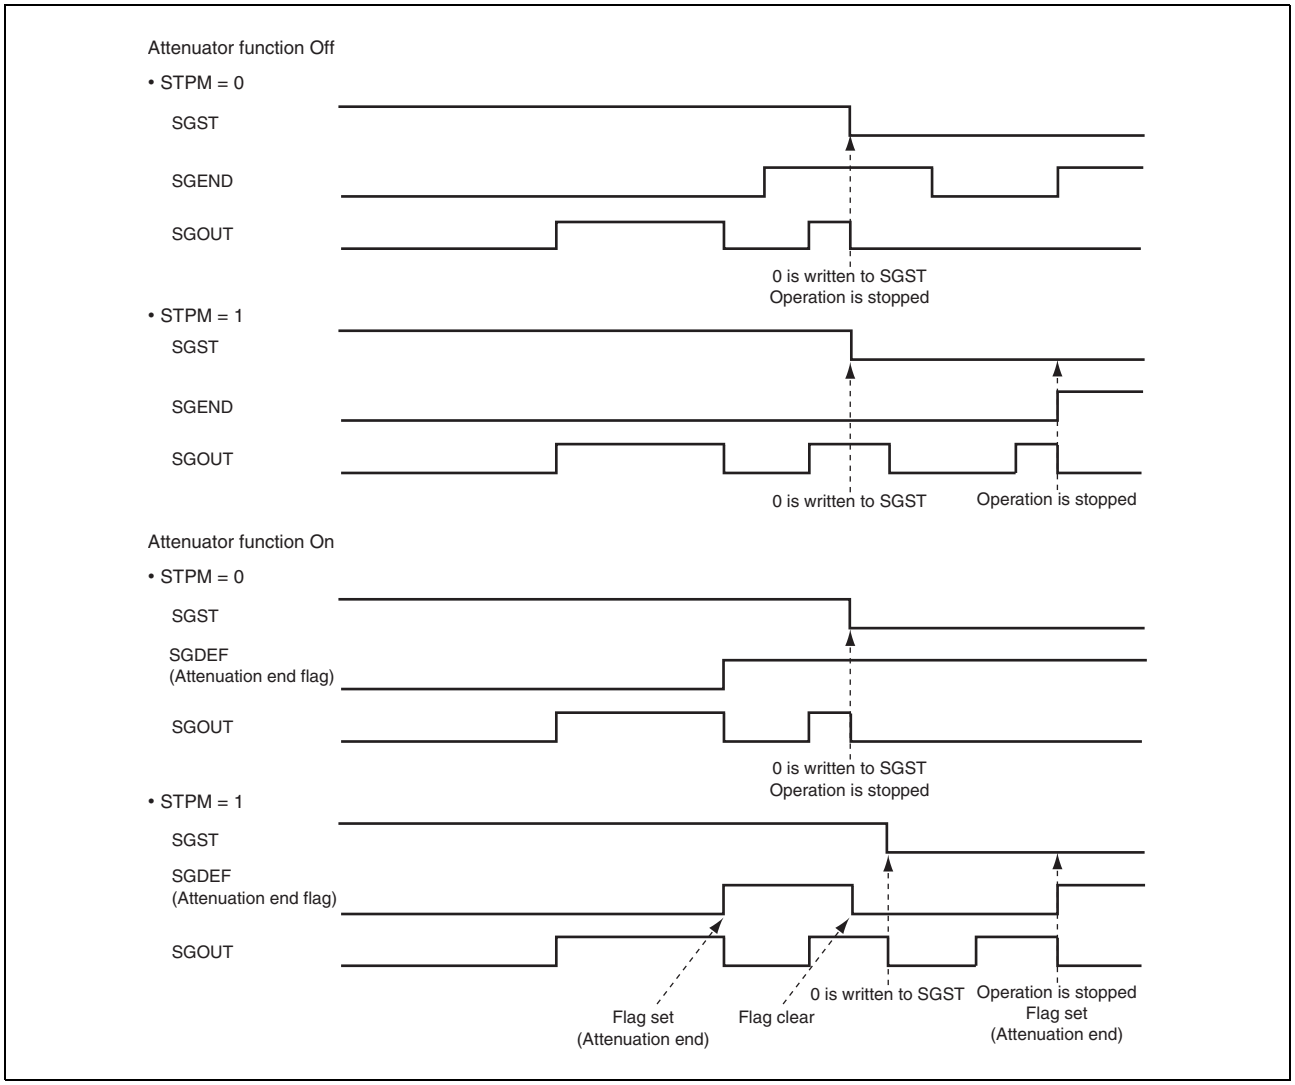

Figure 49.2 Examples of Stopping Operation

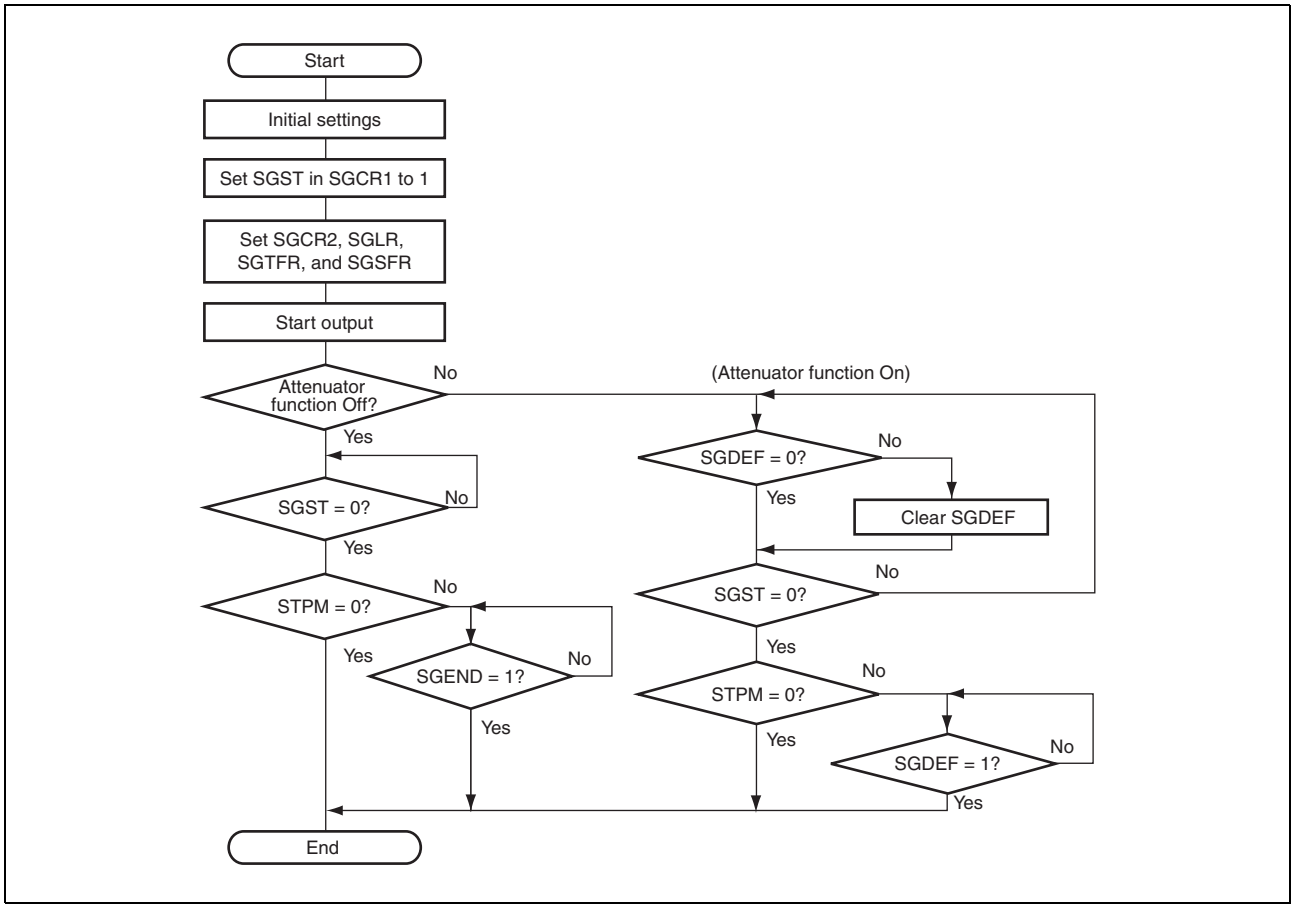

Figure 49.3 Operation Flow

49.4.2 Tone Frequency Setting

This module provides tone frequency output in the range of 25 Hz to 20 kHz, with precision of 1% or less.
The tone frequency is calculated by:

Reference frequency (Hz) = SGCLK (Hz)/SFS
Tone frequency (Hz) = Reference frequency (Hz)/(2 × TONE)
= SGCLK (Hz)/(2 × SFS × TONE)

Setting values of the TONE bits in SGTFR and SFS bits in SGFSR are calculated by:

SFS = SGCLK (Hz)/reference frequency (Hz) (0 < SFS ≤ 255)
TONE = Reference frequency (Hz)/(2 × TONE frequency (Hz)) (0 < TONE ≤ 127)

An example of relationship between the tone frequency and output error is shown in Table 49.4.

Table 49.4 Relationship between Tone Frequency and Output Error

Tone Frequency	SFS[7:0]	TONE[6:0]	Error (%)
220.00	B1	6B	0.008
329.63	9E	50	0.007
440.00	4D	7B	0.02
659.26	4F	50	0.007
880.00	40	4A	0.03
1318.50	28	4F	0.005
1760.00	20	4A	0.03
2637.00	14	4F	0.005
3520.00	10	4A	0.03
5274.00	A	4F	0.005
7040.00	8	4A	0.03

Note: • SGCLK = P0φ [MHz]/4 = 33.33 [MHz]/4 = 8.3 [MHz]

Since changing P0φ frequency affects the tone frequency, care should be taken when changing it.

49.4.3 Auto Attenuator Function

When the auto attenuator function is on, the loudness data (LD) determines the initial duty cycle for SGOUT.
The SGOUT duty cycle is attenuated by a factor of 1/32 using the attenuation cycle set by the DPF bits in SGCR1.
The attenuation characteristics are calculated by the equation:

$LD_n = int (LD0 \times (1 - 1/32)^n)$
LD: SGOUT duty cycle (The initial data is SGLR.)
n: Attenuation cycle number

Figure 49.4 is a graph of attenuation characteristics.

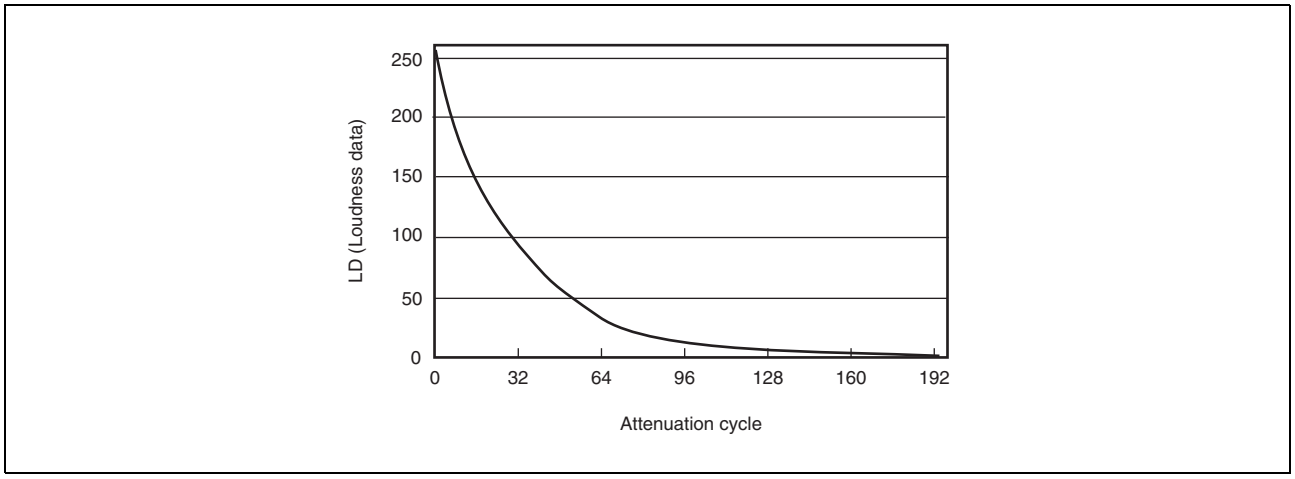

Figure 49.4 Attenuation Characteristics

49.4.4 Output Waveform

As shown in Figure 49.5, the output waveform of this module is obtained by synthesis of the on-chip 8-bit PWM pulse output and the tone frequency output. The duty cycle for the on-chip 8-bit PWM pulse output is set by SGLR.

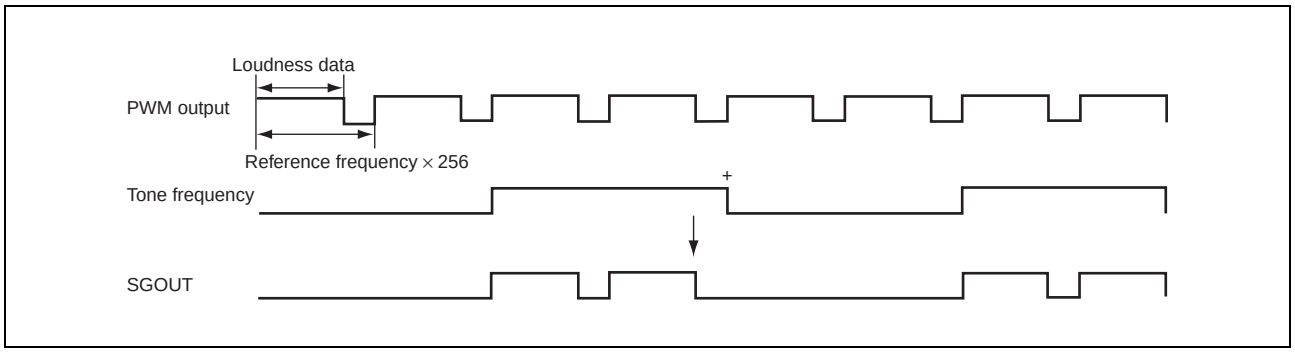

Figure 49.5 Output Waveforms

49.5 Interrupt Source

When the attenuator function is on and an automatic attenuation operation is completed (duty cycle for the on-chip PWM pulse output is 0), the SGDEF bit in SGCSR is set. An interrupt request is issued if the SGIE bit in SGCSR is set to 1. When STPM = 0, the SGDEF bit is set only when the first attenuation operation is completed. If the SGDEF bit is cleared during automatic attenuation, the SGDEF bit is set when the next attenuation operation is completed.

Table 49.5 Interrupt Source

Name	Interrupt Source	Interrupt Flag
SGDEI	Attenuation end	SGDEF

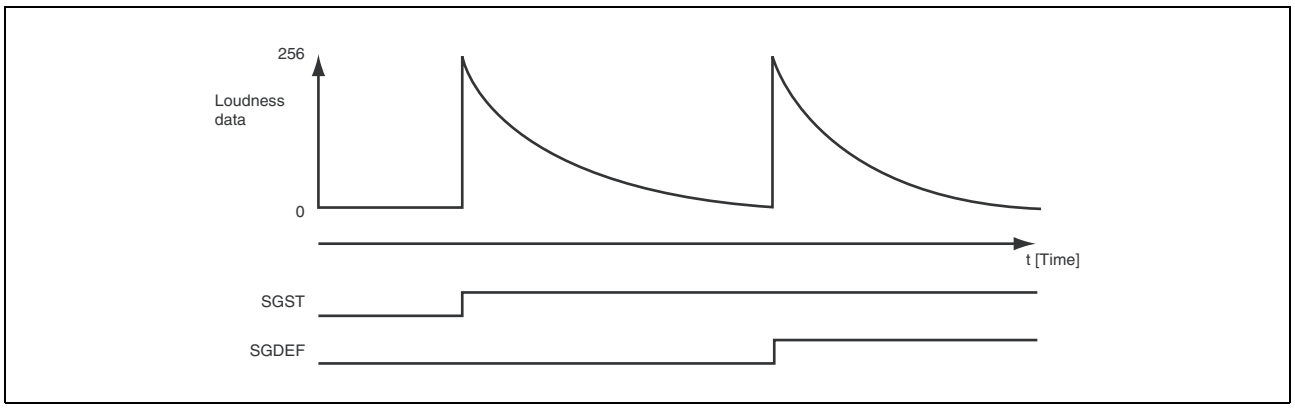

Figure 49.6 Attenuation End Flag Setting Timing

49.6 Usage Note

49.6.1 Module Stop Mode Settings

The module stop control register enables or disables the operation of this module. With the initial setting, the operation of this module is stopped. Register access is enabled by canceling module stop mode. For details, see section 55, Power-Down Modes.

50. SD Host Interface

Note: • SD Host/Ancillary Product License Agreement (SD HALA) is required to develop SD host-related products.

50.1 Overview

50.1.1 Features

- SD memory/IO card interface (1-bit/4-bit SD bus)
- SD memory card: SD, SDHC, SDXC
- Transfer mode: Default mode, High-Speed mode
- SD clock (SD_CLK) frequency = $1/2^n$ P1φ (Peripheral clock 1) frequency (n = 1 to 9)
- Error check function: CRC7 (for command/response), CRC16 (for data)
- Three interrupt requests
- DMA transfer request: SD_BUF read/write
- Card detect function
- Write protect support

50.1.2 Block Diagram

Figure 50.1 shows a block diagram of the SD host interface.

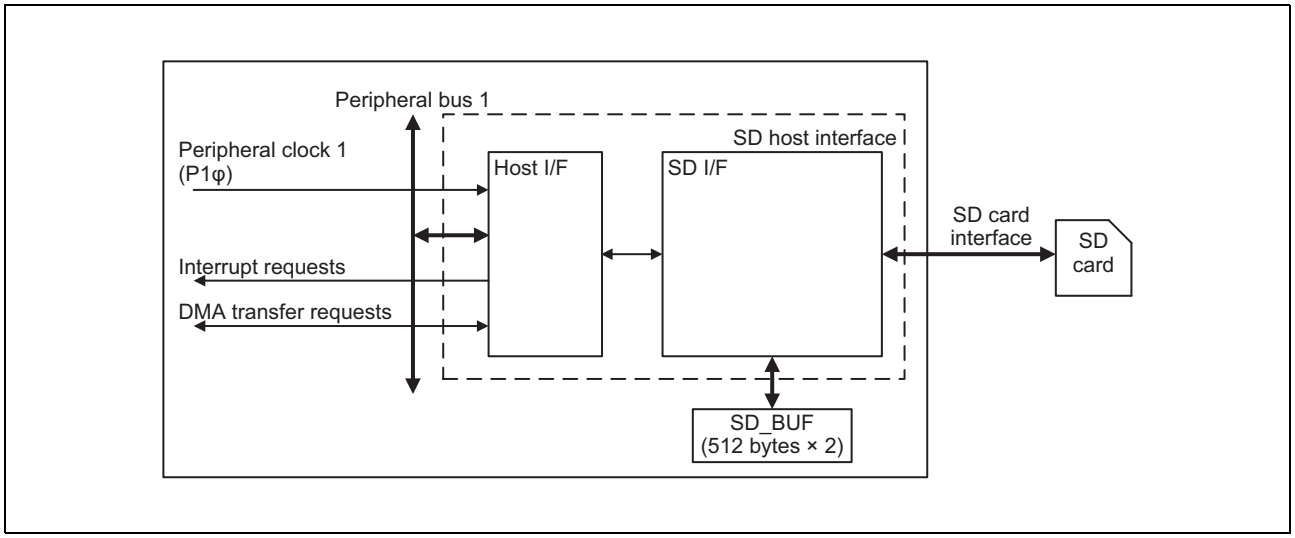

Figure 50.1 Block Diagram of SD Host Interface

50.1.3 Input/Output Pins

Table 50.1 lists the input and output pins used by the SD host interface.

Table 50.1 Pin Configuration

Pin Name	Signal Name	I/O	Function
SD_CLK[1:0]*1	SDCLK	Output	SD clock
SD_CMD[1:0]*1	SDCMD	I/O	Command/response
SD_D0[1:0]*1	SDDAT0	I/O	Data[bit 0]
SD_D1[1:0]*1	SDDAT1	I/O	Data[bit 1]/SDIO interrupt
SD_D2[1:0]*1	SDDAT2	I/O	Data[bit 2]/Read wait
SD_D3[1:0]*1	SDDAT3	I/O	Data[bit 3]
SD_CD[1:0]*1	ISDCD	Input	Card detect*2
SD_WP[1:0]*1	ISDWP	Input	Write protect*2

Note 1. [1:0] indicates the SD Host Interface channel number.
Note 2. When a pin is not in use, fix the corresponding signal to 1.

50.2 Register Descriptions

Table 50.2 summaries the registers of the SD host interface.

Table 50.2 Register Configuration

Channel	Register Name	Abbreviation	Address	Access Size
0	Command type register	SD_CMD	H'E804E000	16

50.2.1 Command Type Register (SD_CMD)

The command type register (SD_CMD) selects the command type and response type. The command sequence is started by writing to SD_CMD. For details on the SD_CMD setting, refer to section 50.4.10, Example of SD_CMD Register Setting.
Do not write to SD_CMD while the SCLKDIVEN bit in SD_INFO2 is set to 0.

Bit	Bit Name	Initial Value	R/W	Description
15	MD7	0	R/W	Multiple Block Transfer Mode (enabled at multiple block transfer) 00: CMD12 is automatically issued at multiple block transfer. 01: CMD12 is not automatically issued at multiple block transfer. 10: Setting prohibited 11: Setting prohibited
14	MD6	0	R/W	
13	MD5	0	R/W	Single/Multiple Block Transfer (enabled when the command with data is handled) 0: Single block transfer 1: Multiple block transfer
12	MD4	0	R/W	Write/Read Mode (enabled when the command with data is handled) 0: Write (SD host interface → SD card) 1: Read (SD host interface ← SD card)
11	MD3	0	R/W	Data Mode (Command Type) 0: Command without data transfer (bc, bcr, ac) 1: Command with data transfer (adtc)
10	MD2	0	R/W	Mode/Response Type 000: Normal mode The response type and the transfer mode are selected by SD_CMD[7:0], and the SD_CMD[15:11] setting is disabled. 001: Setting prohibited 010: Setting prohibited 011: Extended mode/No response 100: Extended mode/SD card R1, R5, R6, R7 response 101: Extended mode/SD card R1b response 110: Extended mode/SD card R2 response 111: Extended mode/SD card R3, R4 response As some commands cannot be used in normal mode, see section 50.4.10, Example of SD_CMD Register Setting to select mode/response type.
9	MD1	0	R/W	
8	MD0	0	R/W	
7	C1	0	R/W	00: CMD 01: ACMD 10: Setting prohibited 11: Setting prohibited
6	C0	0	R/W	
5	CF45	0	R/W	Command Index These bits specify Command Format[45:40] (command index). [Examples] CMD6: SD_CMD[7:0] = 8'b00_000110 CMD18: SD_CMD[7:0] = 8'b00_010010 ACMD13: SD_CMD[7:0] = 8'b01_001101
4	CF44	0	R/W	
3	CF43	0	R/W	
2	CF42	0	R/W	
1	CF41	0	R/W	
0	CF40	0	R/W	

Note: • SD_CMD cannot be written to when the CBSY bit in SD_INFO2 is 1.

50.2.2 SD Command Argument Registers (SD_ARG)

The SD command argument registers (SD_ARG) set the command argument of SD card. Set the command argument before writing to SD_CMD.

- SD_ARG0

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	CF23 to CF8	All 0	R/W	Set command format[23:8] (argument)

- SD_ARG1

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	CF39 to CF24	All 0	R/W	Set command format[39:24] (argument)

50.2.3 Data STOP Register (SD_STOP)

The data stop register (SD_STOP) is used to enable or disable block counting at multiple block transfer, and to control the issuing of CMD12 within command sequences.

Bit	Bit Name	Initial Value	R/W	Description
15 to 9	—	All 0	R	Fixed 0
8	SEC	0*1	R/W	Block Count Enable*2 0: Disables SD_SECCNT setting value. 1: Enables SD_SECCNT setting value. Set SEC to 1 at multiple block transfer. When SD_CMD is set as follows to start the command sequence while SEC is set to 1, CMD12 is automatically issued. 1. CMD18 or CMD25 in normal mode (SD_CMD[10:8] = 000) 2. SD_CMD[15:13] = 001 in extended mode (CMD12 is automatically issued, multiple block transfer) When the command sequence is halted because of a communications error or timeout, CMD12 is not automatically issued.
7 to 1	—	All 0	R	Fixed 0
0	STP	0*1	R/W	Stop*3 • When STP is set to 1 during multiple block transfer, CMD12 is issued to halt the transfer through the SD host interface. However, if a command sequence is halted because of a communications error or timeout, CMD12 is not issued. Although continued buffer access is possible even after STP has been set to 1, the buffer access error bit (ERR5 or ERR4) in SD_INFO2 will be set accordingly. • When STP has been set to 1 during transfer for single block write, the access end flag is set when SD_BUF becomes empty, and CMD12 is not issued. If SD_BUF does contain data, the access end flag is set on completion of reception of the busy state without CMD12 having been issued. • When STP has been set to 1 during transfer for single block read, the access end flag is set immediately after setting of the STP bit and CMD12 is not issued. • When STP is set to 1 during reception of the busy state after an R1b response, the access end flag is set on completion of reception of the busy state without CMD12 having been issued. • When STP is set to 1 after a command sequence has been completed, CMD12 is not issued and the access end flag is not set.

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.
Note 2. Do not change the value of this bit when the SCLKDIVEN bit in SD_INFO2 is set to 0.
Note 3. Do not change the value of this bit from 1 to 0 when the SCLKDIVEN bit in SD_INFO2 is set to 0.

50.2.4 Block Count Register (SD_SECCNT)

The block count register (SD_SECCNT) specifies the number of transfer blocks at multiple block transfer.

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	CNT15 to CNT0	All 0	R/W	Number of Transfer Blocks*1 When 0x0001 is set, the number of transfer blocks is 1. : When 0xFFFF is set, the number of transfer blocks is 65535. However, when 0x0000 is set, the number of transfer blocks is 65536.

Note 1. Do not change the value of this bit when the SCLKDIVEN bit in SD_INFO2 is set to 0.

50.2.5 SD Card Response Registers (SD_RSP)

The SD card response registers (SD_RSP) store the response from the SD card.

- SD_RSP00

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	R23 to R8	All 0	R	Store the response from the SD card

- SD_RSP01

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	R39 to R24	All 0	R	Store the response from the SD card

- SD_RSP02

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	R55 to R40	All 0	R	Store the response from the SD card

- SD_RSP03

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	R71 to R56	All 0	R	Store the response from the SD card

- SD_RSP04

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	R87 to R72	All 0	R	Store the response from the SD card

- SD_RSP05

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	R103 to R88	All 0	R	Store the response from the SD card

- SD_RSP06

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	R119 to R104	All 0	R	Store the response from the SD card

- SD_RSP07

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	—	All 0	R	Fixed 0
7 to 0	R127 to R120	All 0	R	Store the response from the SD card

Table 50.3 lists the response types and corresponding SD_RSP registers.

Table 50.3 Response Types and Corresponding SD_RSP Registers

Response Types	SD_RSP Registers
R1, R1b[39:8]	SD_RSP01 and SD_RSP00
R2[127:8]	SD_RSP07 to SD_RSP00
R3[39:8]	SD_RSP01 and SD_RSP00
R4[39:8]	SD_RSP01 and SD_RSP00
R5[39:8]	SD_RSP01 and SD_RSP00
R6[39:8]	SD_RSP01 and SD_RSP00
R7[39:8]	SD_RSP01 and SD_RSP00

50.2.6 SD Card Interrupt Flag Register 1 (SD_INFO1)

The SD card interrupt flag register 1 (SD_INFO1) indicates the response end and access end in the command sequence. This register also indicates the card detect/write protect state.
For CMD12 and CMD52 (SDIO abort) at multiple block transfer, INFO0 is not set but only INFO2 is set.
Even if the command sequence is halted because of a communications error or timeout, INFO0 or INFO2 is set.
INFO10, INFO9, and INFO8 change depending on the SD_D3 state after a reset is released and continue to change in 4-bit transfer mode.
To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	—	All 0	R	Fixed 0
10	INFO10	Unknown	R	Indicates the SD_D3 state. 1: SD_D3 is set to 1. 0: SD_D3 is set to 0.
9	INFO9	0	R/W*1	SD_D3 set [Setting condition] After change in SD_D3 from 0 to 1, two cycles of P1φ has elapsed with SD_D3 held 1. [Clearing condition] When 0 is written to INFO9
8	INFO8	0	R/W*1	SD_D3 clear [Setting condition] After change in SD_D3 from 1 to 0, two cycles of P1φ has elapsed with SD_D3 held 0. [Clearing condition] When 0 is written to INFO8
7	INFO7	Unknown	R	Write Protect Indicates the SD_WP state. 1: SD_WP is set to 0. 0: SD_WP is set to 1.
6	—	0	R	Fixed 0
5	INFO5	Unknown	R	Indicates the SD_CD state. 1: Indicates that Ncycle has elapsed with SD_CD held 0. 0: Indicates that Ncycle has elapsed with SD_CD held 1. Ncycle is set by bits 3 to 0 in SD_OPTION.
4	INFO4	0	R/W*1	SD_CD Card Insertion [Setting condition] After change in SD_CD from 1 to 0, Ncycle has elapsed with SD_CD held 0. [Clearing condition] When 0 is written to INFO4 Ncycle is set by bits 3 to 0 in SD_OPTION.
3	INFO3	0	R/W*1	SD_CD Card Removal [Setting condition] After change in SD_CD from 0 to 1, Ncycle has elapsed with SD_CD held 1. [Clearing condition] When 0 is written to INFO3 Ncycle is set by bits 3 to 0 in SD_OPTION.

Bit	Bit Name	Initial Value	R/W	Description
2	INFO2	0*2	R/W*1	Access End [Setting conditions] • When read access to the buffer is completed in the case of transfer for single block read • When read access to the buffer for the last block of data is completed in the case of transfer for multiple block read • When read access to the buffer and reception of the response to CMD12 are completed in the case of transfer for multiple block read with automatic issuing of CMD12 • When reception of the busy state after reception of the CRC status is completed in the case of transfer for single block write • When reception of the busy state after reception of the CRC status of the last block of data is completed in the case of transfer for multiple block write • When reception of the response busy state for CMD12 is completed in the case of transfer for multiple block write with automatic issuing of CMD12 • When reception of the response to CMD12 that was issued by setting the STP bit to1 is completed in the case of transfer for multiple block read • When reception of the response busy state for CMD12 that was issued by setting the STP bit to1 is completed in the case of transfer for multiple block write • When reception of the response to CMD52 that was issued by setting the IOABT bit to1 is completed in the case of transfer for multiple block read • When reception of the response to CMD52 that was issued by setting the IOABT bit to1 is completed in the case of transfer for multiple block write In addition to the above conditions, this bit is set when a command sequence is halted because of a communications error or timeout. [Clearing condition] When 0 is written to INFO2
1	—	0	R	Fixed 0
0	INFO0	0*2	R/W*1	Response End [Setting conditions] • When reception of the response is completed • When transmission of a command without response is completed • When reception of the busy state after R1b response is completed • When reception of the response to CMD52 that was issued by setting the C52PUB bit to1 is completed in the case of transfer for multiple block read • When reception of the response to CMD52 that was issued by setting the C52PUB bit to1 is completed in the case of transfer for multiple block write In addition to the above conditions, this bit is set when a command sequence is halted because of a communications error or timeout. [Clearing condition] When 0 is written to INFO0

Note 1. It is effective only if 0 is written.
Note 2. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

50.2.7 SD Card Interrupt Flag Register 2 (SD_INFO2)

The SD card interrupt flag register 2 (SD_INFO2) indicates the access status of the SD buffer (SD_BUF) and SD card. To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Bit	Bit Name	Initial Value	R/W	Description
15	ILA	0*2	R/W*1	Illegal Access Error [Setting conditions] • When data is written to SD_CMD within a command sequence • When SD_CMD[10:8] = 3'b011 (no response) and SD_CMD[11] = 1'b1 (command with data transfer) are set in SD_CMD • When SD_CMD[11] = 1'b1 (command with data transfer) and SD_CMD[7:0] = 8'b00001100 (CMD12) are set in SD_CMD [Clearing condition] When 0 is written to ILA
14	CBSY	0*2	R	Command Type Register Busy 1: The command sequence is being executed. 0: The command sequence is ended.
13	SCLKDIVEN	1*2	R	SD Bus Busy 1: SD buses (CMD and DAT) are not busy. 0: SD buses (CMD and DAT) are busy. When a command sequence is started by writing to SD_CMD, CBSY is set to 1. At the same time, SCLKDIVEN is set to 0. After CBSY has been set to 0 at the end of the command sequence, SCLKDIVEN is set to 1 when 8 cycles of SD_CLK elapses.
12	—	0	R	Fixed 0
11	—	0*2	R/W*1	Reserved. The write value should always be 1.
10	—	0	R	Fixed 0
9	BWE	0*2	R/W*1	SD_BUF Write Enable 1: Data can be written in SD_BUF0. 0: Data cannot be written in SD_BUF0. [Setting conditions] • When SD_BUF is empty at single block transfer • When either bank 1 or bank 2 of SD_BUF is empty at multiple block transfer [Clearing condition] • When 0 is written to BWE When data is written to SD_BUF0 by the CPU, clear BWE and then write amount of data specified by SD_SIZE*3. Note that this bit is not set when the SD_BUF read/write DMA transfer is enabled by setting the DMASDRW bit in CC_EXT_ MODE to 1.
8	BRE	0*2	R/W*1	SD_BUF Read Enable 1: Data can be read from SD_BUF0. 0: Data cannot be read from SD_BUF0. [Setting conditions] • When data set in SD_SIZE is stored in SD_BUF at single block transfer • When data set in SD_SIZE is stored in either bank 1 or bank 2 of SD_BUF at multiple block transfer [Clearing condition] • When 0 is written to BRE When data is read from SD_BUF0 by the CPU, clear BRE and then read amount of data specified by SD_SIZE*3. Note that this bit is not set when the SD_BUF read/write DMA transfer is enabled by setting the DMASDRW bit in CC_EXT_ MODE to 1. Even if a CRC error or an END error occurs while block data is read, data is stored in SD_BUF and BRE is set.

Bit	Bit Name	Initial Value	R/W	Description
7	DAT0	Unknown	R	SD_D0 Indicates the SD_D0 state 1: SD_D0 is set to 1. 0: SD_D0 is set to 0. If the data timeout (ERR3) is set but the response timeout (ERR6) is not set after the Erase command has been issued, the end of the Erase sequence (DAT0 = 1) is confirmed by polling DAT0. If a communications error or timeout occurs during a write sequence, the DAT0 bit may retain the value 0.
6	ERR6	0*2	R/W*1	Response Timeout [Setting condition] When a response is not received though a longer time than 640 cycles of SD_CLK has elapsed [Clearing condition] When 0 is written to ERR6 The command sequence is halted by the response timeout.*4
5	ERR5	0*2	R/W*1	SD_BUF Illegal Read Access [Setting conditions] • When SD_BUF is empty while SD_BUF0 is read • When data with a CRC error or END error is read from SD_BUF0 [Clearing condition] When 0 is written to ERR5
4	ERR4	0*2	R/W*1	SD_BUF Illegal Write Access [Setting conditions] • When data is written to SD_BUF0 while it is not in the data read/write command state • When data is written to SD_BUF0 while SD_BUF is full. • When data is written to SD_BUF0 while an error occurs in the CRC status or CRC status length. • When data is written to SD_BUF0 while a busy state after the CRC status continues for longer than Ncycle [Clearing condition] When 0 is written to ERR4 Ncycle is set by bits 7 to 4 in SD_OPTION.
3	ERR3	0*2	R/W*1	Data Timeout (except response timeout) [Setting conditions] • After R1b response, the busy state (SD_D0 = 0) continues for longer than Ncycle. • After CRC status, the busy state (SD_D0 = 0) continues for longer than Ncycle. • After write data, the CRC status is not received though Ncycle has elapsed. • After read command, read data is not received though a longer time than Ncycle has elapsed. • After CMD12 has been issued within a command sequence, the busy state (SD_D0 = 0) for longer than Ncycle continues. • After the reception of read data, read data for the next block are not received though a longer time than Ncycle has elapsed. • After release of the read wait state, read data for the next block are not received though a longer time than Ncycle has elapsed. [Clearing condition] • When 0 is written to ERR3 Ncycle is set by bits 7 to 4 in SD_OPTION. The command sequence is halted by the data timeout.

Bit	Bit Name	Initial Value	R/W	Description
2	ERR2	0*2	R/W*1	END Error [Setting conditions] • When an error occurs in the response length (and the end bit has not been detected) • When an error occurs in the read data length (and the end bit has not been detected among the valid bits) • When an error occurs in the CRC status length (and the end bit has not been detected) [Clearing condition] When 0 is written to ERR2 The command sequence is halted by the End error.*4
1	ERR1	0*2	R/W*1	CRC Error [Setting conditions] • When an error occurs in the CRC status • When a CRC error occurs in the read data • When a CRC error occurs in the response [Clearing condition] When 0 is written to ERR1 The command sequence is halted by the CRC error.*4
0	ERR0	0*2	R/W*1	CMD Error [Setting condition] When the command index of the transmitted command differed from the command index of the received response [Clearing condition] When 0 is written to ERR0 The command sequence is halted by the CMD error.*4

Note 1. It is effective only if 0 is written.
Note 2. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.
Note 3. The single byte or three bytes from the fraction of a full 32-bit unit are regarded as excess data due to an odd value for the number of bytes setting in SD_SIZE, or the two bytes from the fraction of a full 32-bit unit are regarded as excess data due if the value for the number of bytes setting in SD_SIZE is even but is not on a four-byte boundary.
Note 4. After the C52PUB bit in SDIO_MODE has been set to 1, if a communications error or timeout for response occurs in response to the CMD52 that is issued, since the command sequence has not been completed, complete the sequence with error processing as in usage examples in Figure 50.17 under section 50.4.7, IO_RW_EXTENDED Command (CMD53/Multiple Block Read) or in Figure 50.20 under section 50.4.8, IO_RW_EXTENDED Command (CMD53/Multiple Block Write).

50.2.8 SD_INFO1 Interrupt Mask Register (SD_INFO1_MASK)

The SD_INFO1 interrupt mask register (SD_INFO1_MASK) enables or disables the SD_INFO1 interrupt. When 0 is set in SD_INFO1_MASK while the corresponding flag in SD_INFO1 is set, an interrupt occurs.

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R	Fixed 0
9	IMASK9	1	R/W	INFO9 interrupt masked
8	IMASK8	1	R/W	INFO8 interrupt masked
7 to 5	—	All 0	R	Fixed 0
4	IMASK4	1	R/W	INFO4 interrupt masked
3	IMASK3	1	R/W	INFO3 interrupt masked
2	IMASK2	1	R/W	INFO2 interrupt masked
1	—	0	R	Fixed 0
0	IMASK0	1	R/W	INFO0 interrupt masked

50.2.9 SD_INFO2 Interrupt Mask Register (SD_INFO2_MASK)

The SD_INFO2 interrupt mask register (SD_INFO2_MASK) enables or disables the SD_INFO2 interrupt. When 0 is set in SD_INFO2_MASK while the corresponding flag in SD_INFO2 is set, an interrupt occurs.

Bit	Bit Name	Initial Value	R/W	Description
15	IMASK	1	R/W	ILA interrupt masked
14 to 12	—	All 0	R	Fixed 0
11	—	1	R/W	Reserved. The write value should always be 1.
10	—	0	R	Fixed 0
9	BMASK1	1	R/W	BWE interrupt masked
8	BMASK0	1	R/W	BRE interrupt masked
7	—	0	R	Fixed 0
6	EMASK6	1	R/W	ERR6 interrupt masked
5	EMASK5	1	R/W	ERR5 interrupt masked
4	EMASK4	1	R/W	ERR4 interrupt masked
3	EMASK3	1	R/W	ERR3 interrupt masked
2	EMASK2	1	R/W	ERR2 interrupt masked
1	EMASK1	1	R/W	ERR1 interrupt masked
0	EMASK0	1	R/W	ERR0 interrupt masked

50.2.10 SD Clock Control Register (SD_CLK_CTRL)

The SD clock control register (SD_CLK_CTRL) controls the SD clock (SD_CLK) output and sets the frequency. Set SCLKEN to 1 before writing to SD_CMD to issue a command.
Do not write to SD_CLK_CTRL while the SCLKDIVEN bit in SD_INFO2 is set to 0.

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R	Fixed 0
9	SDCLKOFFEN	0	R/W	SD Clock (SD_CLK) Output Automatic Control Enable 0: Automatic control for SD clock (SD_CLK) output is disabled. 1: Automatic control for SD clock (SD_CLK) output is enabled. This function of automatic control for SD clock (SD_CLK) output causes SD_CLK output only within a command sequence. The timing with which SD_CLK output starts and stops is as follows. SD_CLK output starts after writing to SD_CMD. SD_CLK output stops when 8 cycles of SD_CLK have elapsed after the end of the command sequence. In addition, automatic control for SD clock (SD_CLK) output is enabled when SCLKEN in SD_CLK_CTRL is 1.
8	SCLKEN	0*1	R/W*2	SD Clock (SD_CLK) Output Control Enable 0: SD clock (SD_CLK) output is disabled. The SD_CLK signal is fixed 0. 1: SD clock (SD_CLK) output is enabled.
7	DIV7	0	R/W*2	SD Clock (SD_CLK) 10000000: P1φ/512 01000000: P1φ/256 00100000: P1φ/128 00010000: P1φ/64 00001000: P1φ/32 00000100: P1φ/16 00000010: P1φ/8 00000001: P1φ/4 00000000: P1φ/2 Other settings are prohibited.
6	DIV6	0	R/W*2	
5	DIV5	1	R/W*2	
4	DIV4	0	R/W*2	
3	DIV3	0	R/W*2	
2	DIV2	0	R/W*2	
1	DIV1	0	R/W*2	
0	DIV0	0	R/W*2	

Note 1. This initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.
Note 2. Writing is impossible when the CBSY bit in SD_INFO2 is 1.

50.2.11 Transfer Data Length Register (SD_SIZE)

The transfer data length register (SD_SIZE) specifies the transfer data size.

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	—	All 0	R	Fixed 0
11, 10	—	All 0	R	Reserved
9 to 0	LEN9 to LEN0	1000000000	R/W	Transfer Data Size*1 These bits specify a size between 1 and 512 bytes for the transfer of single blocks. In cases of multiple block transfer with automatic issuing of CMD12 (CMD18 and CMD25), the only specifiable transfer data size is 512 bytes. Furthermore, in cases of multiple block transfer without automatic issuing of CMD12, as well as 512 bytes, 32, 64, 128, and 256 bytes are specifiable. However, in the reading of 32, 64, 128, and 256 bytes for the transfer of multiple blocks, this is restricted to cases of multiple block transfer by CMD53. Additionally, if a command accompanies data transfer, do not set these bits to 0.

Note 1. Do not change the values of these bits when the SCLKDIVEN bit in SD_INFO2 is 0.

50.2.12 SD Card Access Control Option Register (SD_OPTION)

The SD card access control option register (SD_OPTION) sets the bus width and timeout counter.

Bit	Bit Name	Initial Value	R/W	Description
15	WIDTH	0*1	R/W	Bus Width*2 0: 4-bit width 1: 1-bit width
14	—	1	R	Fixed 1
13 to 8	—	All 0	R	Fixed 0
7	TOP27	1*1	R/W	Timeout Counter*2 1111: Setting prohibited 1110: SD_CLK × 2^{27} 1101: SD_CLK × 2^{26} : 0001: SD_CLK × 2^{14} 0000: SD_CLK × 2^{13}
6	TOP26	1*1	R/W	
5	TOP25	1*1	R/W	
4	TOP24	0*1	R/W	
3	CTOP24	1*1	R/W	Card Detect Time Counter 1111: Setting prohibited 1110: P1φ × 2^{24} 1101: P1φ × 2^{23} : 0001: P1φ × 2^{11} 0000: P1φ × 2^{10}
2	CTOP23	1*1	R/W	
1	CTOP22	1*1	R/W	
0	CTOP21	0*1	R/W	

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.
Note 2. Do not change the values of these bits when the SCLKDIVEN bit in SD_INFO2 is 0.

50.2.13 SD Error Status Register 1 (SD_ERR_STS1)

The SD error status register 1 (SD_ERR_STS1) indicates the CRC status, CRC error, End error, and CMD error.

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Fixed 0
14	E14	0*1	R	These bits store the CRC status. (normal: 010)
13	E13	1*1	R	
12	E12	0*1	R	
11	E11	0*1	R	Set to 1 when an error occurs in the CRC status
10	E10	0*1	R	Set to 1 when a CRC error occurs in the read data
9	E9	0*1	R	Set to 1 when a CRC error occurs in the response to a command*2 issued within a command sequence. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E8.
8	E8	0*1	R	Set to 1 when a CRC error occurs in a response (other than a response to a command*2 issued within a command sequence)
7, 6	—	All 0	R	Fixed 0
5	E5	0*1	R	Set to 1 when an error occurs in the CRC status length (and the end bit has not been detected)
4	E4	0*1	R	Set to 1 when an error occurs in the read data length (and the end bit has not been detected among the valid bits)
3	E3	0*1	R	Set to 1 when an error occurs in the response length to a command*2 issued within a command sequence. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E2.
2	E2	0*1	R	Set to 1 when an error occurs in the response length (other than a response to a command*2 issued within a command sequence)
1	E1	0*1	R	Set to 1 when an error occurs in the command index of the response to a command*2 issued within a command sequence. In cases where CMD12 is issued by setting a command index in SD_CMD, this is Indicated in E0.
0	E0	0*1	R	Set to 1 when an error occurs in the command index of a response (other than a response to a command*2 issued within a command sequence).

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.
Note 2. "Command issued within a command sequence" refers to CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.

50.2.14 SD Error Status Register 2 (SD_ERR_STS2)

The SD error status register 2 (SD_ERR_STS2) indicates the timeout state. Ncycle is set by bits 7 to 4 in SD_OPTION.

Bit	Bit Name	Initial Value	R/W	Description
15 to 7	—	All 0	R	Fixed 0
6	E6	0*1	R	Set to 1 when the busy state continues for longer than Ncycle after the CRC status
5	E5	0*1	R	Set to 1 when the CRC status is not received though a longer time than Ncycle has elapsed after data writing
4	E4	0*1	R	Set to 1 when read data is not received though a longer time than Ncycle has elapsed after read command. Set to 1 when read data for the next block are not received though a longer time than Ncycle has elapsed after the reception of read data. Set to 1 when read data for the next block are not received though a longer time than Ncycle has elapsed after release of the read wait state.
3	E3	0*1	R	Set to 1 when the busy state for longer than Ncycle continues after CMD12 has been issued within a command sequence. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E2.
2	E2	0*1	R	Set to 1 when the busy state for longer than Ncycle continues after R1b response
1	E1	0*1	R	Set to 1 when the response to a command*2 issued within a command sequence is not received though a longer time than 640 cycles of SD_CLK has elapsed. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E0.
0	E0	0*1	R	Set to 1 when the response (other than a response to a command*2 issued within a command sequence) is not received though a longer time than 640 cycles of SD_CLK has elapsed.

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.
Note 2. "Command issued within a command sequence" refers to CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.

50.2.15 SD Buffer Read/Write Register (SD_BUF0)

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	BUF31 to BUF0	Unknown	R/W	When writing to the SD card, the write data is written to this register. When reading from the SD card, the read data is read from this register. This register is internally connected to two 512-byte (128-word) buffers.

50.2.16 SDIO Mode Control Register (SDIO_MODE)

The SDIO mode control register (SDIO_MODE) controls the CMD52 issuance and the read wait state at multiple block transfer, and the reception of SDIO interrupt. C52PUB and IOABT should not be set to 1 simultaneously.

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R	Fixed 0
9	C52PUB	0	R/W	SDIO None Abort*2 • When C52PUB is set to 1 in the CMD53 (multiple block) write sequence, CMD52 is automatically issued if SD_BUF becomes empty and between the current one-block and next-block. C52PUB is automatically cleared to 0 after reception of the response to CMD52 is completed. Additionally, if C52PUB is set to 1 while the last block is being transferred, CMD52 is not issued. In this case, C52PUB is automatically cleared to 0 after the access end flag has been set to 1. • When C52PUB and RWREQ are set to 1 in the CMD53 (multiple block) read sequence, the block transfer enters the read wait state between the current one-block and next-block and CMD52 is automatically issued. C52PUB is automatically cleared to 0 after reception of the response to CMD52 is completed. Additionally, if C52PUB is set to 1 while the last block is being transferred, CMD52 is not issued. In this case, C52PUB is automatically cleared to 0 after the access end flag has been set to 1. • If C52PUB is set to 1 in the CMD53 (multiple block) read sequence, be sure to set RWREQ to 1 as well as C52PUB. • Set SD_ARG before setting C52PUB to 1.
8	IOABT	0	R/W	SDIO Abort*2 • When IOABT is set to 1 in the CMD53 (multiple block) sequence, the CMD53 sequence is halted and CMD52 is issued. However, if a command sequence is halted because of a communications error or timeout, CMD52 is not issued. Although continued buffer access is possible even after IOABT has been set to 1, the buffer access error bit (ERR5 or ERR4) in SD_INFO2 will be set accordingly. Set SD_ARG before setting IOABT to 1. • When IOABT has been set to 1 during transfer for single block write, the access end flag is set when SD_BUF becomes empty, and CMD52 is not issued. If SD_BUF does contain data, the access end flag is set on completion of reception of the busy state without CMD52 having been issued. • When IOABT has been set to 1 during transfer for single block read, the access end flag is set immediately after setting of IOABT and CMD52 is not issued. • When IOABT is set to 1 during reception of the busy state after an R1b response, the access end flag is set on completion of reception of the busy state without CMD52 having been issued. • When IOABT is set to 1 after a command sequence has been completed, CMD52 is not issued and the access end flag is not set.
7 to 3	—	All 0	R	Fixed 0

Bit	Bit Name	Initial Value	R/W	Description
2	RWREQ	0	R/W	Read Wait Request When RWREQ is set to 1 in the CMD53 (multiple block) read sequence, the block transfer enters the read wait state (SD_D2 changes from 1 to 0) between the current one-block and next-block. [Read wait state releasing] • The read wait state is released, when RWREQ is cleared to 0 in the read wait state.*3 • When IOABT is set to 1 in the read wait state, RWREQ is automatically cleared to 0 after CMD52 has been issued, and then the read wait state is released. • When C52PUB and RWREQ are set to 1 simultaneously in the CMD53 (multiple block) read sequence, the read wait state is not automatically released. Therefore, after the CMD52 response is received, clear RWREQ. (Be sure to set RWREQ and C52PUB simultaneously.) When RWREQ is set to 1 while the last block in the CMD53 (multiple block) read sequence is transferred, the read wait state is not entered and RWREQ is automatically cleared to 0 by setting access end.
1	—	0	R	Fixed 0
0	IOMOD	0	R/W	SDIO Mode*1 1: Enables the SD host interface to receive SDIO interrupt from the SDIO card. 0: Disables the SD host interface to receive SDIO interrupt from the SDIO card.

Note 1. Do not change the value of this bit when the SCLKDIVEN bit in SD_INFO2 is set to 0.
Note 2. Do not change the values of these bits from 1 to 0 when the SCLKDIVEN bit in SD_INFO2 is set to 0.
Note 3. Clear this bit after reception of the response to CMD52 is completed.

50.2.17 SDIO Interrupt Flag Register (SDIO_INFO1)

The SDIO interrupt flag register (SDIO_INFO1) indicates the status regarding to the SDIO card access. To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Bit	Bit Name	Initial Value	R/W	Description
15	EXWT	0*2	R/W*1	[Setting condition] While the last block in the CMD53 (multiple block) read sequence is transferred, RWREQ in SDIO_MODE is set to 1. [Clearing condition] When 0 is written to EXWT
14	EXPUB52	0*2	R/W*1	[Setting conditions] • While the last block in the CMD53 (multiple block) sequence is transferred, C52PUB in SDIO_MODE is set to 1. • While C52PUB is set to 1 in the CMD53 (multiple block) write sequence, the last block is transferred. [Clearing condition] When 0 is written to EXPUB52
13 to 3	—	All 0	R	Fixed 0
2, 1	—	0*2	R/W*1	Reserved The write value should always be 1.
0	IOIRQ	0*2	R/W*1	SD IO Interrupt [Setting condition] When SDIO interrupt from an SDIO card is received while IOMOD in SDIO_MODE is set to 1 [Clearing condition] When 0 is written to IOIRQ*3

Note 1. It is effective only if 0 is written.
Note 2. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.
Note 3. Before clearing this bit, access the SDIO card to negate the SDIO interrupt signal from the SDIO card (after CMD25 has been issued and the response received). If the interrupt signal is not negated, this bit may be set again.

50.2.18 SDIO_INFO1 Interrupt Mask Register (SDIO_INFO1_MASK)

The SDIO_INFO1 interrupt mask register (SDIO_INFO1_MASK) enables or disables the SD_INFO1 interrupt. When 0 is set in SDIO_INFO1_MASK while the corresponding flag in SD_INFO1 is set, an interrupt occurs.

Bit	Bit Name	Initial Value	R/W	Description
15	MEXWT	1	R/W	EXWT interrupt masked
14	MEXPUB52	1	R/W	EXPUB52 interrupt masked
13 to 3	—	All 0	R	Fixed 0
2, 1	—	All 1	R/W	Reserved The write value should always be 1.
0	IOMSK	1	R/W	IOIRQ interrupt masked

50.2.19 DMA Mode Enable Register (CC_EXT_MODE)

The DMA mode enable register (CC_EXT_MODE) enables the DMA transfer.

Bit	Bit Name	Initial Value	R/W	Description
15 to 13	—	All 0	R	Fixed 0
12	—	1	R	Reserved
11, 10	—	All 0	R	Fixed 0
9, 8	—	All 0	R	Reserved
7 to 5	—	All 0	R	Fixed 0
4	—	1	R	Reserved
3, 2	—	All 0	R	Reserved
1	DMASDRW	0	R/W	SD_BUF Read/Write DMA Transfer*1 1: The SD_BUF read/write DMA transfer is enabled. 0: The SD_BUF read/write DMA transfer is disabled. At the SD_BUF read/write DMA transfer, set DMASDRW to 1 before setting SD_CMD.
0	—	0	R	Reserved

Note 1. Do not change the values of these bits when the SCLKDIVEN bit in SD_INFO2 is set to 0.

50.2.20 Software Reset Register (SOFT_RST)

The software reset register (SOFT_RST) sets a software reset. Make sure to release the reset before using the SD host interface.

Bit	Bit Name	Initial Value	R/W	Description
15 to 3	—	All 0	R	Fixed 0
2	—	1	R	Reserved
1	—	1	R	Reserved
0	SDRST	0	R/W	Software Reset of SD I/F Unit 0: Reset 1: Reset released

50.2.21 Version Register (VERSION)

The version register (VERSION) indicates the version of the SD host interface.

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	—	1000	R	Reserved
11 to 8	UR3 to UR0	4'h2	R	Version of Renesas IP
7 to 0	IP7 to IP0	8'h0B	R	Version of adopted IP

50.2.22 Swap Control Register (EXT_SWAP)

The swap control register (EXT_SWAP) can replace data when SD_BUF0 is accessed.

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R/W	Reserved The write value should always be 0.
14, 13	—	All 0	R	Reserved
12, 11	—	All 0	R/W	Reserved The write value should always be 0.
10, 9	—	All 0	R	Fixed 0
8	DMASEL	0	R/W	DMA Transfer Size Select Selects the transfer unit for SD_BUF read/write DMA transfer. Set this bit in combination with the transfer size set in the DMA Channel Configuration register. 0: 4-byte (longword) unit 1: 64-byte (longword × 16) unit Note: • For DMA transfer in 64-byte units, set address H'E804E000 (channel 0) / H'E804E800 (channel 1) as the destination or source of DMA transfer instead of the SD buffer read/write register (SD_BUF0). Moreover, if a communications error or timeout occurs during the 64-byte unit DMA transfer, this bit should be set to 0 and re-setting again before using DMA transfer. If a software reset occurs during the 64-byte unit DMA transfer, this bit should be set to 0 and re-setting again before using DMA transfer.
7	SDBRSWAP	0	R/W	SD_BUF0 Swap Read*1 When reading from SD_BUF0, data stored in SD_BUF0 can be replaced and then read.*2 0: The current data is read without replacement. 1: Data replacement for reading proceeds in bytes.
6	SDBWSWAP	0	R/W	SD_BUF0 Swap Write*1 When writing to SD_BUF0, data to be written can be replaced and then stored in SD_BUF0.*2 0: The current data is written without replacement. 1: Data replacement for writing proceeds in bytes.
5	—	0	R	Fixed 0
4, 3	—	All 0	R/W	Reserved The write value should always be 0.
2	—	0	R	Fixed 0
1	—	0	R/W	Reserved The write value should always be 0.
0	—	0	R	Fixed 0

Note 1. Do not change the values of these bits when the SCLKDIVEN bit in SD_INFO2 is set to 0.
Note 2. Details on SD_BUF0 access with data replacement or non-replacement are indicated in (1) SD Data Format in section 50.3.1, SD I/F.

50.3 Operation

50.3.1 SD I/F

(1) SD Data Format

When data is read from the SD card, the procedure is as follows.

1. The SD host interface receives data from the SD card via the SD_D signal. (SD_D signal: see Figure 50.2 and Figure 50.3.)
2. The receive data is stored in SD_BUF of the SD host interface. (SD_BUF store data: see Figure 50.4)
3. The data stored in SD_BUF is read by SD_BUF0. (Reading from SD_BUF0: see Figure 50.5)

When data is written to the SD card, the above procedure will be reversed.
When accessing SD_BUF0, caution should be taken for the transfer order in SD_D and the store order in SD_BUF. In addition, data stored in SD_BUF0 can be replaced in bytes with the EXT_SWAP. (See Figure 50.5)

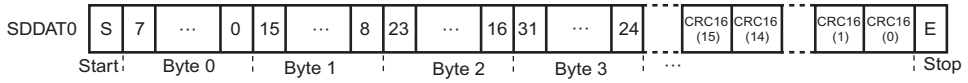

Figure 50.2 SD_D0 in 1-Bit Width Mode

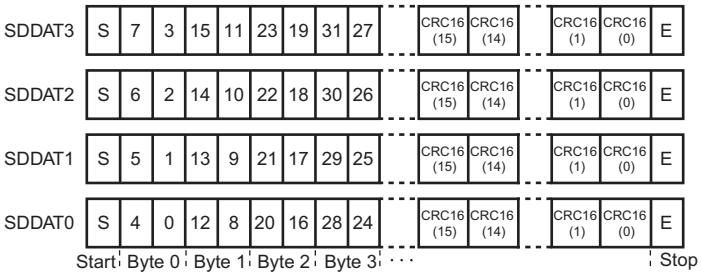

Figure 50.3 SD_D3 to SD_D0 in 4-Bit Width Mode

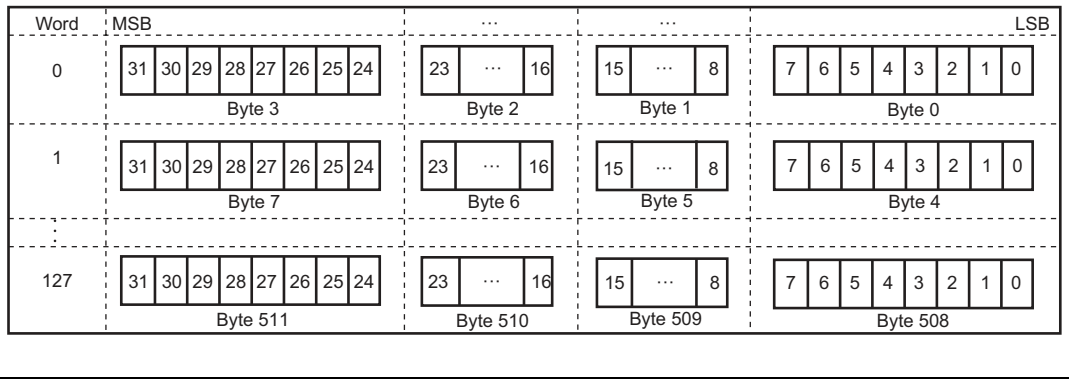

Figure 50.4 SD_BUF Store Data

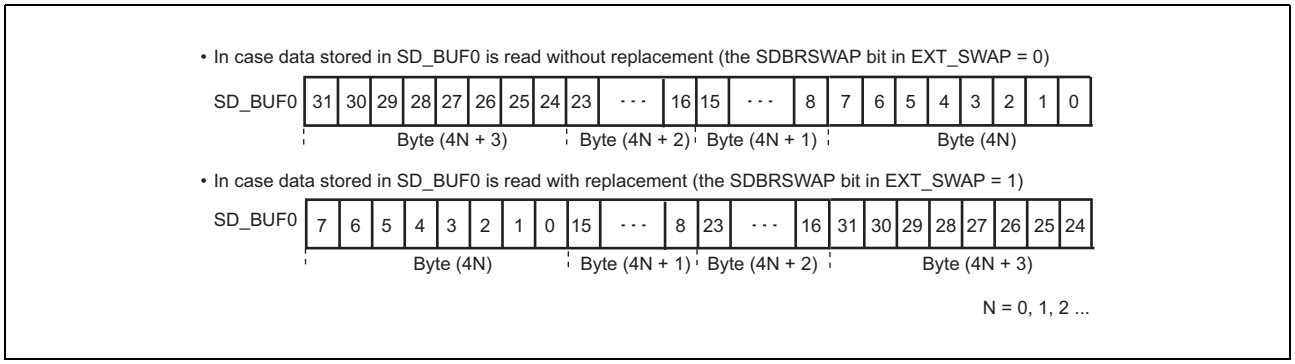

Figure 50.5 Reading from SD_BUF0

50.3.2 Card Detect/Write Protect

(1) Card Detect

The SD host interface has two types of card detect functions as described in the following.

- Card detect with SD_CD
  Figure 50.6 shows the timing chart of card detect using SD_CD. SD_CD is connected to the card socket and pulled up on the host device. The resistance of the pull-up resistor is decided by the specification of the SD host device.

[Card insertion]
SD_CD is pulled down when a card is inserted. At this time, if SD_CD has been pulled down for the Ncycle period (set in SD_OPTION), INFO4 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)
[Card removal]
SD_CD is pulled up when a card is removed. At this time, if SD_CD has been pulled up for the Ncycle period (set in SD_OPTION), INFO3 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

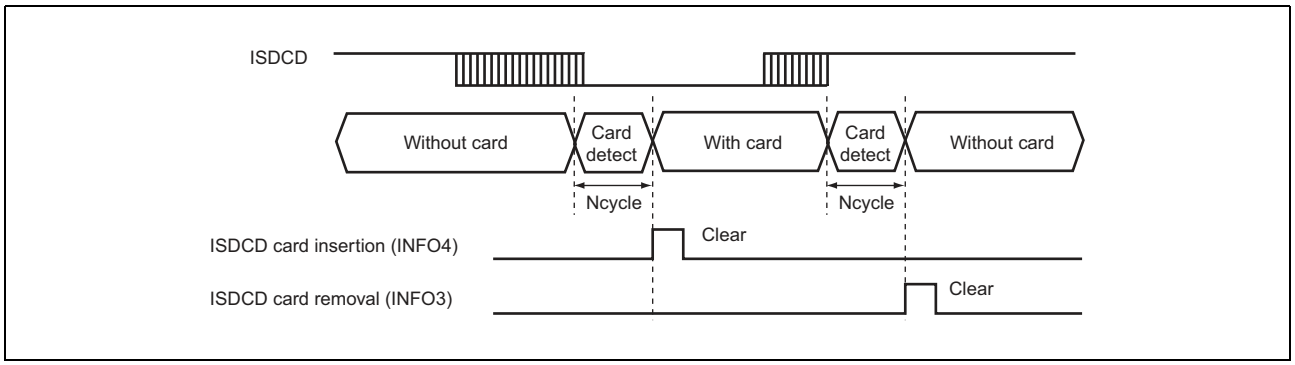

Figure 50.6 Example of Card Detect with SD_CD

- SD card detect with SD_D3
  Figure 50.7 shows the timing chart when the SD card is detected with SD_D3. In addition, SD_D3 is pulled down by the host device, and the resistance value for pulling down is decided by the specification of SD host device.

[Card insertion]
When an SD card is inserted, SD_D3 is pulled up. Accordingly, INFO9 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)
[Card removal]
When an SD card is removed, SD_D3 is pulled down. Accordingly, INFO8 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

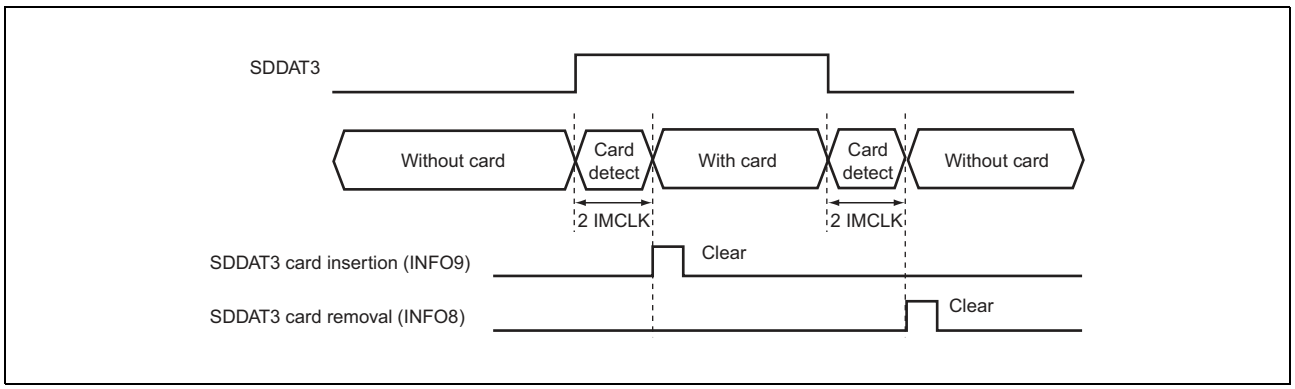

Figure 50.7 SD Card Detect with SD_D3

- Power-Down mode at Card removal
  SD Host Interface module is halted by the MSTP123 bit to MSTP120 bit in Standby Control Register 12 (STBCR12). If these bits of each channel in STBCR12 are set to 10, low power consumption is achieved at Card removal. See section 55, Power-Down Modes.

Bit	Bit Name	Initial Value	R/W	Description
3	MSTP123	1	R/W	SD Host Interface 0 Module Stop 00: SD Host Interface 0 Module runs. 01: Setting prohibited 10: Only card detect block in SD Host Interface 0 Module runs. 11: Clock supply to SD Host Interface 0 Module is halted.
2	MSTP122	1		
1	MSTP121	1	R/W	SD Host Interface 1 Module Stop 00: SD Host Interface 1 Module runs. 01: Setting prohibited 10: Only card detect block in SD Host Interface 1 Module runs. 11: Clock supply to SD Host Interface 1 Module is halted.
0	MSTP120	1		

(2) Write Protect

The SD host interface has two types of write protect functions.

- Write protect with SD_WP
  SD_WP is connected to the card socket, and pulled up or pulled down by the card insertion. The selection of pulling up or pulling down and the resistance value is decided by the specification of SD host device. As the SD_WP state is reflected to INFO7 in SD_INFO1, the write protect is decided after the SD card is inserted.
- Write protect with command
  The card's internal write protection and the card lock/unlock operation are realized by the command.

50.3.3 Interrupt Request and DMA Transfer Request

(1) Interrupt Request

The SD host interface has three interrupt requests. Table 50.4 shows the relationship between the interrupt flag registers and the interrupt mask registers. When a bit in an interrupt mask register is set to 0, an interrupt occurs by setting the corresponding bit in the interrupt flag register to 1.
To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Table 50.4 Interrupt Request

	Interrupt Flag Register		Interrupt Mask Register	
Interrupt Request	**Register Name**	**Bit Name**	**Register Name**	**Bit Name**
Card access interrupt (SDHI0)	SD_INFO1	INFO2	SD_INFO1_MASK	IMASK2
		INFO0		IMASK0
	SD_INFO2	ILA	SD_INFO2_MASK	IMASK
		BWE		BMASK1
		BRE		BMASK0
		ERR6		EMASK6
		ERR5		EMASK5
		ERR4		EMASK4
		ERR3		EMASK3
		ERR2		EMASK2
		ERR1		EMASK1
		ERR0		EMASK0
SDIO access interrupt (SDHI1)	SDIO_INFO1	EXWT	SDIO_INFO1_MASK	MEXWT
		EXPUB52		MEXPUB52
		IOIRQ		IOMSK
Card detect interrupt (SDHI3)	SD_INFO1	INFO9	SD_INFO1_MASK	IMASK9
		INFO8		IMASK8
		INFO4		IMASK4
		INFO3		IMASK3

(2) DMA Transfer Request

The SD host interface has two types of DMA transfer requests. The DMA transfer requests are described in the following passages.

- SD_BUF write DMA transfer request
  - When the buffer is empty while the DMASDRW bit in CC_EXT_MODE is set to 1, the SD_BUF write DMA transfer request is asserted.
  - The SD_BUF write DMA transfer request is negated when the last data in one block (= the transfer data size set in SD_SIZE) is transferred. The SD_BUF write DMA transfer request is also negated by clearing the SDRST bit in SOFT_RST to 0 or setting the STP bit in SD_STOP to 1. Note that if a communications error or timeout occurs at the DMA transfer, the SD_BUF write DMA transfer request is not negated.
  - The number of DMA transfers should be n x one block. (n = integer, one block = the transfer data size set in SD_SIZE)
  - When the IOABT bit in SDIO_MODE is set to 1, the SD_BUF write DMA transfer request is negated.
  - The DMA transfer request is also negated by clearing the DMASDRW bit to 0. However, note that the DMA transfer request is asserted again when the DMASDRW bit is set to 1 before writing to SD_CMD.
- SD_BUF read DMA transfer request
  - When the buffer is full while the DMASDRW bit in CC_EXT_MODE is set to 1, the SD_BUF read DMA transfer request is asserted.
  - The SD_BUF read DMA transfer request is negated when the last data in one block (= the transfer data size set in SD_SIZE) is transferred. The SD_BUF read DMA transfer request is also negated by clearing the SDRST bit in SOFT_RST to 0 or setting the STP bit in SD_STOP to 1. Note that if a communications error or timeout occurs at the DMA transfer, the SD_BUF read DMA transfer request is not negated.
  - The number of DMA transfers should be n x one block. (n = integer, one block = the transfer data size set in SD_SIZE)
  - When the IOABT bit in SDIO_MODE is set to 1, the SD_BUF read DMA transfer request is negated.
  - The DMA transfer request is also negated by clearing the DMASDRW bit to 0. However, note that the DMA transfer request is asserted again when the DMASDRW bit is set to 1 before writing to SD_CMD.
  - The number of cycles at one DMA transfer will be more than P1φ × 10. If SD_CLK is high frequency and SD_BUF is not empty, SD_CLK is stopped until SD_BUF is empty.

50.3.4 Communications Errors and Timeouts

- Communications Errors and Timeouts
  Table 50.5 and Table 50.6 show the relationships between the SD card interrupt flag register and SD error status register for communications errors and timeouts, respectively. When a bit in the SD card interrupt flag register is set to 1, the corresponding bit in the SD error status register is set to 1. The values of the SD error status register are cleared by writing to SD_CMD or writing 0 to the SDRST bit in SOFT_RST.

Table 50.5 Communications Errors

	SD Card Interrupt Flag Register		SD Error Status Register		
Communication Error	**Register Name**	**Bit Name**	**Register Name**	**Bit Name**	**Description**
END error	SD_INFO2	ERR2	SD_ERR_STS1	E5	When an error occurs in the CRC status length
				E4	When an error occurs in read data length
				E3	When an error occurs in the response length to a command issued within a command sequence
				E2	When an error occurs in the response length (other than a response to a command issued within a command sequence)
CRC error		ERR1		E11	When an error occurs in the CRC status
				E10	When a CRC error occurs in the read data
				E9	When a CRC error occurs in the response to a command issued within a command sequence
				E8	When a CRC error occurs in the response (other than a response to a command issued within a command sequence)
CMD error		ERR0		E1	The command index of the transmitted command differed from the command index of the received response (for a command issued within a command sequence).
				E0	The command index of the transmitted command differed from the command index of the received response (for a command issued other than within a command sequence)

Table 50.6 Timeouts

Timeout	SD Card Interrupt Flag Register		SD Error Status Register		Description
	Register Name	Bit Name	Register Name	Bit Name	
Response timeout	SD_INFO2	ERR6	SD_ERR_STS2	E1	When the response to a command issued within a command sequence is not received though a longer time than 640 cycles of SD_CLK has elapsed
				E0	When the response (other than a response to a command issued within a command sequence) is not received though a longer time than 640 cycles of SD_CLK has elapsed
Data timeout (other than response timeout)		ERR3		E6	When the busy state (SD_D0 = 0) continues for longer than Ncycle after the CRC status
				E5	When the CRC status is not received though a longer time than Ncycle has elapsed after data writing
				E4	When read data is not received though a longer time than Ncycle has elapsed after read command
					When read data for the next block are not received though a longer time than Ncycle has elapsed after the reception of read data
					When read data for the next block are not received though a longer time than Ncycle has elapsed after release of the read wait state
				E3	When the busy state (SD_D0 = 0) for longer than Ncycle continues after CMD12 has been issued within a command sequence.
				E2	When the busy state (SD_D0 = 0) for longer than Ncycle continues after R1b response

50.4 Usage Example

50.4.1 Command without Data Transfer

(1) Flowchart

Figure 50.8 and Figure 50.9 show flowchart examples.

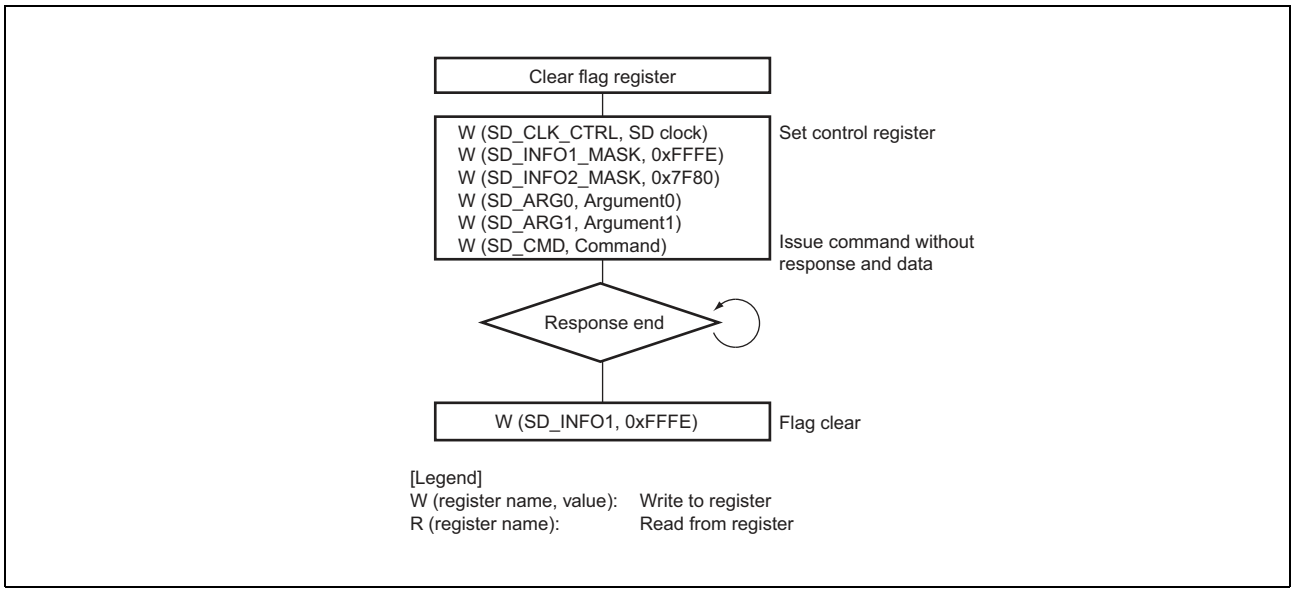

Figure 50.8 Flow Example of Command Without Response and Data

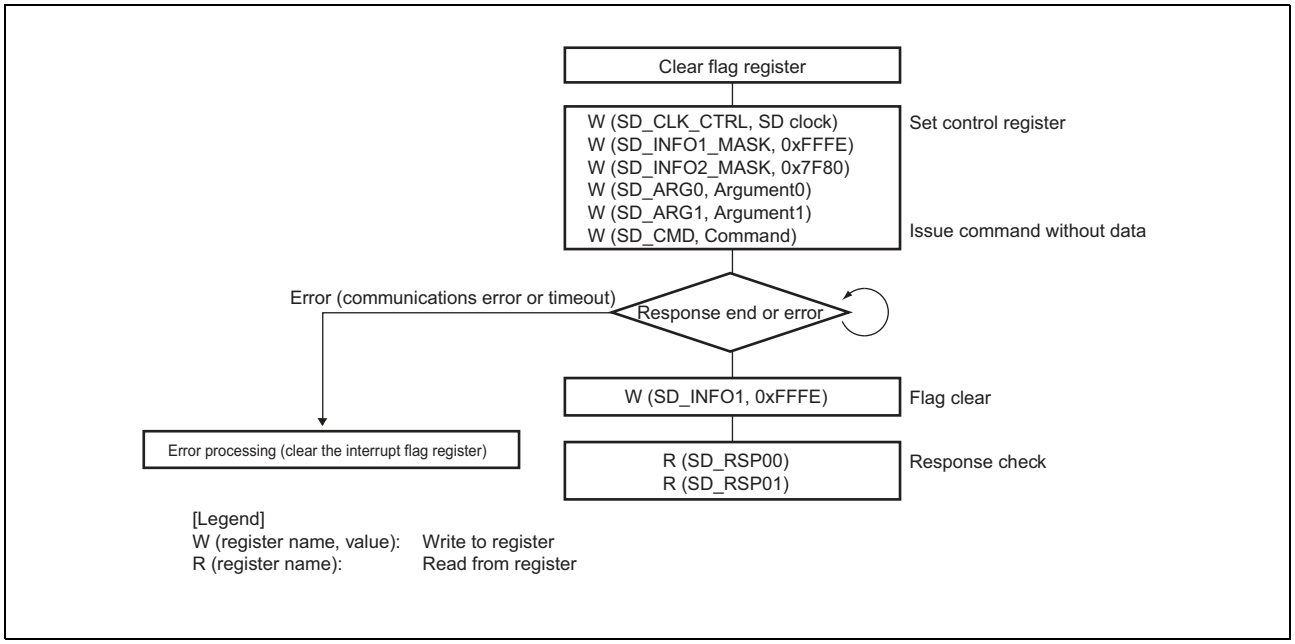

Figure 50.9 Flow Example of Command Without Data

(2) Operation for Command without Data Transfer: The operation of the command without data transfer is described in the following.

- Command without response and data
  - Flag register clear
    First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
  - Control register set
    Set the SD clock (SD_CLK), interrupt mask, and so on. (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK)
  - Command issue
    Set CMD Argument in SD_ARG0 and SD_ARG1 and write to SD_CMD.
    Accordingly, CMD is issued, and the operation is started.
  - Flag clear
    When transmission of a command is completed, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0.

- Command without data
  - Flag register clear
    First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
  - Control register set
    Set the SD clock (SD_CLK), interrupt mask, and so on. (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK)
  - Command issue
    Set CMD Argument in SD_ARG0 and SD_ARG1 and write to the SD_CMD.
    Accordingly, CMD is issued, and the operation is started.
  - Flag clear
    When a response is received, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0.
  - Read a response from SD_RSP00 and SD_RSP01.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

50.4.2 Single Block Read

(1) Flowchart

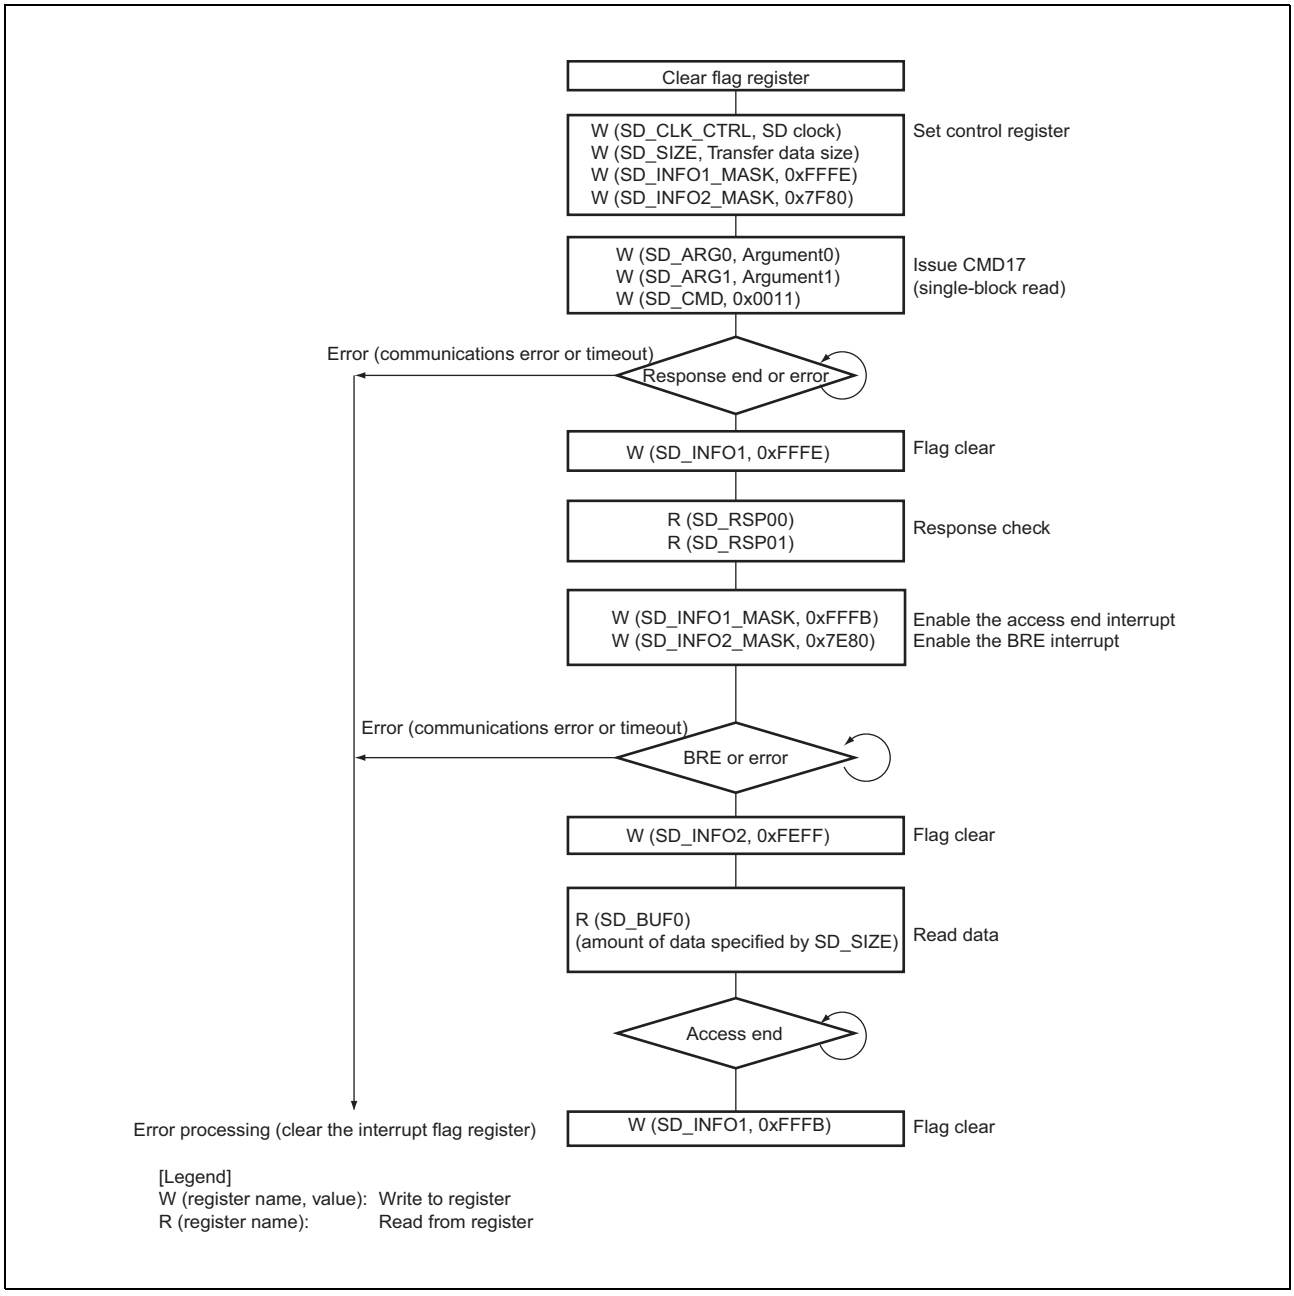

Figure 50.10 Single Block Read Flowchart Example

(2) Operation for Single Block Read: The operation of the single block read is described in the following.

– Flag register clear
First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)

– Control register set
Set the SD clock (SD_CLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)

– Command issue (CMD17)
Set CMD17 Argument in SD_ARG0 and SD_ARG1 and write 0x0011 to SD_CMD.
Accordingly, CMD17 is issued, and the single block read operation is started.

– Response check
On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP00 and SD_RSP01.
If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP or the IOABT bit in SDIO_MODE to 1. Furthermore, this causes CMD12 and CMD52 to not be issued.
If the INFO2 bit (access end) in SD_INFO has been set, halting the command sequence will also lead to the generation of an interrupt.

– Data receive from SD card and data read
Write 0xFFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0x7E80 to SD_INFO2_MASK to enable the BRE interrupt. When the data receive from the SD card is completed, the BRE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BRE bit to 0 and read the amount of data specified by SD_SIZE from SD_BUF0.
However, a communications error or timeout may be generated if data are being received while reading of SD_BUF0 is in progress.

– Operation complete
When the data read from SD_BUF0 is completed, INFO2 (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO2 to 0 to end the single block read operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

50.4.3 Single Block Write

(1) Flowchart

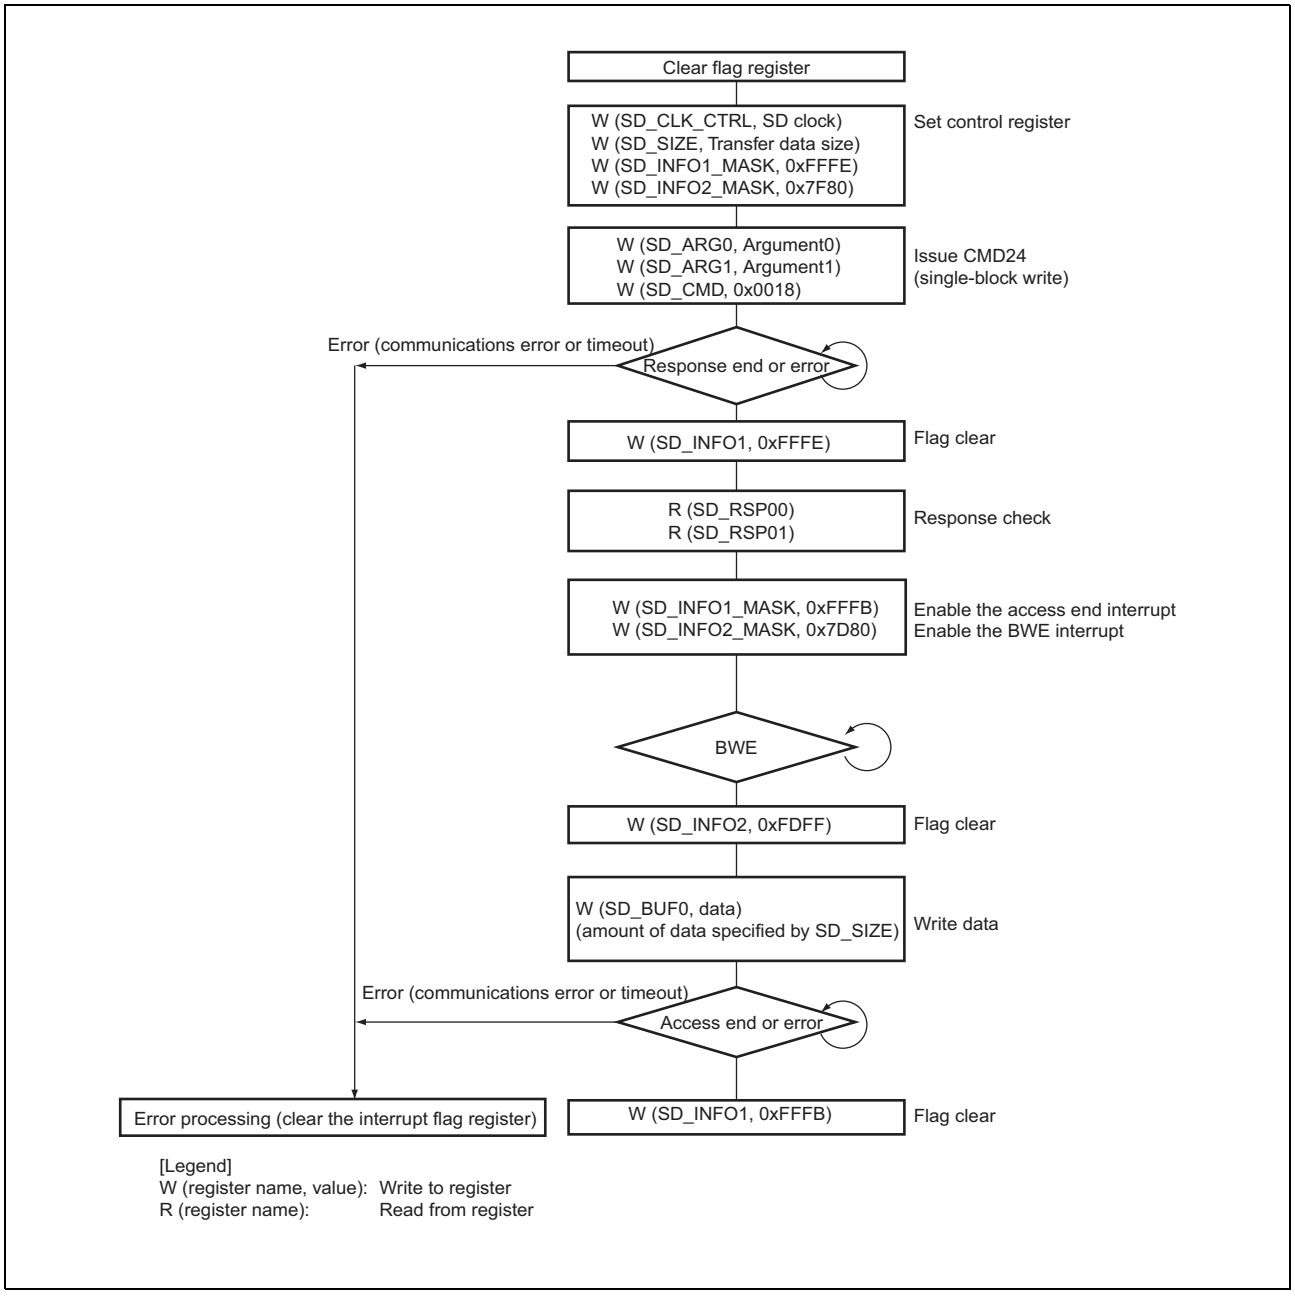

Figure 50.11 Single Block Write Flowchart Example

(2) Operation for Single Block Write: The operation of the single block write is described in the following.

– Flag register clear
First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)

– Control register set
Set the SD clock (SD_CLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)

– Command issue (CMD24)
Set CMD24 Argument in SD_ARG0 and SD_ARG1 and write 0x0018 to SD_CMD.
Accordingly, CMD24 is issued, and the single block write operation is started.

– Response check
On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP00 and SD_RSP01.
If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP or the IOABT bit in SDIO_MODE to 1. Furthermore, this causes CMD12 and CMD52 to not be issued.
If the INFO2 bit (access end) in SD_INFO has been set, halting the command sequence will also lead to the generation of an interrupt.

– Data write and data transmit to SD card
Write 0xFFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0x7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card.
However, a communications error or timeout may be generated if data are being transmitted after writing to SD_BUF0.

– Operation complete
When the CRC status and busy state are received from the SD card, INFO2 (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO2 bit to 0 to end the single block write operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

50.4.4 Multiple Block Read

(1) Flowchart

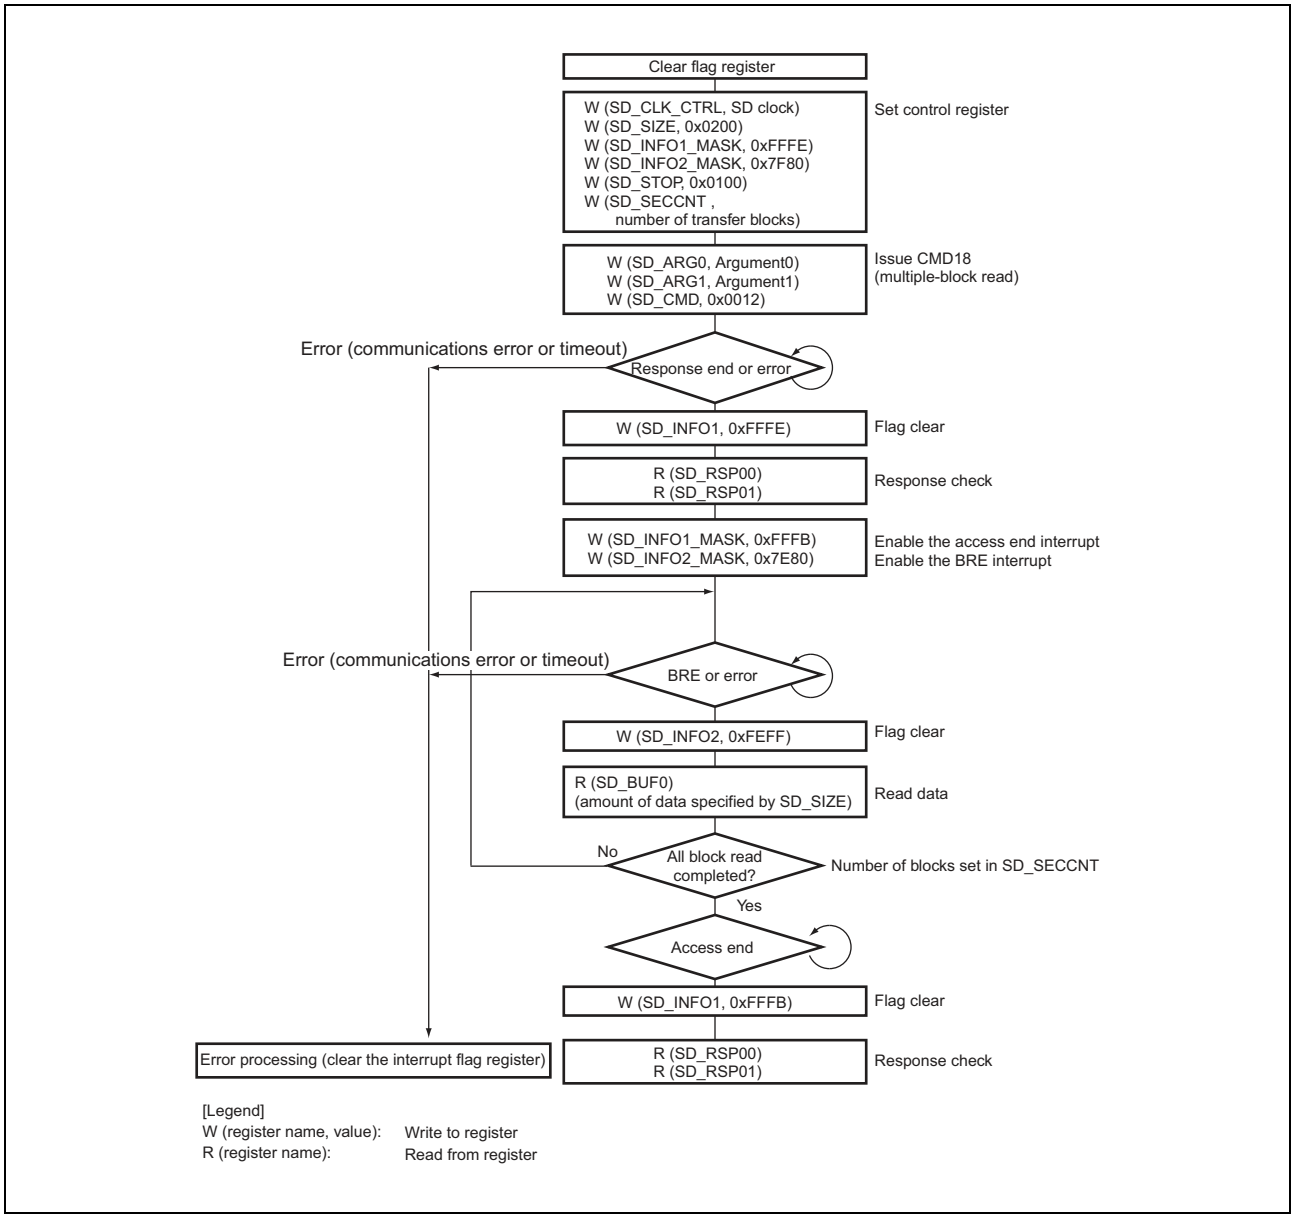

Figure 50.12 Multiple Block Read Flowchart Example

(2) Operation for Multiple Block Read: The operation of the multiple block read is described in the following.

– Flag register clear
First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)

– Control register set
Set the SD clock (SD_CLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
Set SEC in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.

– Command issue (CMD18)
Set CMD18 Argument in SD_ARG0 and SD_ARG1 and write 0x0012 to SD_CMD.
Accordingly, CMD18 is issued, and the multiple block read operation is started.

– Response check
On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP00 and SD_RSP01.
If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. When this happens, the arguments for the CMD12 command are set in SD_ARG0 and SD_ARG1. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) bit in SD_INFO1 to 1 when reception of the response has been completed.
Clear the INFO2 bit to 0 and read the response.

– Data receive from SD card and data read
Write 0xFFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0x7E80 to SD_INFO2_MASK to enable the BRE interrupt. When one-block data receive from the SD card is completed, the BRE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BRE bit to 0 and read the amount of data specified by SD_SIZE from SD_BUF0. Doing this repeats transfer of the number of blocks set in SD_SECCNT. However, a communications error or timeout may be generated if data are being received while reading of SD_BUF0 is in progress. When reception of the last block of data is completed, CMD12 is automatically issued and the response is received.
At this point, the arguments of CMD12 are reflected as the arguments of CMD18.

– Operation complete
When all-block data read and the CMD12 response receive are completed, INFO2 (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO2 to 0 to read the response. This is the end of multiple block read operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

50.4.5 Multiple Block Write

(1) Flowchart

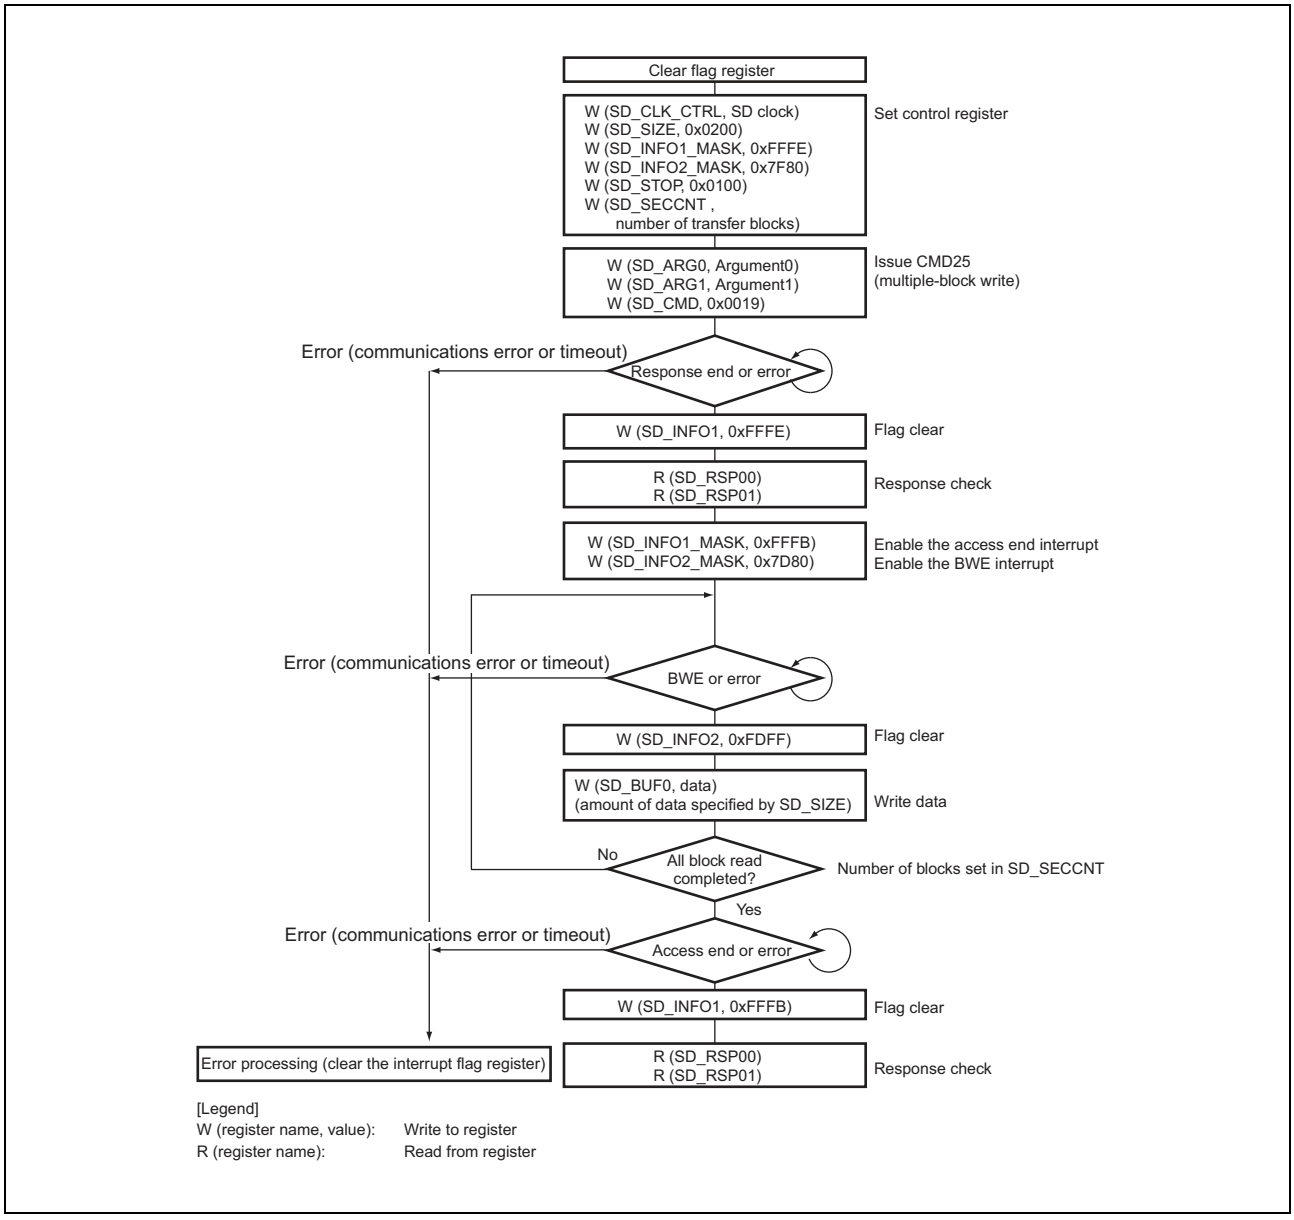

Figure 50.13 Multiple Block Write Flowchart Example

(2) Operation for Multiple Block Write: The operation of the multiple block write is described in the following.

– Flag register clear
First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)

– Control register set
Set the SD clock (SD_CLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.

– Command issue (CMD25)
Set CMD25 Argument in SD_ARG0 and SD_ARG1 and write 0x0019 to SD_CMD.
Accordingly, CMD25 is issued, and the multiple block write operation is started.

– Response check
On receiving the response, the INFO0 bit (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO0 bit to 0 and read the response from SD_RSP00 and SD_RSP01.
If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. When this happens, the arguments for the CMD12 command are set in SD_ARG0 and SD_ARG1. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) bit in SD_INFO1 to 1 when reception of the response has been completed.
Clear the INFO2 bit to 0 and read the response.

– Data write and data transmit to SD card
Write 0xFFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0x7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in the SD_INFO2 resister is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card. Doing this repeats transfer of the number of blocks set in SD_SECCNT. However, a communications error or timeout may be generated if data are being received while writing to SD_BUF0 is in progress. When reception of the last block of data is completed, CMD12 is automatically issued and the response is received.
At this point, the arguments of CMD12 are reflected as the arguments of CMD25.

– Operation complete
When all-block data transmit and the CRC status receive are completed, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO2 bit to 0 to read the response. This is the end of multiple block write operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

50.4.6 IO_RW_DIRECT Command (CMD52)

(1) Flowchart

	ACMD42	0x006A	
	ACMD51	0x0073	

50.5 Usage Note

(1) SD_BUF Illegal Write Access

When writing data to SD_BUF0 after the single block write or multi block write command is issued, the data of the size specified by SD_SIZE must be written to.
If the data of the size which exceeds the size specified by SD_SIZE is written to, the ERR4 bit in SD_INFO2 is set to 1. In addition, the data written to SD_BUF0 may not be transmitted and it causes the SCLKDIVEN bit in SD_INFO2 to hold the value of 0. In such cases, clearing the SDRST bit in SOFT_RST to 0 and then restoring its value to 1 clears the SCLKDIVEN bit to 1.
However, for the single byte or three bytes when the number of bytes setting in SD_SIZE is odd, or the fraction of bytes when the number of bytes setting in SD_SIZE is even, since the portion of dummy data writing is regarded as excess data and ignored, it is not within the scope of the above description (the fraction of bytes: the two bytes that are not in a four-byte unit).

(2) Block Number Limitation for Multiple Block Read

When performing a multiple block read of one or two blocks, depending on the timing with which the response register is read, the response value may not be read properly. When receiving one or two blocks of data, use single block read operation.
Figure 50.23 shows the processing flows of SD host interface (hardware) operation and software operation when a multiple block read is performed on two blocks. As shown in the incorrect operation of Figure 50.23, when an interrupt is generated on reception of the CMD18 response and the timing with which the response register is read by the interrupt is delayed, the data during the CMD12 response reception or the CMD12 response may be read. In the case of a multiple block read of three or more blocks, CMD12 is not issued until the block of data has been read, so this problem does not arise. Furthermore, in the case of a multiple block write, since the CMD25 response is read before the block of data is sent, the problem does not arise.

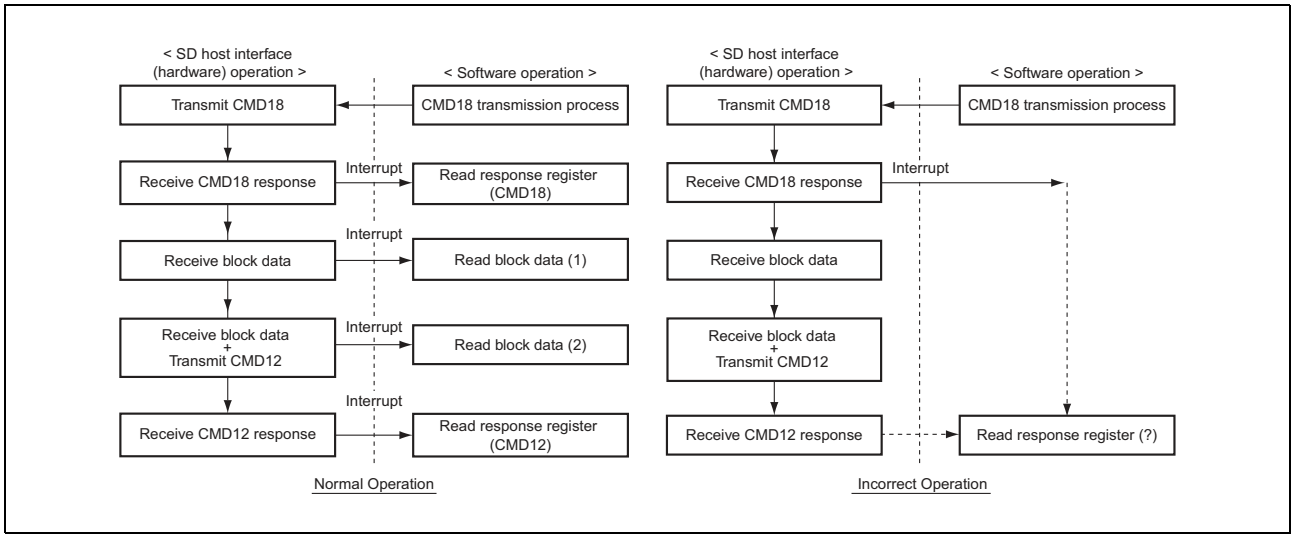

Figure 50.23 Flowcharts for Multiple Block Read Operation (Two Blocks)

(3) Automatic Control of SD_CLK Output

In the SD Card standard, 74 cycles of SD_CLK must be output before initialization of the card. For this reason, use automatic control of SD_CLK output after 74 cycles of SD_CLK have been output. Furthermore, if automatic control of SD_CLK output was in use, SD_CLK output is stopped on completion of the sequence for a communications error or timeout. Thus, in cases where state transitions within the SD card are necessary and so on after completion of the sequence, release automatic control of SD_CLK output and restart supply of SD_CLK to the SD card.

(4) Control of the C52PUB Setting for Multiple Block Write

If the C52PUB bit in SDIO_MODE is set to 1 during a sequence of multiple block write due to CMD53, CMD52 is not issued until SD_BUF becomes empty. For this reason, set the C52PUB bit after suspending writing to SD_BUF by following the appropriate procedure below.

- When DMA transfer is not in use

1. Before setting the C52PUB bit, suspend writing to SD_BUF by making the setting in SD_INFO2 to disable BWE interrupts.
2. Set the C52PUB bit in SDIO_MODE to 1 (so that CMD52 is issued when SD_BUF becomes empty).
3. After the INFO0 interrupt processing in SD_INFO1 due to the issuing of CMD52 has been completed, restart writing to SD_BUF by making the setting in SD_INFO2 to enable BWE interrupts.

- When DMA transfer is in use

1. Every time DMA transfer of the value set in SD_SIZE × n blocks (where n = 1, 2, ...) proceeds, suspend writing to SD_BUF by DMA transfer before the C52PUB bit is set.
2. Set the C52PUB bit in SDIO_MODE to 1 (so that CMD52 is issued when SD_BUF becomes empty).
3. After the INFO0 interrupt processing in SD_INFO1 due to the issuing of CMD52 has been completed, restart writing to SD_BUF by DMA transfer.

(5) Erroneous Detection of SDIO interrupts

The SD host interface erroneously detects an SDIO interrupt when all of the following conditions are satisfied.

1. SDIO access
2. The SDIO device supports the SDIO interrupt (an optional part of the standard).
3. The SDIO device supports 4-bit width multi-block read of CMD53 (an optional part of the standard).
4. The SDIO device does not support the SDIO interrupt between 4-bit width data blocks (an optional part of the standard).

Avoid this problem by following the procedure below when the values of the SMB and S4MI bits in the card capability register of the SDIO device are 1 and 0, respectively.

1. Immediately before executing the multiple block read command, clear (to 0) the IOMOD bit of the SDIO_MODE register.
2. Execute the command.
3. Set (to 1) the IOMOD bit of the SDIO_MODE register immediately after multiple block read operation is completed.

(6) Setting STP bit during multiple read

During multiple block read with auto CMD12 setting 1 to SEC bit of SD_STOP, if performing a force-quit by setting 1 to STP bit of SD_STOP, the command sequence is not terminated depending on the timing of setting 1 to STP bit of SD_STOP.
To avoid this, if setting STP bit of SD_STOP during multiple block transfer, setting 0 to SEC bit of SD_STOP at the same time.
Switching the value of SEC bit of SD_STOP from 1 to 0, even if CBSY bit of SD_INFO2 is 1.
In case the command sequence is not terminated because of not setting 0 to SEC bit of SD_STOP at the same time, setting SDRST bit of SOFT_RST is also available to terminate the command sequence.
If performing a force-quit by setting 1 to IOABT bit of SDIO_MODE during CMD53 multiple block transfer, leave the value (=1) of SEC bit of SD_STOP as it is.

(7) Software Reset

For transitions to the software reset state by the SDRST bit in the SOFT_RST register, see section 55.3.6, Software Reset. However, where the procedure refers to the SRST bit, read this as the SDRST bit in the SOFT_RST register.

51. MMC Host Interface

The MMC host interface is a host controller conforming to the JEDEC Standard JESD84-A441 that allows connection with devices with the MMC interface.

51.1 Features

- Supports 1/4/8-bit MMC bus
- Supports the Single Data Rate only
- MMC clock frequency = P1ϕ frequency/2^n (n = 1 to 10)
- Supports High Priority Interrupt (HPI)*
- Supports background operation
- Data buffer: 512 bytes × 2
- Three types of interrupt requests: normal operation, error/timeout, card detection
- DMA transfer requests: buffer write and buffer read
- Card detection function

Note: * Supports HPI in the sequences of CMD6, CMD24, CMD25 (pre-defined), and CMD38.

Figure 51.1 shows a block diagram of this module.

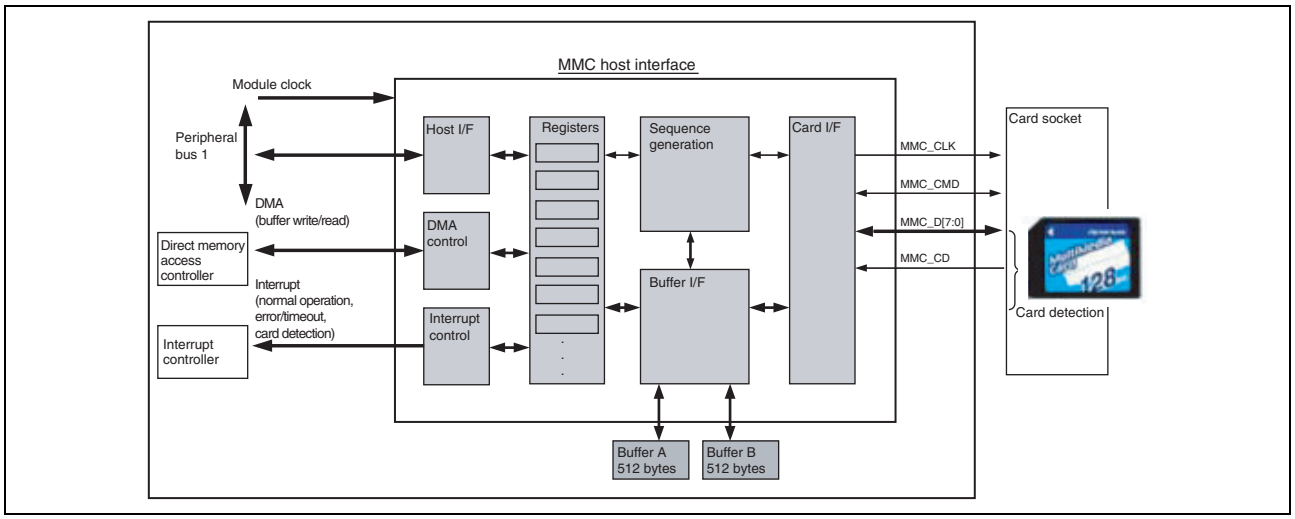

Figure 51.1 Block Diagram of MMC Host Interface

51.2 Input/Output Pins

Table 51.1 shows the pin configuration of this module.

Table 51.1 Pin Configuration

Pin Name	I/O	Function
MMC_CLK	Output	MMC clock
MMC_CMD	Input/output	Command/response
MMC_D[7:0]	Input/output	Transmit/receive data
MMC_CD	Input	Card detection*1

Note 1. Check the specifications of the card socket to be used before connection.

51.3 Register Descriptions

Table 51.2 shows the register configuration of this module.

Table 51.2 Register Configuration

Register Name	Abbreviation	R/W	Address	Access Size
Command setting register	CE_CMD_SET	R/W	H'E804C800 H'E804C802	16 16
Argument register	CE_ARG	R/W	H'E804C808	32

Version register	CE_VERSION	R/W	H'E804C87C	32

Note: • Do not access registers other than those shown above.

51.3.1 Command Setting Register (CE_CMD_SET)

CE_CMD_SET sets a command sequence.
The command sequence starts when the settings have been made in bits 31 to 16. Note that writing to CE_CMD_SET is disabled while a command sequence is proceeding (i.e., the value of CMDSEQ in CE_HOST_STS1 is 1).
CE_CMD_SET should be set according to the description in section 51.7.12, Setting Values of CE_CMD_SET. This register should be accessed in 16 bits. (The address of bits 31 to 16 is H'E804C800 and that of bits 15 to 0 is H'E804C802.)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	CMD[5:0]						RTYP[1:0]		RBSY	—	WDAT	DWEN	CMLTE	CMD12EN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	00	R	Reserved These bits are always read as 0. The write value should always be 0.
29 to 24	CMD[5:0]	All 0	R/W	Command Index These bits set a command index ([45:40]). Note: Setting a command index in these bits initiates the command sequence.
23, 22	RTYP[1:0]	00	R/W	Response Type 00: No response 01: 6-byte response (R1, R1b, R3, R4, R5) 10: 17-byte response (R2) 11: Setting prohibited
21	RBSY	0	R/W	Response Busy Select Selects whether “busy” is involved in response reception. 0: No response busy 1: Response busy involved (R1b)
20	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
19	WDAT	0	R/W	Presence/Absence of Data 0: No data 1: With data
18	DWEN	0	R/W	Read/Write (valid when “with data” is selected) 0: Read from the card 1: Write to the card
17	CMLTE	0	R/W	Single/Multi Block Transfer Select (valid when “with data” is selected) 0: Single-block transfer 1: Multi-block transfer
16	CMD12EN	0	R/W	Automatic CMD12 Issuance (valid when multi-block transfer is selected)* 0: Does not issue CMD12 automatically. 1: Issues CMD12 automatically (= automatic CMD12) For details of automatic CMD12 issuance, see section 51.6.4, Automatic CMD12 Issuance. Note: Set the transfer block size to 512 bytes. Set RBSY to 0.

Bit	Bit Name	Initial Value	R/W	Description
15, 14	RIDXC[1:0]	00	R/W	Response Index Check Specify the items to be checked for [45:40] of a 6-byte response or [133:128] of a 17-byte response. 00: Checks the response index (ensure that the response index matches the command index.) 01: Checks the check bits (ensure that the bits are all 1.) 10: No checking 11: Setting prohibited
13, 12	RCRC7C [1:0]	00	R/W	Response CRC7 Check Specify the items to be checked for [7:1] of a 6-byte response or a 17-byte response. 00: Checks CRC7 (set the response type to 01) 01: Checks the check bits (set the response type to 01) 10: Checks internal CRC7 (R2 only) (set the response type to 10) 11: No checking
11	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
10	CRC16C	0	R/W	CRC16 Check in Reception (valid when “with data” and “read” are selected) 0: Checks CRC16 1: Does not check CRC16 (use when CMD14)
9	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
8	CRCSTE	0	R/W	CRC Status Reception (valid when “with data” and “write” are selected) 0: Receives CRC status 1: Does not receive CRC status (use when CMD19)
7	TBIT	0	R/W	Transmission Bit Setting 0: Sets the transmission bit ([46]) to 1. 1: Sets the transmission bit ([46]) to 0.
6	OPDM	0	R/W	Open-Drain Output Mode 0: Normal output 1: Open-drain output Note: This setting is only applied to the MMC_CMD line.
5, 4	—	00	R	Reserved These bits are always read as 0. The write value should always be 0.
3	SBIT	0	R/W	Read Data Start Bit Detection (valid when "with data" and "read" are selected) 0: Detects the start bit when the MMC_D signals set by DATW are all 0. 1: Detects the start bit when MMC_D[0] is 0.
2	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
1, 0	DATW[1:0]	00	R/W	Data Bus Width Setting (valid when "with data" is selected) 00: 1 bit 01: 4 bits 10: 8 bits 11: Setting prohibited

Note: * When HPI is executed, use multi-block transfer (pre-defined) without setting this bit to 1.

51.3.2 Argument Register (CE_ARG)

CE_ARG sets the argument for the command to be transmitted. Set CE_ARG before starting the command sequence.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ARG[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ARG[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ARG[31:0]	H'00000000	R/W	These bits set [39:8] of a command. Note: Set the argument of automatically-issued CMD12 by CE_ARG_CMD12.

51.3.3 Argument Register for Automatically-Issued CMD12 (CE_ARG_CMD12)

CE_ARG_CMD12 is used to set the argument for the automatically-issued CMD12 in multi-block transfer. For the automatically-issued CMD12, see section 51.6.4, Automatic CMD12 Issuance. Set CE_ARG_CMD12 before starting the command sequence.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	C12ARG[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	C12ARG[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	C12ARG[31:0]	H'00000000	R/W	These bits set [39:8] of the automatically-issued CMD12.

51.3.4 Command Control Register (CE_CMD_CTRL)

CE_CMD_CTRL is used to terminate a command sequence forcibly.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BREAK
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	BREAK	0	R/W	Forcible Termination of Command Sequence To discontinue the current command sequence, write 1 to this bit while the bit is 0 and then write 0. After the above procedure, check if the value of the CMDSEQ bit in CE_HOST_STS1 has become 0 and then perform a software reset. Note: Since a software reset returns the register value to the initial value, the register needs be set again.

51.3.5 Transfer Block Setting Register (CE_BLOCK_SET)

CE_BLOCK_SET specifies the size of the block and the number of blocks for the data to be transferred. Set CE_BLOCK_SET before starting the command sequence.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	BLKCNT[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BLKSIZ[15:0]															
Initial value:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	BLKCNT [15:0]	H'0000	R/W	Number of Blocks for Transfer Note: This setting is valid for multi-block transfer.
15 to 0	BLKSIZ [15:0]	H'0200	R/W	Transfer Block Size Note: Transfer block size should be set as follows. • Single-block transfer: 1 to 512 bytes • Multi-block transfer: 512 bytes

51.3.6 Clock Control Register (CE_CLK_CTRL)

CE_CLK_CTRL controls the MMC clock and sets timeout values. Do not change the setting of this register while a command sequence is in progress.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	CLKEN	—	—	—	—	CLKDIV[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	SRSPTO[1:0]		SRBSYTO[3:0]				SRWDTO[3:0]				—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	CLKEN	0	R/W	MMC Clock Output Control 0: Does not output the MMC clock (tied to low level) 1: Outputs the MMC clock
23 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19 to 16	CLKDIV[3:0]	0000	R/W	MMC Clock Frequency Setting 0000: P1ϕ/2 0001: P1ϕ/2^2 0111: P1ϕ/2^8 1000: P1ϕ/2^9 1001: P1ϕ/2^{10} 1010 to 1111: Setting prohibited
15, 14	—	00	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	SRSPTO [1:0]	00	R/W	Response Timeout Setting Specifies the timeout period for the RSPTO bit of CE_INT. 00: 64 MMC clock cycles 01: 128 MMC clock cycles 10: 256 MMC clock cycles 11: Setting prohibited
11 to 8	SRBSYTO [3:0]	0000	R/W	Response Busy Timeout Setting Specifies the timeout period for the RBSYTO bit of CE_INT. 0000: 2^{14} MMC clock cycles 0001: 2^{15} MMC clock cycles : 1110: 2^{28} MMC clock cycles 1111: 2^{29} MMC clock cycles
7 to 4	SRWDTO [3:0]	0000	R/W	Write Data/Read Data Timeout Setting Specifies the timeout period for the WDATTO and RDATTO bits of CE_INT. 0000: 2^{14} MMC clock cycles 0001: 2^{15} MMC clock cycles : 1110: 2^{28} MMC clock cycles 1111: 2^{29} MMC clock cycles
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

51.3.7 Buffer Access Configuration Register (CE_BUF_ACC)

CE_BUF_ACC configures the method of accessing data registers and mode of DMA transfer. Do not change the setting of this register while a command sequence is in progress. For explanation of the buffers, see section 51.6.3, Buffer Structure and Buffer Accesses.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	DMAWEN	DMAREN	—	—	—	—	—	—	—	ATYP
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R/W

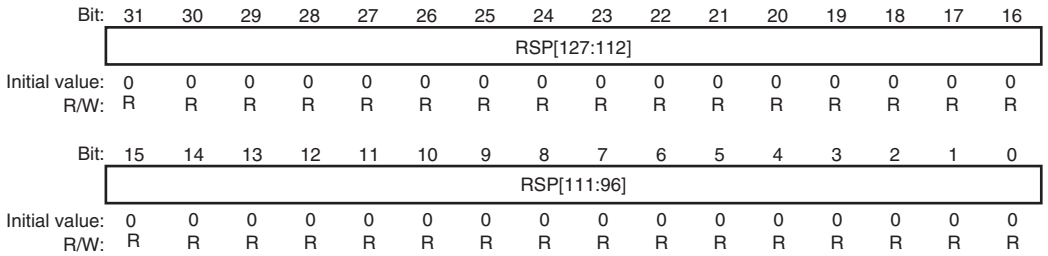
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25	DMAWEN	0	R/W	Buffer Write DMA Transfer Request Enable 0: Disables DMA transfer request for buffer writing 1: Enables DMA transfer request for buffer writing
24	DMAREN	0	R/W	Buffer Read DMA Transfer Request Enable 0: Disables DMA transfer request for buffer reading 1: Enables DMA transfer request for buffer reading
23 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	ATYP	0	R/W	Buffer Access Select 0: When not swapped byte-wise. 1: When swapped byte-wise. Note: For explanation of buffer access, see section 51.6.3, Buffer Structure and Buffer Accesses.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

51.3.8 Response Registers 3 to 0 (CE_RESP3 to CE_RESP0)

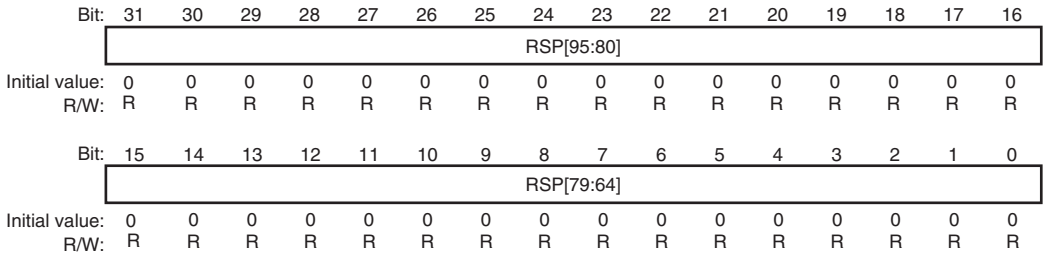
CE_RESP3 to CE_RESP0 are the registers for storing the response that has been received. For the formats of response values, see section 51.6.1, Command/Response Formats.

- CE_RESP3



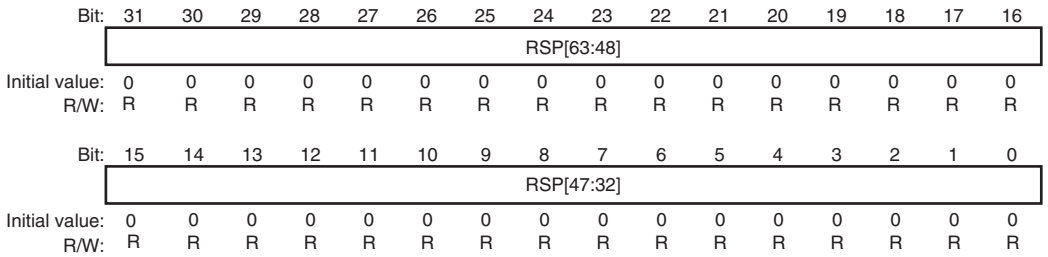
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RSP[127:96]	H'00000000	R	[127:96] of a 17-byte response are stored.

- CE_RESP2



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RSP[95:64]	H'00000000	R	[95:64] of a 17-byte response are stored.

- CE_RESP1



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RSP[63:32]	H'00000000	R	[63:32] of a 17-byte response are stored.

- CE_RESP0

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RSP[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RSP[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RSP[31:0]	H'00000000	R	[39:8] of a 6-byte response or [31:0] of a 17-byte response are stored. Note: The response to the automatically-issued CMD12 is stored in CE_RESP_CMD12.

51.3.9 Response Register for Automatically-Issued CMD12 (CE_RESP_CMD12)

CE_RESP_CMD12 is the register for storing the response to the automatically-issued CMD12.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RSP12[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RSP12[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RSP12[31:0]	H'00000000	R	[39:8] of a response to the automatically-issued CMD12 are stored.

51.3.10 Data Register (CE_DATA)

CE_DATA is used to access the buffers of this module.

For the write/read data formats, see section 51.6.2, Data Block Format.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DATA[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DATA[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DATA[31:0]	H'00000000	R/W	Buffer write/read data [31:0]

51.3.11 Interrupt Flag Register (CE_INT)

CE_INT indicates various status during execution of a command sequence. Each bit is set to 1 when its setting condition has been met. To clear flag(s), write 0 only to the bit(s) to be cleared and write 1 to the other bits.
For the operation in the case of an error or timeout, see section 51.6.7, Operation in the Case of Error/Timeout.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	CMD12 DRE	CMD12 RBE	CMD12 CRE	DTRAN E	BUFR E	BUFW EN	BUFR EN	—	—	RBSY E	CRSP E
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CMD VIO	BUF VIO	—	—	WDAT ERR	RDAT ERR	RIDX ERR	RSP ERR	—	—	—	CRCS TO	WDAT TO	RDAT TO	RBSY TO	RSP TO
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bets are always read as 0. The writing value should always be 0.
26	CMD12DRE	0	R/W*1	Automatic CMD12 Issuance & Buffer Read Complete [Setting condition] Response busy for automatically-issued CMD12 and buffer reading have been completed. [Clearing condition] Writing a 0 to this bit Note: When CMD12DRE has been set, CMD12RBE, CMD12CRE, and BUFRE have also been set. So, these bits should be cleared as well.
25	CMD12RBE	0	R/W*1	Automatic CMD12 Issuance Response Busy Complete [Setting condition] Reception of the response and response busy for an automatically-issued CMD12 have been completed. [Clearing condition] Writing a 0 to this bit Note: When CMD12RBE is set, CMD12CRE is also set. So, clear the bit as well. When CMD12RBE is set during a multi-block write, DTRANE is also set. So clear the bit as well.
24	CMD12CRE	0	R/W*1	Automatic CMD12 Response Complete [Setting condition] The response to an automatically-issued CMD12 has been received. [Clearing condition] Writing a 0 to this bit
23	DTRANE	0	R/W*1	Data Transmission Complete [Setting conditions] Transmission of all blocks of data has been completed. • When configured to receive CRC status: Completion of busy (data busy) after reception of CRC status • When configured not to receive CRC status: Completion of data transmission [Clearing condition] Writing a 0 to this bit
22	BUFRE	0	R/W*1	Buffer Read Complete [Setting condition] All blocks of data have been received and the data have been read from the buffer [Clearing condition] Writing a 0 to this bit

Bit	Bit Name	Initial Value	R/W	Description
21	BUFWEN	0	R/W*1	Buffer Write Ready [Setting condition] The buffer has become empty and ready for writing. [Clearing condition] Writing a 0 to this bit Note: When data is written to CE_DATA by the CPU, clear this bit first, and then write the amount of data equivalent to the block size set in the CE_BLOCK_SET register. Note that this bit is not set when DMA transfer request for buffer writing is enabled.
20	BUFREN	0	R/W*1	Buffer Read Ready [Setting condition] Transfer block size of data have been stored in the buffer and it has become ready for reading [Clearing condition] Writing a 0 to this bit Note: When data is read from CE_DATA by the CPU, clear this bit first, and then read the amount of data equivalent to the block size set in the CE_BLOCK_SET register. Note that this bit is not set when DMA transfer request for buffer reading is enabled.
19, 18	—	00	R	Reserved These bits are always read as 0.The write value should always be 0.
17	RBSYE	0	R/W*1	Response Busy Complete [Setting condition] Reception of a response and response busy have been completed [Clearing condition] Writing a 0 to this bit Note: When RBSYE has been set, CRSPE has also been set. So, this bit should be cleared as well. Completion of reception of the response and response busy for automatically-issued CMD12 is reflected in CMD12RBE.
16	CRSPE	0	R/W*1	Command/Response Complete [Setting conditions] A command has been transmitted or a response has been received • When configured not to receive response: A command has been transmitted • When configured to receive 6- or 17-byte response: A response has been received [Clearing condition] Writing a 0 to this bit Note: Completion of reception of the response to automatically-issued CMD12 is reflected in CMD12CRE.
15	CMDVIO	0	R/W*1	Command Issuance Error [Setting conditions] Illegal setting has been made in CE_CMD_SET or CE_BLOCK_SET • During execution of a command sequence: Writing to CMD[5:0] in CE_CMD_SET (The command sequence is not stopped automatically.) • At the start of command sequence: Writing to CMD[5:0] in CE_CMD_SET when the registers have been set for one of the following combinations of selection - No response + response busy - No response + with data - No data + automatic CMD12 issuance - With data + single-block transfer + automatic CMD12 issuance - With data + response busy + automatic CMD12 issuance - With data + transfer block size = 0 - With data + transfer block size ≥ 513 - With data + multi-block transfer + number of blocks for transfer = 0 [Clearing condition] Writing a 0 to this bit

Bit	Bit Name	Initial Value	R/W	Description
14	BUFVIO	0	R/W*1	Buffer Access Error [Setting conditions] Illegal buffer access has been attempted. • CE_ DATA has been accessed exceeding the block size set in BLKSIZ[15:0] in CE_BLOCK_SET • While data is being read from the card: CE_DATA has been accessed with BUFREN not set (when DMA is used, with no DMA transfer request asserted for buffer reading) • While data is being written to the card: CE_DATA has been accessed with BUFWEN not set (when DMA is used, with no DMA transfer request asserted for buffer writing) [Clearing condition] Writing a 0 to this bit Note: When BUFVIO is set, the command sequence is not stopped automatically. When an error occurs, this bit may be set.
13, 12	—	00	R	Reserved These bits are always read as 0. The write value should always be 0.
11	WDATERR	0	R/W*1	Write Data Error [Setting conditions] Error is found in the data that has been written. • Error is in the status of the CRC status • Error is in the end bit of the CRC status [Clearing condition] Writing a 0 to this bit Note: When WDATERR is set, the command sequence is stopped automatically.
10	RDATERR	0	R/W*1	Read Data Error [Setting conditions] Error is found in the read data. • Error is in CRC16 of the read data • Error is in the end bit of the read data [Clearing condition] Writing a 0 to this bit Note: When RDATERR is set, the command sequence is stopped automatically.
9	RIDXERR	0	R/W*1	Response Index Error [Setting condition] Error has been found in the index value of the response. • When an error has been found in [45:40] of a 6-byte response (including automatically-issued CMD12) or [133:128] of a 17-byte response (The items to be checked are set by RIDXC in CE_CMD_SET.) [Clearing condition] Writing a 0 to this bit Note: When RIDXERR is set, the command sequence is stopped automatically.
8	RSPERR	0	R/W*1	Response Error [Setting conditions] Error has been found in the response values of the response. • Transmission bit in the response is high • Error is in the end bit of the response • When an error has been found in [7:1] of a 6-byte response (including automatically-issued CMD12) or a 17-byte response (The items to be checked are set by RCRC7C in CE_CMD_SET.) [Clearing condition] Writing a 0 to this bit Note: When RSPERR is set, the command sequence is stopped automatically.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
4	CRCSTO	0	R/W*1	CRC Status Timeout [Setting condition] CRC status could not be received [Clearing condition] Writing a 0 to this bit Note: The command sequence is not stopped even if CRCSTO is set.
3	WDATTO	0	R/W*1	Write Data Timeout [Setting condition] The busy status remains unchanged after the period set by SRWDTO in CE_CLK_CTRL after the CRC status was received. [Clearing condition] Writing a 0 to this bit Note: The command sequence is not stopped even if WDATTO is set.
2	RDATTO	0	R/W*1	Read Data Timeout [Setting conditions] • Read data could not be received within the period set by SRWDTO in CE_CLK_CTRL after the read command was transmitted • Read data could not be received within the period set by SRWDTO in CE_CLK_CTRL after the read data was received. [Clearing condition] Writing a 0 to this bit Note: The command sequence is not stopped even if RDATTO is set.
1	RBSYTO	0	R/W*1	Response Busy Timeout [Setting condition] The busy status remains unchanged after the period set by SRBSYTO in CE_CLK_CTRL after the command (including automatically-issued CMD12) was transmitted. [Clearing condition] Writing a 0 to this bit Note: The command sequence is not stopped even if RBSYTO is set.
0	RSPTO	0	R/W*1	Response Timeout [Setting condition] Response could not be received within the period set by SRSPTO in CE_CLK_CTRL after the command (including automatically-issued CMD12) was transmitted. [Clearing condition] Writing a 0 to this bit Note: The command sequence is not stopped even if RSPTO is set.

Note 1. A 0 is the only value that can be written to the bit. Writing a 1 is ignored.

51.3.12 Interrupt Enable Register (CE_INT_EN)

CE_INT_EN controls output of the CE_INT-related interrupt signals. If a flag in CE_INT is set to 1 while its corresponding bit in CE_INT_EN is set to 1, an interrupt request is output. For details on interrupt requests, see section 51.4, Interrupt Requests.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

51.3.13 Status Register 1 (CE_HOST _STS1)

CE_HOST_STS1 indicates the number of blocks that have been transferred, states of the MMC_CMD and MMC_D lines, index of the received response, and command sequence status.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CMD SEQ	CMD SIG	RSPIDX[5:0]						DATSIG[7:0]							
Initial value:	0	—	0	0	0	0	0	0	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RCVBLK[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	CMDSEQ	0	R	Command Sequence Status 0: Command sequence is in the initial state 1: Command sequence is being executed
30	CMDSIG	Undefined	R	MMC_CMD Line Status Indicates the state on the MMC_CMD line.
29 to 24	RSPIDX [5:0]	H'00	R	Response Index Indicate [45:40] of a 6-byte response or [133:128] of a 17-byte response.
23 to 16	DATSIG [7:0]	Undefined	R	MMC_D Status Indicate the states on the MMC_D[7:0] lines. Note: When an error or timeout occurs, MMCDAT[0] may remain 0.
15 to 0	RCVBLK [15:0]	H'0000	R	Number of Transferred Blocks Indicate the number blocks that have been transferred. • When the DWEN bit in CE_CMD_SET is 0 Number of blocks read from the card • When the DWEN bit in CE_CMD_SET is 1 Number of blocks written to the card

51.3.14 Status Register 2 (CE_HOST _STS2)

CE_HOST _STS2 indicates timeout and error status.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CRCSTE	CRC16E	AC12CRCE	RSPCRC7E	CRCSTEBE	RDATEBE	AC12REBE	RSPEBE	AC12IDXE	RSPIDXE	—	—	—	CRCST[2:0]

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	CRCSTE	0	R	CRC Status Error This bit is set to 1 when an error is found in the CRC status value.
30	CRC16E	0	R	Read Data CRC16 Error This bit is set to 1 when an error is found in CRC16 in the read data.
29	AC12CRCE	0	R	Automatic CMD12 Response CRC7 Error This bit is set to 1 when an error is found in [7:1] of the response to the automatically-issued CMD12. Note: The items to be checked are set by RCRC7C in CE_CMD_SET.
28	RSPCRC7E	0	R	Command Response CRC7 Error (other than automatically-issued CMD12) This bit is set to 1 when an error is found in [7:1] of a 6-byte response or a 17-byte response. Note: The items to be checked are set by RCRC7C in CE_CMD_SET.
27	CRCSTEBE	0	R	CRC Status End Bit Error This bit is set to 1 when an error is found in the end bit in CRC status.
26	RDATEBE	0	R	Read Data End Bit Error This bit is set to 1 when an error is found in the end bit in the read data.
25	AC12REBE	0	R	Automatic CMD12 Response End Bit Error This bit is set to 1 when an error is found in the end bit of the response to the automatically-issued CMD12.
24	RSPEBE	0	R	Command Response End Bit Error (other than automatically-issued CMD12) This bit is set to 1 when an error is found in the end bit of the response.
23	AC12IDXE	0	R	Automatic CMD12 Response Index Error This bit is set to 1 when an error is found in [45:40] of the response to the automatically-issued CMD12. Note: The items to be checked are set by RIDXC in CE_CMD_SET.
22	RSPIDXE	0	R	Command Response Index Error (other than automatically-issued CMD12) This bit is set to 1 when an error is found in [45:40] of a 6-byte response or [133:128] of a 17-byte response. Note: The items to be checked are set by RIDXC in CE_CMD_SET.
21 to 19	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
18 to 16	CRCST [2:0]	000	R	CRC Status Indicate the value of the CRC status that has been received.
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14	STRDATTO	0	R	Read Data Timeout • This bit is set to 1 if read data is not received within the period set by the SRWDTO bits in CE_CLK_CTRL after a read command was transmitted. • This bit is set to 1 if read data is not received within the period set by the SRWDTO bits in CE_CLK_CTRL after a read data was received.

Bit	Bit Name	Initial Value	R/W	Description
13	DATBSYTO	0	R	Data Busy Timeout This bit is set to 1 if busy status remains unchanged after the period set by the SRWDTO bits in CE_CLK_CTRL after the CRC status was received.
12	CRCSTTO	0	R	CRC Status Timeout This bit is set to 1 if CRC status could not be received.
11	AC12BSYTO	0	R	Automatic CMD12 Response Busy Timeout This bit is set to 1 if busy state remains unchanged after the period set by the SRBSYTO bits in CE_CLK_CTRL after the automatically-issued CMD12 was transmitted.
10	RSPBSYTO	0	R	Response Busy Timeout This bit is set to 1 if busy state remains unchanged after the period set by the SRBSYTO bits in CE_CLK_CTRL after a command (other than automatically-issued CMD12) was transmitted.
9	AC12RSPTO	0	R	Automatic CMD12 Response Timeout This bit is set to 1 if the response is not received within the period set by the SRSPTO bits in CE_CLK_CTRL after the automatically-issued CMD12 was transmitted.
8	STRSPTO	0	R	Response Timeout This bit is set to 1 if the response is not received within the period set by the SRSPTO bits in CE_CLK_CTRL after a command (other than automatically-issued CMD12) was transmitted.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

51.3.15 DMA Mode Setting Register (CE_DMA_MODE)

CE_DMA_MODE sets the transfer unit for DMA transfer.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DMA SEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	DMASEL	0	R/W	DMA Transfer Size Select Selects the transfer unit for CE_DATA read/write DMA transfer. Set this bit in combination with the transfer size set in the DMA channel configuration register. 0: 2-byte (word) or 4-byte (longword) unit 1: 64-byte (longword × 16) unit Note: For DMA transfer in 64-byte units, set address H'E804C800 as the destination or source of DMA transfer instead of the data register (CE_DATA). In addition, when a transfer error or timeout occurs during DMA transfer in 64-byte units, leading to the forced termination of transfer, write 0 to this bit and then set it to 1 again. Also do this whenever a software reset is used.

51.3.16 Card Detection/Port Control Register (CE_DETECT)

CE_DETECT controls card detection. For details on interrupt requests by card detection, see section 51.4, Interrupt Requests.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	CD SIG	CD RISE	CD FALL	—	—	—	—	—	—	MCD RISE	MCD FALL	—	—	—	—
Initial value:	0	—	0	0	0	—	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W*	R/W*	R	R	R	R	R	R	R/W	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 15	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
14	CDSIG	Undefined	R	MMC_CD Pin Status Indication Indicates the MMC_CD pin status.
13	CDRISE	0	R/W*1	MMC_CD Pin Rise Detection Flag [Setting condition] The MMC_CD pin level changes from low to high. [Clearing condition] Writing a 0 to this bit
12	CDFALL	0	R/W*1	MMC_CD Pin Fall Detection Flag [Setting condition] The MMC_CD pin level changes from high to low. [Clearing condition] Writing a 0 to this bit
11	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
10	—	Undefined	R	Reserved The write value should always be 0.
9 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	MCDRISE	0	R/W	CDRISE Interrupt Enable 0: Disables interrupt output by the CDRISE flag. 1: Enables interrupt output by the CDRISE flag.
4	MCDFALL	0	R/W	CDFALL Interrupt Enable 0: Disables interrupt output by the CDFALL flag. 1: Enables interrupt output by the CDFALL flag.
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note 1. A 0 is the only value that can be written to the bit. Writing a 1 is ignored.

51.3.17 Special Mode Setting Register (CE_ADD_MODE)

CE_ADD_MODE controls the internal clock.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	CLK MAIN	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19	CLKMAIN	0	R/W	Internal Clock Control 0: Normal mode 1: Low power consumption mode (only card detection is enabled)
18 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

51.3.18 Version Register (CE_VERSION)

CE_VERSION indicates the version number and controls software reset of this module.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SW RST	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VERSION[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	SWRST	0	R/W	Software Reset 0: Software reset cleared (normal operation) 1: Executes software reset. When SWRST is set to 1, all the register values are reset to the initial values. (SWRST is not reset to the initial value)
30 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	VERSION [15:0]	H'0003	R	Version Information Indicates the version number of this module.

51.4 Interrupt Requests

Table 51.3 shows the interrupt request specifications of this module.
This module generates three types of interrupt requests: normal operation, error/timeout, and card detection. When an interrupt flag is set to 1 and also the corresponding interrupt is enabled, an interrupt request is asserted.

Table 51.3 Specifications of Interrupt Requests

Flag Register	Bit	Mask Register	Bit	Interrupt Request
CE_INT	CMD12DRE	CE_INT_EN	MCMD12DRE	Normal operation interrupt (MMC2)
	CMD12RBE		MCMD12RBE	
	CMD12CRE		MCMD12CRE	
	DTRANE		MDTRANE	
	BUFRE		MBUFRE	
	BUFWEN		MBUFWEN	
	BUFREN		MBUFREN	
	RBSYE		MRBSYE	
	CRSPE		MCRSPE	
	CMDVIO		MCMDVIO	Error/timeout interrupt (MMC1)
	BUFVIO		MBUFVIO	
	WDATERR		MWDATERR	
	RDATERR		MRDATERR	
	RIDXERR		MRIDXERR	
	RSPERR		MRSPERR	
	CRCSTO		MCRCSTO	
	WDATTO		MWDATTO	
	RDATTO		MRDATTO	
	RBSYTO		MRBSYTO	
	RSPTO		MRSPTO	
CE_DETECT	CDRISE	CE_DETECT	MCDRISE	Card detection interrupt (MMC0)
	CDFALL		MCDFALL	

51.5 DMA Specifications

This module provides two channels for DMA transfer requests: one for buffer reading and the other for buffer writing.

51.5.1 DMA for Buffer Writing

The DMA transfer request is asserted for buffer writing when the buffer has become empty while the DMAWEN bit in CE_BUF_ACC is 1.

The DMA transfer request stays asserted for the amount of data specified by BLKSIZ (the block size set in CE_BLOCK_SET) × BLKCNT (the number of blocks for transfer set in CE_BLOCK_SET), and negated after the last block has been transferred. Note that the BUFWEN bit in CE_INT will not be asserted in this case.

If an error occurs during DMA transfer or DMA transfer is forcibly terminated, the command sequence is stopped automatically, which causes the DMA transfer request to be negated.

51.5.2 DMA for Buffer Reading

The DMA transfer request is asserted for buffer reading when the buffer stores data of the block size specified in CE_BLOCK_SET while the DMAREN bit in CE_BUF_ACC is 1.

The DMA transfer request stays asserted for the amount of data specified by BLKSIZ (the block size set in CE_BLOCK_SET) × BLKCNT (the number of blocks for transfer set in CE_BLOCK_SET), and negated after the last block has been transferred. Note that the BUFREN bit in CE_INT will not be asserted in this case.

If an error occurs during DMA transfer or DMA transfer is forcibly terminated, the command sequence is stopped automatically, which causes the DMA transfer request to be negated.

51.6 Operation

51.6.1 Command/Response Formats

Figure 51.2 shows the format of the command to be transferred. The command index that is set in CMD[5:0] of CE_CMD_SET and the argument set in ARG[31:0] of CE_ARG are reflected in the command.

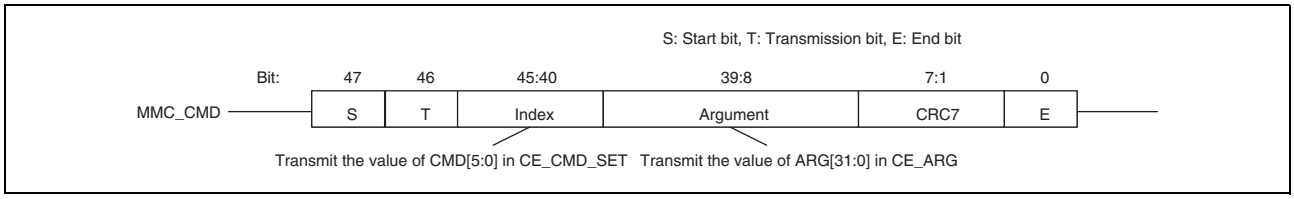

Figure 51.2 Command Format

Figure 51.3 and Figure 51.4 show the formats when a 6-byte response and 17-byte response (R2) are received, respectively. The response index is stored in RSPIDX[5:0] of CE_HOST_STS1, and the status value of the response is stored to CE_RESP0 or CE_RESP3 to CE_RESP0.

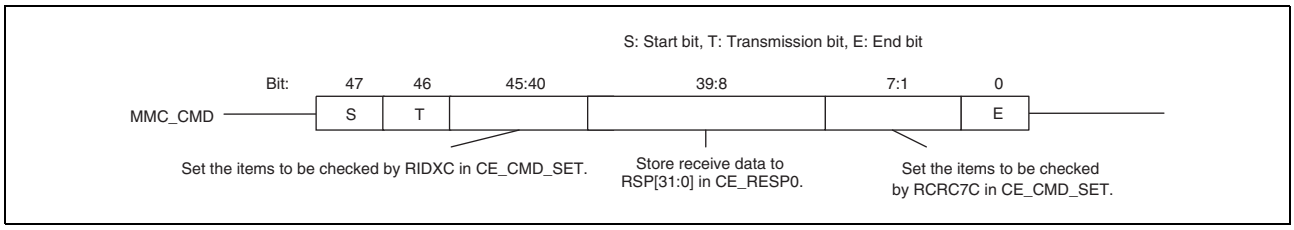

Figure 51.3 Format of 6-Byte Response

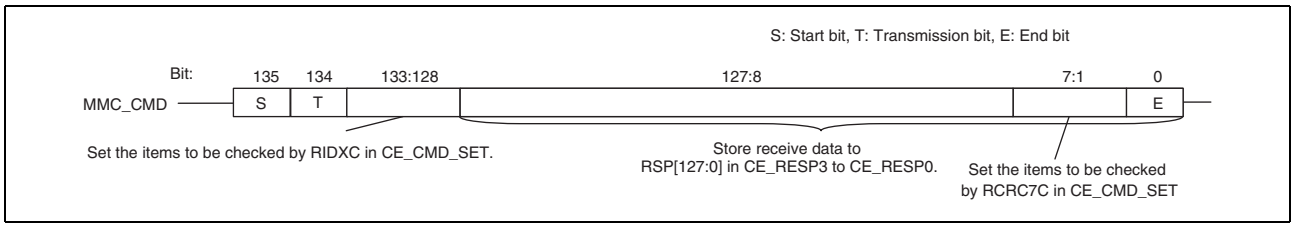

Figure 51.4 Format of 17-Byte Response (R2)

51.6.2 Data Block Format

Figure 51.5 shows the format of data blocks. For details on D0 to D3 in Figure 51.5, see section 51.6.3, Buffer Structure and Buffer Accesses. When data is written to a card, data stored in the buffer is transmitted. When data is read from a card, receive data is stored to the buffer.

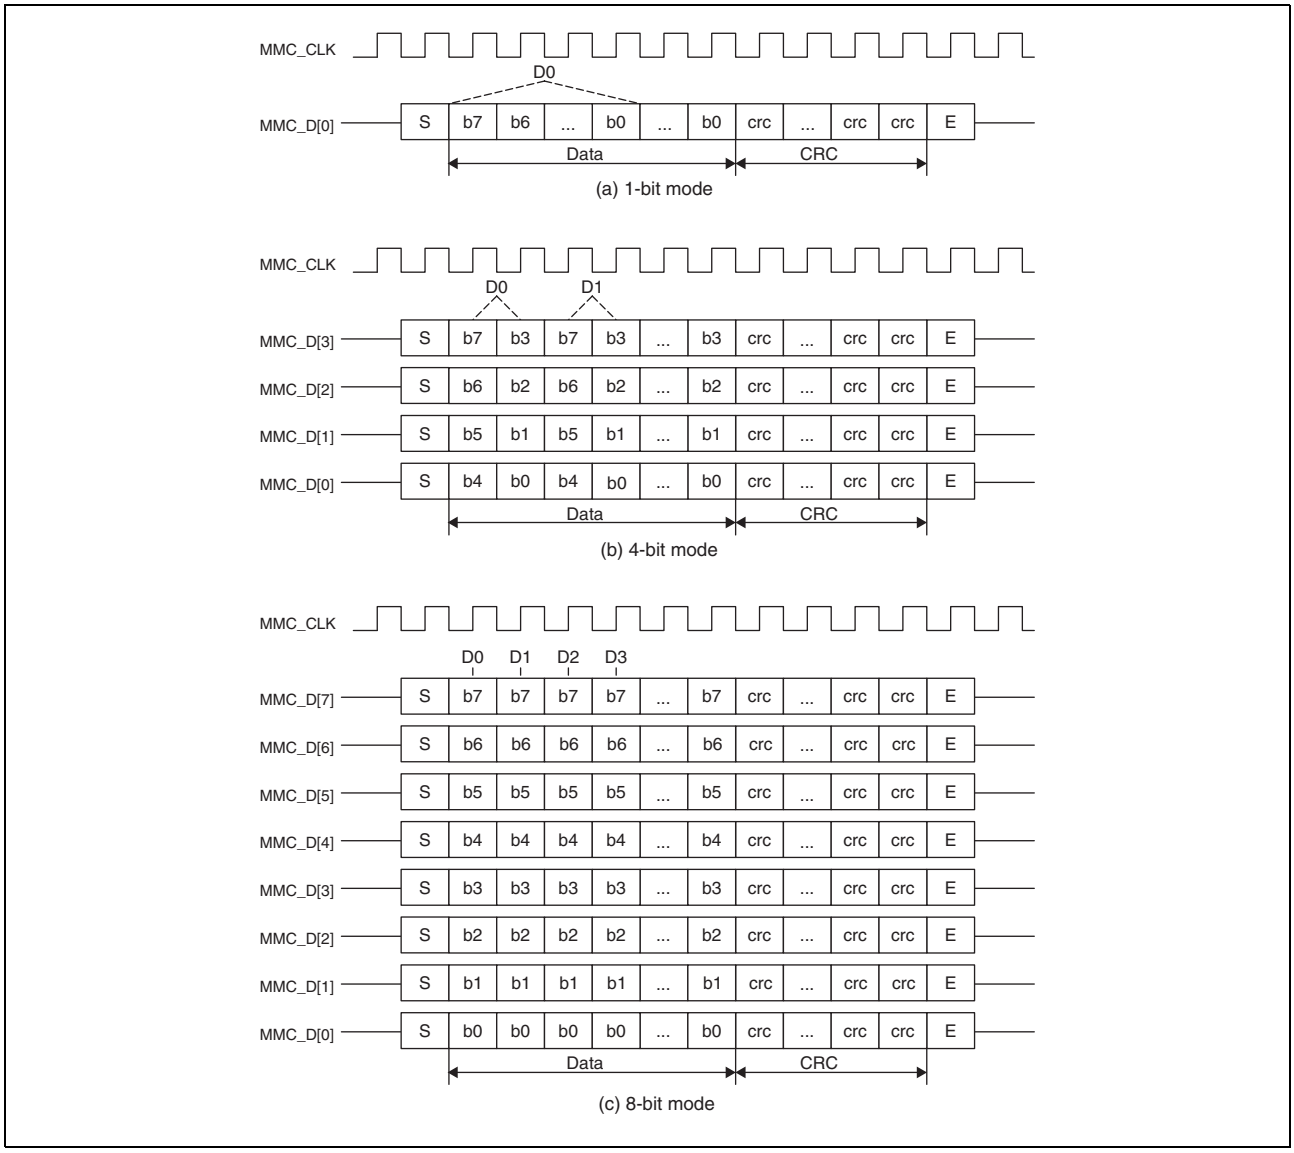

Figure 51.5 Data Block Format

51.6.3 Buffer Structure and Buffer Accesses

This module has two units of 512-byte RAM as shown in Figure 51.6. Therefore, for multi-block writing, if one block of data (512 bytes) stored in one buffer has been transmitted but the other buffer is full, the next block of data can be continuously transmitted. For multi-block reading, if one block of receive data (512 bytes) has been stored in one buffer but the other buffer is empty, the next block of receive data can be continuously stored in the buffer.

If neither of the buffers is empty for multi-block reading, the MMC clock is stopped and reception is suspended. When one of the buffers becomes empty, the MMC clock supply is started to start reception.

The buffer is accessed with CE_DATA. CE_DATA should be accessed for 4 × (n + 1) bytes (n = 0, 1, 2, 3, …, 127).

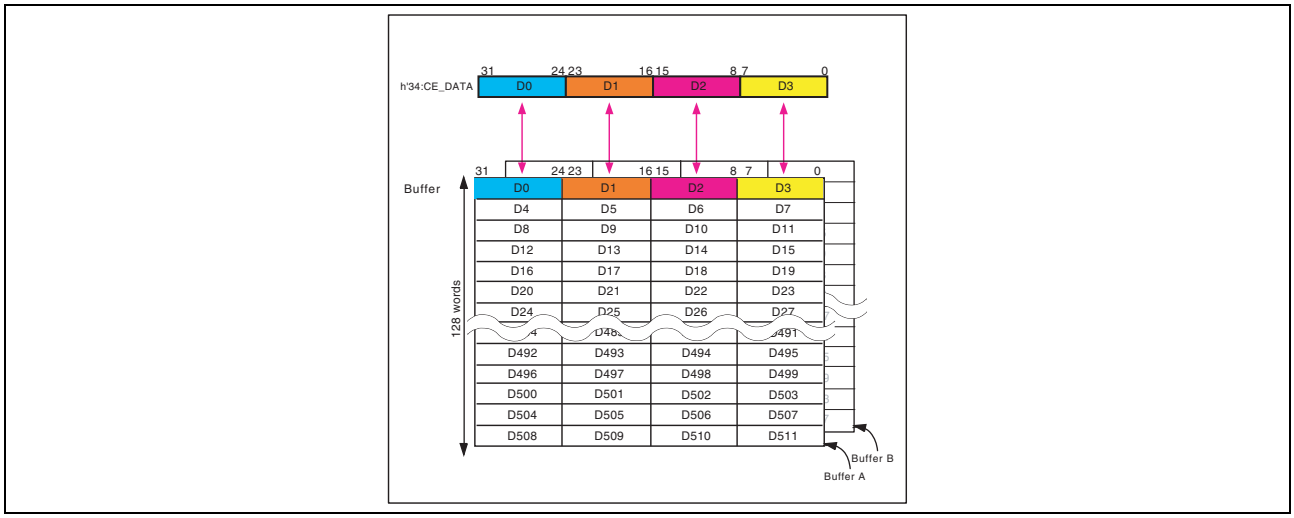

Figure 51.6 Double Buffer Structure

The buffer access select function allows byte-wise swapping of data when the buffer is accessed by writing to or reading from CE_DATA. This function is enabled by the setting of CE_BUFF_ACC. Figure 51.7 shows the specification of byte-wise swapping.

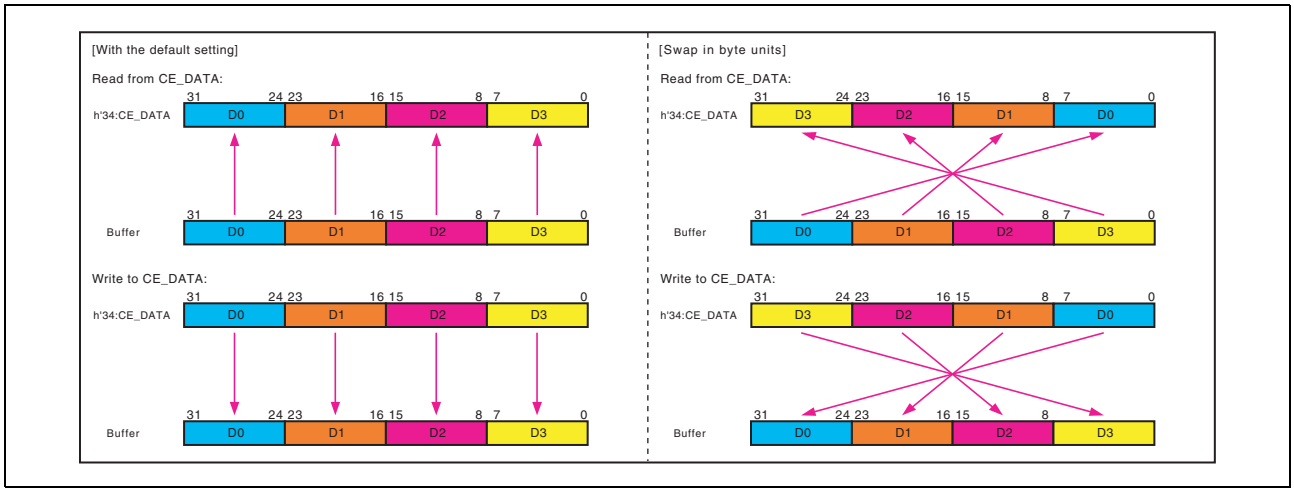

Figure 51.7 Specification of Byte-Wise Swapping

51.6.4 Automatic CMD12 Issuance

This module automatically issues CMD12 when multi-block transfer is performed with the CMD12EN bit in CE_CMD_SET set to 1.

Figure 51.8 shows the timing of automatic CMD12 issuance in multi-block read. CMD12 is issued such that the end bit of the command is sent two bits before the end bit of the data during reception of the last block.

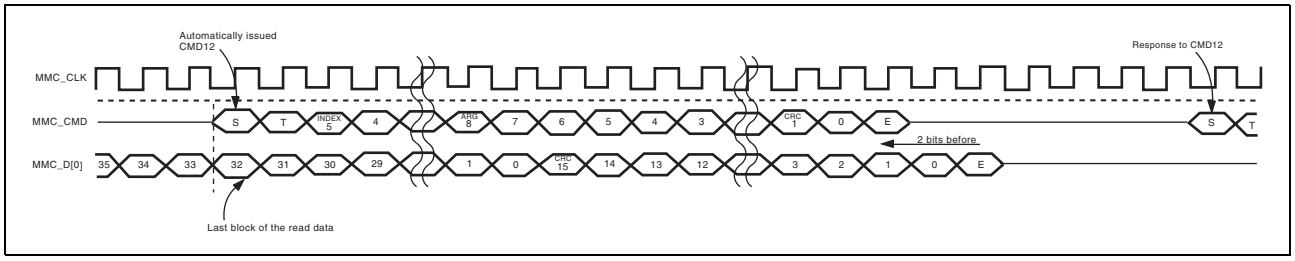

Figure 51.8 Timing of Automatically-Issued CMD12 in Multi-Block Read (1-Bit Mode)

Figure 51.9 shows the timing of automatic CMD12 issuance in multi-block write. CMD12 is issued after the data busy after transmission of the last block has ended.

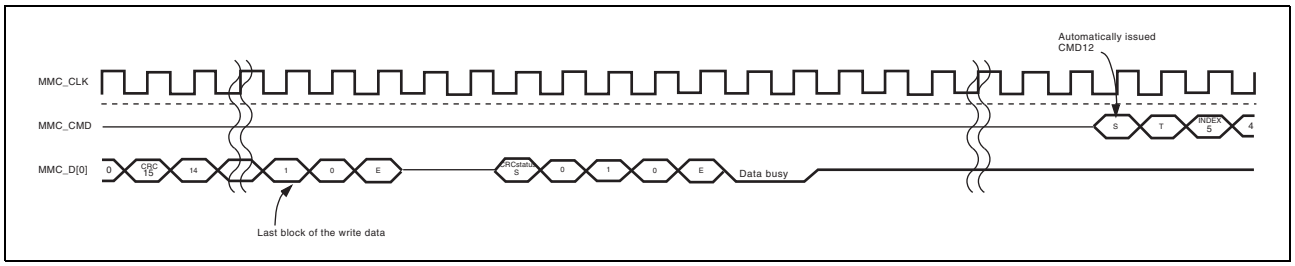

Figure 51.9 Timing of Automatically-Issued CMD12 in Multi-Block Write (1-Bit Mode)

The argument of the automatically-issued CMD12 is set by CE_ARG_CMD12. The value of [39:8] of the response to CMD12 is stored to CE_RESP_CMD12. The busy status on response reception is received.

51.6.5 High Priority Interrupt (HPI)

HPI should be executed as described below with reference to section 51.3, Register Descriptions and section 51.7, Examples of Setting.

(1) When HPI is executed during a write to the device

(a) Terminate the command sequence forcibly.
(b) Wait for the CMDSEQ bit in CE_HOST_STS1 to be cleared to 0.
(c) Issue CMD12 (R1) to make the device in the rcv state enter the prg state. Note that the device does not output the response when the device is in the prg state before issuance of CMD12(R1).
(d) Issue CMD13 (R1).
(e) Issue the HPI command.

(2) When HPI is executed during response busy while not writing to the device

(a) Terminate the command sequence forcibly.
(b) Wait for the CMDSEQ bit in CE_HOST_STS1 to be cleared to 0.
(c) Issue CMD13 (R1).
(d) Issue the HPI command*.

The procedure above is for HPI generated in the CMD6, CMD24, CMD25 (Pre-defined), or CMD38 sequence.

Note: * CMD12 (R1b) or CMD13 (R1b) depending on the device connected

51.6.6 Background Operation

Background operation should be executed as described below with reference to section 51.3, Register Descriptions and section 51.7, Examples of Setting.

To execute background operation, issue CMD6 (R1) to write to the BKOPS_START byte in the EXT_CSD register of the device.

Completion of background operation can be determined by checking the device state with CMD13 (R1) issued after CMD6 (R1) or by polling MMCDAT[0]. When the device state is indicated as “tran” or MMCDAT[0] is high, background operation is determined to be completed.

To suspend background operation, use HPI described in section 51.6.5.

51.6.7 Operation in the Case of Error/Timeout

This module may not be stopped in case of error occurrence. If the command sequence is in progress when an error occurs (check the CMDSEQ bit in CE_HOST_STS1), terminate the sequence forcibly and perform a software reset. The data for transmission or received data that had been stored in the buffers at the time of error occurrence are not guaranteed.

This module is not stopped when a timeout has occurred. To execute the next command after a timeout error has occurred, terminate the sequence forcibly, perform a software reset.

For forcible termination, refer to section 51.7.11, Forcible Termination.

51.7 Examples of Setting

This section shows the procedures for executing typical command sequences.

51.7.1 Legends

Figure 51.10 shows the legends for the symbols used in the figures in the following subsections.

Note: • This module does not support CMD11 and CMD20.

51.8 Usage Note

51.8.1 Card Detection

The CDRISE and CDFALL bits in CE_DETECT which are used for the card detection function do not have a chattering elimination function. The chattering elimination processing should be implemented by software.

51.8.2 Multi-Block Transfer

When HPI is executed, use pre-defined multi-block transfer.

51.8.3 Software Reset

For transitions to the software reset state by the SWRST bit in the CE_VERSION register, see section 55.3.6, Software Reset. However, where the procedure refers to the SRST bit, read this as the SWRST bit in the CE_VERSION register.

52. Motor Control PWM Timer

This LSI has two channels of on-chip motor control PWM (pulse width modulator) timer with a maximum capability of eight pulse outputs for each channel.

52.1 Features

- Maximum of 16 pulse outputs
  — Two 10-bit PWM channels, each with eight outputs
  — 10-bit counter (PWCNT) and cycle register (PWCYR)
  — Duty and output polarity can be set for each output.
- Automatic data transfer in every cycle
  — Each of four duty registers (PWDTR) is provided with buffer registers (PWBFR), with data transferred automatically every cycle.
- Duty cycle configurable
  — A duty cycle of 0% to 100% can be configured by means of a duty register.
- Counting clock selectable
  — There is a choice of five counting clocks (P0ϕ, P0ϕ/2, P0ϕ/4, P0ϕ/8, P0ϕ/16).
- High-speed access via internal 16-bit bus
- Two interrupt sources
  — An interrupt can be requested independently for each channel by a cycle register compare match.
- Automatic transfer of register data
  — Block transfer and one-word data transfer are available by activating the direct memory access controller.
- Module stop mode can be set

Figure 52.1 shows a block diagram of the motor control PWM timer.

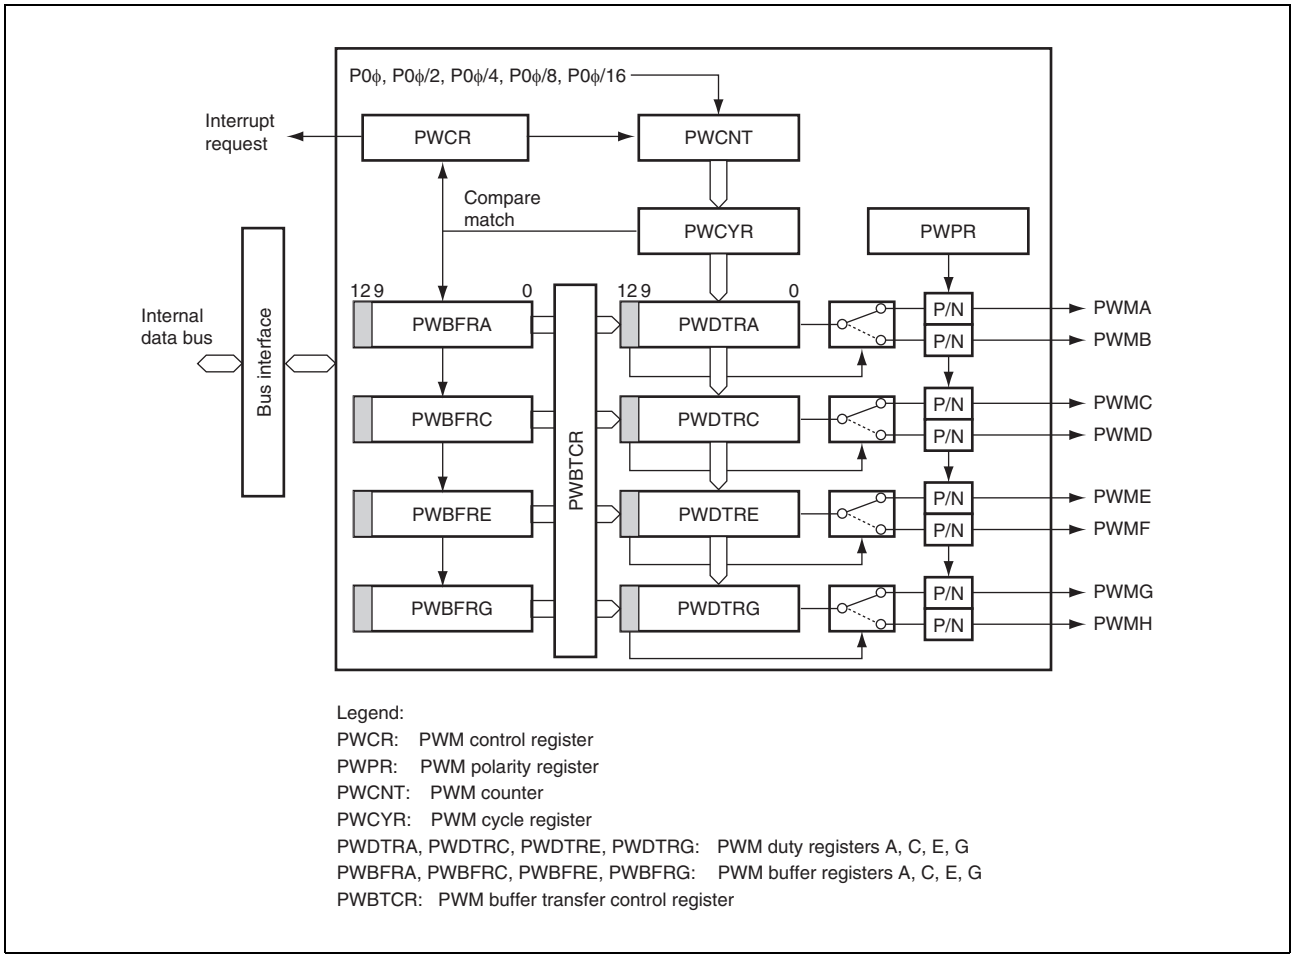

Figure 52.1 Block Diagram of Motor Control PWM Timer

52.2 Input/Output Pins

Table 52.1 shows the pin configuration of this module.

Table 52.1 Pin Configuration

Channel	Name	Abbrev.	I/O	Function
1	PWM output pin 1A	PWM1A	Output	Channel 1A PWM output
	PWM output pin 1B	PWM1B	Output	Channel 1B PWM output
	PWM output pin 1C	PWM1C	Output	Channel 1C PWM output
	PWM output pin 1D	PWM1D	Output	Channel 1D PWM output
	PWM output pin 1E	PWM1E	Output	Channel 1E PWM output
	PWM output pin 1F	PWM1F	Output	Channel 1F PWM output
	PWM output pin 1G	PWM1G	Output	Channel 1G PWM output
	PWM output pin 1H	PWM1H	Output	Channel 1H PWM output
2	PWM output pin 2A	PWM2A	Output	Channel 2A PWM output
	PWM output pin 2B	PWM2B	Output	Channel 2B PWM output
	PWM output pin 2C	PWM2C	Output	Channel 2C PWM output
	PWM output pin 2D	PWM2D	Output	Channel 2D PWM output
	PWM output pin 2E	PWM2E	Output	Channel 2E PWM output
	PWM output pin 2F	PWM2F	Output	Channel 2F PWM output
	PWM output pin 2G	PWM2G	Output	Channel 2G PWM output
	PWM output pin 2H	PWM2H	Output	Channel 2H PWM output

52.3 Register Descriptions

This module has the following registers for each channel as listed in Table 52.2.

Table 52.2 Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
PWM control register_1	PWCR_1	R/W	H'C0	H'FCFF50E0	8
PWM polarity register_1	PWPR_1	R/W	H'00	H'FCFF50E4	8
PWM cycle register_1	PWCYR_1	R/W	H'FFFF	H'FCFF50E6	16
PWM buffer register_1A	PWBFR_1A	R/W	H'EC00	H'FCFF50E8	16
PWM buffer register_1C	PWBFR_1C	R/W	H'EC00	H'FCFF50EA	16
PWM buffer register_1E	PWBFR_1E	R/W	H'EC00	H'FCFF50EC	16
PWM buffer register_1G	PWBFR_1G	R/W	H'EC00	H'FCFF50EE	16
PWM control register_2	PWCR_2	R/W	H'C0	H'FCFF50F0	8
PWM polarity register_2	PWPR_2	R/W	H'00	H'FCFF50F4	8
PWM cycle register_2	PWCYR_2	R/W	H'FFFF	H'FCFF50F6	16
PWM buffer register_2A	PWBFR_2A	R/W	H'EC00	H'FCFF50F8	16
PWM buffer register_2C	PWBFR_2C	R/W	H'EC00	H'FCFF50FA	16
PWM buffer register_2E	PWBFR_2E	R/W	H'EC00	H'FCFF50FC	16
PWM buffer register_2G	PWBFR_2G	R/W	H'EC00	H'FCFF50FE	16
PWM buffer transfer control register	PWBTCR	R/W	H'00	H'FCFF5006	8

52.3.1 PWM Control Register_n (PWCR_n) (n = 1, 2)

PWCR_n performs interrupt control, starting/stopping of the counter, and counter clock selection. It also contains a flag that indicates a compare match with the cycle register.

Bit	7	6	5	4	3	2	1	0
Bit Name	—	—	IE	CMF	CST	CKS2	CKS1	CKS0
Initial Value	1	1	0	0	0	0	0	0
R/W	—	—	R/W	R/(W)*	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 1	—	Reserved These bits are always read as 1 and cannot be modified.
5	IE	0	R/W	Interrupt Enable Enables or disables an interrupt request in the event of a compare match with PWCYR_n of the corresponding channel. 0: Interrupt disabled 1: Interrupt enabled
4	CMF	0	R/(W)*	Compare Match Flag Indicates the occurrence of a compare match with PWCYR_n of the corresponding channel. [Setting condition] When PWCNT_n = PWCYR_n – 1 [Clearing conditions] • When 0 is written to CMF after reading CMF = 1 • When the direct memory access controller is activated by a compare match interrupt, and DMA transfer is executed (When the CPU is used to clear this flag by writing 0 while the corresponding interrupt is enabled, be sure to read the flag after writing 0 to it.)
3	CST	0	R/W	Counter Start Selects starting or stopping of PWCNT_n of the corresponding channel. 0: PWCNT_n is stopped 1: PWCNT_n is started
2 1 0	CKS2 CKS1 CKS0	0 0 0	R/W R/W R/W	Clock Select These bits select the operating clock for PWCNT_n of the corresponding channel. 000: Counts on P0ϕ/1 001: Counts on P0ϕ/2 010: Counts on P0ϕ/4 011: Counts on P0ϕ/8 1XX: Counts on P0ϕ/16

[Legend]
X: Don't care
Note: * Only 0 can be written, to clear the flag.

52.3.2 PWM Polarity Register_n (PWPR_n) (n = 1, 2)

PWPR_n selects the PWM output polarity.

Bit	7	6	5	4	3	2	1	0
Bit Name	OPSnH	OPSnG	OPSnF	OPSnE	OPSnD	OPSnC	OPSnB	OPSnA
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	OPSnH	0	R/W	Output Polarity Select Each of these bits selects the PWM output polarity. 0: PWM direct output 1: PWM inverse output
6	OPSnG	0	R/W	
5	OPSnF	0	R/W	
4	OPSnE	0	R/W	
3	OPSnD	0	R/W	
2	OPSnC	0	R/W	
1	OPSnB	0	R/W	
0	OPSnA	0	R/W	

(n = 1, 2)

52.3.3 PWM Counter_n (PWCNT_n) (n = 1, 2)

PWCNT_n is a 10-bit up-counter incremented by the input clock. The input clock is selected by clock select bits CKS2 to CKS0 in PWCR_n.

PWCNT_n can not be directly accessed by the CPU. PWCNT_n is initialized to H'FC00, when the CST bit in PWCR_n is cleared to 0.

52.3.4 PWM Cycle Register_n (PWCYR_n) (n = 1, 2)

PWCYR_n is a 16-bit readable/writable register that sets the PWM conversion cycle.

Bit:	15	14	13	12	11	10	9	8
	PWCY15	PWCY14	PWCY13	PWCY12	PWCY11	PWCY10	PWCY9	PWCY8
Initial value:	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	7	6	5	4	3	2	1	0
	PWCY7	PWCY6	PWCY5	PWCY4	PWCY3	PWCY2	PWCY1	PWCY0
Initial value:	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

When a PWCYR_n compare match occurs, PWCNT_n is cleared and data is transferred from the buffer register (PWBFR_n) to the duty register (PWDTR_n).

PWCYR_n should be written to only while PWCNT_n is stopped. A value of H'FC00 must not be set to PWCYR_n.

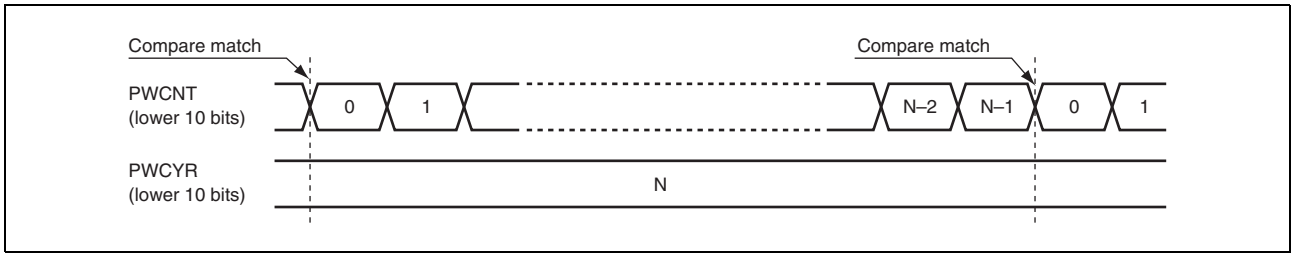

Figure 52.2 Cycle Register Compare Match

52.3.5 PWM Duty Registers_nA, nC, nE, nG (PWDTR_nA, PWDTR_nC, PWDTR_nE, PWDTR_nG) (n = 1, 2)

There are four PWDTR_n registers (PWDTR_nA, PWDTR_nC, PWDTR_nE, and PWDTR_nG). The PWDTR_nA is used for outputs PWMnA and PWMnB, PWDTR_nC for outputs PWMnC and PWMnD, PWDTR_nE for outputs PWMnE and PWMnF, and PWDTR_nG for outputs PWMnG and PWMnH.
PWDTR_n can not be directly accessed by the CPU. When a PWCYR_n compare match occurs, data is transferred from the buffer register (PWBFR_n) to the duty register (PWDTR_n). PWDTR_n is initialized to H'0000 when the CST bit is cleared to 0.

Bit	15	14	13	12	11	10	9	8
Bit Name	—	—	—	OTS	—	—	DT9	DT8
Initial Value	—	—	—	0	—	—	0	0
R/W	—	—	—	—	—	—	—	—

Bit	7	6	5	4	3	2	1	0
Bit Name	DT7	DT6	DT5	DT4	DT3	DT2	DT1	DT0
Initial Value	0	0	0	0	0	0	0	0
R/W	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
15 to 13	—	—	—	Reserved
12	OTS	0	—	Output Terminal Select Selects the pin used for PWM output. Unselected pins output a low level (or a high level when the corresponding bit in PWPR_n is set to 1). For details, see Table 52.3.
11, 10	—	—	—	Reserved
9	DT9	0	—	Duty These bits specify the PWM output duty. A high level (or a low level when the corresponding bit in PWPR_n is set to 1) is output from the time PWCNT_n is cleared by a PWCYR_n compare match until a PWDTR_n compare match occurs. When all of the bits are 0, there is no high-level (or low-level when the corresponding bit in PWPR_n is set to 1) output period.
8	DT8	0	—

52.3.6 PWM Buffer Registers_nA, nC, nE, nG (PWBFR_nA, PWBFR_nC, PWBFR_nE, PWBFR_nG) (n = 1, 2)

There are four PWBFR_n registers (PWBFR_nA, PWBFR_nC, PWBFR_nE, and PWBFR_nG). When a PWCYR_n compare match occurs, data is transferred from the buffer register (PWBFR_n) to the duty register (PWDTR_n).

52.4 Bus Master Interface

52.4.1 16-Bit Data Registers

PWCYR_n and PWBFR_n are 16-bit registers. These registers are linked to the bus master by a 16-bit data bus, and can be read or written in 16-bit units. They cannot be read or written by 8-bit access; 16-bit access must always be used.

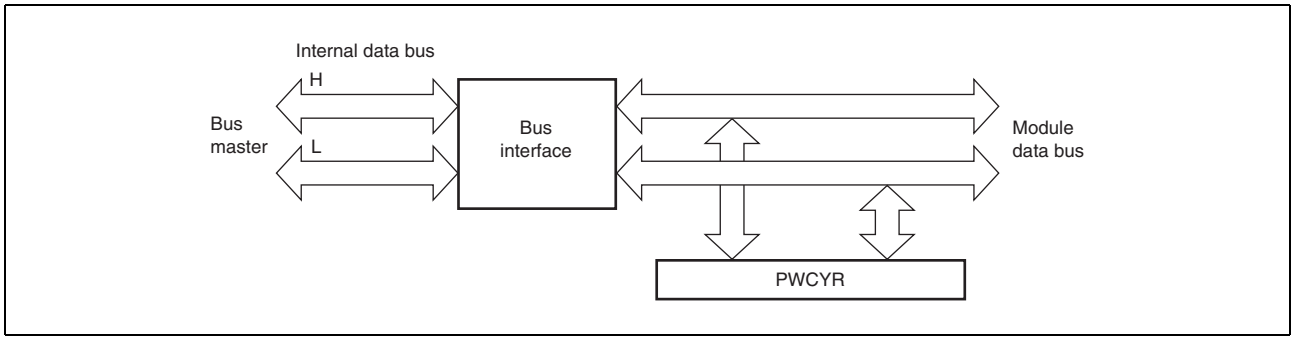

Figure 52.5 16-Bit Register Access Operation (Bus Master ↔ PWCYR_n (16 Bits))

52.4.2 8-Bit Data Registers

PWCR_n, PWPR_n, and PWBTCR are 8-bit registers that can be read and written to in 8-bit units. These registers are linked to the bus master by a 16-bit data bus, and can be read or written by 16-bit access; in this case, the lower eight bits are read as H'FF.

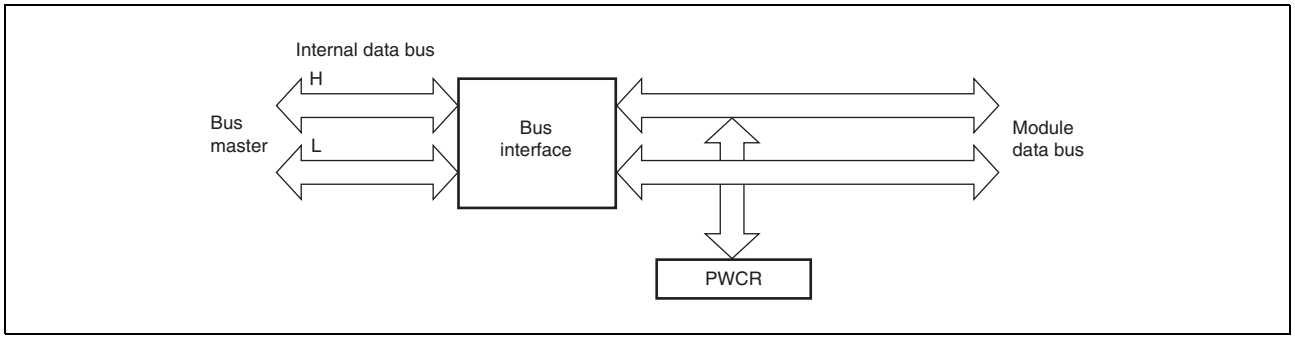

Figure 52.6 8-Bit Register Access Operation (Bus Master ↔ PWCR_n (Upper Eight Bits))

52.5 Operation

52.5.1 PWM Operation

PWM waveforms are output from pins PWM1A to PWM1H and PWM2A to PWM2H as shown in Figure 52.7.

(1) Initial Settings

Set the PWM output polarity in PWPR_n; select the clock to be input to PWCNT_n with the CKS2 to CKS0 bits in PWCR_n; set the PWM conversion cycle in PWCYR_n; and set the first frame of data in PWBFR_nA, PWBFR_nC, PWBFR_nE, and PWBFR_nG.

(2) Activation

When the CST bit in PWCR_n is set to 1, PWCNT_n starts counting up. On compare match between PWCNT_n and PWCYR_n, data is transferred from the buffer register to the duty register and the CMF bit in PWCR_n is set to 1. At the same time, if the IE bit in PWCR_n has been set to 1, an interrupt can be requested or the direct memory access controller can be activated.

(3) Waveform Output

The PWM outputs selected by the OTS bits in PWDTR_nA, PWDTR_nC, PWDTR_nE, and PWDTR_nG go high when a compare match occurs between PWCNT_n and PWCYR_n. The PWM outputs not selected by the OTS bit are low. When a compare match occurs between PWCNT_n and PWDTR_nA, PWDTR_nC, PWDTR_nE, or PWDTR_nG, the corresponding PWM output goes low. If the corresponding bit in PWPR_n is set to 1, the output is inverted.

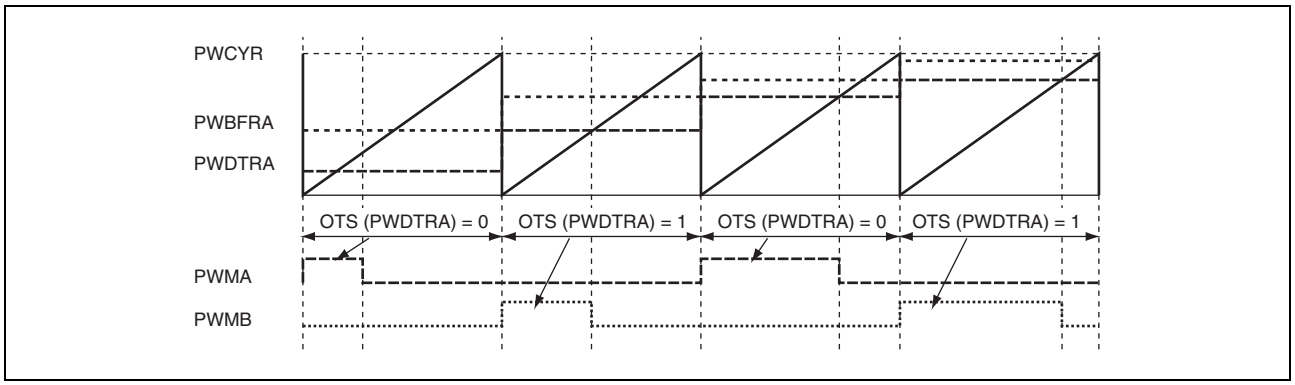

Figure 52.7 PWM Operation

(4) Next Frame

When a compare match occurs between PWCNT_n and PWCYR_n, data is transferred from the buffer register to the duty register. PWCNT_n is reset and starts counting up from H'000. The CMF bit in PWCR_n is set, and if the IE bit in PWCR_n has been set, an interrupt can be requested or the direct memory access controller can be activated.

(5) Stopping

When the CST bit in PWCR_n is cleared to 0, PWCNT_n is reset and stops. All PWM outputs go low (or high if the corresponding bit in PWPR_n is set to 1).

52.5.2 Buffer Transfer Control

Setting a corresponding bit in the PWM buffer transfer control register disables a buffer transfer on compare match. This prevents the output from changing when compare match occurs while the buffer register is being changed. A buffer transfer on compare match is resumed after cleaning the bit.

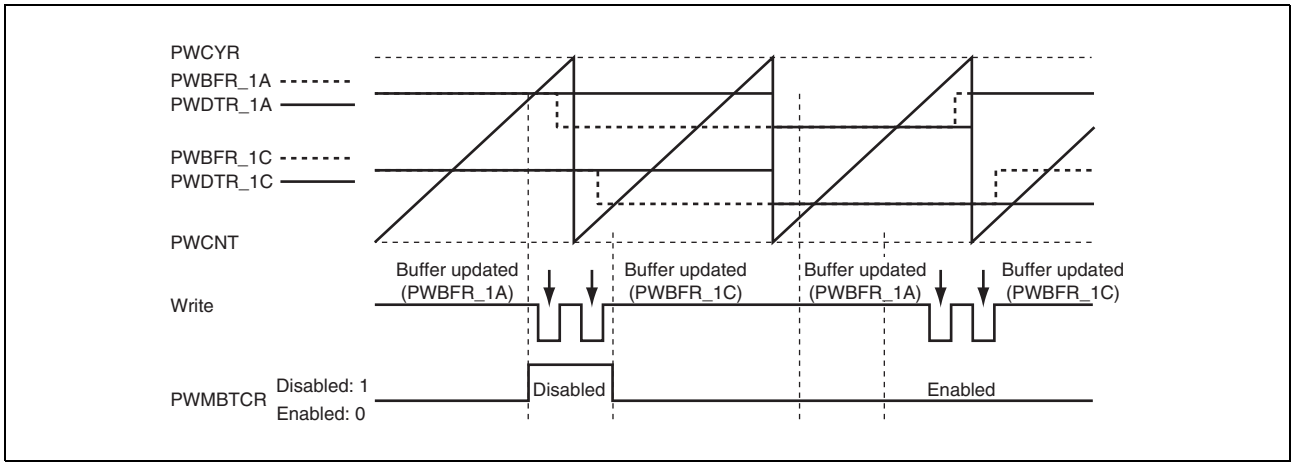

Figure 52.8 Disabling Buffer Transfer

52.6 Usage Note

52.6.1 Conflict between Buffer Register Write and Compare Match

If a PWBFR_n write is performed in the state immediately after a cycle register compare match, the buffer register and duty register are both modified. PWM output changed by the cycle register compare match is not changed by modification of the duty register due to conflict. This may result in unanticipated duty output.
Buffer register modification must be completed before automatic transfer by the direct memory access controller, exception handling due to a compare match interrupt, or the occurrence of a cycle register compare match on detection of the rise of CMF (compare match flag) in PWCR_n.

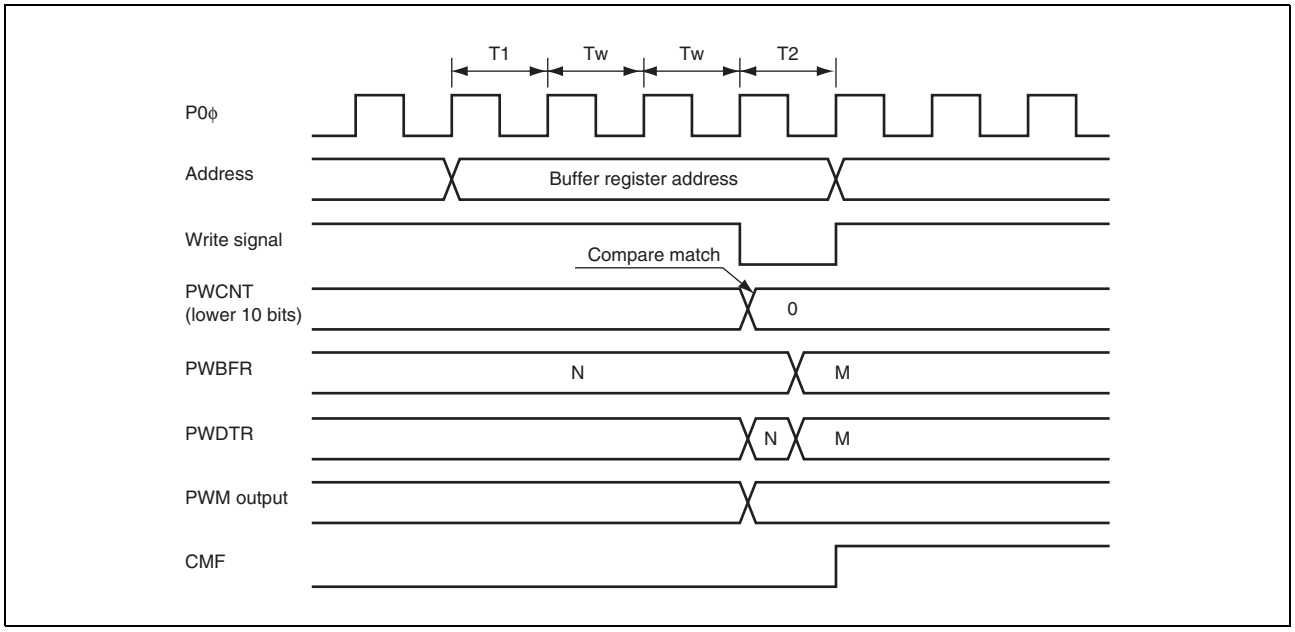

Figure 52.9 Conflict between Buffer Register Write and Compare Match

53. On-Chip RAM

This LSI has an on-chip large-capacity RAM for display area and work area (128 Kbytes of this RAM are shared with the on-chip data retention RAM) and an on-chip data retention RAM, which can retain data in deep standby mode. These memory units can be used to store instructions or data.
The operation and write access to the large-capacity RAM (including on-chip data retention RAM) can be enabled or disabled through the RAM enable bits and RAM write enable bits.
The on-chip data retention RAM is assigned to page 0 in the on-chip large-capacity RAM. Retention or non-retention of data by the on-chip data retention RAM in deep standby mode is selectable on a per-page basis.

53.1 Features

- Page
  - The on-chip large-capacity RAM consists of five pages.
  - The on-chip data retention RAM consists of four pages. Page 0 has 16-Kbytes, page 1 has 16-Kbytes, page 2 has 32-Kbytes, and page 3 has 64-Kbytes.
- Memory map
  The on-chip RAM is located in the address spaces shown in tables 53.1 and 53.2 Each page of the large-capacity RAM in products with a 10-Mbyte on-chip RAM has a capacity of 2 Mbytes, while each page of the large-capacity RAM in products with a 5-Mbyte on-chip RAM has a capacity of 1 Mbyte. Except for the size, the address maps for products with a 5-Mbyte on-chip RAM and with a 10-Mbyte on-chip RAM are compatible. Furthermore, to obtain a continuous address space for 5-Mbyte RAM compatibility when a 10-Mbyte RAM is in use, each page of the latter is divided into two. If you wish to use the pages continuously when using a 10-Mbyte RAM, use mirror addresses.

Table 53.1 Address Spaces of On-Chip Large-Capacity RAM

Address	RZ/A1H	RZ/A1M
0x6090_0000 to 0x609F_FFFF	Page 4 of bank 1 (mirrored) (1024 KB)	Reserved area
0x6080_0000 to 0x608F_FFFF	Page 4 of bank 0 (mirrored) (1024 KB)	
0x6070_0000 to 0x607F_FFFF	Page 3 of bank 1 (mirrored) (1024 KB)	
0x6060_0000 to 0x606F_FFFF	Page 3 of bank 0 (mirrored) (1024 KB)	
0x6050_0000 to 0x605F_FFFF	Page 2 of bank 1 (mirrored) (1024 KB)	
0x6040_0000 to 0x604F_FFFF	Page 2 of bank 0 (mirrored) (1024 KB)	
0x6030_0000 to 0x603F_FFFF	Page 1 of bank 1 (mirrored) (1024 KB)	
0x6020_0000 to 0x602F_FFFF	Page 1 of bank 0 (mirrored) (1024 KB)	
0x6010_0000 to 0x601F_FFFF	Page 0 of bank 1 (mirrored) (1024 KB)	
0x6002_0000 to 0x600F_FFFF	Page 0 of bank 0 (mirrored) (896 KB)	
0x6000_0000 to 0x6001_FFFF	Page 0 of bank 0 (for retention, mirrored) (128 KB)	
0x2090_0000 to 0x209F_FFFF	Page 4 of bank 1 (1024 KB)	Reserved area
0x2080_0000 to 0x208F_FFFF	Page 3 of bank 0 (1024 KB)	
0x2070_0000 to 0x207F_FFFF	Page 2 of bank 1 (1024 KB)	
0x2060_0000 to 0x206F_FFFF	Page 1 of bank 0 (1024 KB)	
0x2050_0000 to 0x205F_FFFF	Page 0 of bank 1 (1024 KB)	
0x2040_0000 to 0x204F_FFFF	Page 4 of bank 0 (1024 KB)	Page 4 of bank 0 (1024 KB)
0x2030_0000 to 0x203F_FFFF	Page 3 of bank 1 (1024 KB)	Page 3 of bank 0 (1024 KB)
0x2020_0000 to 0x202F_FFFF	Page 2 of bank 0 (1024 KB)	Page 2 of bank 0 (1024 KB)
0x2010_0000 to 0x201F_FFFF	Page 1 of bank 1 (1024 KB)	Page 1 of bank 0 (1024 KB)
0x2002_0000 to 0x200F_FFFF	Page 0 of bank 0 (896 KB)	Page 0 of bank 0 (896 KB)
0x2000_0000 to 0x2001_FFFF	Page 0 of bank 0 (for retention) (128 KB)	Page 0 of bank 0 (for retention) (128 KB)

"Bank" in the above table indicates the physical configuration of the RAM for each page.
The RAM of the RZ/A1H is in a two-bank configuration, consisting of bank 0 and bank 1.
The RAM of the RZ/A1M is in a one-bank configuration, consisting only of bank 0.

Table 53.2 Address Spaces of On-Chip Data Retention RAM

Address	RZ/A1H	RZ/A1M
0x6001_0000 to 0x6001_FFFF	Page 3 of bank 0 (mirrored) (64 KB)	Reserved area
0x6000_8000 to 0x6000_FFFF	Page 2 of bank 0 (mirrored) (32 KB)	
0x6000_4000 to 0x6000_7FFF	Page 1 of bank 0 (mirrored) (16 KB)	
0x6000_0000 to 0x6000_3FFF	Page 0 of bank 0 (mirrored) (16 KB)	
0x2001_0000 to 0x2001_FFFF	Page 3 of bank 0 (64 KB)	Page 3 of bank 0 (64 KB)
0x2000_8000 to 0x2000_FFFF	Page 2 of bank 0 (32 KB)	Page 2 of bank 0 (32 KB)
0x2000_4000 to 0x2000_7FFF	Page 1 of bank 0 (16 KB)	Page 1 of bank 0 (16 KB)
0x2000_0000 to 0x2000_3FFF	Page 0 of bank 0 (16 KB)	Page 0 of bank 0 (16 KB)

- Ports
  Each page of the on-chip large-capacity RAM has one read and write port and is connected to the AXI bus. The on-chip RAM for data retention, which has a port independent of the port in page 0, is shared with the read and write port in four pages.
- Method of arbitration
  When the same port of the on-chip large-capacity RAM is accessed from different masters simultaneously, the AXI bus performs arbitration in round-robin mode.
- Number of access cycles
  The number of cycles for access to read or write is one cycle of Bϕ.

53.2 Usage Notes

53.2.1 Page Conflict

When the same page of the on-chip large-capacity RAM is accessed from different masters simultaneously, a conflict on the page occurs. Although each access is completed correctly, this kind of conflict degrades the memory access speed. Therefore, it is advisable to provide software measures to prevent such conflicts as far as possible. For example, no conflict will arise if different pages are accessed by each master.

53.2.2 Data Retention

Data in the large-capacity RAM (including on-chip data retention RAM) are retained in the states other than power-on reset and deep standby mode. In power-on reset and deep standby mode, these RAMs operate as described below.

(1) Power-on Reset

(a) On-Chip Large-Capacity RAM (Excluding On-Chip Data Retention RAM)

Data are retained on a power-on reset by disabling the setting of either the VRAME or VRAMWE bit.
Data are not retained when the setting of the VRAME and VRAMWE bits are both enabled.

(b) On-Chip Data Retention RAM

Data are retained on a power-on reset by disabling the setting of any of the VRAME, VRAMWE, or RRAMWE, excluding the case that deep standby mode is canceled by power-on reset.
Data are not retained when the setting of the VRAME, VRAMWE and RRAMWE bits are all enabled.

(2) Deep Standby Mode

(a) On-Chip Large-Capacity RAM (Excluding On-Chip Data Retention RAM)

Data are not retained.

(b) On-Chip Data Retention RAM

Data are retained in deep standby mode by enabling the setting of the RRAMKP bit, excluding the case that deep standby mode is canceled by power-on reset. In the case that deep standby mode is canceled by interrupt or pins for cancelling, power-on reset exception handling is executed, but the data are retained.

54. Ports

54.1 Features

The 256-pin version of this LSI has eleven ports (JP0 and P0 to P9) and the 324-pin version has thirteen ports (JP0 and P0 to P11). All port pins are multiplexed with other peripheral module pin functions, and by setting the control registers, multiplexed pin functions (alternative functions) can be selected.

54.1.1 Port group

This LSI has the following number of port groups.

Table 54.1 Port Group

Package	Number	Name
RZ/A1H 256-pin	11	P0 to P9, JP0
RZ/A1H 324-pin	13	P0 to P11, JP0

54.1.2 Port group index n

Throughout this section, the individual port groups are identified by the index "n" (n = 0 to 11), for example PMCn for the port mode control register, which is used for the Pn pin.

54.1.3 Base address

The addresses of the registers used to control the JTAG ports are given as addresses offset from the base address <JPORTn_base>. The addresses of the other registers used to control the general ports are given as addresses offset from the base address <PORTn_base>.

Table 54.2 Base Addresses <PORTn_base> and <JPORTn_base>

<PORTn_base> address	<JPORTn_base> address
H'FCFE 3000	H'FCFE 7B00

54.2 Functional Overview

54.2.1 Mode of Pin Functions

Pins can operate in three modes.

Port mode (PMCn.PMCnm bit = 0)
A pin in port mode operates as a general purpose input/output pin. The I/O mode is selected by setting the PMn.PMnm bit.
Software I/O control alternative mode (PMCn.PMCnm bit = 1, PIPCn.PIPCnm bit = 0)
In this mode, the pins operate as alternative functions.
The I/O mode is selected by setting the PMn.PMnm bit by using software.
Direct I/O control alternative mode (PMCn.PMCnm bit = 1, PIPCn.PIPCnm bit = 1)
In this mode, the pins operate as alternative functions.
Unlike the software I/O alternative mode, however, the I/O mode is selected by the alternative function.

An overview of the register settings is given in the tables below.

Table 54.3 Pin Function Configuration (Overview)

	Bit			
Mode	**PMCn. PMCnm**	**PMn. PMnm**	**PIPCn. PIPCnm**	**I/O**
Port mode	0	0	X	O
		1*1		I
Software I/O control alternative mode	1*2	0	0	O
		1		I
Direct I/O control alternative mode		X	1	Controlled by the alternative function

Note 1. The input buffer can be enabled in the port mode only when the PIBCn.PIBCnm bit is set to 1.
Note 2. When the pins are in alternative mode (PMCn.PMCnm = 1), one of the eight alternative functions is selected by the PFCn, PFCEn, and PFCAEn registers. For details, see Table 54.6, Alternative Mode Selection*2.

54.2.2 Pin Data Input/Output

The registers used for data input/output are described below. The location that is read via the PPRn register differs depending on the pin mode.

- Output data
  In the port mode (PMCn.PMCnm = 0), the value of the Pn.Pnm bit is output from the Pn_m pin.

- Input data
  When the PPRn register is read, either the value of the Pn_m pin, the value of the Pn.Pnm bit, or the value output by the alternative function is returned. Which value is returned depends on the pin mode and setting of several control bits. The different PPRn read values are shown in the table below.

Table 54.4 PPRnm Read Values

PMCn. PMCnm	PMn. PMnm	PIBCn. PIBCnm	PIPCn. PIPCnm	Mode	PPRnm Read Value
0	1	0	X	Port input, input buffer disabled	Pn.Pnm register
		1		Port input, input buffer enabled	Pn_m pin
	0	X		Port output	Pn.Pnm register*1
1	1	X	0	Software I/O control alternative function input	Pn_m pin
	0			Software I/O control alternative function output	Alternative-function internal output signal*1
	X		1	Direct I/O control alternative function	I/O port in alternative mode: • Input: Pn_m pin • Output: Alternative-function internal output signal*1

Note 1. When the PBDCn.PBDCnm bit is 1, the level of the Pn_m pin is returned by the PPRn.PPRnm bit.

54.3 Register Description

The following registers are used for setting the individual pins of the port groups:

Table 54.5 Register Configuration

Symbol	Register Name	R/W	16 Bit Access	32 Bit Access	Address
Pn	Port register	R/W	√	—	<PORTn_base> + 0000H + n × 4
PSRn	Port set/reset register	R/W	—	√	<PORTn_base> + 0100H + n × 4
PPRn	Port pin read register	R	√	—	<PORTn_base> + 0200H + n × 4
PMn	Port mode register	R/W	√	—	<PORTn_base> + 0300H + n × 4
PMCn	Port mode control register	R/W	√	—	<PORTn_base> + 0400H + n × 4
PFCn	Port function control register	R/W	√	—	<PORTn_base> + 0500H + n × 4
PFCEn	Port function control expansion register	R/W	√	—	<PORTn_base> + 0600H + n × 4
PNOTn	Port NOT register	W	√	—	<PORTn_base> + 0700H + n × 4
PMSRn	Port mode set/reset register	R/W	—	√	<PORTn_base> + 0800H + n × 4
PMCSRn	Port mode control set/reset register	R/W	—	√	<PORTn_base> + 0900H + n × 4
PFCAEn	Port Function Control Additional Expansion register	R/W	√	—	<PORTn_base> + 0A00H + n × 4
PIBCn	Port input buffer control register	R/W	√	—	<PORTn_base> + 4000H + n × 4
PBDCn	Port bi-direction control register	R/W	√	—	<PORTn_base> + 4100H + n × 4
PIPCn	Port IP control register	R/W	√	—	<PORTn_base> + 4200H + n × 4
JPPR0	Port pin read register	R	√	—	<JPORTn_base> + 0020H
JPMC0	Port mode control register	R/W	√	—	<JPORTn_base> + 0040H
JPMCSR0	Port mode control set/reset register	R/W	—	√	<JPORTn_base> + 0090H
JPIBC0	Port input buffer control register	R/W	√	—	<JPORTn_base> + 0400H
SNCRn	Serial sound interface noise canceler control register	R/W	—	√	<PORTn_base> + 0C00H

54.3.1 Port Register (Pn)

In output port mode (PMCn.PMCnm = 0 and PMn.PMnm = 0), this register holds the Pn.Pnm data to be output via the Pn_m pin.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Pn15	Pn14	Pn13	Pn12	Pn11	Pn10	Pn9	Pn8	Pn7	Pn6	Pn5	Pn4	Pn3	Pn2	Pn1	Pn0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15 to 0	Pn[15:0]	These bits set the output level of the Pn_m pin (m = 0 to 15). 0: Outputs low level 1: Outputs high level

54.3.2 Port Set and Reset Register (PSRn)

This register provides an alternative method for writing data to the Pn register.
The higher 16 bits of the PSRn register specify whether data can be written to the Pn.Pnm bit specified by the lower 16 bits of the PSRn register.
When reading, the higher 16 bits are read as 0000H. The lower 16 bits are read as the value of the Pn register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PSRn 31	PSRn 30	PSRn 29	PSRn 28	PSRn 27	PSRn 26	PSRn 25	PSRn 24	PSRn 23	PSRn 22	PSRn 21	PSRn 20	PSRn 19	PSRn 18	PSRn 17	PSRn 16
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PSRn 15	PSRn 14	PSRn 13	PSRn 12	PSRn 11	PSRn 10	PSRn9	PSRn8	PSRn7	PSRn6	PSRn5	PSRn4	PSRn3	PSRn2	PSRn1	PSRn0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
31 to 16	PSRn[31:16]	These are enable bits that specify whether the value of the corresponding lower bit of the PSRn.PSRnm bits is written to the corresponding Pn.Pnm bit. 0: Pn.Pnm is independent of PSRn.PSRnm 1: Pn.Pnm becomes the value of the PSRn.PSRnm bit. Example: If PSRn.PSRn31 = 1, the value of PSRn.PSRn15 is written to Pn.Pn15.
15 to 0	PSRn[15:0]	These are data bits that specify the value of the Pn.Pnm bit if the corresponding higher bit, PSRn.PSRn (m+16), is 1. 0: Pn.Pnm = 0 1: Pn.Pnm = 1

54.3.3 Port Pin Read Register (PPRn/JPPR0)

The PPRn register reflects either the level of the Pn_m pin, the value of the Pn.Pnm bit, or the output level of the alternative function. The value read depends on various register settings as described in Table 54.4, PPRnm Read Values.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PPRn 15	PPRn 14	PPRn 13	PPRn 12	PPRn 11	PPRn 10	PPRn9	PPRn8	PPRn7	PPRn6	PPRn5	PPRn4	PPRn3	PPRn2	PPRn1	PPRn0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15 to 0	PPRn[15:0]	The value of the Pn_m pin, the value of the Pn.Pnm bit, or the output level of the alternative function.

Notes: 1. For the PPRn register read value, see section 54.2.2, Pin Data Input/Output.
2. The JPPR0[1:0] bits are control bits in the JTAG port pin read register (JPPR0).

54.3.4 Port Mode Register (PMn)

The PMn register specifies whether the Pn_m pins are in input mode or in output mode.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMn15	PMn14	PMn13	PMn12	PMn11	PMn10	PMn9	PMn8	PMn7	PMn6	PMn5	PMn4	PMn3	PMn2	PMn1	PMn0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15 to 0	PMn[15:0]	Specifies input/output mode of the corresponding pin: 0: Output mode (output enabled) 1: Input mode (output disabled)

Notes: 1. To use the Pn_m pin in input port mode (PMCn.PMCnm = 0 and PMn.PMnm = 1), the input buffer must be enabled by setting the PIBCn.PIBCnm bit to 1.

2. After reset is issued, the PIPCn.PIPCnm bit is set to 0 and the PMn.PMnm bit specifies the I/O direction for port mode (PMCn.PMCnm = 0) and alternative mode (PMCn.PMCnm = 1). For the pins whose functions are automatically selected in boot mode (see Table 8.3, Initial States by Areas in Boot Modes 0, 1, and 2 to 5), the I/O direction is controlled by the alternative functions instead of the PMn register.

54.3.5 Port Mode Control Register (PMCn/JPMC0)

This register is used to specify whether the Pn_m pins are in port mode or in alternative mode.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMCn15	PMCn14	PMCn13	PMCn12	PMCn11	PMCn10	PMCn9	PMCn8	PMCn7	PMCn6	PMCn5	PMCn4	PMCn3	PMCn2	PMCn1	PMCn0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15 to 0	PMCn[15:0]	Specifies the operation mode of the corresponding pin: 0: Port mode 1: Alternative mode

Caution: The input/output control is not performed just by setting alternative mode (PMCn.PMCnm). Set 1 in the PIPCn.PIPCnm bit too when the I/O control is to be performed by using the alternative function.

Note: The JPMC0[1:0] bits are control bits in the JTAG port mode control register (JPMC0).

54.3.6 Port Function Control Register (PFCn)

This register, together with the PFCEn and PFCAEn register, specifies the alternative function of the pins.
The I/O direction of several alternative functions can be controlled directly by using the Pn_m pin. For these alternative functions, the PIPCn.PIPCnm bit must be set to 1.
For all other alternative functions, the I/O direction is specified by using the PMn.PMnm bit.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFCn 15	PFCn 14	PFCn 13	PFCn 12	PFCn 11	PFCn 10	PFCn9	PFCn8	PFCn7	PFCn6	PFCn5	PFCn4	PFCn3	PFCn2	PFCn1	PFCn0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15 to 0	PFCn[15:0]	Specifies the alternative function of a pin.

Table 54.6 Alternative Mode Selection*2

PMCn. PMCnm	PFCAEn. PFCAEnm	PFCEn. PFCEnm	PFCn. PFCnm	PMn. PMnm*1	Function
0	X	X	X	1	Port mode/input
				0	Port mode/output
1	0	0	0	1	Alternative mode/1st alternative function/input
				0	Alternative mode/1st alternative function/output
			1	1	Alternative mode/2nd alternative function/input
				0	Alternative mode/2nd alternative function/output
		1	0	1	Alternative mode/3rd alternative function/input
				0	Alternative mode/3rd alternative function/output
			1	1	Alternative mode/4th alternative function/input
				0	Alternative mode/4th alternative function/output
	1	0	0	1	Alternative mode/5th alternative function/input
				0	Alternative mode/5th alternative function/output
			1	1	Alternative mode/6th alternative function/input
				0	Alternative mode/6th alternative function/output
		1	0	1	Alternative mode/7th alternative function/input
				0	Alternative mode/7th alternative function/output
			1	1	Alternative mode/8th alternative function/input
				0	Alternative mode/8th alternative function/output

Note 1. When the PIPCn.PIPCnm bit is set to 1, the I/O direction is directly controlled by the alternative function and the setting of the PMn.PMnm bit becomes invalid.
Note 2. Use alternative functions that are open to users. If a mode to which no alternative function is assigned is selected, correct operation is not guaranteed.

54.3.7 Port Function Control Expansion Register (PFCEn)

This register, together with the PFCn and PFCAEn register, specifies the alternative function of the pins.
The I/O direction of several alternative functions can be controlled directly by using the Pn_m pin. For these alternative functions, the PIPCn.PIPCnm bit must be set to 1.
For all other alternative functions, the I/O direction is specified by using the PMn.PMnm bit.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFCEn 15	PFCEn 14	PFCEn 13	PFCEn 12	PFCEn 11	PFCEn 10	PFCEn 9	PFCEn 8	PFCEn 7	PFCEn 6	PFCEn 5	PFCEn 4	PFCEn 3	PFCEn 2	PFCEn 1	PFCEn 0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15 to 0	PFCEn[15:0]	Specifies the alternative function of a pin.

54.3.8 Port NOT Register (PNOTn)

This register allows a Pn.Pnm bit to be inverted without directly writing to the Pn register.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PNOTn 15	PNOTn 14	PNOTn 13	PNOTn 12	PNOTn 11	PNOTn 10	PNOTn 9	PNOTn 8	PNOTn 7	PNOTn 6	PNOTn 5	PNOTn 4	PNOTn 3	PNOTn 2	PNOTn 1	PNOTn 0
R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit Position	Bit Name	Function
15 to 0	PNOTn[15:0]	Specifies whether to invert Pn.Pnm. 0: Pn.Pnm is not inverted (Pnm → Pnm) 1: Pn.Pnm is inverted ($\overline{\text{Pnm}}$ → Pnm)

54.3.9 Port Mode Set and Reset Register (PMSRn)

This register provides an alternative method for writing data to the PMn register.
The higher 16 bits of the PMSRn register specify whether data can be written to the PMn.PMnm bit specified by the lower 16 bits of the PMSRn register.
When reading, the higher 16 bits are read as 0000H. The lower 16 bits are read as the value of the PMn register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PMSRn 31	PMSRn 30	PMSRn 29	PMSRn 28	PMSRn 27	PMSRn 26	PMSRn 25	PMSRn 24	PMSRn 23	PMSRn 22	PMSRn 21	PMSRn 20	PMSRn 19	PMSRn 18	PMSRn 17	PMSRn 16
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMSRn 15	PMSRn 14	PMSRn 13	PMSRn 12	PMSRn 11	PMSRn 10	PMSRn 9	PMSRn 8	PMSRn 7	PMSRn 6	PMSRn 5	PMSRn 4	PMSRn 3	PMSRn 2	PMSRn 1	PMSRn 0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
31 to 16	PMSRn[31:16]	These are enable bits that specify whether the value of the corresponding lower bit of the PMSRn.PMSRnm bits is written to the corresponding PMn.PMnm bit. 0: PMn.PMnm does not depend on the PMSRn.PMSRnm bit. 1: PMn.PMnm becomes the value of the PMSRn.PMSRnm bit. Example: If PMSRn.PMSRn31 = 1, the value of PMSRn.PMSRn15 is written to PMn.PMn15.
15 to 0	PMSRn[15:0]	These are data bits that specify the value of the PMn.PMnm bit if the corresponding higher bit, PMSRn.PMSRn(m+16), is 1. 0: PMn.PMnm = 0 1: PMn.PMnm = 1

54.3.10 Port Mode Control Set and Reset Register (PMCSRn/JPMCSR0)

This register provides an alternative method for writing data to the PMCn register.

The higher bits of the PMCSRn register specify whether data can be written to the PMCn.PMCnm bit specified by the lower bits of the PMCSRn register.

When reading, the higher 16 bits are read as 0000H. The lower 16 bits are read as the value of the PMCn register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PMCSRn31	PMCSRn30	PMCSRn29	PMCSRn28	PMCSRn27	PMCSRn26	PMCSRn25	PMCSRn24	PMCSRn23	PMCSRn22	PMCSRn21	PMCSRn20	PMCSRn19	PMCSRn18	PMCSRn17	PMCSRn16
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMCSRn15	PMCSRn14	PMCSRn13	PMCSRn12	PMCSRn11	PMCSRn10	PMCSRn9	PMCSRn8	PMCSRn7	PMCSRn6	PMCSRn5	PMCSRn4	PMCSRn3	PMCSRn2	PMCSRn1	PMCSRn0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
31 to 16	PMCSRn[31:16]	These are enable bits that specify whether the value of the corresponding lower bit of the PMCSRn.PMCSRnm bits is written to the corresponding PMCn.PMCnm bit. 0: PMCn.PMCnm does not depend on the PMCSRn.PMCSRnm bit. 1: PMCn.PMCnm becomes the value of the PMCSRn.PMCSRnm bit. Example: If PMCSRn.PMCSRn31 = 1, the value of PMCSRn.PMCSRn15 is written to PMCn.PMCn15.
15 to 0	PMCSRn[15:0]	These are data bits that specify the value of the PMCn.PMCnm bit if the corresponding higher bit, PMCSRn.PMCSRn(m+16), is 1. 0: PMCn.PMCnm = 0 1: PMCn.PMCnm = 1

Note: The JPMCSR0[1:0] bits are control bits in the JTAG port mode control set/reset register (JPMCSR0).

54.3.11 Port Function Control Additional Expansion Register (PFCAEn)

This register, together with the PFCn and PFCEn register, specifies the alternative function of the pins.

The I/O direction of several alternative functions can be controlled directly by using the Pn_m pin. For these alternative functions, the PIPCn.PIPCnm bit must be set to 1.

For all other alternative functions, the I/O direction is specified by using the PMn.PMnm bit.

After selecting an alternative function by the PFCn.PFCnm, PFCEn.PFCEnm, or PFCAEn.PFCAEnm bit, set the PMCn.PMCnm bit to 1.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFCAEn15	PFCAEn14	PFCAEn13	PFCAEn12	PFCAEn11	PFCAEn10	PFCAEn9	PFCAEn8	PFCAEn7	PFCAEn6	PFCAEn5	PFCAEn4	PFCAEn3	PFCAEn2	PFCAEn1	PFCAEn0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15 to 0	PFCAEn[15:0]	Specifies the alternative function of a pin.

Caution: Although some alternative functions are assigned to multiple pins in this LSI, only one of the pins can be used for each alternative function. Do not set the same alternative function in multiple pins. For example, when the a/b/c pin is used as the b pin, the b/d/e pin cannot be used as the b pin. Before using the b/d/e pin, set the pin as an alternative function other than b.

Note: For the allocation of the alternative functions, see the table of the pin functions of each port.

54.3.12 Port Input Buffer Control Register (PIBCn/JPIBC0)

In input port mode (PMCn.PMCnm = 0 and PMn.PMnm = 1 or JPMC0.JPMC0 = 0), this register enables or disables the input buffer for the Pn_m pin.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIBCn 15	PIBCn 14	PIBCn 13	PIBCn 12	PIBCn 11	PIBCn 10	PIBCn 9	PIBCn 8	PIBCn 7	PIBCn 6	PIBCn 5	PIBCn 4	PIBCn 3	PIBCn 2	PIBCn 1	PIBCn 0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15 to 0	PIBCn[15:0]	These bits enable or disable the input buffer. 0: Input buffer disabled 1: Input buffer enabled

Note: When the input buffer is disabled, through current does not flow even when the pin level is Hi-Z. Thus the pin does not need to be fixed to a high or low level externally (except for P2_12, P2_15, P3_1, P3_3, P3_9, P5_09, P6_2, P6_4, P7_8, P8_02, P8_7, and P9_1).
The JPIBC0[1:0] bits are control bits in the JTAG port input buffer control register (JPIBC0).

Caution: When the output buffer is enabled and the PBDCn.PBDCnm bit is 1, the input buffer is enabled regardless of this register setting.

54.3.13 Port Bidirection Control Register (PBDCn)

This register enables or disables the input buffer while the output buffer is enabled. When the input buffer is enabled while the output buffer is enabled, the bidirectional mode is entered, allowing the level of the Pn_m pin to always be read via the PPRn.PPRnm bit.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PBDCn 15	PBDCn 14	PBDCn 13	PBDCn 12	PBDCn 11	PBDCn 10	PBDCn 9	PBDCn 8	PBDCn 7	PBDCn 6	PBDCn 5	PBDCn 4	PBDCn 3	PBDCn 2	PBDCn 1	PBDCn 0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15 to 0	PBDCn[15:0]	Enables/disables bidirectional mode of the corresponding pin: 0: Bidirectional mode disabled 1: Bidirectional mode enabled

Caution: When using the Pn_m bit as the output of an alternative function (PMCn.PMCnm = 1, PMn.PMnm = 0), the level of the Pn_m pin can be read at the PPRn.PPRnm bit by setting the PBDCn.PBDCnm bit to 1. Note, however, that in this case, the level of the Pn_m pin will be conveyed to the input of the alternative function that the Pn_m pin is being used as.

54.3.14 Port IP Control Register (PIPCn)

This register is used to specify whether the I/O direction of the Pn_m pin is controlled by the PMn.PMnm bit or by the alternative function in alternative mode (the PMCn.PMCnm bit is 1).
When using an alternative function shown in Table 54.7, set the PIPCn.PIPCnm bit to 0. When using an alternative function that is not shown in Table 54.7, set the PIPCn.PIPCnm bit to 1. When the PIPCn.PIPCnm bit is set to 1, the alternative function controls the I/O direction and the PMn.PMnm bit setting becomes invalid.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIPCn 15	PIPCn 14	PIPCn 13	PIPCn 12	PIPCn 11	PIPCn 10	PIPCn 9	PIPCn 8	PIPCn 7	PIPCn 6	PIPCn 5	PIPCn 4	PIPCn 3	PIPCn 2	PIPCn 1	PIPCn 0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15 to 0	PIPCn[15:0]	These bits specify how to control the I/O direction in alternative mode. 0: The I/O direction is controlled according to the value of the PMn.PMnm bit (software I/O control). 1: The I/O direction is controlled by the alternative function (direct I/O control).

Table 54.7 Alternative Functions that PIPCn.PIPCnm Bit Should be Set to 0

Classification	Pin Name	Remark

Watchdog timer	$\overline{\text{WDTOVF}}$	Set the PIPCn.PIPCnm and PMn.PMnm bits to 0.

54.3.15 Serial Sound Interface Noise Canceler Control Register (SNCR)

This register controls the noise canceler in the input route from the LSI pin to a serial sound interface and the pins for MII supported in the Ethernet. Six lower-order bits can be set only when slave mode is selected for the corresponding channel of the serial sound interface.
In master mode, the bit corresponding to the channel of the serial sound interface must be set to 0.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

P0_2			
P0_3			
P0_4		RTC_X3	
P0_5			RTC_X4

Note 1. Only input in port mode. P0_0 to P0_3 pins have no alternative mode.
Note 2. P0_0, P0_1, P0_2, P0_3 pins are MD_BOOT0, MD_BOOT1, MD_CLK, MD_CLKS functions in the state of $\overline{\text{RES}}$ = L.

Table 54.12 Control Registers (P0)

		Valid Bit			
Register	**Register Size**	**Location**	**R/W**	**Offset Address <PORTn_base>**	**Initial Value**
PPR0	16	5 to 0	R	H'0200	H'0000
PMC0	16	5, 4	R/W	H'0400	H'0000
PMCSR0	32	21, 20, 5, 4	W, R/W	H'0900	H'0000_0000
PIBC0	16	5 to 0	R/W	H'4000	H'0000

Note: When a control register is read, the initial value is read from the fields where no valid bit is allocated. When writing to these fields, write the initial value.

54.7 Port 1 (P1)

Table 54.13 Pin Function (P1)

Port Mode		Alternative Mode															
		1st Alternative		2nd Alternative		3rd Alternative		4th Alternative		5th Alternative		6th Alternative		7th Alternative		8th Alternative	
Input	Output	Input	Output	Input	Output	Input	Output	Input	Output	Input	Output	Input	Output	Input	Output	Input	Output
P1_0	P1_0	RIIC0SCL		DV0_ DATA16		TCLKA		IRQ0		VIO_VD		DV0_ VSYNC					
P1_1	P1_1	RIIC0SDA		DV0_ DATA17		TCLKC		IRQ1		VIO_HD		DV0_ HSYNC					
P1_2	P1_2	RIIC1SCL		DV0_ DATA18		FRB		IRQ2						LCD1_ EXTCLK			
P1_3	P1_3	RIIC1SDA		DV0_ DATA19		ET_COL		IRQ3		$\overline{\text{ADTRG}}$							
P1_4	P1_4	RIIC2SCL		DV0_ CLK		CAN1RX		IRQ4						CAN_CLK			
P1_5	P1_5	RIIC2SDA		DV1_ CLK		CAN4RX		IRQ5		VIO_CLK				LCD1_ EXTCLK			
P1_6	P1_6	RIIC3SCL		DV1_ VSYNC		IERxD		IRQ6		VIO_D12		DV0_ DATA12					
P1_7	P1_7	RIIC3SDA		DV1_ HSYNC		RLIN30 RX		IRQ7		VIO_D13		DV0_ DATA13					
P1_8		AN0				IRQ2		DREQ0		VIO_D14		DV0_ DATA14					
P1_9		AN1				IRQ3				VIO_D15		DV0_ DATA15					
P1_10		AN2				IRQ4		TCLKB									
P1_11		AN3				IRQ5		TCLKD									
P1_12		AN4		DV0_ VSYNC				VIO_FLD									
P1_13		AN5		DV0_ HSYNC				$\overline{\text{WAIT}}$									
P1_14		AN6						ET_COL									
P1_15		AN7						AVB_ CAPTURE									

Note: P1_0 to P1_7 pins are input pins with open-drain output. P1_8 to P1_15 pins are only input.

Table 54.14 Control Registers (P1)

Register	Register Size	Valid Bit Location	R/W	Offset Address <PORTn_base>	Initial Value
P1	16	7 to 0	R/W	H'0004	H'0000
PSR1	32	23 to 16, 7 to 0	W, R/W	H'0104	H'0000_0000
PPR1	16	15 to 0	R	H'0204	H'0000
PM1	16	7 to 0	R/W	H'0304	H'FFFF*2
PMC1	16	15 to 0	R/W	H'0404	H'0000
PFC1	16	15 to 0	R/W	H'0504	H'0000
PFCE1	16	15 to 0	R/W	H'0604	H'0000
PNOT1	16	7 to 0	W	H'0704	H'0000
PMSR1	32	23 to 16, 7 to 0	W, R/W	H'0804	H'0000_FFFF
PMCSR1	32	23 to 16, 7 to 0	W, R/W	H'0904	H'0000_0000
PFCAE1	16	15 to 0	R/W	H'0A04	H'0000
PIBC1	16	15 to 0	R/W	H'4004	H'0000
PBDC1	16	15 to 0	R/W	H'4104	H'0000
PIPC1	16	7 to 0	R/W	H'4204	H'FF00*2

Note 1. When a control register is read, the initial value is read from the fields where no valid bit is allocated. When writing to these fields, write the initial value.
Note 2. The values of bits 8 to 15 of the PM1 and PIPC1 registers are fixed. When read, all of these bits are always read as 1.

54.8 Port 2 (P2)

Table 54.15 Pin Function (P2)

54.18 Port Control Logical Diagram

The following shows a logical diagram of the port control function.
Note: This figure shows the logic for reference, not the circuit.

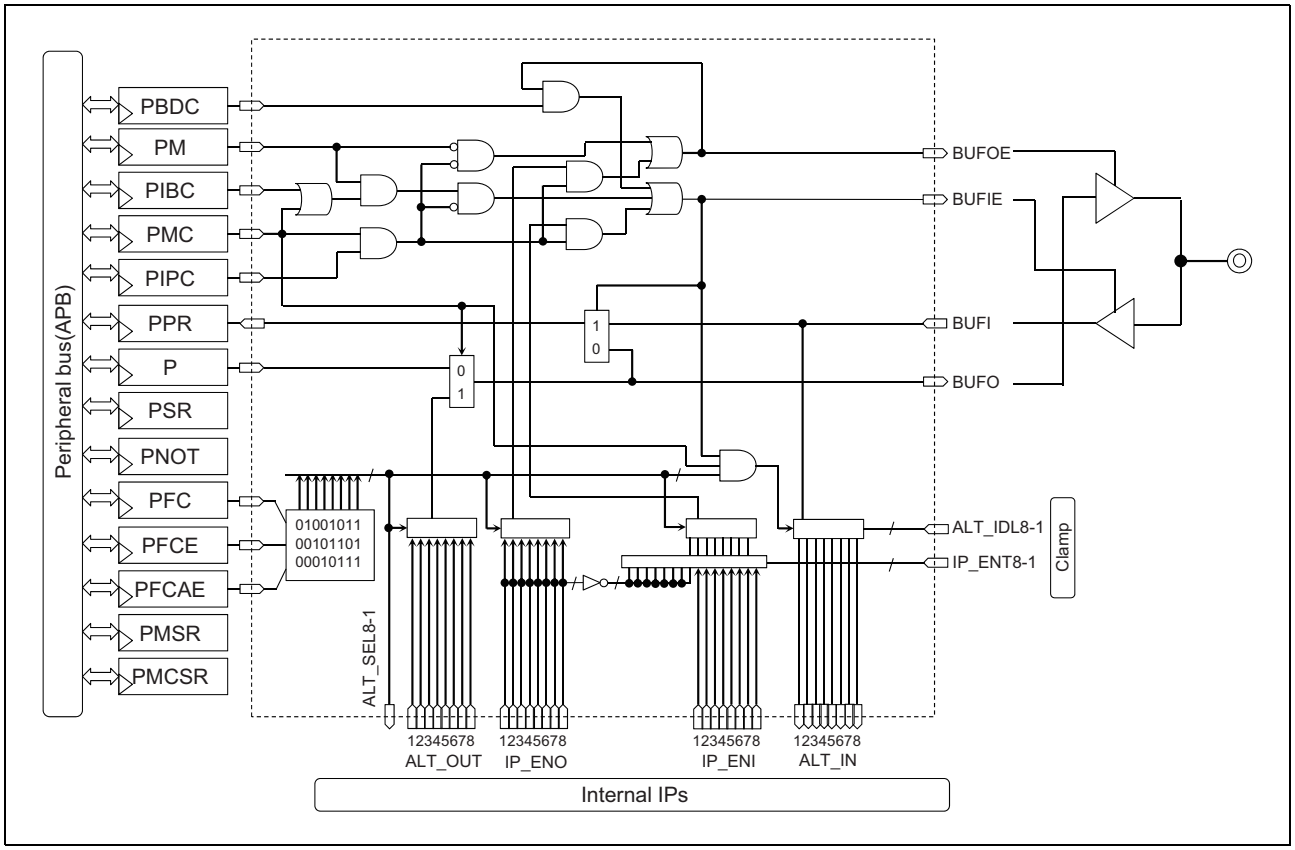

Figure 54.1 Logical Diagram of Port Control

54.19 Flowchart Examples of Port Setting

A flowchart example for setting the Pn_m pin to port mode is shown in (a), an example for setting software I/O control alternative mode is shown in (b), and an example for setting direct I/O control alternative mode is shown in (c).

(a) Port settings for port mode

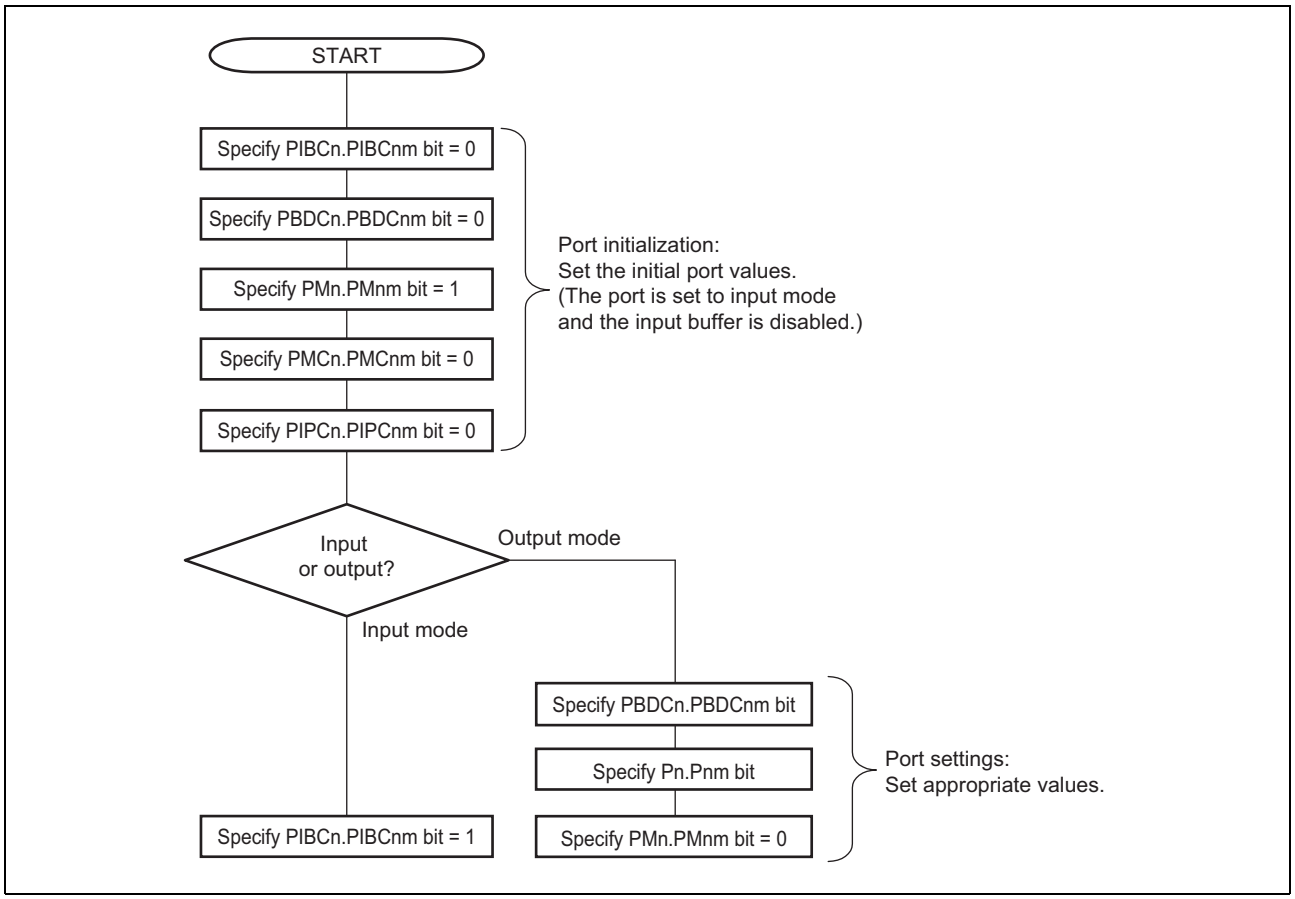

Figure 54.2 Example of Port Settings (in Port Mode) (1/3)

(b) Port settings for software I/O control alternative mode

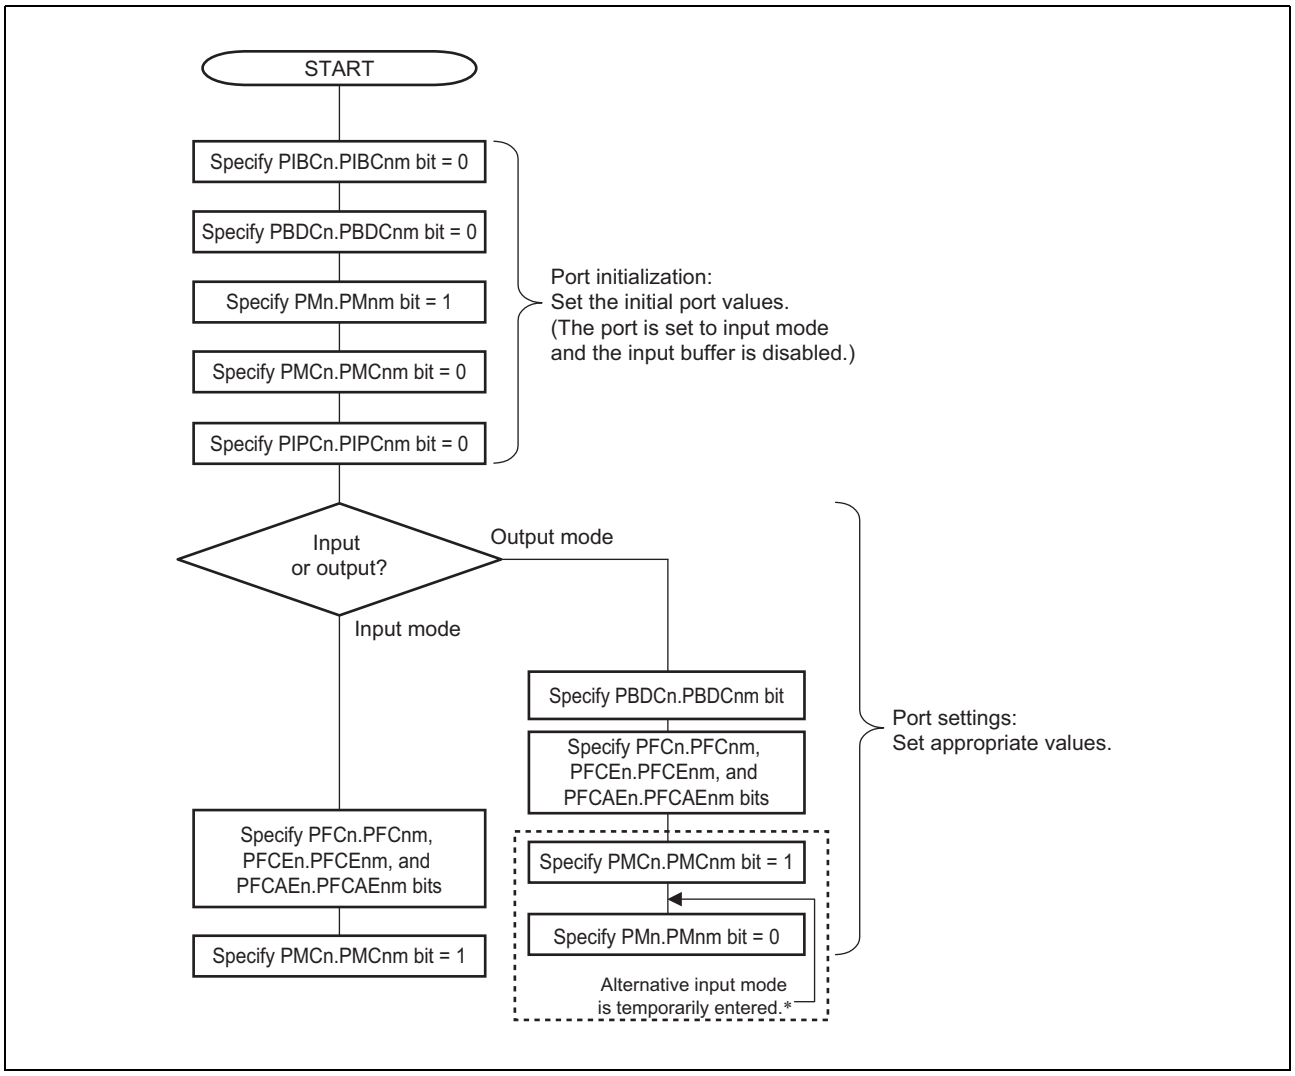

Figure 54.3 Example of Port Settings (in Software I/O Control Alternative Mode) (2/3)

Note: * When the Pn_m pin is set to the output mode in software I/O control alternative mode, the alternative input mode is temporarily entered after the PMCn.PMCnm bit is set to 1 until the PMn.PMnm bit is cleared to 0. Therefore, when an interrupt-related signal is selected as the alternative function for the port pin, appropriate settings should be made so that the interrupt does not occur or is ignored.

(c) Port settings for direct I/O control alternative mode

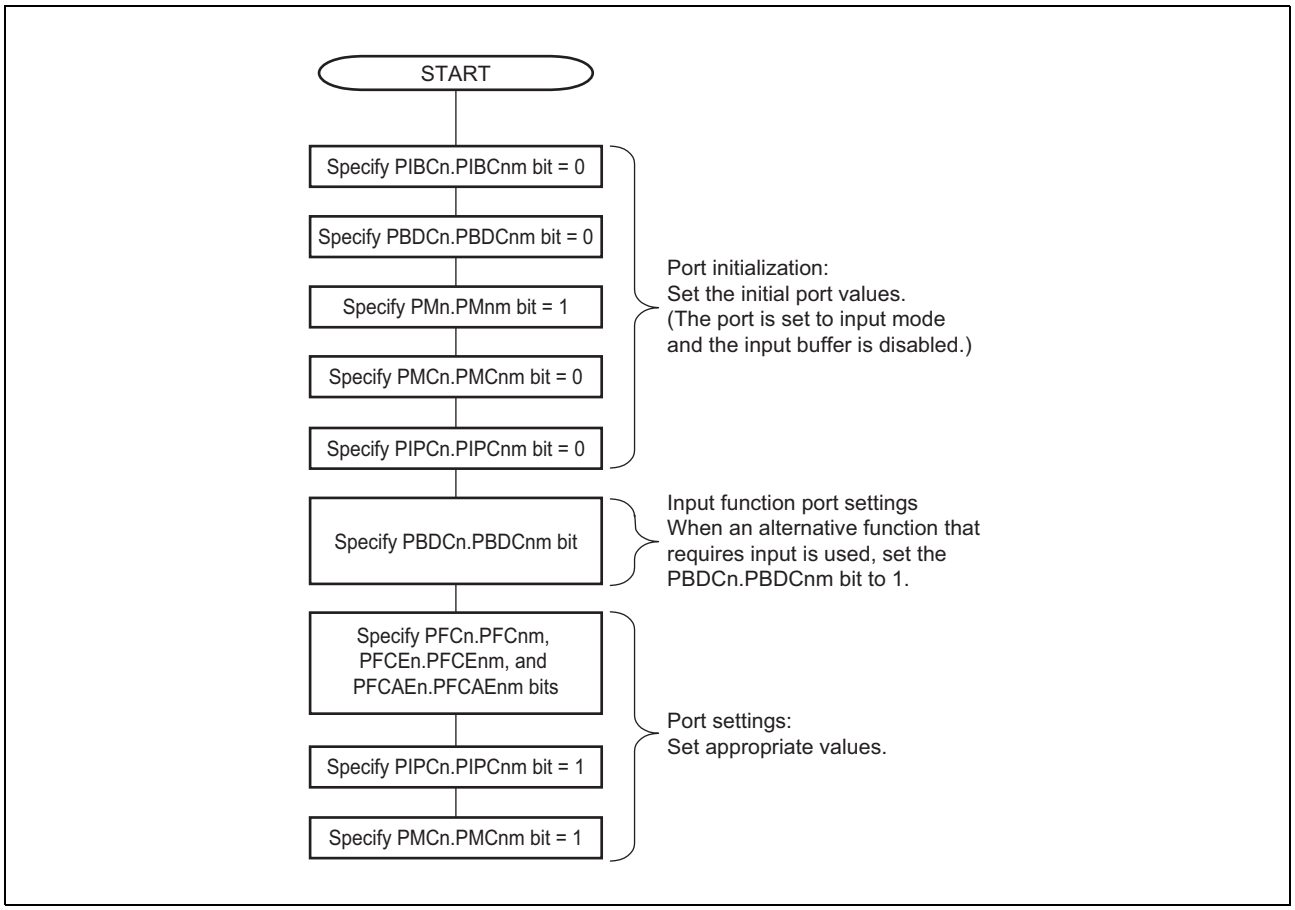

Figure 54.4 Example of Port Settings (in Direct I/O Control Alternative Mode) (3/3)

55. Power-Down Modes

This LSI supports sleep mode, software standby mode, deep standby mode, and module standby mode. In power-down modes, functions of CPU, clocks, on-chip memory, or part of on-chip peripheral modules are halted or the power-supply is turned off, through which low power consumption is achieved. These modes are canceled by a reset or interrupt.

55.1 Features

55.1.1 States of Processing and Power-Down Modes

(1) States of processing

This LSI has three general states of processing: the reset state, the program execution state, and the power-down modes. Figure 55.1 shows transitions between these states.

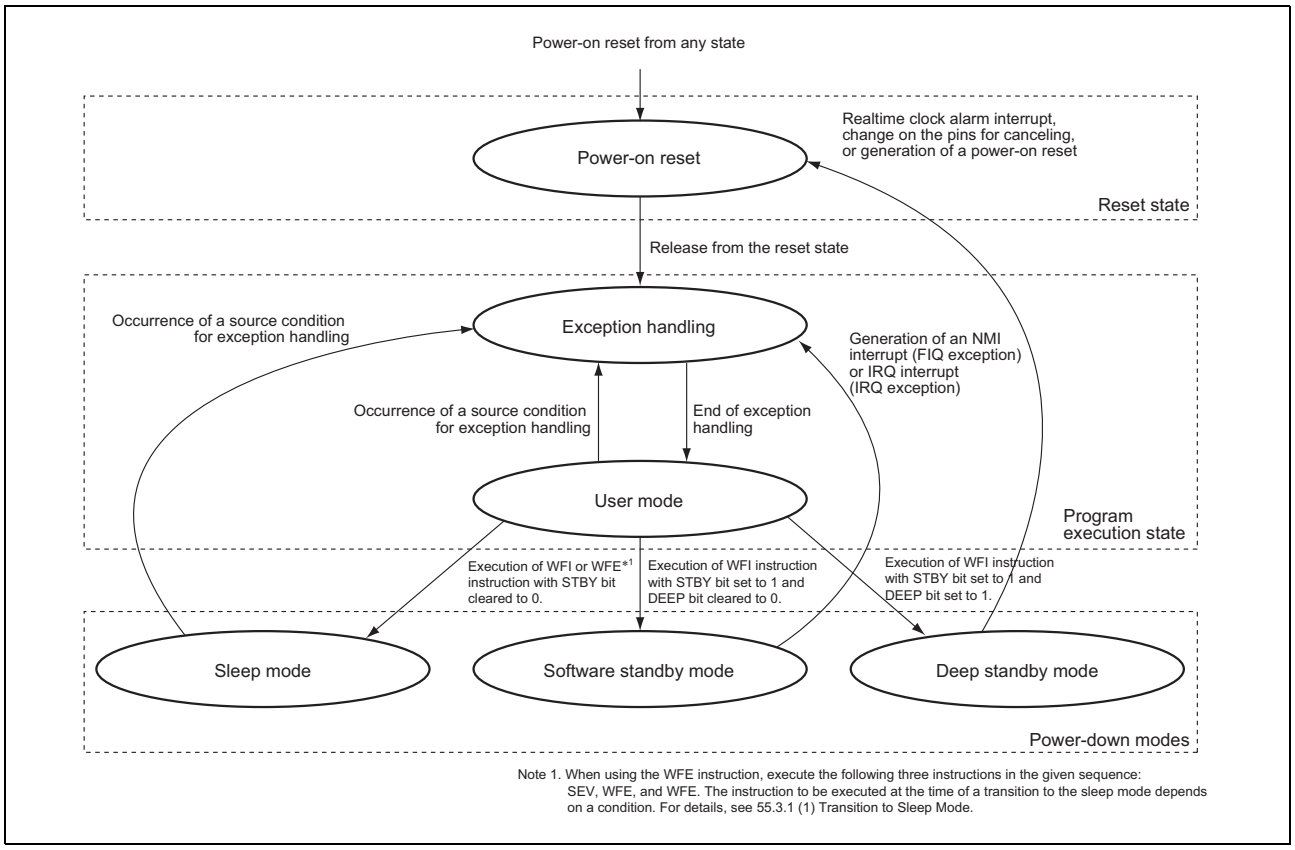

Figure 55.1 Transitions between Processing States

(2) Power-down modes

This LSI has the following power-down modes and function:

1. Sleep mode
2. Software standby mode
3. Deep standby mode
4. Module standby function

Table 55.1 shows the transition conditions for entering the modes from the program execution state, as well as the CPU and peripheral module states in each mode and the procedures for canceling each mode.

Table 55.1 States of Power-Down Modes

		State							
Power-Down Mode	**Transition Conditions**	**CPU, CPU Register, Primary Cache, TLB**	**Secondary Cache**	**Large-Capacity On-Chip RAM (including on-chip data-retention RAM)**	**On-Chip Peripheral Modules**	**Realtime Clock**	**Internal Power Supply**	**External Memory**	**Canceling Procedure**
Sleep mode	Execute WFI or WFE*6 instruction with STBY bit in STBCR1 cleared to 0	Halted Contents are held.*4	Running	Running	Running	Running*1	Applied	Auto-refresh	• Interrupt • Power-on reset
Software standby mode	Execute WFI instruction with STBY and DEEP bits in STBCR1 set to 1 and 0, respectively	Halted Contents are held.*4	Halted Contents are held.*4	Halted Contents are held.*5	Halted	Running*1	Applied	Self-refresh	• NMI or IRQ interrupt • Power-on reset
Deep standby mode	Execute WFI instruction with STBY and DEEP bits in STBCR1 set to 1	Halted Contents are not held.	Halted Contents are not held.	Halted Contents in on-chip data-retention RAM are held*2, and the other contents in large-capacity on-chip RAM are not held.	Halted	Running*1	Shut off	Self-refresh	• Power-on reset*3 • Realtime clock alarm interrupt*3 • Change on the pins for canceling*3
Module standby mode	Set the MSTP bits in STBCR2 to STBCR13 to 1	Running	Running	Running	Specified module halted	Halted	Applied	Auto-refresh	• Clear MSTP bit to 0

Note 1. The realtime clock operates when the START bit in the RCR2 register is set to 1. For details, see section 13, Realtime Clock. When deep standby mode is canceled by a power-on reset, the running state cannot be retained. Make the initial setting for the realtime clock again.

Note 2. Setting the bits RRAMKP3 to RRAMKP0 in the RRAMKP register to 1 enables to retain the data in the corresponding area on the on-chip data-retention RAM during the transition to deep standby mode. When the deep standby mode is canceled by a power-on reset, the retained contents are initialized.

Note 3. Deep standby mode can be canceled by a power-on reset, a realtime clock alarm interrupt, or change on the pins for canceling (P2_12, P2_15, P3_1, P3_3, P3_9, P5_9, P6_2, P6_4, P7_8, P8_2, P8_7, P9_1, and NMI). Even when deep standby mode is canceled by a source other than a power-on reset, the reset exception handling is executed instead of the interrupt exception handling.

Note 4. When sleep mode or software standby mode is canceled by a power-on reset, the retained contents are initialized.

Note 5. By setting the VRAME bit in the SYSCR1 register or VRAMWE bit in the SYSCR2 register to enable accesses, the retained contents are initialized when software standby mode is canceled by a power-on reset. By setting the VRAME bit in the SYSCR1 register or VRAMWE bit in the SYSCR2 register to disable accesses, contents in the large-capacity on-chip RAM (including on-chip data-retention RAM) can be retained when software standby mode is canceled by a power-on reset. Note that the area at addresses from H'2002_0000 to H'2002_3FFF is used as working memory for the boot program in boot modes 3 to 5. In boot modes 4 and 5, a 28-Kbyte program is transferred from the external flash memory to the area at addresses from H'2002_4000 to H'2002_AFFF. For details, see section 3, Boot Mode.

Note 6. When using the WFE instruction, execute the following three instructions in the given sequence: SEV, WFE, and WFE. The instruction to be executed at the time of a transition to the sleep mode depends on a condition. For details, see 55.3.1 (1) Transition to Sleep Mode.

55.2 Register Descriptions

Table 55.2 shows the register configuration.

Table 55.2 Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Standby control register 1	STBCR1	R/W	H'00	H'FCFE0020	8
Standby control register 2	STBCR2	R/W	H'6A	H'FCFE0024	8
Standby control register 3	STBCR3	R/W	H'FD	H'FCFE0420	8
Standby control register 4	STBCR4	R/W	H'FF	H'FCFE0424	8
Standby control register 5	STBCR5	R/W	H'FF	H'FCFE0428	8
Standby control register 6	STBCR6	R/W	H'FE	H'FCFE042C	8
Standby control register 7	STBCR7	R/W	H'3F	H'FCFE0430	8
Standby control register 8	STBCR8	R/W	H'FF	H'FCFE0434	8
Standby control register 9	STBCR9	R/W	H'FF	H'FCFE0438	8
Standby control register 10	STBCR10	R/W	H'FF	H'FCFE043C	8
Standby control register 11	STBCR11	R/W	H'FF	H'FCFE0440	8
Standby control register 12	STBCR12	R/W	H'FF	H'FCFE0444	8
Standby control register 13	STBCR13	R/W	H'FF	H'FCFE0470	8
Software reset control register 1	SWRSTCR1	R/W	H'00	H'FCFE0460	8
Software reset control register 2	SWRSTCR2	R/W	H'00	H'FCFE0464	8
Software reset control register 3	SWRSTCR3	R/W	H'80	H'FCFE0468	8
System control register 1	SYSCR1	R/W	H'FF	H'FCFE0400	8
System control register 2	SYSCR2	R/W	H'FF	H'FCFE0404	8
System control register 3	SYSCR3	R/W	H'00	H'FCFE0408	8
CPU status register	CPUSTS	R	H'00	H'FCFE0018	8
Standby request register 1	STBREQ1	R/W	H'00	H'FCFE0030	8
Standby request register 2	STBREQ2	R/W	H'00	H'FCFE0034	8
Standby acknowledge register 1	STBACK1	R	H'00	H'FCFE0040	8
Standby acknowledge register 2	STBACK2	R	H'00	H'FCFE0044	8
On-chip data-retention RAM area setting register	RRAMKP	R/W	H'00	H'FCFF1800	8
Deep standby control register	DSCTR	R/W	H'00	H'FCFF1802	8
Deep standby cancel source select register	DSSSR	R/W	H'0000	H'FCFF1804	16
Deep standby cancel edge select register	DSESR	R/W	H'0000	H'FCFF1806	16
Deep standby cancel source flag register	DSFR	R/W	H'0000	H'FCFF1808	16
XTAL crystal oscillator gain control register	XTALCTR	R/W	H'00	H'FCFF1810	8

55.2.1 Standby Control Register 1 (STBCR1)

STBCR1 is an 8-bit readable/writable register that specifies the state of the power-down mode.

Note: • When writing to this register, see section 55.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	STBY	DEEP	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	STBY	0	R/W	Software Standby, Deep Standby
6	DEEP	0	R/W	Specifies transition to software standby mode or deep standby mode. 0x: Executing WFI or WFE*1 instruction puts chip into sleep mode. 10: Executing WFI instruction puts chip into software standby mode.*2 11: Executing WFI instruction puts chip into deep standby mode.*2 Note 1. When using the WFE instruction, execute the following three instructions in the given sequence: SEV, WFE, and WFE. The instruction to be executed at the time of a transition to the sleep mode depends on a condition. For details, see 55.3.1 (1) Transition to Sleep Mode. Note 2. Do not execute the WFE instruction while the STBY bit in STBCR1 is 1.
5 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

[Legend]
x: Don't care

55.2.2 Standby Control Register 2 (STBCR2)

STBCR2 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 55.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	HIZ	-	-	-	-	-	-	MSTP 20
Initial value:	0	1	1	0	1	0	1	0
R/W:	R/W	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	HIZ	0	R/W	Port High Impedance Selects whether the state of specific output pin is retained or high impedance in software standby mode or deep standby mode. As to which pins are controlled, see section 60.1, Pin States in section 60, States and Handling of Pins. 0: The pin state is retained in software standby mode or deep standby mode. 1: The pin is set to high-impedance in software standby mode or deep standby mode.
6, 5	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
4	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
3	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
2	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
1	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
0	MSTP20	0	R/W	Module Stop 20*1 [not for disclosure] When the MSTP20 bit is set to 1, the clock supply to CoreSight is halted. 0: CoreSight runs. 1: Clock supply to CoreSight is halted.

Note 1. The transition to and release from module stop mode proceed in the steps described in section 55.3.5, Module Standby Function.

55.2.3 Standby Control Register 3 (STBCR3)

STBCR3 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 55.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP37	MSTP36	MSTP35	MSTP34	MSTP33	MSTP32	MSTP31	MSTP30
Initial value:	1	1	1	1	1	1	0	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP37	1	R/W	Module Stop 37 When the MSTP37 bit is set to 1, the clock supply to the IEBus™ controller is halted. 0: The IEBus™ controller runs. 1: Clock supply to the IEBus™ controller is halted.
6	MSTP36	1	R/W	Module Stop 36 When the MSTP36 bit is set to 1, the clock supply to serial communication interface (IrDA) is halted. 0: Serial communication interface (IrDA) runs. 1: Clock supply to serial communication interface (IrDA) is halted.
5	MSTP35	1	R/W	Module Stop 35 When the MSTP35 bit is set to 1, the clock supply to the LIN interface channel 0 is halted. 0: The LIN interface channel 0 runs. 1: Clock supply to the LIN interface channel 0 is halted.
4	MSTP34	1	R/W	Module Stop 34 When the MSTP34 bit is set to 1, the clock supply to the LIN interface channel 1 is halted. 0: The LIN interface channel 1 runs. 1: Clock supply to the LIN interface channel 1 is halted.
3	MSTP33	1	R/W	Module Stop 33 When the MSTP33 bit is set to 1, the clock supply to the multi-function timer pulse unit 2 is halted. 0: The multi-function timer pulse unit 2 runs. 1: Clock supply to the multi-function timer pulse unit 2 is halted.
2	MSTP32	1	R/W	Module Stop 32 When the MSTP32 bit is set to 1, the clock supply to the CAN interface is halted. 0: The CAN interface runs. 1: Clock supply to the CAN interface is halted.
1	MSTP31	0	R/W	Module Stop 31 When the MSTP31 bit is set to 1, the clock supply to the A/D converter is halted and the analog power supply to the A/D converter is shut off. 0: Clock signal and analog voltage are supplied to the A/D converter. 1: Supply of clock signal and analog voltage to the A/D converter is shut off.
0	MSTP30	1	R/W	Module Stop 30 When the MSTP30 bit is set to 1, the clock supply to the motor control PWM timer is halted. 0: The motor control PWM timer runs. 1: Clock supply to the motor control PWM timer is halted.

55.2.4 Standby Control Register 4 (STBCR4)

STBCR4 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 55.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP47	MSTP46	MSTP45	MSTP44	MSTP43	MSTP42	MSTP41	MSTP40
Initial value:	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP47	1	R/W	Module Stop 47 When the MSTP47 bit is set to 1, the clock supply to channel 0 of the serial communication interface with FIFO is halted. 0: Channel 0 of the serial communication interface with FIFO runs. 1: Clock supply to channel 0 of the serial communication interface with FIFO is halted.
6	MSTP46	1	R/W	Module Stop 46 When the MSTP46 bit is set to 1, the clock supply to channel 1 of the serial communication interface with FIFO is halted. 0: Channel 1 of the serial communication interface with FIFO runs. 1: Clock supply to channel 1 of the serial communication interface with FIFO is halted.
5	MSTP45	1	R/W	Module Stop 45 When the MSTP45 bit is set to 1, the clock supply to channel 2 of the serial communication interface with FIFO is halted. 0: Channel 2 of the serial communication interface with FIFO runs. 1: Clock supply to channel 2 of the serial communication interface with FIFO is halted.
4	MSTP44	1	R/W	Module Stop 44 When the MSTP44 bit is set to 1, the clock supply to channel 3 of the serial communication interface with FIFO is halted. 0: Channel 3 of the serial communication interface with FIFO runs. 1: Clock supply to channel 3 of the serial communication interface with FIFO is halted.
3	MSTP43	1	R/W	Module Stop 43 When the MSTP43 bit is set to 1, the clock supply to channel 4 of the serial communication interface with FIFO is halted. 0: Channel 4 of the serial communication interface with FIFO runs. 1: Clock supply to channel 4 of the serial communication interface with FIFO is halted.
2	MSTP42	1	R/W	Module Stop 42 When the MSTP42 bit is set to 1, the clock supply to channel 5 of the serial communication interface with FIFO is halted. 0: Channel 5 of the serial communication interface with FIFO runs. 1: Clock supply to channel 5 of the serial communication interface with FIFO is halted.
1	MSTP41	1	R/W	Module Stop 41 When the MSTP41 bit is set to 1, the clock supply to channel 6 of the serial communication interface with FIFO is halted. 0: Channel 6 of the serial communication interface with FIFO runs. 1: Clock supply to channel 6 of the serial communication interface with FIFO is halted.
0	MSTP40	1	R/W	Module Stop 40 When the MSTP40 bit is set to 1, the clock supply to channel 7 of the serial communication interface with FIFO is halted. 0: Channel 7 of the serial communication interface with FIFO runs. 1: Clock supply to channel 7 of the serial communication interface with FIFO is halted.

55.2.5 Standby Control Register 5 (STBCR5)

STBCR5 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 55.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP57	MSTP56	MSTP55	MSTP54	MSTP53	MSTP52	MSTP51	MSTP50
Initial value:	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP57	1	R/W	Module Stop 57 When the MSTP57 bit is set to 1, the clock supply to channel 0 of the serial communication interface (SCI) is halted. 0: Channel 0 of the serial communication interface (SCI) runs. 1: Clock supply to channel 0 of the serial communication interface (SCI) is halted.
6	MSTP56	1	R/W	Module Stop 56 When the MSTP56 bit is set to 1, the clock supply to channel 1 of the serial communication interface (SCI) is halted. 0: Channel 1 of the serial communication interface (SCI) runs. 1: Clock supply to channel 1 of the serial communication interface (SCI) is halted.
5	MSTP55	1	R/W	Module Stop 55 When the MSTP55 bit is set to 1, the clock supply to channel 0 of the sound generator is halted. 0: Channel 0 of the sound generator runs. 1: Clock supply to channel 0 of the sound generator is halted.
4	MSTP54	1	R/W	Module Stop 54 When the MSTP54 bit is set to 1, the clock supply to channel 1 of the sound generator is halted. 0: Channel 1 of the sound generator runs. 1: Clock supply to channel 1 of the sound generator is halted.
3	MSTP53	1	R/W	Module Stop 53 When the MSTP53 bit is set to 1, the clock supply to channel 2 of the sound generator is halted. 0: Channel 2 of the sound generator runs. 1: Clock supply to channel 2 of the sound generator is halted.
2	MSTP52	1	R/W	Module Stop 52 When the MSTP52 bit is set to 1, the clock supply to channel 3 of the sound generator is halted. 0: Channel 3 of the sound generator runs. 1: Clock supply to channel 3 of the sound generator is halted.
1	MSTP51	1	R/W	Module Stop 51 When the MSTP51 bit is set to 1, the clock supply to channel 0 of the OS timer is halted. 0: Channel 0 of the OS timer runs. 1: Clock supply to channel 0 of the OS timer is halted.
0	MSTP50	1	R/W	Module Stop 50 When the MSTP50 bit is set to 1, the clock supply to channel 1 of the OS timer is halted. 0: Channel 1 of the OS timer runs. 1: Clock supply to channel 1 of the OS timer is halted.

55.2.6 Standby Control Register 6 (STBCR6)

STBCR6 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 55.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP 67	MSTP 66	MSTP 65	MSTP 64	MSTP 63	MSTP 62	MSTP 61	MSTP 60
Initial value:	1	1	1	1	1	1	1	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP67	1	R/W	Module Stop 67 When the MSTP67 bit is set to 1, the clock supply to the A/D converter is halted. 0: The A/D converter runs. 1: Clock supply to channel 0 of the A/D converter is halted.
6	MSTP66	1	R/W	Module Stop 66*1 When the MSTP66 bit is set to 1, the clock supply to the capture engine unit is halted. 0: The capture engine unit runs. 1: Clock supply to the capture engine unit is halted.
5	MSTP65	1	R/W	Module Stop 65 When the MSTP65 bit is set to 1, the clock supply to channel 0 of the display out comparison unit is halted. 0: Channel 0 of the display out comparison unit runs. 1: Clock supply to channel 0 of the display out comparison unit is halted.
4	MSTP64	1	R/W	Module Stop 64 When the MSTP64 bit is set to 1, the clock supply to channel 1 of the display out comparison unit is halted. 0: Channel 1 of the display out comparison unit runs. 1: Clock supply to channel 1 of the display out comparison unit is halted.
3	MSTP63	1	R/W	Module Stop 63 When the MSTP63 bit is set to 1, the clock supply to channel 0 of the dynamic range compression is halted. 0: Channel 0 of the dynamic range compression runs. 1: Clock supply to channel 0 of the dynamic range compression is halted.
2	MSTP62	1	R/W	Module Stop 62 When the MSTP62 bit is set to 1, the clock supply to channel 1 of the dynamic range compression is halted. 0: Channel 1 of the dynamic range compression runs. 1: Clock supply to channel 1 of the dynamic range compression is halted.
1	MSTP61	1	R/W	Module Stop 61*1 When the MSTP61 bit is set to 1, the clock supply to the JPEG codec unit is halted. 0: The JPEG codec unit runs. 1: Clock supply to the JPEG codec unit is halted.
0	MSTP60	0	R/W	Module Stop 60 When the MSTP60 bit is set to 1, the clock supply to the realtime clock is halted. 0: The realtime clock runs. 1: Clock supply to the realtime clock is halted. Note: When the realtime clock is halted, set the bits in registers shown below. • Set bit RTCEN in the control register 2 (RCR2) to 0. • Set bits RCKSEL[1:0] in the control register 5 (RCR5) to 00. After the settings above, set bit MSTP60 to 1.

Note 1. The transition to and release from module stop mode proceed in the steps described in section 55.3.5, Module Standby Function.

55.2.7 Standby Control Register 7 (STBCR7)

STBCR7 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 55.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP77	MSTP76	-	MSTP74	MSTP73	-	MSTP71	MSTP70
Initial value:	0	0	1	1	1	1	1	1
R/W:	R/W	R/W	R	R/W	R/W	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP77	0	R/W	Module Stop 77 When the MSTP77 bit is set to 1, the clock supply to channel 0 of the digital video decoder is halted. 0: Channel 0 of the digital video decoder runs. 1: Clock supply to channel 0 of the digital video decoder is halted. Note: When this bit is set to 1, A/D converter A for the input of video signals will stop operating and the LSI will be placed in the power saving state. When the LSI is released from the power saving mode (by clearing this bit to 0), the precision of conversion by A/D converter A cannot be guaranteed until the time for return from the power saving state has elapsed. For details, see section 59, Electrical Characteristics.
6	MSTP76	0	R/W	Module Stop 76 When the MSTP76 bit is set to 1, the clock supply to channel 1 of the digital video decoder is halted. 0: Channel 1 of the digital video decoder runs. 1: Clock supply to channel 1 of the digital video decoder is halted. Note: When this bit is set to 1, A/D converter B for the input of video signals will stop operating and the LSI will be placed in the power saving state. When the LSI is released from the power saving mode (by clearing this bit to 0), the precision of conversion by A/D converter B cannot be guaranteed until the time for return from the power saving state has elapsed. For details, see section 59, Electrical Characteristics.
5	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
4	MSTP74	1	R/W	Module Stop 74*1 When the MSTP74 bit is set to 1, the clock supply to the Ethernet controller is halted. 0: The Ethernet controller runs. 1: Clock supply to the Ethernet controller is halted.
3	MSTP73	1	R/W	Module Stop 73 When the MSTP73 bit is set to 1, the clock supply to the NAND flash memory controller is halted. 0: The NAND flash memory controller runs. 1: Clock supply to the NAND flash memory controller is halted.
2	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
1	MSTP71	1	R/W	Module Stop 71 When the MSTP71 bit is set to 1, the clock supply to channel 0 of the USB 2.0 host/function module is halted. 0: Channel 0 of the USB 2.0 host/function module runs. 1: Clock supply to channel 0 of the USB 2.0 host/function module is halted.
0	MSTP70	1	R/W	Module Stop 70 When the MSTP70 bit is set to 1, the clock supply to channel 1 of the USB 2.0 host/function module is halted. 0: Channel 1 of the USB 2.0 host/function module runs. 1: Clock supply to channel 1 of the USB 2.0 host/function module is halted.

Note 1. The transition to and release from module stop mode proceed in the steps described in section 55.3.5, Module Standby Function.

55.2.8 Standby Control Register 8 (STBCR8)

STBCR8 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 55.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP87	MSTP86	MSTP85	MSTP84	MSTP83	MSTP82	MSTP81	-
Initial value:	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP87	1	R/W	Module Stop 87*1 When the MSTP87 bit is set to 1, the clock supply to channel 0 of the image renderer is halted. 0: Channel 0 of the image renderer runs. 1: Clock supply to channel 0 of the image renderer is halted.
6	MSTP86	1	R/W	Module Stop 86*1 When the MSTP86 bit is set to 1, the clock supply to channel 1 of the image renderer is halted. 0: Channel 1 of the image renderer runs. 1: Clock supply to channel 1 of the image renderer is halted.
5	MSTP85	1	R/W	Module Stop 85*1 When the MSTP85 bit is set to 1, the clock supply to the display image renderer is halted. 0: The display image renderer runs. 1: Clock supply to the display image renderer is halted.
4	MSTP84	1	R/W	Module Stop 84 When the MSTP84 bit is set to 1, the clock supply to the MMC host interface is halted. 0: The MMC host interface runs. 1: Clock supply to the MMC host interface is halted.
3	MSTP83	1	R/W	Module Stop 83*1 When the MSTP83 bit is set to 1, the clock supply to the media local bus is halted. 0: The media local bus runs. 1: Clock supply to the media local bus is halted.
2	MSTP82	1	R/W	Module Stop 82*1 When the MSTP82 bit is set to 1, the clock supply to the EthernetAVB is halted. 0: The EthernetAVB runs. 1: Clock supply to the EthernetAVB is halted.
1	MSTP81	1	R/W	Module Stop 81 When the MSTP81 bit is set to 1, the clock supply to SCUX is halted. 0: SCUX runs. 1: Clock supply to SCUX is halted.
0	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.

Note 1. The transition to and release from module stop mode proceed in the steps described in section 55.3.5, Module Standby Function.

55.2.9 Standby Control Register 9 (STBCR9)

STBCR9 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 55.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP97	MSTP96	MSTP95	MSTP94	MSTP93	MSTP92	MSTP91	MSTP90
Initial value:	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP97	1	R/W	Module Stop 97 When the MSTP97 bit is set to 1, the clock supply to channel 0 of the I2C bus interface is halted. 0: Channel 0 of the I2C bus interface runs. 1: Clock supply to channel 0 of the I2C bus interface is halted.
6	MSTP96	1	R/W	Module Stop 96 When the MSTP96 bit is set to 1, the clock supply to channel 1 of the I2C bus interface is halted. 0: Channel 1 of the I2C bus interface runs. 1: Clock supply to channel 1 of the I2C bus interface is halted.
5	MSTP95	1	R/W	Module Stop 95 When the MSTP95 bit is set to 1, the clock supply to channel 2 of the I2C bus interface is halted. 0: Channel 2 of the I2C bus interface runs. 1: Clock supply to channel 2 of the I2C bus interface is halted.
4	MSTP94	1	R/W	Module Stop 94 When the MSTP94 bit is set to 1, the clock supply to channel 3 of the I2C bus interface is halted. 0: Channel 3 of the I2C bus interface runs. 1: Clock supply to channel 3 of the I2C bus interface is halted.
3	MSTP93	1	R/W	Module Stop 93 When the MSTP93 bit is set to 1, the clock supply to channel 0 of the SPI multi I/O bus controller is halted. 0: Channel 0 of the SPI multi I/O bus controller runs. 1: Clock supply to channel 0 of the SPI multi I/O bus controller is halted.
2	MSTP92	1	R/W	Module Stop 92 When the MSTP92 bit is set to 1, the clock supply to channel 1 of the SPI multi I/O bus controller is halted. 0: Channel 1 of the SPI multi I/O bus controller runs. 1: Clock supply to channel 1 of the SPI multi I/O bus controller is halted.
1	MSTP91	1	R/W	Module Stop 91*1 When the MSTP91 bit is set to 1, the clock supply to channel 0 of the video display controller 5 and the LVDS output interface is halted. 0: Channel 0 of the video display controller 5 and the LVDS output interface run. 1: Clock supply to channel 0 of the video display controller 5 and the LVDS output interface is halted.
0	MSTP90	1	R/W	Module Stop 90*1 When the MSTP90 bit is set to 1, the clock supply to channel 1 of the video display controller 5 is halted. 0: Channel 1 of the video display controller 5 runs. 1: Clock supply to channel 1 of the video display controller 5 is halted.

Note 1. The transition to and release from module stop mode proceed in the steps described in section 55.3.5, Module Standby Function.

55.2.10 Standby Control Register 10 (STBCR10)

STBCR10 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 55.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP107	MSTP106	MSTP105	MSTP104	MSTP103	MSTP102	MSTP101	MSTP100
Initial value:	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP107	1	R/W	Module Stop 107 When the MSTP107 bit is set to 1, the clock supply to channel 0 of the Renesas serial peripheral interface is halted. 0: Channel 0 of the Renesas serial peripheral interface runs. 1: Clock supply to channel 0 of the Renesas serial peripheral interface is halted.
6	MSTP106	1	R/W	Module Stop 106 When the MSTP106 bit is set to 1, the clock supply to channel 1 of the Renesas serial peripheral interface is halted. 0: Channel 1 of the Renesas serial peripheral interface runs. 1: Clock supply to channel 1 of the Renesas serial peripheral interface is halted.
5	MSTP105	1	R/W	Module Stop 105 When the MSTP105 bit is set to 1, the clock supply to channel 2 of the Renesas serial peripheral interface is halted. 0: Channel 2 of the Renesas serial peripheral interface runs. 1: Clock supply to channel 2 of the Renesas serial peripheral interface is halted.
4	MSTP104	1	R/W	Module Stop 104 When the MSTP104 bit is set to 1, the clock supply to channel 3 of the Renesas serial peripheral interface is halted. 0: Channel 3 of the Renesas serial peripheral interface runs. 1: Clock supply to channel 3 of the Renesas serial peripheral interface is halted.
3	MSTP103	1	R/W	Module Stop 103 When the MSTP103 bit is set to 1, the clock supply to channel 4 of the Renesas serial peripheral interface is halted. 0: Channel 4 of the Renesas serial peripheral interface runs. 1: Clock supply to channel 4 of the Renesas serial peripheral interface is halted.
2	MSTP102	1	R/W	Module Stop 102 When the MSTP102 bit is set to 1, the clock supply to the CD-ROM decoder is halted. 0: The CD-ROM decoder runs. 1: Clock supply to the CD-ROM decoder is halted.
1	MSTP101	1	R/W	Module Stop 101 When the MSTP101 bit is set to 1, the clock supply to the Renesas SPDIF interface is halted. 0: The Renesas SPDIF interface runs. 1: Clock supply to the Renesas SPDIF interface is halted.
0	MSTP100	1	R/W	Module Stop 100*1 When the MSTP100 bit is set to 1, the clock supply to the OpenVG™-compliant Renesas graphics processor is halted. 0: The OpenVG™-compliant Renesas graphics processor runs. 1: Clock supply to the OpenVG™-compliant Renesas graphics processor is halted.

Note 1. The transition to and release from module stop mode proceed in the steps described in section 55.3.5, Module Standby Function.

55.2.11 Standby Control Register 11 (STBCR11)

STBCR11 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 55.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	-	-	MSTP115	MSTP114	MSTP113	MSTP112	MSTP111	MSTP110
Initial value:	1	1	1	1	1	1	1	1
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
5	MSTP115	1	R/W	Module Stop 115 When the MSTP115 bit is set to 1, the clock supply to channel 0 of the serial sound interface is halted. 0: Channel 0 of the serial sound interface runs. 1: Clock supply to channel 0 of the serial sound interface is halted.
4	MSTP114	1	R/W	Module Stop 114 When the MSTP114 bit is set to 1, the clock supply to channel 1 of the serial sound interface is halted. 0: Channel 1 of the serial sound interface runs. 1: Clock supply to channel 1 of the serial sound interface is halted.
3	MSTP113	1	R/W	Module Stop 113 When the MSTP113 bit is set to 1, the clock supply to channel 2 of the serial sound interface is halted. 0: Channel 2 of the serial sound interface runs. 1: Clock supply to channel 2 of the serial sound interface is halted.
2	MSTP112	1	R/W	Module Stop 112 When the MSTP112 bit is set to 1, the clock supply to channel 3 of the serial sound interface is halted. 0: Channel 3 of the serial sound interface runs. 1: Clock supply to channel 3 of the serial sound interface is halted.
1	MSTP111	1	R/W	Module Stop 111 When the MSTP111 bit is set to 1, the clock supply to channel 4 of the serial sound interface is halted. 0: Channel 4 of the serial sound interface runs. 1: Clock supply to channel 4 of the serial sound interface is halted.
0	MSTP110	1	R/W	Module Stop 110 When the MSTP110 bit is set to 1, the clock supply to channel 5 of the serial sound interface is halted. 0: Channel 5 of the serial sound interface runs. 1: Clock supply to channel 5 of the serial sound interface is halted.

55.2.12 Standby Control Register 12 (STBCR12)

STBCR12 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 55.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	-	-	-	-	MSTP123	MSTP122	MSTP121	MSTP120
Initial value:	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
3	MSTP123	1	R/W	Module Stop 123 When the MSTP123 bit is set to 1, the SD host interface 00 is halted. 0: The SD host interface 00 runs. 1: Clock supply to the SD host interface 00 is halted.
2	MSTP122	1	R/W	Module Stop 122 When the MSTP122 bit is set to 1, the SD host interface 01 is halted. 0: The SD host interface 01 runs. 1: Clock supply to the SD host interface 01 is halted.
1	MSTP121	1	R/W	Module Stop 121 When the MSTP121 bit is set to 1, the SD host interface 10 is halted. 0: The SD host interface 10 runs. 1: Clock supply to the SD host interface 10 is halted.
0	MSTP120	1	R/W	Module Stop 120 When the MSTP120 bit is set to 1, the SD host interface 11 is halted. 0: The SD host interface 11 runs. 1: Clock supply to the SD host interface 11 is halted.

Note: For details on this register, see section 50.3.2, Card Detect/Write Protect.

55.2.13 Standby Control Register 13 (STBCR13)

STBCR13 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 55.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	-	-	-	-	-	MSTP132	MSTP131	-
Initial value:	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R/W	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 3	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
2	MSTP132	1	R/W	Module Stop 132 When the MSTP132 bit is set to 1, the clock supply to channel 1 of the pixel format converter is halted. 0: Channel 1 of the pixel format converter runs. 1: Clock supply to channel 1 of the pixel format converter is halted.
1	MSTP131	1	R/W	Module Stop 131 When the MSTP131 bit is set to 1, the clock supply to channel 0 of the pixel format converter is halted. 0: Channel 0 of the pixel format converter runs. 1: Clock supply to channel 0 of the pixel format converter is halted.
0	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.

55.2.14 Software Reset Control Register 1 (SWRSTCR1)

SWRSTCR1 is an 8-bit readable/writable register that controls a software reset for the serial sound interface and the operation of the crystal resonator for audio.

Note: • When writing to this register, see section 55.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	AXTALE	SRST16	SRST15	SRST14	SRST13	SRST12	SRST11	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
7	AXTALE	0	R/W	AUDIO_X1 Clock Control Controls the function of AUDIO_X1 pin. 0: Runs the on-chip crystal oscillator/enables the external clock input. 1: Halts the on-chip crystal oscillator/disables the external clock input.
6	SRST16	0	R/W	Serial Sound Interface Channel 0 Software Reset Controls the serial sound interface channel 0 reset with software. 0: The serial sound interface channel 0 reset is canceled. 1: The serial sound interface channel 0 is reset.
5	SRST15	0	R/W	Serial Sound Interface Channel 1 Software Reset Controls the serial sound interface channel 1 reset with software. 0: The serial sound interface channel 1 reset is canceled. 1: The serial sound interface channel 1 is reset.
4	SRST14	0	R/W	Serial Sound Interface Channel 2 Software Reset Controls the serial sound interface channel 2 reset with software. 0: The serial sound interface channel 2 reset is canceled. 1: The serial sound interface channel 2 is reset.
3	SRST13	0	R/W	Serial Sound Interface Channel 3 Software Reset Controls the serial sound interface channel 3 reset with software. 0: The serial sound interface channel 3 reset is canceled. 1: The serial sound interface channel 3 is reset.
2	SRST12	0	R/W	Serial Sound Interface Channel 4 Software Reset Controls the serial sound interface channel 4 reset with software. 0: The serial sound interface channel 4 reset is canceled. 1: The serial sound interface channel 4 is reset.
1	SRST11	0	R/W	Serial Sound Interface Channel 5 Software Reset Controls the serial sound interface channel 5 reset with software. 0: The serial sound interface channel 5 reset is canceled. 1: The serial sound interface channel 5 is reset.
0	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

55.2.15 Software Reset Control Register 2 (SWRSTCR2)

SWRSTCR2 is an 8-bit readable/writable register that controls a software reset for each module.

Note: • When writing to this register, see section 55.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	SRST21	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	SRST21	0	R/W	JPEG Codec Unit Software Reset Controls the JPEG codec unit reset with software. 0: The JPEG codec unit reset is canceled. 1: The JPEG codec unit is reset.
0	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

55.2.16 Software Reset Control Register 3 (SWRSTCR3)

SWRSTCR3 is an 8-bit readable/writable register that controls a software reset for each module.

Note: • When writing to this register, see section 55.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	-	-	-	-	-	SRST32	-	-
Initial value:	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
6 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	SRST32	0	R/W	OpenVG™-Compliant Renesas Graphics Processor Software Reset Controls the OpenVG™-compliant Renesas graphics processor reset with software. 0: The OpenVG™-compliant Renesas graphics processor reset is canceled. 1: The OpenVG™-compliant Renesas graphics processor is reset.
1, 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

55.2.17 System Control Register 1 (SYSCR1)

SYSCR1 is an 8-bit readable/writable register that enables or disables access (read and write) to a specified page in the large-capacity on-chip RAM.

When a VRAMEn (n = 0 to 4) bit in SYSCR1 is set to 1, access to page n is enabled. When a VRAMEn bit is cleared to 0, page n cannot be accessed. In this case, an undefined value is returned when reading data or fetching an instruction from page n, and writing to page n is ignored. The initial value of a VRAMEn bit is 1.

SYSCR1 should be set with a program located in an area other than the large-capacity on-chip RAM. Furthermore, an instruction to read SYSCR1 should be located immediately after the instruction to write to SYSCR1. If not, normal access is not guaranteed.

Note: • When writing to this register, see section 55.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	-	-	-	VRAME4	VRAME3	VRAME2	VRAME1	VRAME0
Initial value:	1	1	1	1	1	1	1	1
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
4	VRAME4	1	R/W	RAM Enable 4 (corresponding area: page 4*1 in large-capacity on-chip RAM) 0: Access to page 4 is disabled. 1: Access to page 4 is enabled.
3	VRAME3	1	R/W	RAM Enable 3 (corresponding area: page 3*1 in large-capacity on-chip RAM) 0: Access to page 3 is disabled. 1: Access to page 3 is enabled.
2	VRAME2	1	R/W	RAM Enable 2 (corresponding area: page 2*1 in large-capacity on-chip RAM) 0: Access to page 2 is disabled. 1: Access to page 2 is enabled.
1	VRAME1	1	R/W	RAM Enable 1 (corresponding area: page 1*1 in large-capacity on-chip RAM) 0: Access to page 1 is disabled. 1: Access to page 1 is enabled.
0	VRAME0	1	R/W	RAM Enable 0 (corresponding area: page 0*1 in large-capacity on-chip RAM) 0: Access to page 0 is disabled. 1: Access to page 0 is enabled.

Note 1. For addresses in each page, see section 53, On-Chip RAM.

55.2.18 System Control Register 2 (SYSCR2)

SYSCR2 is an 8-bit readable/writable register that enables or disables writing to a specified page in the large-capacity on-chip RAM.

When a VRAMWEn (n = 0 to 4) bit in SYSCR2 is set to 1, writing to page n is enabled. When a VRAMWEn bit is cleared to 0, writing to page n is ignored. The initial value of a VRAMWEn bit is 1.

SYSCR2 should be set with a program located in an area other than the large-capacity on-chip RAM. Furthermore, an instruction to read SYSCR2 should be located immediately after the instruction to write to SYSCR2. If not, normal access is not guaranteed.

Note: • When writing to this register, see section 55.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	-	-	-	VRAMWE4	VRAMWE3	VRAMWE2	VRAMWE1	VRAMWE0
Initial value:	1	1	1	1	1	1	1	1
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
4	VRAMWE4	1	R/W	RAM Write Enable 4 (corresponding area: page 4*1 in large-capacity on-chip RAM) 0: Writing to page 4 is disabled. 1: Writing to page 4 is enabled.
3	VRAMWE3	1	R/W	RAM Write Enable 3 (corresponding area: page 3*1 in large-capacity on-chip RAM) 0: Writing to page 3 is disabled. 1: Writing to page 3 is enabled.
2	VRAMWE2	1	R/W	RAM Write Enable 2 (corresponding area: page 2*1 in large-capacity on-chip RAM) 0: Writing to page 2 is disabled. 1: Writing to page 2 is enabled.
1	VRAMWE1	1	R/W	RAM Write Enable 1 (corresponding area: page 1*1 in large-capacity on-chip RAM) 0: Writing to page 1 is disabled. 1: Writing to page 1 is enabled.
0	VRAMWE0	1	R/W	RAM Write Enable 0 (corresponding area: page 0*1 in large-capacity on-chip RAM) 0: Writing to page 0 is disabled. 1: Writing to page 0 is enabled.

Note 1. For addresses in each page, see section 53, On-Chip RAM.

55.2.19 System Control Register 3 (SYSCR3)

SYSCR3 is an 8-bit readable/writable register that enables or disables writing to a specified page in the on-chip data-retention RAM.

When a RRAMWEn (n = 0 to 3) bit in SYSCR3 is set to 1, writing to page n is enabled. When a RRAMWEn bit is cleared to 0, writing to page n is ignored. The initial value of a RRAMWEn bit is 0.

SYSCR3 should be set with a program located in an area other than the on-chip data-retention RAM.

Note: • When writing to this register, see section 55.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	-	-	-	-	RRAMWE3	RRAMWE2	RRAMWE1	RRAMWE0
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	RRAMWE3	0	R/W	RAM Write Enable 3 (corresponding area: page 3*2 in on-chip data-retention RAM) 0: Writing to page 3 is disabled. 1: Writing to page 3 is enabled.
2	RRAMWE2	0	R/W	RAM Write Enable 2 (corresponding area: page 2*2 in on-chip data-retention RAM) 0: Writing to page 2 is disabled. 1: Writing to page 2 is enabled.
1	RRAMWE1	0	R/W	RAM Write Enable 1 (corresponding area: page 1*2 in on-chip data-retention RAM) 0: Writing to page 1 is disabled. 1: Writing to page 1 is enabled.
0	RRAMWE0	0	R/W	RAM Write Enable 0 (corresponding area: page 0*2 in on-chip data-retention RAM) 0: Writing to page 0 is disabled. 1: Writing to page 0 is enabled.

Note 1. For addresses in each page, see section 53, On-Chip RAM.

Note 2. When the VRAME0 bit in SYSCR1 is cleared to 0 (access to page 0 in large-capacity on-chip RAM is invalid), the on-chip data-retention RAM cannot be accessed (read and written), regardless of the setting of this bit.
When the VRAMWE0 bit in SYSCR2 is cleared to 0 (writing to page 0 in large-capacity on-chip RAM is invalid), the on-chip data-retention RAM cannot be written, regardless of the setting of this bit.

55.2.20 CPU Status Register (CPUSTS)

CPUSTS is an 8-bit readable register that indicates the status of the CPU.

Bit:	7	6	5	4	3	2	1	0
	-	-	-	ISBUSY	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	—	All 0	R	Reserved These bits are always read as 0.
4	ISBUSY	0	R	State during Changing of the Frequency of CPU and Return from Software Standby Indicates that the frequency of CPU is being changed or that return from software standby is in progress. Do not execute a WFI instruction while this bit is 1. 0: The frequency of CPU is not being changed and returning from software standby is not in progress 1: The frequency of CPU is being changed or return from software standby is in progress
3 to 0	—	All 0	R	Reserved These bits are always read as 0.

55.2.21 Standby Request Register 1 (STBREQ1)

This register is used to request notification of whether a CPU or peripheral module is ready for standby. The CPU or peripheral module returns a standby acknowledgement on receipt of a request for notification if it is ready for standby.

Note: • When writing to this register, see section 55.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	-	-	STBRQ15	-	STBRQ13	STBRQ12	-	STBRQ10
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R	R/W	R/W	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	STBRQ15	0	R/W	Standby Request to CoreSight 0: The standby request to CoreSight is invalid. 1: The standby request to CoreSight is valid.*1
4	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
3	STBRQ13	0	R/W	Standby Request to JPEG Codec Unit 0: The standby request to the JPEG codec unit is invalid. 1: The standby request to the JPEG codec unit is valid.*1
2	STBRQ12	0	R/W	Standby Request to EthernetAVB 0: The standby request to the EthernetAVB is invalid. 1: The standby request to the EthernetAVB is valid.*1
1	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
0	STBRQ10	0	R/W	Standby Request to Capture Engine Unit 0: The standby request to the capture engine unit is invalid. 1: The standby request to the capture engine unit is valid.*1

Note 1. When the MSTP bit for the corresponding module is 1, writing 1 to the STBRQ bit has no effect.

55.2.22 Standby Request Register 2 (STBREQ2)

This register is used to request notification of whether a peripheral module is ready for standby. The peripheral module returns a standby acknowledgement on receipt of a request for notification if it is ready for standby.

Note: • When writing to this register, see section 55.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	STBRQ27	STBRQ26	STBRQ25	STBRQ24	STBRQ23	STBRQ22	STBRQ21	STBRQ20
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	STBRQ27	0	R/W	Standby Request to the media local bus 0: The standby request to the media local bus is invalid. 1: The standby request to the media local bus is valid.*1
6	STBRQ26	0	R/W	Standby Request to Ethernet Controller 0: The standby request to the Ethernet controller is invalid. 1: The standby request to the Ethernet controller is valid.*1
5	STBRQ25	0	R/W	Standby Request to Channel 0 of Video Display Controller 5 0: The standby request to channel 0 of the video display controller 5 is invalid. 1: The standby request to channel 0 of the video display controller 5 is valid.*1
4	STBRQ24	0	R/W	Standby Request to Channel 1 of Video Display Controller 5 0: The standby request to channel 1 of the video display controller 5 is invalid. 1: The standby request to channel 1 of the video display controller 5 is valid.*1
3	STBRQ23	0	R/W	Standby Request to Channel 0 of Image Renderer 0: The standby request to channel 0 of the image renderer is invalid. 1: The standby request to channel 0 of the image renderer is valid.*1
2	STBRQ22	0	R/W	Standby Request to Channel 1 of Image Renderer 0: The standby request to channel 1 of the image renderer is invalid. 1: The standby request to channel 1 of the image renderer is valid.*1
1	STBRQ21	0	R/W	Standby Request to Display Image Renderer 0: The standby request to the display image renderer is invalid. 1: The standby request to the display image renderer is valid.*1
0	STBRQ20	0	R/W	Standby Request to OpenVG™-Compliant Renesas Graphics Processor 0: The standby request to the OpenVG™-compliant Renesas graphics processor is invalid. 1: The standby request to the OpenVG™-compliant Renesas graphics processor is valid.*1

Note 1. When the MSTP bit for the corresponding module is 1, writing 1 to the STBRQ bit has no effect.

55.2.23 Standby Acknowledge Register 1 (STBACK1)

This register is used to provide notification that a CPU or peripheral module is in the standby ready state. The CPU or peripheral module returns a standby acknowledgement on reception of a standby notification request if it is ready for standby. This register is a read-only register.

Bit:	7	6	5	4	3	2	1	0
	-	-	STBAK15	-	STBAK13	STBAK12	-	STBAK10
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 0	R	Reserved These bits are always read as 0.
5	STBAK15	0	R	Standby Acknowledgement from CoreSight 0: The standby acknowledgement from CoreSight is invalid. 1: The standby acknowledgement from CoreSight is valid.*1
4	—	0	R	Reserved This bit is always read as 0.
3	STBAK13	0	R	Standby Acknowledgement from JPEG Codec Unit 0: The standby acknowledgement from the JPEG codec unit is invalid. 1: The standby acknowledgement from the JPEG codec unit is valid.*1
2	STBAK12	0	R	Standby Acknowledgement from EthernetAVB 0: The standby acknowledgement from the EthernetAVB is invalid. 1: The standby acknowledgement from the EthernetAVB is valid.*1
1	—	0	R	Reserved This bit is always read as 0.
0	STBAK10	0	R	Standby Acknowledgement from Capture Engine Unit 0: The standby acknowledgement from the capture engine unit is invalid. 1: The standby acknowledgement from the capture engine unit is valid.*1

Note 1. The bits in STBACK1 are set to 1 when a standby acknowledgement is transmitted from the module while the MSTP bit for the corresponding module is set to 0.

55.2.24 Standby Acknowledge Register 2 (STBACK2)

This register is used to provide notification that a peripheral module is in the standby ready state. The peripheral module returns a standby acknowledgement on reception of a standby notification request if it is ready for standby. This register is a read-only register.

Bit:	7	6	5	4	3	2	1	0
	STBAK 27	STBAK 26	STBAK 25	STBAK 24	STBAK 23	STBAK 22	STBAK 21	STBAK 20
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	STBAK27	0	R	Standby Acknowledgement from the media local bus 0: The standby acknowledgement from the media local bus is invalid. 1: The standby acknowledgement from the media local bus is valid.*1
6	STBAK26	0	R	Standby Acknowledgement from Ethernet Controller 0: The standby acknowledgement from the Ethernet controller is invalid. 1: The standby acknowledgement from the Ethernet controller is valid.*1
5	STBAK25	0	R	Standby Acknowledgement from Channel 0 of Video Display Controller 5 0: The standby acknowledgement from channel 0 of the video display controller 5 is invalid. 1: The standby acknowledgement from channel 0 of the video display controller 5 is valid.*1
4	STBAK24	0	R	Standby Acknowledgement from Channel 1 of Video Display Controller 5 0: The standby acknowledgement from channel 1 of the video display controller 5 is invalid. 1: The standby acknowledgement from channel 1 of the video display controller 5 is valid.*1
3	STBAK23	0	R	Standby Acknowledgement from Channel 0 of Image Renderer 0: The standby acknowledgement from channel 0 of the image renderer is invalid. 1: The standby acknowledgement from channel 0 of the image renderer is valid.*1
2	STBAK22	0	R	Standby Acknowledgement from Channel 1 of Image Renderer 0: The standby acknowledgement from channel 1 of the image renderer is invalid. 1: The standby acknowledgement from channel 1 of the image renderer is valid.*1
1	STBAK21	0	R	Standby Acknowledgement from Display Image Renderer 0: The standby acknowledgement from the display image renderer is invalid. 1: The standby acknowledgement from the display image renderer is valid.*1
0	STBAK20	0	R	Standby Acknowledgement from OpenVG™-Compliant Renesas Graphics Processor 0: The standby acknowledgement from the OpenVG™-compliant Renesas graphics processor is invalid. 1: The standby acknowledgement from the OpenVG™-compliant Renesas graphics processor is valid.*1

Note 1. The bits in STBACK2 are set to 1 when a standby acknowledgement is transmitted from the module while the MSTP bit for the corresponding module is set to 0.

55.2.25 On-Chip Data-Retention RAM Area Setting Register (RRAMKP)

RRAMKP is an 8-bit readable/writable register that selects whether the contents of the corresponding area of the on-chip data-retention RAM are retained or not in deep standby mode.

When the RRAMKP3 to RRAMKP0 bits are set to 1, the contents of the corresponding area of the on-chip data-retention RAM are retained in deep standby mode. When these bits are cleared to 0, the contents of the corresponding area of the on-chip data-retention RAM are not retained in deep standby mode.

Note: • When writing to this register, see section 55.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	-	-	-	-	RRAMKP3	RRAMKP2	RRAMKP1	RRAMKP0
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	RRAMKP3	0	R/W	On-Chip Data-Retention RAM Storage Area 3 (corresponding area: page 3*1 in on-chip data-retention RAM) 0: The contents of the on-chip data-retention RAM are not retained in deep standby mode. 1: The contents of the on-chip data-retention RAM are retained in deep standby mode.
2	RRAMKP2	0	R/W	On-Chip Data-Retention RAM Storage Area 2 (corresponding area: page 2*1 in on-chip data-retention RAM) 0: The contents of the on-chip data-retention RAM are not retained in deep standby mode. 1: The contents of the on-chip data-retention RAM are retained in deep standby mode.
1	RRAMKP1	0	R/W	On-Chip Data-Retention RAM Storage Area 1 (corresponding area: page 1*1 in on-chip data-retention RAM) 0: The contents of the on-chip data-retention RAM are not retained in deep standby mode. 1: The contents of the on-chip data-retention RAM are retained in deep standby mode.
0	RRAMKP0	0	R/W	On-Chip Data-Retention RAM Storage Area 0 (corresponding area: page 0*1 in on-chip data-retention RAM) 0: The contents of the on-chip data-retention RAM are not retained in deep standby mode. 1: The contents of the on-chip data-retention RAM are retained in deep standby mode.

Note 1. For addresses in each page, see section 53, On-Chip RAM.

55.2.26 Deep Standby Control Register (DSCTR)

DSCTR is an 8-bit readable/writable register that selects whether the states of the external memory control pins are retained or not when returning from deep standby mode and specifies the method to start the LSI.

Note: • When writing to this register, see section 55.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	EBUSKEEPE	RAMBOOT	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	EBUSKEEPE	0	R/W	Retention of External Memory Control Pin State 0: The state of the external memory control pins is not retained when returning from deep standby mode. 1: The state of the external memory control pins is retained when returning from deep standby mode. Note: The following setting is prohibited: (EBUSKEEPE, RAMBOOT) = (1, 0).
6	RAMBOOT	0	R/W	Selection of Method after Returning from Deep Standby Mode Selects an activation method after returning from deep standby mode. 0: Activated according to the boot mode specified for a reset. 1: The program is read from the on-chip data-retention RAM. Instruction fetch from H'20000000 Note: The following setting is prohibited: (EBUSKEEPE, RAMBOOT) = (1, 0).
5 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

55.2.27 Deep Standby Cancel Source Select Register (DSSSR)

DSSSR is a 16-bit readable/writable register that consists of the bits for selecting a source to cancel deep standby mode. The realtime clock alarm interrupt or change on the pins for canceling (P2_12, P2_15, P3_1, P3_3, P3_9, P5_9, P6_2, P6_4, P7_8, P8_2, P8_7, and P9_1) can be selected as a cancel source. The pins for canceling can be used for canceling deep standby, regardless of pin function settings in the general I/O port.

Note: • When writing to this register, see section 55.4, Usage Notes.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	P6_2	P3_9	P3_1	P2_12	P8_7	P3_3	NMI	-	RTCAR	P6_4	P5_9	P7_8	P2_15	P9_1	P8_2

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14	P6_2	0	R/W	Cancel by Change on P6_2 0: Deep standby mode is not canceled by change on the P6_2 pin. 1: Deep standby mode is canceled by change on the P6_2 pin.
13	P3_9	0	R/W	Cancel by Change on P3_9 0: Deep standby mode is not canceled by change on the P3_9 pin. 1: Deep standby mode is canceled by change on the P3_9 pin.
12	P3_1	0	R/W	Cancel by Change on P3_1 0: Deep standby mode is not canceled by change on the P3_1 pin. 1: Deep standby mode is canceled by change on the P3_1 pin.
11	P2_12	0	R/W	Cancel by Change on P2_12 0: Deep standby mode is not canceled by change on the P2_12 pin. 1: Deep standby mode is canceled by change on the P2_12 pin.
10	P8_7	0	R/W	Cancel by Change on P8_7 0: Deep standby mode is not canceled by change on the P8_7 pin. 1: Deep standby mode is canceled by change on the P8_7 pin.
9	P3_3	0	R/W	Cancel by Change on P3_3 0: Deep standby mode is not canceled by change on the P3_3 pin. 1: Deep standby mode is canceled by change on the P3_3 pin.
8	NMI	0	R/W	Cancel by Change on NMI 0: Deep standby mode is not canceled by change on the NMI pin. 1: Deep standby mode is canceled by change on the NMI pin.
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6	RTCAR	0	R/W	Cancel by Realtime Clock Alarm Interrupt 0: Deep standby mode is not canceled by a realtime clock alarm interrupt. 1: Deep standby mode is canceled by a realtime clock alarm interrupt.
5	P6_4	0	R/W	Cancel by Change on P6_4 0: Deep standby mode is not canceled by change on the P6_4 pin. 1: Deep standby mode is canceled by change on the P6_4 pin.
4	P5_9	0	R/W	Cancel by Change on P5_9 0: Deep standby mode is not canceled by change on the P5_9 pin. 1: Deep standby mode is canceled by change on the P5_9 pin.
3	P7_8	0	R/W	Cancel by Change on P7_8 0: Deep standby mode is not canceled by change on the P7_8 pin. 1: Deep standby mode is canceled by change on the P7_8 pin.
2	P2_15	0	R/W	Cancel by Change on P2_15 0: Deep standby mode is not canceled by change on the P2_15 pin. 1: Deep standby mode is canceled by change on the P2_15 pin.
1	P9_1	0	R/W	Cancel by Change on P9_1 0: Deep standby mode is not canceled by change on the P9_1 pin. 1: Deep standby mode is canceled by change on the P9_1 pin.

Bit	Bit Name	Initial Value	R/W	Description
0	P8_2	0	R/W	Cancel by Change on P8_2 0: Deep standby mode is not canceled by change on the P8_2 pin. 1: Deep standby mode is canceled by change on the P8_2 pin.

55.2.28 Deep Standby Cancel Edge Select Register (DSESR)

DSESR is a 16-bit readable/writable register that consists of the bits for selecting an edge to be detected for the pin specified as a deep standby cancel source with DSSSR. This register setting is always valid for canceling deep standby, regardless of the interrupt controller setting.

Note: • When writing to this register, see section 55.4, Usage Notes.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	P6_2E	P3_9E	P3_1E	P2_12E	P8_7E	P3_3E	NMIE	-	-	P6_4E	P5_9E	P7_8E	P2_15E	P9_1E	P8_2E

55.2.29 Deep Standby Cancel Source Flag Register (DSFR)

DSFR is a 16-bit readable/writable register composed of two types of bits. One is the flag that confirms which source canceled deep standby mode. The other is the bit that releases the state of pins after canceling deep standby mode. When deep standby mode is canceled by an interrupt (NMI or realtime clock alarm interrupt) and changes on the pins for canceling, this register retains the previous data although power-on reset exception handling is executed. When deep standby mode is canceled by a power-on reset, this register is initialized to H'0000.
All flags must be cleared immediately before transition to deep standby mode.

Note: • When writing to this register, see section 55.4, Usage Notes.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	IO KEEP	P6_2F	P3_9F	P3_1F	P2_12F	P8_7F	P3_3F	NMIF	-	RTC ARF	P6_4F	P5_9F	P7_8F	P2_15F	P9_1F	P8_2F
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*

Note: * Only 0 can be written after reading 1 to clear the flag.

Bit	Bit Name	Initial Value	R/W	Description
15	IOKEEP	0	R/(W)*1	Release of Pin State Retention Releases the retention of the pin state after canceling deep standby mode 0: Pin state not retained [Clearing condition] • Writing 0 after reading 1 1: Pin state retained [Setting condition] • When deep standby mode is entered
14	P6_2F	0	R/(W)*1	P6_2 Flag 0: No change on the P6_2 pin 1: Change on the P6_2 pin
13	P3_9F	0	R/(W)*1	P3_9 Flag 0: No change on the P3_9 pin 1: Change on the P3_9 pin
12	P3_1F	0	R/(W)*1	P3_1 Flag 0: No change on the P3_1 pin 1: Change on the P3_1 pin
11	P2_12F	0	R/(W)*1	P2_12 Flag 0: No change on the P2_12 pin 1: Change on the P2_12 pin
10	P8_7F	0	R/(W)*1	P8_7 Flag 0: No change on the P8_7 pin 1: Change on the P8_7 pin
9	P3_3F	0	R/(W)*1	P3_3 Flag 0: No change on the P3_3 pin 1: Change on the P3_3 pin
8	NMIF	0	R/(W)*1	NMI Flag 0: No interrupt on NMI pin 1: Interrupt on NMI pin
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6	RTCARF	0	R/(W)*1	RTCAR Flag 0: No realtime clock alarm interrupt generated 1: Realtime clock alarm Interrupt generated
5	P6_4F	0	R/(W)*1	P6_4 Flag 0: No change on the P6_4 pin 1: Change on the P6_4 pin

Bit	Bit Name	Initial Value	R/W	Description
4	P5_9F	0	R/(W)*1	P5_9 Flag 0: No change on the P5_9 pin 1: Change on the P5_9 pin
3	P7_8F	0	R/(W)*1	P7_8 Flag 0: No change on the P7_8 pin 1: Change on the P7_8 pin
2	P2_15F	0	R/(W)*1	P2_15 Flag 0: No change on the P2_15 pin 1: Change on the P2_15 pin
1	P9_1F	0	R/(W)*1	P9_1 Flag 0: No change on the P9_1 pin 1: Change on the P9_1 pin
0	P8_2F	0	R/(W)*1	P8_2 Flag 0: No change on the P8_2 pin 1: Change on the P8_2 pin

Note 1. Only 0 can be written after reading 1 to clear the flag.

55.2.30 XTAL Crystal Oscillator Gain Control Register (XTALCTR)

XTALCTR is an 8-bit readable/writable register that controls the gain of the crystal oscillator for XTAL and the realtime clock.

If the realtime clock uses the EXTAL input, the GAIN0 bit retains the previous value when software standby mode or deep standby mode is canceled by a source other than a power-on reset. If the realtime clock does not use the EXTAL input, this bit is initialized to 0 when software standby or deep standby mode is entered.

If the realtime clock uses the RTC_X1 or RTC_X3 input, the GAIN1 bit retains the previous value when software standby mode or deep standby mode is canceled by a source other than a power-on reset. If the realtime clock does not use the RTC_X1 or RTC_X3 input, this bit is initialized to 0 when software standby or deep standby mode is entered.

This bit is initialized to H'00 when software standby or deep standby mode is canceled by a power-on reset.

Note: • When writing to this register, see section 55.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	GAIN1	GAIN0
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	GAIN1	0	R/W	Realtime Clock Crystal Oscillator (RTC_X3 or RTC_X4 Pin) Gain Select 0: Large gain 1: Small gain
0	GAIN0	0	R/W	XTAL Crystal Oscillator (EXTAL or XTAL Pin) Gain Select 0: Large gain 1: Small gain

55.3 Operation

55.3.1 Sleep Mode

(1) Transition to Sleep Mode

When causing the device to make a transition from the program execution state to sleep mode, follow procedure (a) or (b) depending on the condition described following the description of the procedures.

(a) Execute the WFI instruction while the STBY bit in STBCR1 is 0.
(b) While the STBY bit in STBCR1 is 0 and bits I and F in the current program status register (CPSR) corresponding to the interrupt source to trigger release from the sleep mode are 0 (mask disabled), execute the following three instructions in the given sequence: SEV, WFE, and WFE.

When the following condition is met, follow procedure (b) and do not use the WFI instruction other than to initiate a transition to software standby or deep standby.

- Software standby is also being used.
- When software standby is not being used, deep standby is being used, and the procedure (a) in 55.3.4 (1) Transition to Deep Standby Mode is followed to initiate the transition to deep standby.

Although the CPU halts immediately after a transition to the sleep mode, the contents of its internal registers remain unchanged. The on-chip peripheral modules continue to run. The clock output from the CKIO pin is continued.

Note: • When writing to STBCR1 register, see section 55.4, Usage Notes.

(2) Canceling Sleep Mode

Sleep mode is canceled by an interrupt (NMI, IRQ, and on-chip peripheral module) or a power-on reset.

- Canceling by an interrupt
  When an NMI, IRQ, or on-chip peripheral module interrupt occurs, sleep mode is canceled and interrupt exception handling is executed. When the priority level of the generated interrupt is lower than the setting of the interrupt controller execution priority register, or the interrupt by the on-chip peripheral module is disabled on the module side, the interrupt request is not accepted and sleep mode is not canceled. When procedure (a) in 55.3.1 (1) Transition to Sleep Mode is followed and an interrupt request occurs with an interrupt masked by bits 6 (the FIQ mask bit) and 7 (the IRQ mask bit) in the CPSR register in the CPU, sleep mode is canceled but interrupt exception handling is not executed.
- Canceling by a reset
  Sleep mode is canceled by a power-on reset.

55.3.2 Software Standby Mode

(1) Transition to Software Standby Mode

The LSI switches from a program execution state to software standby mode by executing the WFI instruction when the STBY bit and DEEP bit in STBCR1 are 1 and 0 respectively. In software standby mode, not only the CPU but also the clock and on-chip peripheral modules halt. The clock output from the CKIO pin also stops.
The contents of the CPU and cache registers remain unchanged. Some registers of on-chip peripheral modules are, however, initialized. As for the states of on-chip peripheral module registers in software standby mode, see section 58.3, Register States.
The CPU takes one cycle to finish writing to STBCR1, and then executes processing for the next instruction. However, it takes one or more cycles to actually write. Therefore, execute a WFI instruction after reading STBCR1 to have the values written to STBCR1 by the CPU to be definitely reflected in the WFI instruction.
After a WFI instruction is issued, the hardware automatically stops the bus master following the wait for completion of the issuing-finished request from the bus master and the transition to software standby proceeds.
Since the transition to software standby is not possible if completion of the issuing-finished request is not possible at this time, do not proceed with access to the registers of modules in the module-standby state and so on.
Furthermore, as the issuing of unintended requests by the bus master is inhibited, using software to stop all bus masters in preparation for the procedure for the transition to software standby is also effective.

The procedure for switching to software standby mode is as follows:

1. Set the standby_mode_en bit of the power control register in the PL310 to 1. For the details of this register, see CoreLink Level 2 Cache Controller L2C-310 Technical Reference Manual issued by Arm Ltd.
2. Clear the TME bit in the watchdog timer control/status register (WTCSR) of the watchdog timer to 0 to stop the watchdog timer.
3. Set the CKS[2:0] bits of the WTCSR register and the watchdog timer counter (WTCNT) to appropriate values so that the watchdog timer overflow period will be at least the oscillation settling time on return from standby.
4. After setting the STBY and DEEP bits in STBCR1 to 1 and 0 respectively, read STBCR1. Then, execute a WFI instruction.

(2) Canceling Software Standby Mode

Software standby mode is canceled by interrupts (NMI or IRQ) or a reset (power-on reset). Clock signal starts to be output from the CKIO pin.

- Canceling by an interrupt
  When the falling edge or rising edge of the NMI pin (selected by the NMI edge select bit (NMIE) in the interrupt control register 0 (ICR0) of the interrupt controller) or the falling edge or rising edge of an IRQ pin (IRQ7 to IRQ0) (selected by the IRQn sense select bits (IRQn1S and IRQn0S) in interrupt control register 1 (ICR1) of the interrupt controller) is detected, clock oscillation is started. This clock pulse is supplied only to the oscillation settling counter (watchdog timer) used to count the oscillation settling time.
  After the elapse of the time set in the clock select bits (CKS[2:0]) in the watchdog timer control/status register (WTCSR) of the watchdog timer before the transition to software standby mode, the watchdog timer overflow occurs. Since this overflow indicates that the clock has been stabilized, the clock pulse will be supplied to the entire chip after this overflow. Software standby mode is thus cleared and NMI interrupt exception handling (IRQ interrupt exception handling in case of IRQ) is started. If the priority level of the generated interrupt is lower than the setting of the interrupt controller execution priority register, the interrupt request is not accepted and sleep mode is entered. So, cancel software standby mode by an interrupt whose priority level is higher than the setting of the interrupt controller execution priority register.
  When canceling software standby mode by the NMI interrupt or IRQ interrupt, set the CKS[2:0] bits so that the watchdog timer overflow period will be equal to or longer than the oscillation settling time.
  The clock output phase of the CKIO pin may be unstable immediately after detecting an interrupt and until software standby mode is canceled.

- Canceling by a reset
  When the $\overline{\text{RES}}$ pin is driven low, software standby mode is canceled and the LSI enters the power-on reset state. After that, if the $\overline{\text{RES}}$ pin is driven high, the power-on reset exception handling is started.
  Keep the $\overline{\text{RES}}$ pin low until the clock oscillation settles. The internal clock will continue to be output to the CKIO pin.

(3) Note on Transition to Software Standby Mode

Release from software standby mode is triggered by interrupts (NMI or IRQ) or a power-on reset. If, however, a WFI instruction and an interrupt other than NMI and IRQ are generated at the same time, software standby mode may be canceled due to acceptance of the interrupt.
When initiating a transition to software standby mode, make settings so that interrupts other than NMI and IRQ are not generated before execution of the WFI instruction.

(4) Note on Canceling Software Standby Mode

After software standby mode is canceled, unstable clock pulses are output from the CKIO pin during oscillation settling time. To prevent malfunction due to the unstable pulses, the CKOEN[1:0] bits in FRQCR should be modified.

55.3.3 Software Standby Mode Application Example

This example describes a transition to software standby mode on the falling edge of the NMI signal, and cancellation on the rising edge of the NMI signal. The timing is shown in Figure 55.2.
When the NMI pin is changed from high to low level while the NMI edge select bit (NMIE) in the interrupt control register 0 (ICR0) is set to 0 (falling edge detection), the NMI interrupt is accepted. When the NMIE bit is set to 1 (rising edge detection) by the NMI exception service routine, the STBY and DEEP bits in STBCR1 are set to 1 and 0 respectively, and a WFI instruction is executed, software standby mode is entered. Thereafter, software standby mode is canceled when the NMI pin is changed from low to high level.

Note: • When writing to STBCR1 register, see section 55.4, Usage Notes.

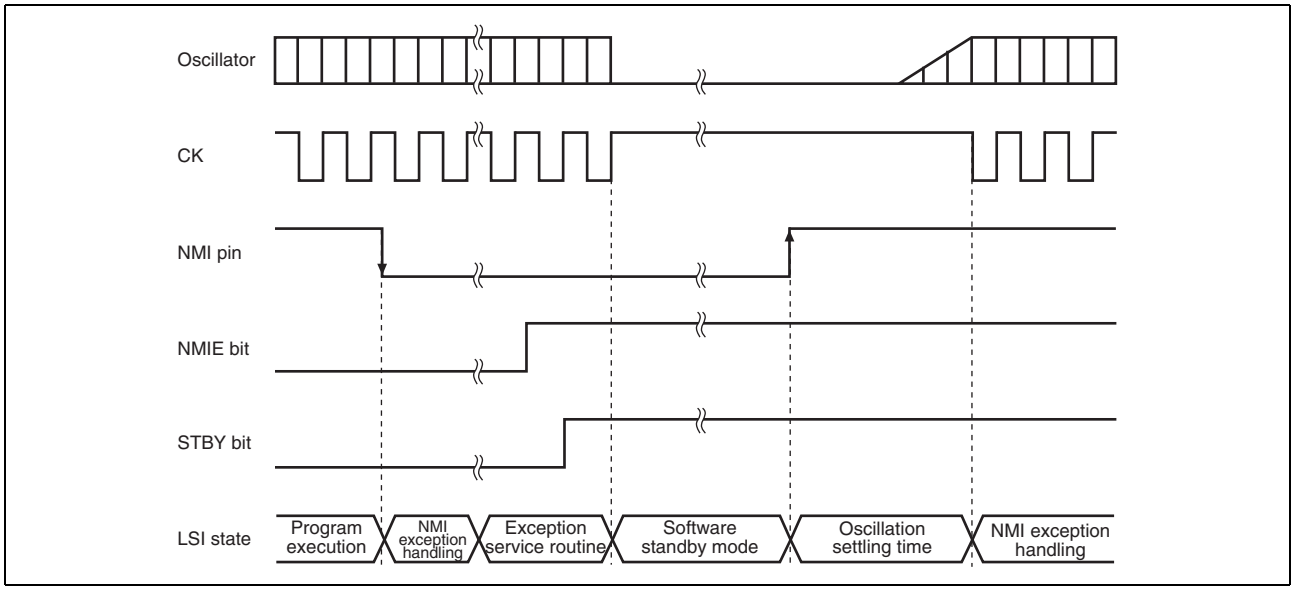

Figure 55.2 NMI Timing in Software Standby Mode (Application Example)

55.3.4 Deep Standby Mode

(1) Transition to Deep Standby Mode

The LSI switches from a program execution state to deep standby mode by executing the WFI instruction when the STBY bit and DEEP bit in STBCR1 are set to 1. In deep standby mode, not only the CPU, clocks, and on-chip peripheral modules but also power supply is turned off excluding the on-chip data-retention RAM area specified by the RRAMKP3 to RRAMKP0 bits in RRAMKP and realtime clock. This can significantly reduce power consumption. Therefore, data in the registers of the CPU, cache, and on-chip peripheral modules are not retained. Pin state values immediately before the transition to deep standby mode are retained.
The CPU takes one cycle to finish writing to STBCR1, and then executes processing for the next instruction. However, it actually takes one or more cycles to write. Therefore, execute a WFI instruction after reading STBCR1 to reflect the values written to STBCR1 by the CPU in the WFI instruction without fail.
After a WFI instruction is issued, the hardware automatically stops the bus master following the wait for completion of the issuing-finished request from the bus master and the transition to deep standby proceeds.
Since the transition to deep standby is not possible if completion of the issuing-finished request is not possible at this time, do not proceed with access to the registers of modules in the module-standby state and so on.
Furthermore, as the issuing of unintended requests by the bus master is inhibited, using software to stop all bus masters in preparation for the procedure for the transition to deep standby is also effective.

The procedure for switching to deep standby mode is as follows. Figure 55.3 also shows its flowchart.

1. Set the standby_mode_en bit of the power control register in the PL310 to 1. For the details of this register, see CoreLink Level 2 Cache Controller L2C-310 Technical Reference Manual issued by Arm Ltd.
2. Set the RRAMKP3 to RRAMKP0 bits in RRAMKP for the corresponding on-chip data-retention RAM area that must be retained. Transfer the programs to be retained to the specified areas of the on-chip data-retention RAM.
3. Set the RAMBOOT and EBUSKEEPE bits in DSCTR to specify the activation method for returning from deep standby mode and to select whether the external memory control pin status is retained or not.
4. When canceling deep standby mode by an interrupt, set the corresponding bit in DSSSR to select the pin or source to cancel deep standby mode. In this case, specify the input signal detection mode for the selected pin with the corresponding bit in DSESR.
5. Execute read and write of an arbitrary but the same address for each page in the on-chip data-retention RAM area. When this is not executed, data last written may not be written to the on-chip data-retention RAM. If there is a write to the on-chip data-retention RAM after this time, execute this processing after the last write to the on-chip data-retention RAM.

The procedures for steps 6 to 8 are as listed under (a) or (b), and which procedure is correct depends on the condition described after the procedures.

(a)

6. Set the STBY and DEEP bits in the STBCR1 register to 1, and then read this register.
7. Clear the flag in the DSFR register.
8. Set the CPU interface control register (ICCICR) of the interrupt controller to 0 so that the CPU is not notified of interrupts other than NMIs. Then, read the ICCICR register.

(b)

6. Clear the flag in the DSFR register.
7. Set the CPU interface control register (ICCICR) of the interrupt controller to 0 so that the CPU is not notified of interrupts other than NMIs. Then, read the ICCICR register.
8. Set the STBY and DEEP bits in the STBCR1 register to 1, and then read this register.

When the condition below is met, follow procedure (b).

- Software standby is not being used, the sleep mode is being used, and procedure (a) in section 55.3.1 (1) Transition to Sleep Mode is followed to initiate the transition to sleep mode.

9. Execute the WFI instruction.
10. The conflict between the instruction and the NMI interrupt may prevent transition to deep standby mode. After executing the WFI instruction, locate the branch instruction to return to step 9.

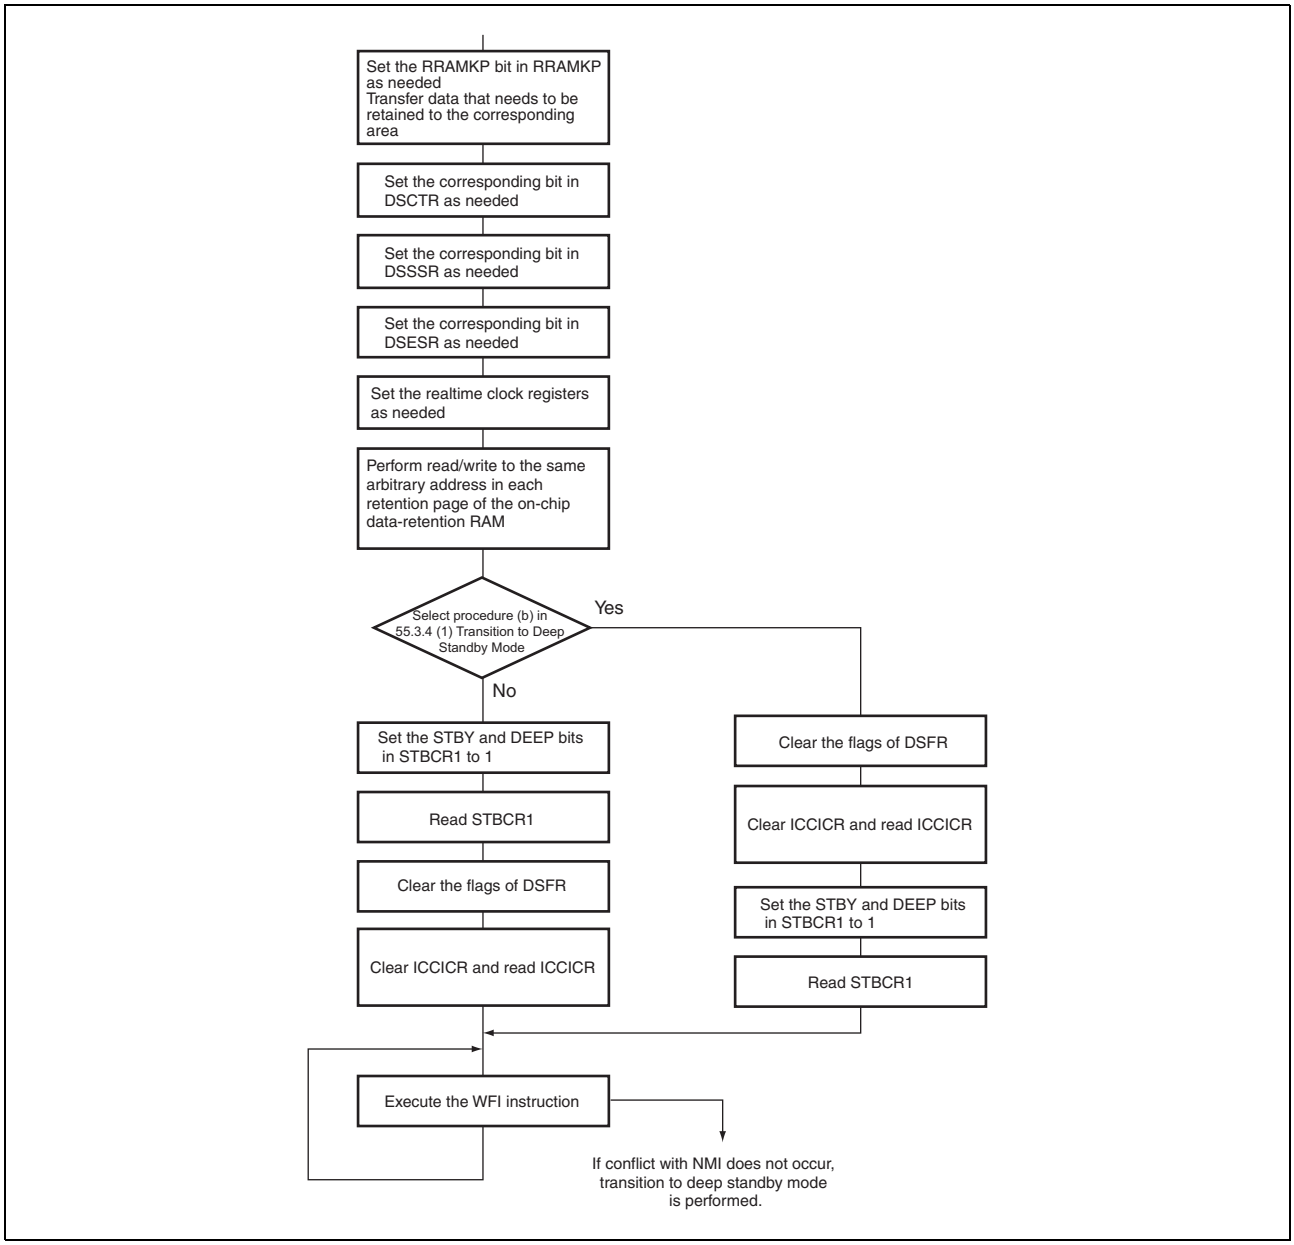

Figure 55.3 Flowchart of Transition to Deep Standby Mode

(2) Canceling Deep Standby Mode

Deep standby mode is canceled by interrupts (NMI or realtime clock alarm interrupt), change on the pins for canceling, or a reset (power-on reset). The realtime clock alarm interrupt can always cancel deep standby mode regardless of the setting of the execution priority register for the interrupt controller and of the alarm interrupt enable flag (RCR1.AIE). This interrupt can also always cancel this mode do regardless of the states of bit 6 (the FIQ mask bit) and bit 7 (the IRQ mask bit) in the CPSR register of the CPU. When canceling the mode by a source other than a reset, a power-on reset exception handling is executed instead of an interrupt exception handling.
Figure 55.4 shows the flowchart of canceling deep standby mode.

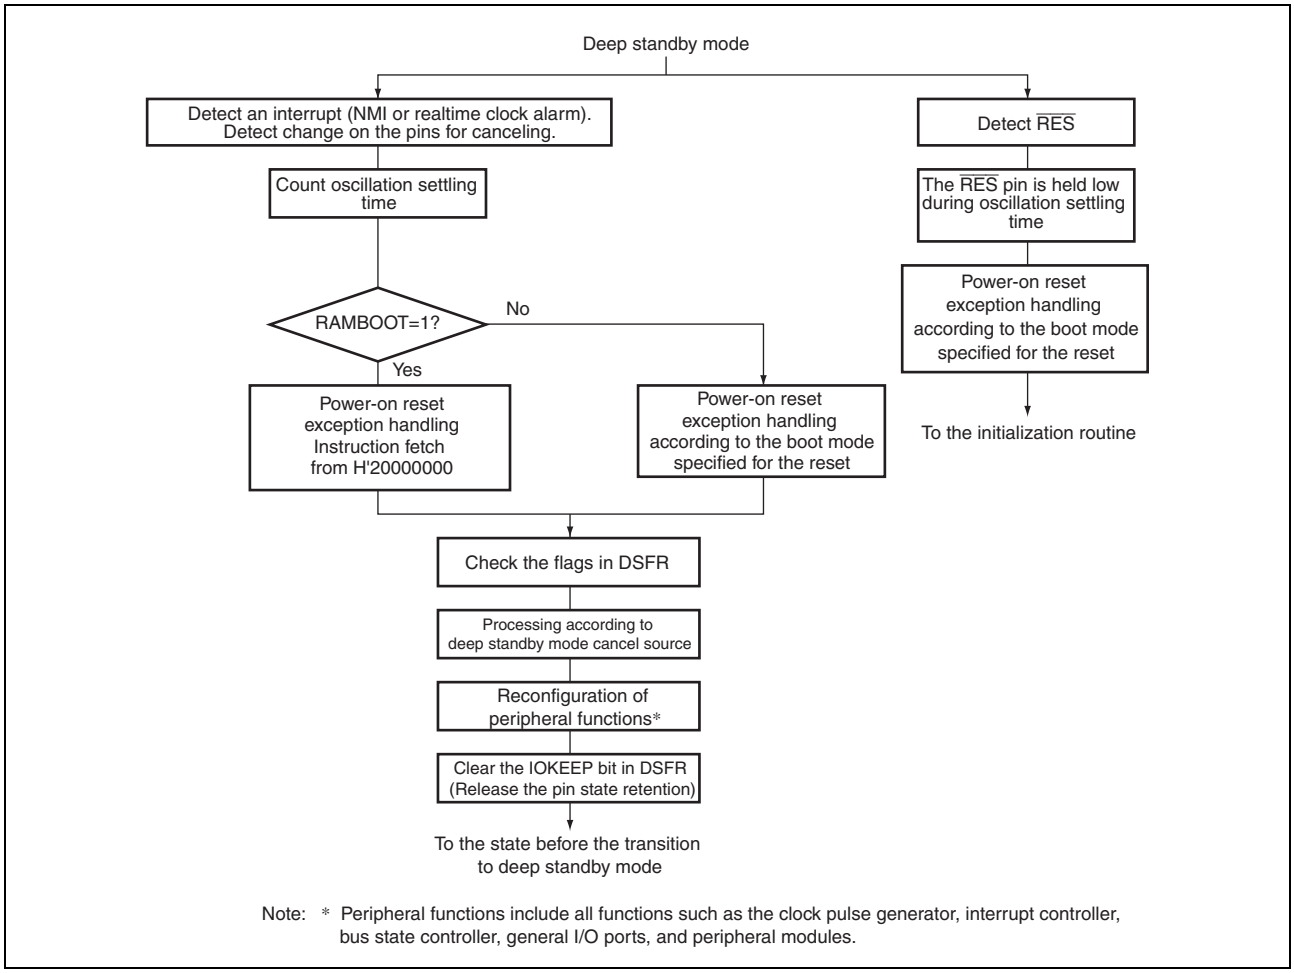

Figure 55.4 Flowchart of Canceling Deep Standby Mode

- Canceling by a source other than a reset
  When the falling or rising edge of the NMI pin (selected by a corresponding bit in DSESR) or falling or rising edge of the pins for canceling (selected by a corresponding bit in DSESR) is detected or the realtime clock alarm interrupt (see section 13.4.4, Alarm Function) is generated, clock oscillation is started after the wait time for the oscillation settling time. After the oscillation settling time has elapsed, deep standby mode is cancelled and the power-on reset exception handling is executed.
  The clock output phase of the CKIO pin may be unstable immediately after detecting a cancel source and until deep standby mode is canceled.
  The detecting of the NMI pin, the pins for canceling, and the realtime clock alarm interrupt becomes enable when the corresponding bits in DSSSR are set. The detected cancel sources are kept, but they are reflected to DSFR after canceling the deep standby mode. When the CPU accepts any interrupts and reads the interrupt response register (ICCIAR), all of the cancel sources that are kept are cleared. When the CPU enters the deep standby mode as the

detected cancel sources are kept, the deep standby mode is canceled immediately after the CPU enters the deep standby mode.

- Canceling with a reset
  Driving the $\overline{\text{RES}}$ pin low cancels deep standby mode and causes a transition to the power-on reset state. After this, driving the $\overline{\text{RES}}$ pin high initiates power-on reset exception handling. Output of the internal clock from the CKIO pin also starts by driving the $\overline{\text{RES}}$ pin low.
  Keep the $\overline{\text{RES}}$ pin low until the clock oscillation has settled.

(3) Operation after Canceling Deep Standby Mode

After canceling deep standby mode, the LSI can be activated through the external memory or from the on-chip data-retention RAM, which can be selected by setting the RAMBOOT bit in DSCTR. By setting the EBUSKEEPE bit, the states of the external memory control pins can be retained even after cancellation of deep standby mode. Table 55.3 shows the pin states after cancellation of deep standby mode according to the setting of each bit. Table 55.4 lists the external memory control pins.

Table 55.3 Pin States after Cancellation of Deep Standby Mode and System Activation Method by the DSCTR Settings

EBUSKEEPE Bit	RAMBOOT Bit	Activation Method	Pin States After Cancellation of Deep Standby Mode
0	0	External memory	The states of the external memory control pins are not retained. For other pins, the retention of their states is cancelled when the IOKEEP bit is cleared.
0	1	On-chip data-retention RAM	The states of the external memory control pins are not retained. After cancellation of deep standby mode, the retention of the external memory control pin states is cancelled. For other pins, the retention of their states is cancelled when the IOKEEP bit is cleared.
1	0	—	Setting prohibited.
1	1	On-chip data-retention RAM	The states of the external memory control pin are retained. The retention of the states of the external memory control pins and other pins is cancelled when the IOKEEP bit is cleared.

Table 55.4 External Memory Control Pins in Different Modes

Boot Mode 0 (CS0 Area: Bus Width: 16 Bits)	Boot Mode 1 (CS0 Area: Bus Width: 32 Bits)	Boot Mode 3 (Serial Flash Boot)	Boot Mode 4 (eSD Boot)	Boot Mode 5 (eMMC Boot)
A[20:1] D[15:0] $\overline{\text{CS0}}$, $\overline{\text{RD}}$, CKIO	A[20:2] D[31:0] $\overline{\text{CS0}}$, $\overline{\text{RD}}$, CKIO	SPBCLK_0, SPBSSL_0, SPBMO0_0, SPBMI0_0	SD_CLK_0, SD_CMD_0, SD_D[3:0]_0	MMC_CLK, MMC_CMD, MMC_D[3:0]

When deep standby mode is canceled by interrupts (NMI or realtime clock alarm) or changes on the pins for canceling, the deep standby cancel source flag register (DSFR) can be used to confirm which source has canceled the mode.
Pins retain the state immediately before the transition to deep standby mode. However, in system activation through the external memory, the retention of the states of the external memory control pins is cancelled so that programs can be fetched after cancellation of deep standby mode. Other pins, after cancellation of deep standby mode, continue to retain the pin states until writing 0 to the IOKEEP bit in DSFR after reading 1 from the same bit. In system activation from the on-chip data-retention RAM, after cancellation of deep standby mode, both the external memory control pins and other pins continues to retain the pin states until writing 0 to the IOKEEP bit in DSFR after reading 1 from the same bit.
Reconfiguration of peripheral functions is required to return to the previous state of deep standby mode. Peripheral functions include all functions such as the clock pulse generator, interrupt controller, general I/O ports, and peripheral modules. After the reconfiguration, the retention of the pin state can be canceled and the LSI returns to the state prior to the transition to deep standby mode by reading 1 from the IOKEEP bit in DSFR and then writing 0 to it.

(4) Notes on Transition to Deep Standby Mode

If multiple canceling sources have been specified and multiple canceling sources are input, multiple cancel source flags will be set.

55.3.5 Module Standby Function

(1) Transition to Module Standby Function

Setting an MSTP bit in a standby control register to 1 halts supply of the clock signal to the corresponding on-chip peripheral module. This function can be used to reduce power consumption both while a program is running and in sleep mode. Disable a module before placing it in the module standby state. If interrupt requests are enabled, set the respective register in the target module or in the interrupt controller to disable interrupt requests. If DMA transfer requests are enabled, set the respective register in the target module to disable DMA transfer requests from the module and then set the respective register in the direct memory access controller to stop DMA transfers. In addition, do not attempt to access a module's registers while it is in the module standby state. The procedure for transitions to the module standby state depends on whether the STBREQ register has a bit for the corresponding module.

(a) Procedure for transition to module standby of modules for which the STBREQ register does not have a corresponding bit

1. Set the MSTP bit of the corresponding module to 1.

(b) Procedure for transition to module standby of modules for which the STBREQ register has a corresponding bit

1. Set the corresponding bit in the STBREQ register to 1 to generate a request to stop the module.
2. Confirm that the module is ready to be stopped by the corresponding bit in the STBACK register being set to 1.
3. Set the MSTP bit of the corresponding module to 1.

For states of registers in the module standby function, see section 58.3, Register States.

(2) Canceling Module Standby Function

Release from the module standby state can be achieved in two ways: starting the module by a power-on reset while the MSTP bit is set to 1, then clearing the MSTP bit to 0, or setting the MSTP bit to 0 to activate the module, setting the MSTP bit to 1 to place the module in the standby state, and then setting the MSTP bit to 0 again. If you use the latter approach, the procedure for release from module standby depends on whether the STBREQ register has a bit for the corresponding module.

- Release from the module standby state after the activation of the module by a power-on reset while the MSTP bit is set to 1

1. Clear the MSTP bit to 0.
2. After that, dummy-read the same register.

- Release from the module standby state after a transition to standby following activation of the module

(a) Procedure for release from module standby of modules for which the STBREQ register does not have a corresponding bit

1. Clear the MSTP bit to 0, then dummy-read the same register.

(b) Procedure for release from module standby of modules for which the STBREQ register has a corresponding bit

1. Clear the MSTP bit to 0, then dummy-read the same register.
2. Clear the corresponding bit in the STBREQ register to 0 to cancel the request to stop the module.
3. Confirm that the corresponding bit in the STBACK register has been cleared to 0, indicating the completion of release from standby.

55.3.6 Software Reset

Initialization equivalent to a power-on reset is only applied to the selected modules. The procedure for transitions to the software reset state varies according to whether the STBREQ register has a bit for the corresponding module. Follow the procedures below according to whether this is or is not the case. If DMA transfer requests are enabled, make the settings to stop the DMA transaction for the corresponding channel before transitions to the software reset state. For stopping the DMA transaction, see section 9.7.11, Transfer Status.

(1) Transition to Software Reset State

(a) Procedure for transition to the software reset state of modules for which the STBREQ register does not have a corresponding bit

1. Set the SRST bit of the corresponding module to 1, then dummy-read the same register.

(b) Procedure for transition to the software reset state of modules for which the STBREQ register has a corresponding bit

1. Set the corresponding bit in the STBREQ register to 1 to generate a request to stop the module.
2. Confirm that the corresponding bit in the STBACK register has been set to 1.
3. Set the SRST bit of the corresponding module to 1, then dummy-read the same register.

(2) Canceling Software Reset

(a) Procedure for release from the software reset state of modules for which the STBREQ register does not have a corresponding bit

1. Clear the SRST bit of the corresponding module to 0, then dummy-read the same register.

(b) Procedure for release from the software reset state of modules for which the STBREQ register has a corresponding bit

1. Clear the SRST bit of the corresponding module to 0, then dummy-read the same register.
2. Clear the corresponding bit in the STBREQ register to 0 to cancel the request to stop the module.
3. Confirm that the corresponding bit in the STBACK register has been cleared to 0.

55.3.7 Adjustment of XTAL Crystal Oscillator Gain

The gain of the crystal oscillator for XTAL and the realtime clock can be adjusted using the GAIN1 and GAIN0 bits in XTALCTR. To modify the gain of the signal on the EXTAL or XTAL pin, PLL settling time is needed. The settling time is counted using the on-chip watchdog timer. Counting to secure the PLL settling time is not needed when the gain of the signal on the RTC_X3 or RTC_X4 pin is changed.

After a change to the value of the GAIN0 bit, the hardware automatically stops the bus master following the wait for completion of the issuing-finished request from the bus master and the change to the gain for the crystal oscillator in use with XTAL proceeds.

Since the change to the gain for the crystal oscillator in use with XTAL cannot start if completion of the issuing-finished request is not possible at this time, do not proceed with access to the registers of modules in the module-standby state and so on.

Furthermore, as the issuing of unintended requests by the bus master is inhibited, using software to stop all bus masters in preparation for the procedure to change the gain for the crystal oscillator in use with XTAL is also effective.

1. The large gain is selected in the initial state.
2. Set the standby_mode_en bit of the power control register in the PL310 to 1. For the details of this register, see CoreLink Level 2 Cache Controller L2C-310 Technical Reference Manual issued by Arm Ltd.
3. Set the watchdog timer so that the specified settling time should be obtained and stop the watchdog timer. Specifically, the following settings are necessary:
   TME in WTCSR = 0: Stop the watchdog timer.
   CKS[2:0] in WTCSR: Division ratio for watchdog timer count clock
   WTCNT: Initial counter value
   (The watchdog timer starts counting on the set clock.)
4. Set the GAIN0 bit to the desired value.
5. The LSI is internally stopped and the watchdog timer starts counting. The clock is supplied only to the watchdog timer and other internal clocks are stopped. In this state, the CKIO pin continues to output an unstable clock. To avoid malfunction due to the unstable clock, modify the CKOEN2 bit in FRQCR appropriately. Since this state is equivalent to the software standby mode state, some registers of on-chip peripheral modules are initialized. For details, see section 58.3, Register States.
6. When an overflow occurs on the watchdog timer, the specified clock supply is started and the LSI starts operation. The watchdog timer stops after an overflow.

55.4 Usage Notes

55.4.1 Usage Notes on Setting Registers

When writing to the registers related to power-down modes, note the following.
When writing to the register related to power-down modes, the CPU, after executing a write instruction, executes the next instruction without waiting for the write operation to complete.
Therefore, to reflect the change specified by writing to the register while the next instruction is executed, insert a dummy read of the same register between the register write instruction and the next instruction.

55.4.2 Usage Notes when the Realtime Clock is not Used

When the realtime clock is not used, set the MSTP60 bit in STBCR6 to 1 after setting the bits in registers of the realtime clock. For details, see section 55.2.6, Standby Control Register 6 (STBCR6).

- Set the RTCEN bit in the control register 2 (RCR2) to 0
- Set the RCKSEL[1:0] bits in the control register 5 (RCR5) to 00.

55.4.3 Usage Notes Applying when the USB_X1 Pin is not to be Used

When a 48 MHz clock is not being supplied to the USB_X1 pin, set registers according to the below procedure in the initial settings after release from the power-on reset state or deep standby mode.

(1) When the USB2.0 host/function module is not to be used

1. Set the MSTP71 bit in the STBCR7 register to 0 and dummy-read STBCR7.
2. Set the UCKSEL bit in the SYSCFG0_0 register to 1.
3. Wait for at least 20 cycles of the EXTAL clock.
4. Set the MSTP71 bit in the STBCR7 register to 1 and dummy-read STBCR7.

(2) When the USB2.0 host/function module is to be used

Set the MSTP71 bit* in the STBCR7 register to 0 and dummy-read STBCR7.
Set the UCKSEL bit in the SYSCFG0_0 register to 1.
Follow the procedure of example 1 in 29.4.1 (5) Setting the Clock Supply for the USB Module
Make the initial settings of the USB2.0 host/function module.
Note: * When channel 1 of the USB2.0 host/function module is to be used, also set the MSTP70 bit to 0.

55.4.4 Notes on Using IRQ Pins as Triggers for Release from Standby when Software Standby is in Use

To use an IRQ pin as the trigger for release from standby when software standby is in use, see section 7.8.4, Notes on Using IRQ Pins as Triggers for Release from Standby when Software Standby is in Use.

56. Debugger Interface

This LSI incorporates a debugger interface to support the boundary scan function and connection to the emulator.

56.1 Features

The debugger interface is a serial input/output interface which has a JTAG (Joint Test Action Group, IEEE Std.1149.1 and IEEE Standard Test Access Port and Boundary-Scan Architecture) interface and CoreSight debug interface.

This module has TAP controllers for the boundary scan and CoreSight debug function.

Driving the BSCANP pin high selects the boundary-scan TAP controller, and driving the BSCANP pin low selects the CoreSight debug TAP controller.

Figure 56.1 is a block diagram of this module and Table 56.1 shows the JTAG pin mode.

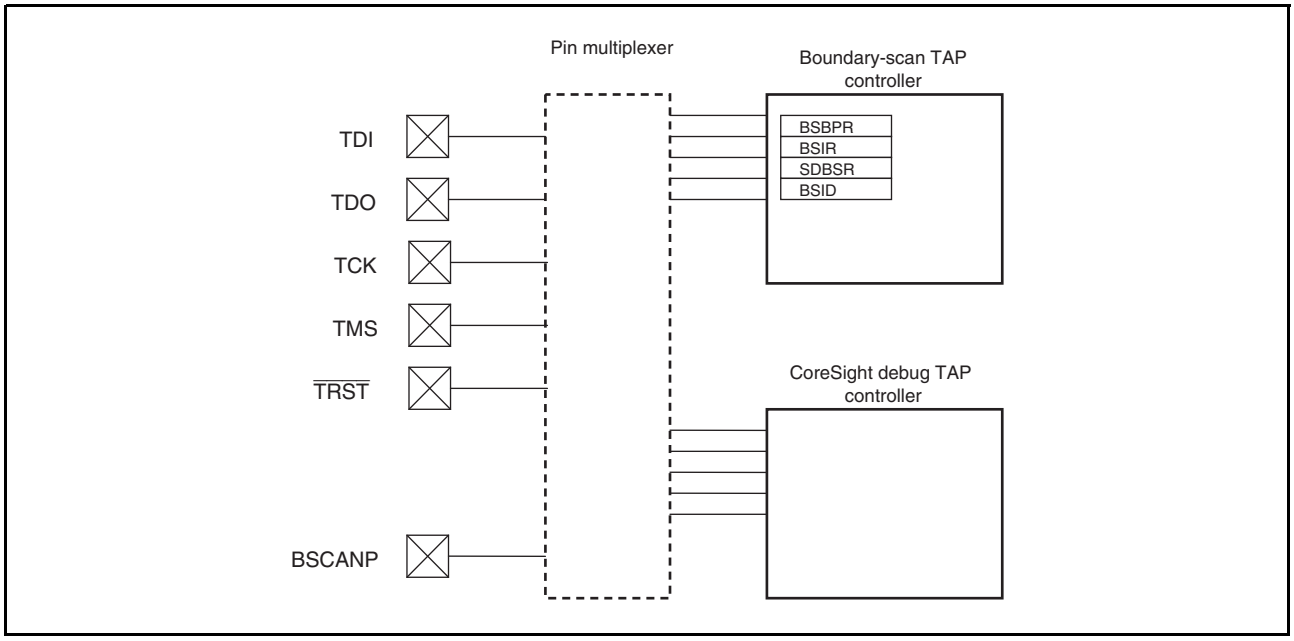

Figure 56.1 Block Diagram

Table 56.1 JTAG Pin Mode

BSCANP	JTAG Pin Mode
0	Normal operation (CoreSight debug mode)
1	Boundary-scan mode

The following lists the features of CoreSight.

- JTAG interface
  Supports JTAG and serial wire debug mode (SWD)
- Trace interface
  Outputs 4-bit × 66-Mbps (33-MHz DDR) trace data
  4-Kbyte Embedded Trace FIFO (ETF)
- Controls by ICE registers
  Control of resetting, debug-enable signal supplied to the CPU, and disabling power shut-off in deep-standby mode during debugging (fake debug mode)

Figure 56.2 is a block diagram of CoreSight, Table 56.2 to Table 56.5 show the input/output pins of the cross-trigger interface (CTI), and Table 56.6 shows the address map for CoreSight. For details of CoreSight other than ICE registers, see the technical reference manual issued by Arm Ltd.

56.2 Input/Output Pins

Table 56.7 shows the pin configuration of the debugger interface.

Table 56.7 Pin Configuration

Name	Pin Name	Input/ Output	Function
Test clock	TCK/SWDCLK	Input	Data is input in serial to this module via the data input pin (TDI) or data is output via the data output pin (TDO) in synchronization with this signal. Functions as the SWDCLK pin in serial wire debug (SWD) mode.
Test mode select	TMS/SWDIO	Input, Input/ Output	Changing this signal in synchronization with the TCK signal determines the state of the TAP controller circuit. Its protocol conforms to the subset of the JTAG standard (IEEE standard 1149.1). Functions as the SWDIO pin in serial wire debug (SWD) mode.
Test reset	$\overline{\text{TRST}}$*	Input	This signal is received asynchronously with the TCK signal. Asserting this signal resets this module. When power is supplied, this pin should be asserted for a given period regardless of whether or not this module function is used. For details on resetting, see section 56.5.2, Reset Signal Setting.
Test data input	TDI	Input	Data is sent to this module by changing this signal in synchronization with the TCK signal.
Test data output	TDO	Output	Data is read from this module by reading this signal in synchronization with the TCK signal. This pin also functions as an output pin in the serial wire debug (SWD) mode. However, a fixed value (the high level) is output because this product does not support the SWO function.
Boundary scan setting	BSCANP	Input	Input a high-level signal during boundary-scan testing. Input a low-level signal during normal use.
Clock output	TRACECLK	Output	Trace clock output pin
Enable output	TRACECTL	Output	Trace enable output pin
Data output	TRACEDAT3 to TRACEDATA0	Output	Trace data output pins

Note: * When designing a board that can use an emulator, the $\overline{\text{RES}}$ and $\overline{\text{TRST}}$ pin circuits should be designed so that they can be set low and the $\overline{\text{TRST}}$ pin can be controlled independently at power-on. When the $\overline{\text{TRST}}$ pin is not in use, it should be either fixed to low level or connected to the $\overline{\text{RES}}$ pin (or another pin which operates in the same manner as the $\overline{\text{RES}}$ pin).

56.3 Registers for Boundary-Scan TAP Controller

The boundary-scan TAP controller has the following registers.

Table 56.8 List of Registers of Boundary-Scan TAP Controller

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Bypass register	BSBPR	—	—	—	—
Instruction register	BSIR	—	H'55	—	—
Boundary scan register	SDBSR	—	—	—	—
ID register	BSID	—	H'08178447 *1 H'0821D447 *2	—	—

Note 1. RZ/A1H
Note 2. RZ/A1M

56.3.1 Bypass Register (BSBPR)

BSBPR is a 1-bit register that cannot be accessed by the CPU. When BSIR is set to BYPASS mode, BSBPR is connected between the TDI and TDO pins. The initial value is undefined.

56.3.2 Instruction Register (BSIR)

BSIR is an 8-bit register. This register is initialized by $\overline{\text{TRST}}$ assertion or in the TAP test-logic-reset state. BSIR cannot be accessed by the CPU.

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	TI[7:0]	01010101	—	Test Instruction The instruction of this module is transferred to BSIR through a serial input from the TDI pin. For commands, see Table 56.9.

Table 56.9 Commands Supported for Boundary Scan TAP Controller

Bits 7 to 0								Description
TI7	TI6	TI5	TI4	TI3	TI2	TI1	TI0	
0	0	0	0	0	0	0	0	EXTEST
0	1	0	0	0	0	0	0	SAMPLE/PRELOAD
0	1	0	1	0	1	0	1	IDCODE (initial value)
1	1	0	1	0	0	0	0	CLAMP
1	0	0	0	0	0	0	0	HIGHZ
1	1	1	1	1	1	1	1	BYPASS
Other than above								Reserved

56.3.3 Boundary Scan Register (SDBSR)

SDBSR is a shift register, located on the PAD, for controlling the input/output pins of this LSI. SDBSR cannot be accessed by the CPU. The initial value is undefined. Using the EXTEST, SAMPLE/PRELOAD, CLAMP, and HIGHZ commands, a boundary scan test conforming to the JTAG standard can be carried out. Table 56.10 shows the correspondence between the pins of this LSI and bits of the boundary scan register.

Table 56.10 Correspondence between Pins of this LSI and Bits of Boundary Scan Registers

Note 1. The pin names are as listed in the “Port function/dedicated function” column of Table 1.4, List of Pins in section 1.6, List of Pins.
Note 2. Open-drain pin. Setting the data bit for the pin to 0 makes the pin output a low-level signal and setting the data bit for the pin to 1 places the pin in the hi-Z state.
Note 3. Bits of type “control” are active low. When the control bit is at the low level, the corresponding pin becomes an output.
Note 4. This pin only operates when data are shifted through during a boundary scan test by a boundary scan register that is not related to a specific pin.

56.3.4 ID Register (BSID)

BSID is a 32-bit read-only register that cannot be accessed by the CPU. BSID can only be read from the pins when the IDCODE command is set.

Note 1. RZ/A1H
Note 2. RZ/A1M

56.4 ICE Registers

The debugger interface has the following ICE registers.
ICE registers are exclusively for use in debugging. Do not use these registers other than for debugging.

Table 56.11 Configuration of ICE Registers

Register Name	Abbreviation	R/W	Initial Value	Address		Access Size
				Viewed from CPU	Viewed from Debugger	
Mode reset control register	ICEREGMDRSTCTL	R/W	H'0000111E	H'FC00F000	H'8000F000	32
JTAG trace select register	ICEREGJTTRCSEL	R/W	H'00800000	H'FC00F004	H'8000F004	32
Clock power control register	ICEREGCLKPWRCTRL	R/W	H'00000000	H'FC00F014	H'8000F014	32
Lock access register	ICEREGLOCKACCES	W	—	H'FC00FFB0	H'8000FFB0	32

56.4.1 Mode Reset Control Register (ICEREGMDRSTCTL)

ICEREGMDRSTCTL is used to set the debug mode and to perform software reset.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	NIDEN_CPU0	—	—	—	DBGEN_CPU0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

	—	—	—	RSTRB_CPU0_DERSTZ	—	—	—	RSTRB_CPU0_CPURSTZ	—	—	—	RSTRB_SYS_SYSRSTZ	—	RSTRB_CPU_PRSTDBGZ	RSTRB_CPU_SYSRSTZ	—
Initial value:	0	0	0	1	0	0	0	1	0	0	0	1	1	1	1	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R/W	R/W	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved The read value is always 0.
20	NIDEN_CPU0	0	R/W	CPU Noninvasive Debug Enable Controls the noninvasive debug enable signal (NIDEN/SPNIDEN) supplied to the CPU. This bit is only effective when the PINSETEN bit in ICEREGJTTRCSEL is set to 0.
19 to 17	—	All 0	R	Reserved The read value is always 0.
16	DBGEN_CPU0	0	R/W	CPU Debug Enable Controls the debug enable signal (DBGEN/SPIDEN) supplied to the CPU. This bit is only effective when the PINSETEN bit in ICEREGJTTRCSEL is set to 0.
15 to 13	—	All 0	R	Reserved The read value is always 0.
12	RSTRB_CPU0_DERSTZ	1	R/W	NEON Reset (low-active) Resets the NEON unit in the CPU.
11 to 9	—	All 0	R	Reserved The read value is always 0.
8	RSTRB_CPU0_CPURSTZ	1	R/W	CPU Reset (low-active) Resets all systems on the CPU block other than debugging resources.

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	—	All 0	R	Reserved The read value is always 0.
4	RSTRB_SYS_SYSRSTZ	1	R/W	System Reset (low-active) Resets all systems on the chip other than debugging resources.
3	—	1	R/W	Reserved The read value is always 1. The write value should always be 1.
2	RSTRB_CPU_PRSTDBGZ	1	R/W	CPU Subsystem Debug Peripheral Reset (low-active) Resets the debug-APB block in the CPU subsystem.
1	RSTRB_CPU_SYSRSTZ	1	R/W	CPU Subsystem Reset (low-active) Resets the CPU subsystem other than those for debugging.
0	—	0	R	Reserved The read value is always 0.

56.4.2 JTAG Trace Select Register (ICEREGJTTRCSEL)

ICEREGJTTRCSEL is used to control trace data output to the respective pins and debug enable signal supplied to the CPU.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	PINSETEN	—	—	TRCMUX_SEL	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved The read value is always 0.
23	PINSETEN	1	R/W	Selects control method of debug enable signal supplied to the CPU. 0: Supply of the DBGEN and NIDEN signals is determined by the ICEREGMDRSTCTL register. 1: Supply of the DBGEN and NIDEN signals is determined by the BSCANP pin.
22, 21	—	All 0	R	Reserved The read value is always 0.
20	TRCMUX_SEL	0	R/W	Sets the priority of the function multiplexed on the pins to which trace output is assigned. 0: The function of the pins depends on the general I/O port setting. 1: The pins act as trace outputs regardless of the general I/O port setting.
19 to 0	—	All 0	R	Reserved The read value is always 0.

56.4.3 Clock Power Control Register (ICEREGCLKPWRCTRL)

ICEREGCLKPWRCTRL is used to set the fake debug mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	FAKEDBGCTRL	—	—	—	—	—	—	FAKEDBG
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved The read value is always 0.
7	FAKEDBGCTRL	0	R/W	Enables or disables the fake debug mode. 0: The power control is determined by the standby control register 1 (STBCR1). 1: The power control is determined by this register.
6 to 1	—	All 0	R	Reserved The read value is always 0.
0	FAKEDBG	0	R/W	Selects whether or not to stop the power supply in deep standby mode. 0: The power supply is actually stopped in deep standby mode. 1: The power supply is not stopped even in deep standby mode.

56.4.4 Lock Access Register (ICEREGLOCKACCESS)

ICEREGLOCKACCESS is used to enable access to ICE registers by the CPU.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ICEREGLOCKACCESS															
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ICEREGLOCKACCESS															
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ICEREGLOCKACCESS	—	W	To enable access to ICE registers by the CPU, first write H'C5AC CE55 to this register.

56.5 Operation

56.5.1 TAP Controller

Figure 56.3 shows the internal states of the TAP controller. State transitions basically conform to the JTAG standard.

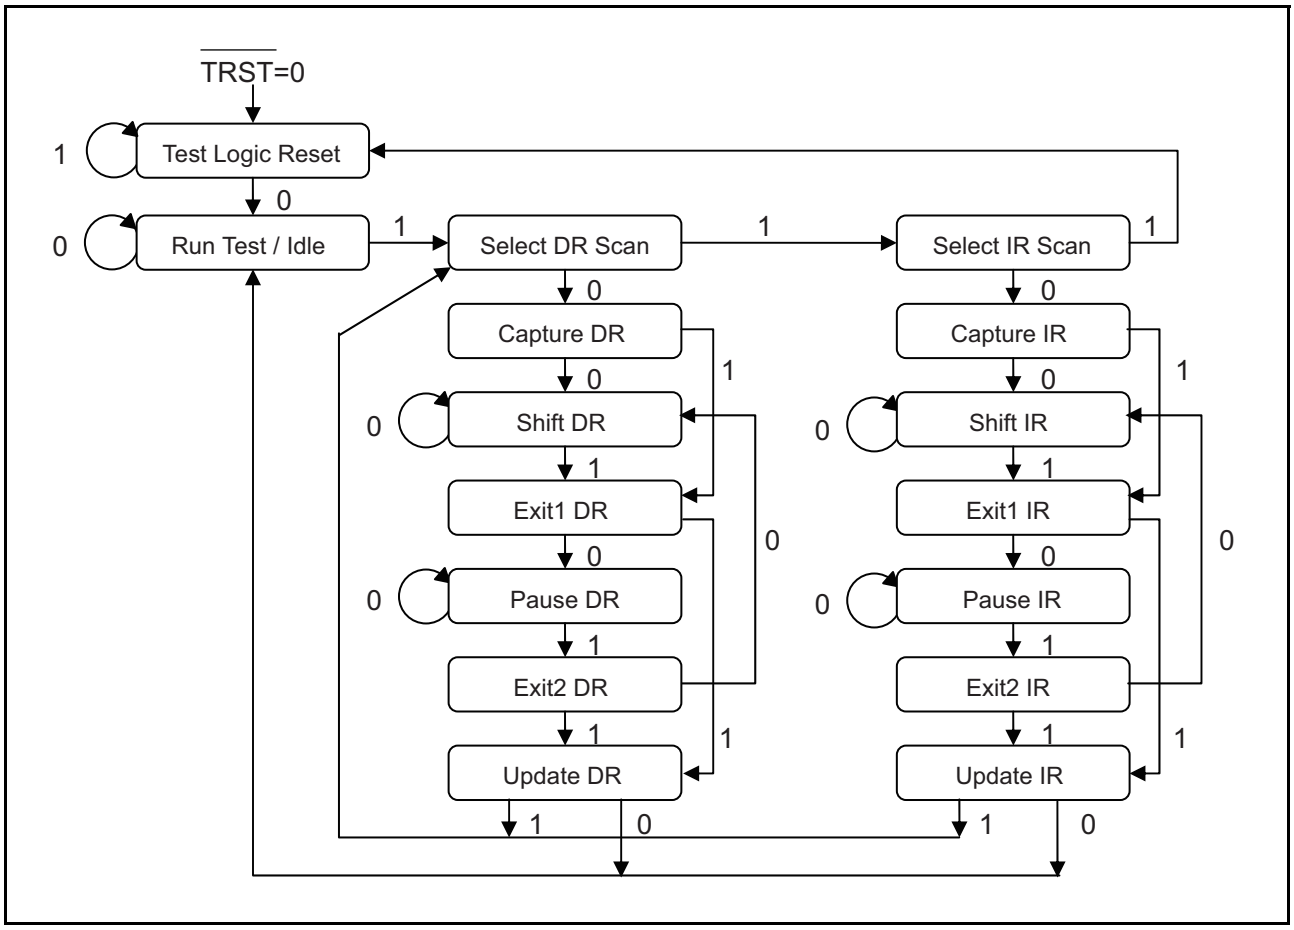

Figure 56.3 State Transitions of TAP Controller

Note: State transition occur according to the TMS value at the rising edge of the TCK signal. The TDI value sampled at the rising edge of the TCK signal and shifted at the falling edge of the TCK signal. TDO value is output at the rising edge of the TCK signal. The TDO signal is in a Hi-Z state for TAP controller states other than Shift-DR and Shift-IR. A transition to the Test-Logic-Reset state by clearing $\overline{\text{TRST}}$ to 0 is performed asynchronously with the TCK signal.

56.5.2 Reset Signal Setting

Table 56.12 Reset Signal Setting

$\overline{\text{RES}}$	$\overline{\text{TRST}}$	Chip State
L	L	The chip is power-on reset and this module is reset.*1
	H	The chip is power-on reset.*1
H	L	This module is only reset.*2
	H	Normal operation*2

Note 1. By asserting the $\overline{\text{RES}}$ and $\overline{\text{TRST}}$ signals, the CPU and CoreSight enter the reset state. Set the debugging function while asserting the $\overline{\text{RES}}$ signal after negating the $\overline{\text{TRST}}$ signal.
Note 2. Do not negate the $\overline{\text{TRST}}$ signal while the $\overline{\text{RES}}$ signal is at the high-level.
Note 3. When the $\overline{\text{TRST}}$ pin is to be negated, make sure that the specification for $\overline{\text{RES}}$ input rise time (t_{RSr}) or $\overline{\text{RES}}$ negating hold time (t_{RSNH}) in Table 59.6, Control Signal Timing, is satisfied.

56.6 Boundary Scan

Commands can be set in BSIR by this module to place this module's pins in boundary scan mode stipulated by JTAG.

56.6.1 Supported Instructions

This LSI supports three mandatory instructions stipulated by JTAG standard (BYPASS, SAMPLE/PRELOAD, and EXTEST) and three option instructions (IDCODE, CLAMP, and HIGHZ).

(1) BYPASS

BYPASS is a mandatory instruction that operates the bypass register. This instruction is used to shorten the shift path to speed up serial data transfer involving other LSI on the printed circuit board. This LSI's system circuits are not affected by execution of this instruction.

(2) SAMPLE/PRELOAD

SAMPLE/PRELOAD is used to input data from this LSI’s internal circuit to the boundary scan register, outputs data from the scan path, and loads data onto the scan path. While this instruction is being executed, signals input to this LSI pins are transmitted directly to the internal circuit, and the values of the internal circuit are directly output externally from the output pins. This LSI's system circuits are not affected by execution of this instruction.

In a SAMPLE operation, a snapshot of a value to be transferred from an input pin to the internal circuit, or a value to be transferred from the internal circuit to an output pin, is latched into the boundary scan register and read from the scan path. Snapshot latching is performed in synchronization with the rising edge of the TCK signal in the Capture-DR state. Snapshot latching does not affect normal operation of this LSI.

In a PRELOAD operation, an initial value is set in the parallel output latch of the boundary scan register from the scan path prior to the EXTEST instruction. Without a PRELOAD operation, when the EXTEST instruction was executed, an undefined value would be output from the output pin until completion of the initial scan sequence (transfer to the output latch) (with the EXTEST instruction, the parallel output latch value is constantly output to the output pin).

(3) EXTEST

This instruction is provided to test external circuit when this LSI is mounted on a printed circuit board. When this instruction is executed, output pins are used to output test data (previously set by the SAMPLE/PRELOAD instruction) from the boundary scan register to the printed circuit board, and input pins are used to latch test results into the boundary scan register from the printed circuit board. If testing is carried out by using the EXTEST instruction N times, the Nth test data is scanned-in when test data (N-1) is scanned out. The data loaded into the output pin boundary scan register in the Capture-DR state are not used for external circuit testing (data are replaced by the shift operation).

(4) IDCODE

Commands can be set in BSIR via pins of this module to place the module’s pins in the IDCODE mode stipulated by JTAG. When this module is initialized ($\overline{\text{TRST}}$ is asserted or TAP is in the Test-Logic-Reset state), the IDCODE mode is entered.

(5) CLAMP, HIGHZ

Commands can be set in BSIR via pins of this module to place the module’s pins in the CLAMP or HIGHZ mode stipulated by JTAG.

56.6.2 Points for Attention

1. Boundary scan mode does not cover clock-related signals (EXTAL, XTAL, CKIO, AUDIO_X1, AUDIO_X2, USB_X1, USB_X2, RTC_X1, and RTC_X2).
2. Boundary scan mode does not cover reset-related signal ($\overline{\text{RES}}$).
3. Boundary scan mode does not cover this module's signals (TCK, TDI, TDO, TMS, $\overline{\text{TRST}}$, and BSCANP).
4. Boundary scan mode does not cover USB-related signals (DP0, DP1, DM0, DM1, VBUS0, VBUS1, and REFRIN).
5. Boundary scan mode does not cover P0_3.
6. Boundary scan mode does not cover the digital video decoder related signals (VIN1A, VIN2A, VIN1B, VIN2B, VIDEO_X1, VIDEO_X2, VRP, VRM, and REXT).
7. Boundary scan mode does not cover AVref (reference voltage pin for the A/D converter).

56.7 Usage Notes

1. Once a command of this module is set, it will not be modified unless another command is reissued. If the same command is given continuously, the command must be set after a command (BYPASS, etc.) that does not affect LSI operations is once set.
2. Regardless of whether or not this module is to be used, it should be initialized by asserting the $\overline{\text{TRST}}$ signal when power is supplied and on release from deep standby mode (excluding fake debug mode) through assertion of the $\overline{\text{RES}}$ signal.
3. Be sure to wait for at least 200 ns after negating the $\overline{\text{TRST}}$ signal before starting TAP controller operation.
4. Be sure to fix the TMS pin to the high level until 200 ns have elapsed after negation of the $\overline{\text{TRST}}$ signal.

57. EthernetAVB

57.1 Overview

The EthernetAVB incorporates an Ethernet controller (E-MAC) that conforms to the definition of the MAC (Media Access Control) layer for Ethernet in the IEEE 802.3 standard.

When connected with a physical-layer LSI chip (PHY-LSI) that complies with the standard, the E-MAC is able to transmit and receive Ethernet (IEEE 802.3) frames. The E-MAC has a single MAC layer interface.

The EthernetAVB has a dedicated direct memory access controller (AVB-DMAC) for transferring transmitted Ethernet frames to and received Ethernet frames from respective storage areas in the on-chip RAM at high speed.

The AVB-DMAC is compliant with the following three standards formulated for IEEE 802.1BA: the IEEE 802.1AS timing and synchronization protocol, the IEEE 802.1Qav real-time transfer, and the IEEE 802.1Qat stream reservation protocol.

For the on-chip RAM, see section 53, On-Chip RAM.

57.1.1 Specifications (Functions)

Table 57.1 lists the specifications of the EthernetAVB module.

Table 57.1 Specifications (Functions)

Item	Description
Protocol	Flow control conforming with the IEEE 802.3x standard
Data transmission and reception	Transmission and reception of Ethernet (IEEE 802.3) frames
Transfer speed	Supports transfer at 10 and 100 Mbps
Mode	Full-duplex mode
Interface	Supports the IEEE 802.3 standard MII (Media Independent Interface)
Summary of the EthernetAVB function	An intelligent frame separation DMAC (AVB-DMAC) conforming with the following standards stipulated for IEEE 802.1BA: • IEEE 802.1AS (time synchronization protocol) • IEEE 802.1Qav (real-time transfer) • IEEE 1722 (AVTP presentation timestamp) IEEE 802.1Qat is supported by software. • Descriptor management system • Identification and sorting of frame data, and extraction and gathering of valid video data • Controllable interrupt frequency (reducing the load on the CPU)

57.1.2 Block Diagram

Figure 57.1 is a block diagram of the EthernetAVB.

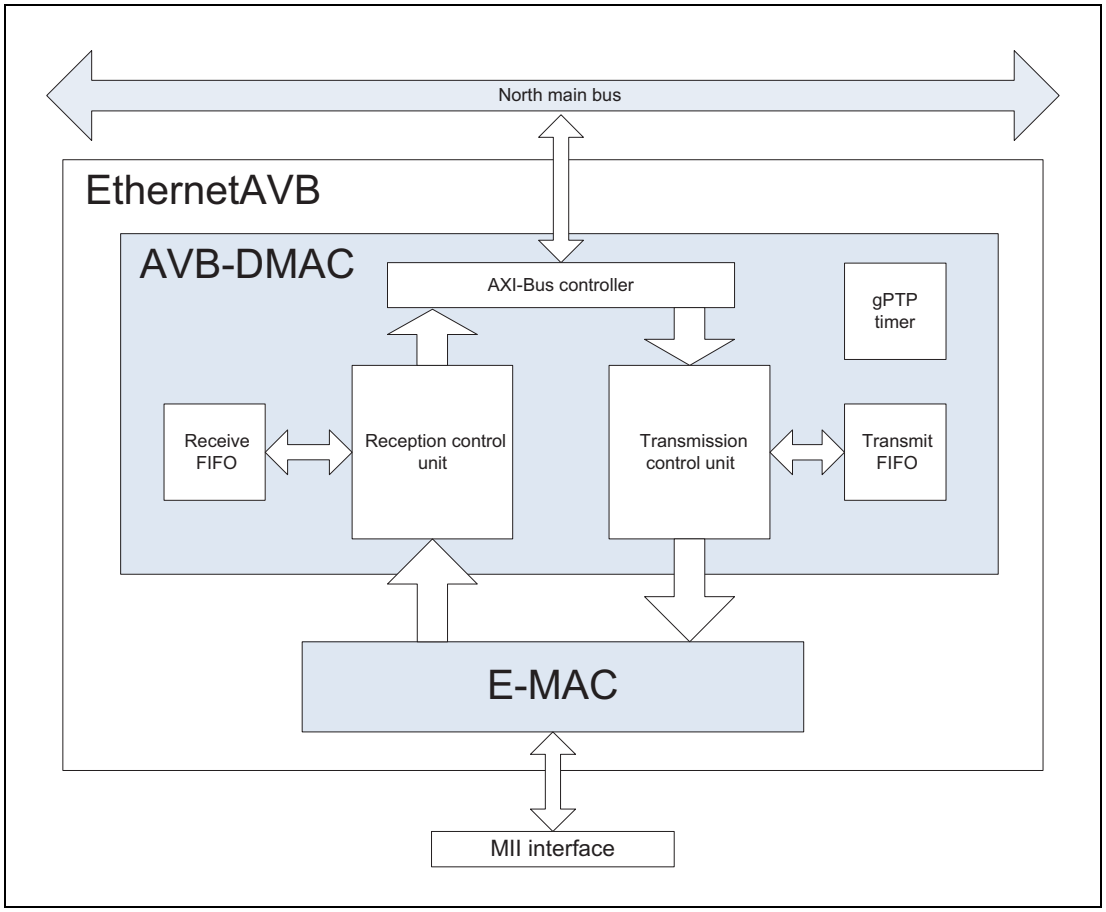

Figure 57.1 Block Diagram of EthernetAVB

57.1.3 I/O Pins

Table 57.2 lists the pins for use by EthernetAVB.

Table 57.2 Pin Configuration

Pin Name	I/O	Function
ET_TXD[3:0]	O	Transmit data signal
ET_TXEN	O	Transmit data enable signal
ET_RXD[3:0]	I	Receive data signal
ET_RXDV	I	Receive data enable signal
ET_TXCLK	I	Transmit clock signal
ET_RXCLK	I	Receive clock signal
ET_TXER	O	Transmit error signal
ET_RXER	I	Reception error signal
ET_MDC	O	Management information transfer clock signal
ET_MDIO	I/O	Management information transmit/receive data
ET_CRS	I	Carrier detection signal
ET_COL	I	Collision detection signal
AVB_CAPTURE	I	Signal for capturing AVTP presentation times
AVB_GPTP_EXTERN	I	External clock signal for gPTP timer

57.2 Register Descriptions

Table 57.3 and Table 57.4 list the EthernetAVB related registers and their configurations

Table 57.3 Configuration of AVB-DMAC-related Registers (1/2)

Register Name	Symbol	Address	Access size
AVB-DMAC mode register	CCC	H'E821 5000	32
Descriptor base address table register	DBAT	H'E821 5004	32
Descriptor base address load request register	DLR	H'E821 5008	32
AVB-DMAC status register	CSR	H'E821 500C	32
Current descriptor address register q (q = 0 to 21)	CDARq	H'E821 5010+q*4	32
Error status register	ESR	H'E821 5088	32
Receive configuration register	RCR	H'E821 5090	32
Receive queue configuration register i (i = 0 to 4)	RQCi	H'E821 5094+i*4	32
Receive padding configuration register	RPC	H'E821 50B0	32
Unread frame counter stop level register	UFCS	H'E821 50C0	32
Unread frame counter register i (i = 0 to 4)	UFCVi	H'E821 50C4+i*4	32
Unread frame counter decrement register i (i = 0 to 4)	UFCDi	H'E821 50E0+i*4	32
Separation filter offset register	SFO	H'E821 50FC	32
Separation filter pattern register i (i = 0 to 31)	SFPi	H'E821 5100+i*4	32
Separation filter mask register i (i = 0, 1)	SFMi	H'E821 51C0+i*4	32
Transmit configuration register	TGC	H'E821 5300	32
Transmit configuration control register	TCCR	H'E821 5304	32
Transmit status register	TSR	H'E821 5308	32
Time stamp FIFO access register 0	TFA0	H'E821 5310	32
Time stamp FIFO access register 1	TFA1	H'E821 5314	32
Time stamp FIFO access register 2	TFA2	H'E821 5318	32
CBS increment value register c (c= 0, 1)	CIVRc	H'E821 5320+c*4	32
CBS decrement value register c (c = 0, 1)	CDVRc	H'E821 5328+c*4	32
CBS upper limit register c (c = 0, 1)	CULc	H'E821 5330+c*4	32
CBS lower limit register c (c = 0, 1)	CLLc	H'E821 5338+c*4	32
Descriptor interrupt control register	DIC	H'E821 5350	32
Descriptor interrupt status register	DIS	H'E821 5354	32
Error interrupt control register	EIC	H'E821 5358	32
Error interrupt status register	EIS	H'E821 535C	32
Receive interrupt control register 0	RIC0	H'E821 5360	32
Receive interrupt status register 0	RIS0	H'E821 5364	32
Receive interrupt control register 1	RIC1	H'E821 5368	32
Receive interrupt status register 1	RIS1	H'E821 536C	32
Receive interrupt control register 2	RIC2	H'E821 5370	32
Receive interrupt status register 2	RIS2	H'E821 5374	32
Transmit interrupt control register	TIC	H'E821 5378	32
Transmit interrupt status register	TIS	H'E821 537C	32
Interrupt summary status register	ISS	H'E821 5380	32
gPTP configuration control register	GCCR	H'E821 5390	32
gPTP maximum transit time register	GMTT	H'E821 5394	32

Table 57.3 Configuration of AVB-DMAC-related Registers (2/2)

Register Name	Symbol	Address	Access size
gPTP presentation time comparison register	GPTC	H'E821 5398	32
gPTP timer increment register	GTI	H'E821 539C	32
gPTP timer offset configuration register i (i = 0 to 2)	GTOi	H'E821 53A0+i*4	32
gPTP interrupt control register	GIC	H'E821 53AC	32
gPTP interrupt status register	GIS	H'E821 53B0	32
gPTP presentation time capture register	GCPT	H'E821 53B4	32
gPTP timer capture register i (i = 0 to 2)	GCTi	H'E821 53B8+i*4	32

Table 57.4 Configuration of E-MAC-related Registers

Register Name	Symbol	Address	Access size
E-MAC mode register	ECMR	H'E821 5500	32
Receive frame length register	RFLR	H'E821 5508	32
E-MAC status register	ECSR	H'E821 5510	32
E-MAC interrupt permission register	ECSIPR	H'E821 5518	32
PHY interface register	PIR	H'E821 5520	32
Automatic PAUSE frame register	APR	H'E821 5554	32
Manual PAUSE frame register	MPR	H'E821 5558	32
PAUSE frame transmit counter	PFTCR	H'E821 555C	32
PAUSE frame receive counter	PFRCR	H'E821 5560	32
Automatic PAUSE frame retransmission count register	TPAUSER	H'E821 5564	32
MAC address high register	MAHR	H'E821 55C0	32
MAC address low register	MALR	H'E821 55C8	32
CRC error frame receive counter register	CEFCR	H'E821 5740	32
Frame receive error counter register	FRECR	H'E821 5748	32
Too-short frame receive counter register	TSFRCR	H'E821 5750	32
Too-long frame receive counter register	TLFRCR	H'E821 5758	32
Residual-bit frame receive counter register	RFCR	H'E821 5760	32
Multicast address frame receive counter register	MAFCR	H'E821 5778	32

57.2.1 AVB-DMAC Mode Register (CCC)

The CCC register specifies the operating mode of the AVB-DMAC.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 57.5 CCC register contents

Bit Position	Bit Name	Function
b31 to b26	—	Reserved These bits are read as 0. The write value should be 0.
b25	FCE	Flow Control Enable 0: Normal operation 1: Flow control is enabled.
b24	LBME	Loopback Mode Enable 0: Normal operation 1: Loopback mode is enabled.
b23 to b21	—	Reserved These bits are read as 0. The write value should be 0.
b20	BOC	First Byte Specification 0: The first byte is the 8 lower-order bits (on-chip RAM[7:0]) 1: The first byte is the 8 higher-order bits (on-chip RAM[31:24])
b19, b18	—	Reserved These bits are read as 0. The write value should be 0.
b17, b16	CSEL[1:0]	gPTP Clock Select B'00: gPTP is not in use. B'01: Internal bus clock (Bϕ) B'10: Ethernet transmission clock (ET_TXCLK) B'11: External clock (AVB_GPTP_EXTERN)
b15 to b9	—	Reserved These bits are read as 0. The write value should be 0.
b8	DTSR	Data Transfer Suspend Request 0: Normal operation 1: Requests suspension.
b7 to b2	—	Reserved These bits are read as 0. The write value should be 0.
b1, b0	OPC[1:0]	Operating Mode Configuration B'00: Reset mode B'01: Configuration mode B'10: Operation mode B'11: Standby mode

FCE (Flow Control Enable) Bit

This bit enables flow control by the E-MAC.

Writing to this bit is only possible when the current operating mode is configuration mode.

LBME (Loopback Mode Enable) Bit

This bit enables loopback mode.

In loopback mode, the transmission lines are internally connected to the reception lines. When loopback mode is to be used, the Ethernet transmission clock must be supplied to the MII interface. A received clock signal is not required. Writing to this bit is only possible when the current operating mode is configuration mode.

CAUTION

Data for transmission are still output normally. To eliminate effects on external modules, pin control should be applied to block the output of data. For pin control, see Section 54, Ports.

BOC (First Byte Specification) Bit

Specifies the allocation of the first byte from a received Ethernet frame to the on-chip RAM.

This configuration setting does not affect the format and filter parameters of the descriptor in the on-chip RAM.

Writing to this bit is only possible when the current operating mode is configuration mode.

Figure 57.2 to Figure 57.4 show how data from frames received via the Ethernet connection are stored in the on-chip RAM.

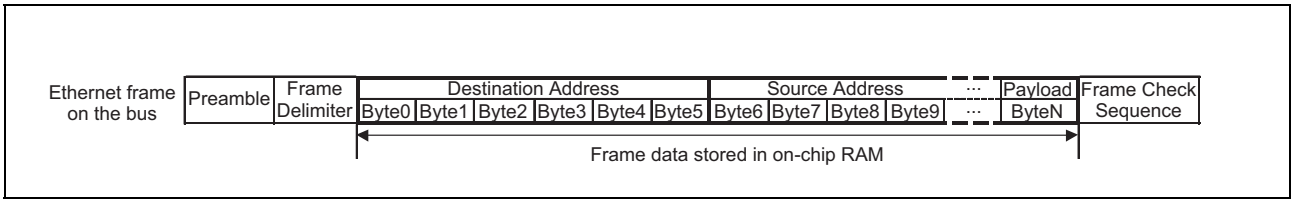

Figure 57.2 Data for Reception in an Ethernet Frame

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

DPTR+4	Byte4								Byte5								Byte6								Byte7							
DPTR+8	Byte8								Byte9								Byte10								Byte11							

Figure 57.4 When CCC.BOC = 1

CSEL[1:0] (gPTP Clock Select) Bits

These bits select the clock source for the gPTP timer.

Writing to these bits is only possible when the current operating mode is configuration mode.

DTSR (Data Transfer Suspend Request) Bit

This bit can suspend access to the on-chip RAM.

The access is suspended on completion of the transfer of the frame currently being transferred.

This function disables access to the on-chip RAM without affecting normal operation of the AVB-DMAC. Use this bit when exclusive control over the contents of the on-chip RAM is necessary, for example, in checking its integrity.

Note that the transmission and reception queues are not processed while access is suspended.

Change neither the AVB-DMAC settings nor the mode from when this bit is set to 1 to complete suspension until when the data transfer suspend status bit (CSR.DTS) is set to 1.

OPC[1:0] (Operating Mode Configuration) Bits

These bits specify the operating mode.

For the operating modes, see Section 57.3.1.1, Operating Modes.

Writing to this bit is possible in any of the operating modes, but should not be done after the standby request has been issued to the EthernetAVB. For issuance of the standby request to the EthernetAVB, see section 55, Power-Down Modes.

57.2.2 Descriptor Base Address Table Register (DBAT)

The DBAT register is used to set the base address of the descriptor table.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	TA[31:16]

Table 57.6 DBAT register contents

Bit Position	Bit Name	Function
b31 to b0	TA[31:0]	Table Address Base address of the descriptor table in the on-chip RAM

CAUTION

The setting of this bit must be a multiple of four (i.e. b0 and b1 must be set to 0).

TAL3[1:0] (Table Address) Bits

These bits specify the base address of the descriptor table in the on-chip RAM.

For the structure of this table, see Section 57.3.3, Descriptors.

Writing to this bit is only possible when the current operating mode is configuration mode.

57.2.3 Descriptor Base Address Load Request Register (DLR)

The DLR register is used to issue a request to load the values from the current descriptor address register q (CDARq) for each queue to the descriptor base address table register (DBAT).

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 57.7 DLR register contents (1/2)

Bit Position	Bit Name	Function
b31 to 22	—	Reserved These bits are read as 0. The write value should be 0.
b21	LBA21	Base Address Load Request (Rx17: Stream 15) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b20	LBA20	Base Address Load Request (Rx16: Stream 14) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b19	LBA19	Base Address Load Request (Rx15: Stream 13) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b18	LBA18	Base Address Load Request (Rx14: Stream 12) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b17	LBA17	Base Address Load Request (Rx13: Stream 11) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b16	LBA16	Base Address Load Request (Rx12: Stream 10) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b15	LBA15	Base Address Load Request (Rx11: Stream 9) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b14	LBA14	Base Address Load Request (Rx10: Stream 8) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b13	LBA13	Base Address Load Request (Rx9: Stream 7) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.

Table 57.7 DLR register contents (2/2)

Bit Position	Bit Name	Function
b12	LBA12	Base Address Load Request (Rx8: Stream 6) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b11	LBA11	Base Address Load Request (Rx7: Stream 5) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b10	LBA10	Base Address Load Request (Rx6: Stream 4) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b9	LBA9	Base Address Load Request (Rx5: Stream 3) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b8	LBA8	Base Address Load Request (Rx4: Stream 2) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b7	LBA7	Base Address Load Request (Rx3: Stream 1) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b6	LBA6	Base Address Load Request (Rx2: Stream 0) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b5	LBA5	Base Address Load Request (Rx1: Network Control) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b4	LBA4	Base Address Load Request (Rx0: Best Effort) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b3	LBA3	Base Address Load Request (Tx3: Stream Class A) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b2	LBA2	Base Address Load Request (Tx2: Stream Class B) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b1	LBA1	Base Address Load Request (Tx1: Network Control) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b0	LBA0	Base Address Load Request (Tx0: Best Effort) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.

LBAq (Base Address Load Request) Bits

Each bit is used to issue requests to load base addresses and to indicate that a base address is currently being loaded.

Setting a bit to 1 issues a request for loading the descriptor base address for the queue q (q = 0 to 21), to change the current descriptor address bit (CDARq.CDA) to DBAT.TA + 8*q.

If transfer is currently in progress, loading is executed on completion of transfer for the current frame.

Completion of loading leads to automatic setting of the corresponding bit to 0.

For the transmission queues, base address load requests are executed even while fetching is in progress (the transmit start request bit in the transmit configuration control register (TCCR.TSRQt) is 1). Therefore, be sure to check that fetching is not in progress before issuing a request.

Writing to a bit of this register is only possible when the current operating mode is configuration mode.

Only 1 can be written to this bit.

57.2.4 AVB-DMAC Status Register (CSR)

The CSR register is used to indicate the operating mode in which the AVB-DMAC is running and the individual communications states.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 57.8 CSR register contents

Bit Position	Bit Name	Function
b31 to b21	—	Reserved These bits are read as 0. The write value should be 0.
b20	RPO	Receive Process Status 0: Reception completed. 1: Reception is in progress.
b19	TPO3	Transmit Process Status 3 (Stream Class A) 0: Transmission completed. 1: Transmission is in progress.
b18	TPO2	Transmit Process Status 2 (Stream Class B) 0: Transmission completed. 1: Transmission is in progress.
b17	TPO1	Transmit Process Status 1 (Network Control) 0: Transmission completed. 1: Transmission is in progress.
b16	TPO0	Transmit Process Status 0 (Best Effort) 0: Transmission completed. 1: Transmission is in progress.
b16 to b9	—	Reserved These bits are read as 0. The write value should be 0.
b8	DTS	Data Transfer Suspend Status 0: Normal operation 1: Transmission is suspended.
b7 to b4	—	Reserved These bits are read as 0. The write value should be 0.
b3 to b0	OPS[3:0]	Operating Mode Status B'0001: Reset mode B'0010: Configuration mode B'0100: Operation mode B'1000: Standby mode Other settings are reserved.

RPO (Receive Process Status) Bit

This bit indicates whether a reception queue contains an unread received frame.

This bit being set to 1 indicates that a received frame is yet to be stored in the on-chip RAM.

- [Clearing conditions]
  The current operating mode is not operation mode.
  Received frames in the reception FIFO all being stored in the on-chip RAM.
- [Setting condition]
  A received frame being stored in the reception FIFO (but not yet in the on-chip RAM)

TPO3 (Transmit Process Status 3) Bit

This bit indicates whether a class A stream is being transmitted.

This bit being set to 1 indicates that the AVB-DMAC is fetching data for transmission from the on-chip RAM, or the E-MAC is transmitting data.

- [Clearing conditions]
  The current operating mode is not operation mode.
  Completion of transfer of all frames for transmission from the transmission FIFO (the transmit start request bit in the transmit configuration control register (TCCR.TSRQ3) is 0)
- [Setting condition]
  Transmission being started (by writing 1 to the transmit start request bit in the transmit configuration control register (TCCR.TSRQ3))

TPO2 (Transmit Process Status 2) Bit

This bit indicates whether a class B stream is being transmitted.

This bit being set to 1 indicates that the AVB-DMAC is fetching data for transmission from the on-chip RAM, or the E-MAC is transmitting data.

- [Clearing conditions]
  The current operating mode is not operation mode.
  Completion of transfer of all frames for transmission from the transmission FIFO (the transmit start request bit in the transmit configuration control register (TCCR.TSRQ2) is 0)
- [Setting condition]
  Transmission being started (by writing 1 to the transmit start request bit in the transmit configuration control register (TCCR.TSRQ2))

TPO1 (Transmit Process Status 1) Bit

This bit indicates whether a network control is being transmitted.

This bit being set to 1 indicates that the AVB-DMAC is fetching data for transmission from the on-chip RAM, or the E-MAC is transmitting data.

- [Clearing conditions]
  The current operating mode is not operation mode.
  Completion of transfer of all frames for transmission from the transmission FIFO (the transmit start request bit in the transmit configuration control register (TCCR.TSRQ1) is 0)
- [Setting condition]
  Transmission being started (by writing 1 to the transmit start request bit in the transmit configuration control register (TCCR.TSRQ1))

TPO0 (Transmit Process Status 0) Bit

This bit indicates whether a best effort is being transmitted.

This bit being set to 1 indicates that the AVB-DMAC is fetching data for transmission from the on-chip RAM, or the E-MAC is transmitting data.

- [Clearing conditions]
  The current operating mode is not operation mode.
  Completion of transfer of all frames for transmission from the transmission FIFO (the transmit start request bit in the transmit configuration control register (TCCR.TSRQ0) is 0)
- [Setting condition]
  Transmission being started (by writing 1 to the transmit start request bit in the transmit configuration control register (TCCR.TSRQ0))

DTS (Data Transfer Suspend Status) Bit

This bit indicates whether access to the on-chip RAM is enabled.

- [Clearing condition]
  The current operating mode is not operation mode.
  The data transfer suspend request bit in the AVB-DMAC mode register (CCC.DTSR) being 0.
- [Setting condition]
  Access to the on-chip RAM not proceeding while the data transfer suspend request bit (CCC.DTSR) in the AVB-DMAC mode register (CCC) is 1 (if the on-chip RAM is being accessed, this bit is set to 1 on completion of access).

OPS[3:0] (Operating Mode Status) Bits

These bits indicate the current operating mode.

For the operating modes, see Section 57.3.1.1, Operating Modes.

57.2.5 Current Descriptor Address Register q (CDARq) (q = 0 to 21)

The CDARq register indicates the current descriptor address.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	CDA[31:16]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CDA[15:0]

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 57.9 CDARq (q = 0 to 21) register contents

Bit Position	Bit Name	Function
b31 to b0	CDA[31:0]	Current Descriptor Address The address of the current descriptors for the transmission queues

CDA[31:0] (Current Descriptor Address) Bits

CDAR0 to CDAR3 indicate the addresses of the current descriptors for the corresponding transmission queues while CDAR4 to CDAR21 indicate the addresses of the current descriptors for the corresponding reception queues.

If the operating mode is changed to operation mode, the contents of the register for the queue to be used are set in the descriptor base address table register (DBAT).

Also, when the descriptor base address load request register (DLR) issues a load request, the contents of the corresponding register are set in the descriptor base address table register (DBAT).

Conditions for updating:

These bits are set to 0 when the operating mode is not operation mode.

This register is updated in response to processing of the descriptor for a queue.

57.2.6 Error Status Register (ESR)

The ESR register indicates the error status in the AVB-DMAC.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	EIL	ET[3:0]				—	—	—	EQN[4:0]				
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 57.10 ESR register contents

Bit Position	Bit Name	Function
b31 to b13	—	Reserved These bits are read as 0. The write value should be 0.
b12	EIL	Error Information Lost 0: No error information lost. 1: Error information lost.
b11 to b8	ET[3:0]	Error Type B'0000: Descriptor reading error from the on-chip RAM B'0001: Descriptor writing error to the on-chip RAM B'0010: Illegal descriptor reading error B'0100: Data/time stamp reading error from the on-chip RAM B'0101: Data/time stamp writing error to the on-chip RAM B'1001: Transmission frame size error B'1010: Transmission FIFO overflow error
b7 to b5	—	Reserved These bits are read as 0. The write value should be 0.
b4 to b0	EQN[4:0]	Error Queue Number Error queue number.

EIL (Error Information Lost) Bit

This bit indicates that error information has been lost because a new error was detected when the previous error remained unprocessed.

Conditions for updating:

This bit is set to 0 when the operating mode is not operation mode.
This bit is also set to 0 when 0 is written to the queue error interrupt status bit in the error interrupt status register (EIS.QEF).

This bit is set to 1 when the condition for setting the queue error interrupt status bit in the error interrupt status register (EIS.QEF) to 1 is satisfied when the queue error interrupt status bit in the error interrupt status register (EIS.QEF) is 1.

ET[3:0] (Error Type) Bits

These bits indicate the detail of the error detected.
When the detected error is related to descriptor reading (ESR.ET = B'0000 or B'0010), the current descriptor address bits in the current descriptor address register q (CDARq.CDA) are not updated thus the same descriptor is processed again. To handle this, correct the descriptor.

When the detected error is related to descriptor writing (ESR.ET = B'0001), the current descriptor address bits in the current descriptor address register q (CDARq.CDA) and the transmit start request bit in the transmit configuration control register (TCCR.TSRQt) are updated as in the normal case thus the descriptor chain processing is not affected.
The other errors are temporary and might be eliminated by transfer continuation. For details, refer to Section 57.3.2.3, Checking Integrity.

This bit should be referred to only when the queue error interrupt status bit in the error interrupt status register (EIS.QEF) is 1.

Conditions for updating:

These bits are updated when the condition for setting the queue error interrupt status bit in the error interrupt status register (EIS.QEF) to 1 is satisfied when the queue error interrupt status bit in the error interrupt status register (EIS.QEF) is 0.

EQN (Error Queue Number) Bits

These bits indicate the queue number in which the error has been detected.
When ESR.EQN is 0 to 3, it means that the related queue is a transmission queue and the EQN value is the transmission queue number. When ESR.EQN is 4 or larger, it means that the related queue is a reception queue and the "ESR.EQN – 4" is the reception queue number r.
Refer to these bits only when the queue error interrupt status bit in the error interrupt status register (EIS.QEF) is 1.

Conditions for updating:

These bits are updated when the condition for setting the queue error interrupt status bit in the error interrupt status register (EIS.QEF) to 1 is satisfied when the EIS.QEF bit is 0.

57.2.7 Receive Configuration Register (RCR)

The RCR register is used to make settings related to reception for the AVB-DMAC.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	RFCL[12:0]												
Initial value	0	0	0	1	1	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	ETS2	ETS0	ESF[1:0]		ENCF	EFFS
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 57.11 RCR register contents

Bit Position	Bit Name	Function
b31 to b29	—	Reserved These bits are read as 0. The write value should be 0.
b28 to b16	RFCL[12:0]	Receive FIFO Caution Level
b15 to b6	—	Reserved These bits are read as 0. The write value should be 0.
b5	ETS2	Time Stamp Enable (Stream) 0: Time stamping is disabled. 1: Time stamping is enabled.
b4	ETS0	Time Stamp Enable (Best Effort) 0: Time stamping is disabled. 1: Time stamping is enabled.
b3, b2	ESF[1:0]	Stream Filtering Select Settings for reception queues 2 to 17 B'00: Filtering is disabled. Frames are processed in queue 0 (best effort). B'01: The filter for separating AVB stream frames from non-AVB stream frames is enabled; non-matching frames from the stream are processed in queue 0 (best effort). B'10: The filter for separating AVB stream frames from non-AVB stream frames is enabled; non-matching frames are discarded. B'11: The filter for separating AVB stream frames from non-AVB stream frames is enabled; non-matching frames from a stream are processed in queue 0 (best effort).
b1	ENCF	Network Control Filtering Enable Setting for reception queue 1 (network control) 0: Network control is disabled. 1: Network control is enabled.
b0	EFFS	Error Frame Enable 0: Error frames are disabled. 1: Error frames are enabled.

RFCL[12:0] (Receive FIFO Caution Level) Bits

These bits set the caution level for the reception FIFO and are used to maintain the priority order of the storage of received data and the fetching of data for transmission.

If the reception FIFO contains less data than this level, processing of both transmission and reception queues becomes pending.

If the reception FIFO contains more data than this level, only data in the reception queue are transferred, and processing of the transmission queue becomes pending.

Writing to this bit is only possible when the current operating mode is configuration mode.

CAUTION

- In the case of this LSI chip, set these bits to H'1800.

ETS2 (Time Stamp Enable (Stream)) Bit

Enables the inclusion of time-stamp information in reception queues 2 to 17.

The descriptor structure differs depending on whether time-stamp information is included or not. The reception queue in which time-stamp information is enabled uses the extended descriptor.

Writing to this bit is only possible when the current operating mode is configuration mode.

ETS0 (Time Stamp Enable (Best Effort)) Bit

Enables the inclusion of time-stamp information in reception queue 0.

The descriptor structure differs depending on whether time-stamp information is included or not. The reception queue 0 in which time-stamp information is enabled uses the extended descriptor.

Writing to this bit is only possible when the current operating mode is configuration mode.

ESF[1:0] (Stream Filtering Select) Bits

These bits select separation filtering for reception queues 2 to 17.

The queue-dependent separation filter can be used in combination with the identification of AVB stream frames.

When the value is B'00, filtering is disabled and frames from streams are processed in reception queue 0 (best effort).

When the value is B'01, the separation filter is enabled for both AVB stream frames and non-AVB stream frames; frames from non-matching streams are processed in reception queue 0 (best effort).

When the value is B'10, the separation filter is enabled for AVB stream frames; frames from non-matching streams are discarded.

When the value is B'11, the separation filter is enabled for AVB stream frames; frames from non-matching streams are processed in reception queue 0 (best effort).

For separation filtering, see 57.3.4.1 (1) Separation Filtering.

Writing to this bit is only possible when the current operating mode is configuration mode.

ENCF (Enable Network Control Filtering) Bit

Enables the AVB network control frame for reception queue 1.

When reception queue 1 is disabled, a received frame is stored in reception queue 0 (best effort).

Writing to this bit is only possible when the current operating mode is configuration mode.

EFFS (Enable Error Frame) Bit

Enables or disables the reception of frames that have been classified as error frames by the E-MAC.

Received error frames are stored in reception queue 0 (best effort).

An indicator of error detection by the E-MAC during reception is stored in the descriptor (DESCR.MS).

Writing to this bit is only possible when the current operating mode is configuration mode.

57.2.8 Receive Queue Configuration Register i (RQCi) (i = 0 to 4)

The RQC0 register is used to set up reception queues 0 to 3.

The RQC1 register is used to set up reception queues 4 to 7.

The RQC2 register is used to set up reception queues 8 to 11.

The RQC3 register is used to set up reception queues 12 to 15.

The RQC4 register is used to set up reception queues 16 to 17.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b15, b14	—	Reserved These bits are read as 0. The write value should be 0.
b13, b12	UFCC1[1:0]	Unread Frame Counter Configuration (Receive Queue 1+i*4) These bits set the unread frame counter used in reception queue 1+4*i.
b11, b10	—	Reserved These bits are read as 0. The write value should be 0.
b9, b8	RSM1[1:0]	Receive Synchronous Mode (Receive Queue 1+i*4) B'00: Mode with write-back Other than B'00: Setting prohibited
b7, b6	—	Reserved These bits are read as 0. The write value should be 0.
b5, b4	UFCC0[1:0]	Unread Frame Counter Configuration (Receive Queue 0+i*4) These bits set the unread frame counter used in reception queue 0+4*i.

Table 57.12 RQCi register contents (2/2)

Bit Position	Bit Name	Function
b3, b2	—	Reserved These bits are read as 0. The write value should be 0.
b1, b0	RSM0[1:0]	Receive Synchronous Mode (Receive Queue 0+i*4) B'00: Mode with write-back Other than B'00: Setting prohibited

UFCCr[1:0] (r = 0 to 17) Unread Frame Counter Configuration Bits

These bits set the unread frame counter for reception queue r.

With the AVB-DMAC, four patterns of settings are available for the unread frame counter. Use the unread frame counter stop level configuration register (UFCS) to set the stop level of the unread frame counter.

When these bits are set to B'00, the stop function is disabled.

Writing to the bits is only possible when the current operating mode is configuration mode.

RSMr[1:0] (r = 0 to 17) Receive Synchronous Mode Bits

These bits set receive synchronous mode.

Set B'00 in this bit.

Writing to the bits is only possible when the current operating mode is configuration mode.

57.2.9 Receive Padding Configuration Register (RPC)

The RPC register is used to set padding for received frames.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	DCNT[7:0]

R/W	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Table 57.13 RPC register contents

Bit Position	Bit Name	Function
b31 to b24	—	Reserved These bits are read as 0. The write value should be 0.
b23 to b16	DCNT[7:0]	Stored Data Counter These bits specify the amount of data to be stored with the descriptor. The setting is in words. I.e. 1 in the counter indicates 1 word (4 bytes).
b15 to b11	—	Reserved These bits are read as 0. The write value should be 0.
b10 to b8	PCNT[2:0]	Stored Padding Counter These bits indicate the amount of padding to be stored in data areas for descriptors. The setting is in words. I.e. 1 in the counter indicates 1 word (4 bytes).
b7 to b0	—	Reserved These bits are read as 0. The write value should be 0.

CAUTION

Padding can be used to extend frame lengths, but frame lengths should not exceed 4 Kbytes.

DCNT[7:0] Stored Data Counter Bits

These bits specify the amount of the frame data (1 to 255) to be stored following the padding. Counting by one indicates one word (4 bytes). For example, when these bits are set to 47, the amount of data is 47 words (= 188 bytes).

When these bits are 0, all received data have been stored following the initial padding.

Writing to the bits is only possible when the current operating mode is configuration mode.

For details on padding, see section 57.3.4.3 (c) Padding.

PCNT[2:0] Stored Padding Counter Bits

These bits specify the amount of padding to be appended to the on-chip RAM. Counting by one indicates one word (4 bytes). For example, when these bits are set to 1, the amount of padding is one word (= 4 bytes).

Writing to the bits is only possible when the current operating mode is configuration mode.

For details on padding, see section 57.3.4.3 (c) Padding.

57.2.10 Unread Frame Counter Stop Level Configuration Register (UFCS)

The UFCS register sets the stop levels for unread frames.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 57.14 UFCS register contents

Bit Position	Bit Name	Function
b31, b30	—	Reserved These bits are read as 0. The write value should be 0.
b29 to b24	SL3[5:0]	Stop Level 3 Unread frame count stop level 3
b23, b22	—	Reserved These bits are read as 0. The write value should be 0.
b21 to b16	SL2[5:0]	Stop Level 2 Unread frame count stop level 2
b15, b14	—	Reserved These bits are read as 0. The write value should be 0.
b13 to b8	SL1[5:0]	Stop Level 1 Unread frame count stop level 1
b7, b6	—	Reserved These bits are read as 0. The write value should be 0.
b5 to b0	SL0[5:0]	Stop Level 0 Unread frame count stop level 0 These bits are read as 0. The write value should be 0.

SL0 to SL3[5:0] Stop Level 0 to 3 Bits

These bits set the stop levels for unread frames.

One of the four stop levels from 0 to 3 can be set for each reception queue. When these bits are set to 0, the stop function is disabled. The level to be used is specified by the receive queue configuration register i (RQCi) (i = 0 to 4).

Writing to the bits is only possible when the current operating mode is configuration mode.

57.2.11 Unread Frame Counter Register i (UFCVi) (i = 0 to 4)

The UFCV0 register indicates the number of unread frames in reception queues 0 to 3.

The UFCV1 register indicates the number of unread frames in reception queues 4 to 7.

The UFCV2 register indicates the number of unread frames in reception queues 8 to 11.

The UFCV3 register indicates the number of unread frames in reception queues 12 to 15.

The UFCV4 register indicates the number of unread frames in reception queues 16 and 17.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 57.15 UFCS0 register contents

Bit Position	Bit Name	Function
b31, b30	—	Reserved These bits are read as 0. The write value should be 0.
b29 to b24	CV3[5:0]	Unread Frame Count 3+4*i Number of unread frames in reception queue 3+4*i
b23, b22	—	Reserved These bits are read as 0. The write value should be 0.
b21 to b16	CV2[5:0]	Unread Frame Count 2+4*i Number of unread frames in reception queue 2+4*i
b15, b14	—	Reserved These bits are read as 0. The write value should be 0.
b13 to b8	CV1[5:0]	Unread Frame Count 1+4*i Number of unread frames in reception queue 1+4*i
b7, b6	—	Reserved These bits are read as 0. The write value should be 0.
b5 to b0	CV0[5:0]	Unread Frame Count 0+4*i Number of unread frames in reception queue 0+4*i

CVr[5:0] Unread Frame Count r (r = 0 to 17) Bits

These bits indicate the number of unread frames in reception queue r.

The number of unread frames is decremented by the value that is written to the unread frame counter decrement register i (UFCDi).

For a description of how to use unread frames, refer to Section 57.3.4.4, Unread Frame Counters.

Conditions for updating:

The bits are set to 0 when the operating mode is not operation mode and when the descriptor base address load request register (DLR) issues a base address load request.

The value of these bits is incremented when a frame is stored in reception queue r normally and a write transaction to the corresponding descriptor is issued. (The maximum setting is H’3F. If the value exceeds H’3F, incrementation will not proceed.) Note that the value is incremented without waiting for response to the write transaction. Therefore confirm that the descriptor type (DESCR.DT) of the corresponding descriptor has been updated before processing the received data.

The value is decremented by the value written to the unread frame counter decrement register i

(UFCDi). Confirm that the descriptor types (DESCR.DT) of all the target descriptors for decrementing have been updated before decrementing.

57.2.12 Unread Frame Counter Decrement Register i (UFCDi) (i = 0 to 4)

The UFCD0 register is used to decrement unread counters in reception queues 0 to 3.

The UFCD1 register is used to decrement unread counters in reception queues 4 to 7.

The UFCD2 register is used to decrement unread counters in reception queues 8 to 11.

The UFCD3 register is used to decrement unread counters in reception queues 12 to 15.

The UFCD4 register is used to decrement unread counters in reception queues 16 and 17.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit Position	Bit Name	Function
b31, b30	—	Reserved These bits are read as 0. The write value should be 0.
b29 to b24	DV3[5:0]	Unread Frame Decrement Value 3+4*i Unread frame decrement value for reception queue 3+4*i
b23, b22	—	Reserved These bits are read as 0. The write value should be 0.
b21 to b16	DV2[5:0]	Unread Frame Decrement Value 2+4*i Unread frame decrement value for reception queue 2+4*i
b15, b14	—	Reserved These bits are read as 0. The write value should be 0.
b13 to b8	DV1[5:0]	Unread Frame Decrement Value 1+4*i Unread frame decrement value for reception queue 1+4*i
b7, b6	—	Reserved These bits are read as 0. The write value should be 0.
b5 to b0	DV0[5:0]	Unread Frame Decrement Value 0+4*i Unread frame decrement value for reception queue 0+4*i

DVr[5:0] Unread Frame Decrement Value r (r = 0 to 17) Bits

These bits set the decrement value for unread frames in reception queue r. The value of an unread frame counter register i (UFCVi) (i = 0 to 4) is decremented by the value set in the corresponding bits of this register.

Write H'3F to these bits to reset the unread counters in reception queue r.

These bits are always read as 0.

57.2.13 Separation Filter Offset Register (SFO)

The SFO register sets an offset into frames for use by the separation filter.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 57.17 SFO register contents

Bit Position	Bit Name	Function
b31 to b6	—	Reserved These bits are read as 0. The write value should be 0.
b5 to b0	FBP[5:0]	First Byte Position Position in Ethernet frames of the first byte of the bytes to be used by the separation filter

FBP[5:0] First Byte Position Bits

These bits set the position in Ethernet frames of the first byte of the bytes to be used by the separation filter.

When these bits are 0, the separation filter starts from the start of each Ethernet frame (first byte of the destination address). For bytes in Ethernet frames, see Figure 57.2 Data for Reception in an Ethernet Frame, in Section 57.2.1, AVB-DMAC Mode Register (CCC).

Writing to the bits is only possible when the current operating mode is configuration mode.

For separation filtering, see section 57.3.4.1 (1) Separation Filtering.

CAUTION

Received frames having fewer bytes than the setting of these bits + 8 bytes are judged to be non-matching by the separation filter. In this case, the data will either be sorted into a reception queue or discarded in accord with the setting of the separation filtering select bits in the receive configuration register (RCR.ESF).

57.2.14 Separation Filter Pattern Register i (SFPi) (i = 0 to 31)

Pairs of SFPi registers set the pattern for the separation filters to be used by the corresponding reception queues 2 to 17.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	FPs[31+32*(i%2):16+32*(i%2)]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 57.18 SFPi register contents

Bit Position	Bit Name	Function
b31 to b0	FPs[31+32*(i%2):0+32*(i%2)]	Separation Filter Pattern These bits set the pattern of the separation filter. The 64-bit filter pattern is set for each queue.

FPs[63:0](s = i/2) Separation Filter Pattern Bits

These bits set the pattern for a separation filter to be used with reception queues 2 to 17 (for streams 0 to 15).

Each queue has a 64-bit setting; reception queue 2 (for stream 0) uses SFP0 and SFP1, reception queue 17 (for stream 15) uses SFP30 and SFP31, and so on.

SFPi.FPs[7:0] (where i is an even number) are used for the byte of Ethernet frame data specified by the separation filter offset register, while SFPi.FPs[63:56] (where i is the corresponding odd number) are used for the byte at the address specified by the separation filter offset register (SFO) + 7.

Data from received frames passes the separation filter when the following formula is satisfied.

(Data from received frames & SFMi.CFM) == SFPi.FPs

Eight bytes from the position specified by the start byte position bits (SFO.FBP) of data in the received frames are used by the separation filter.

Writing to the bits is only possible when the current operating mode is configuration mode.

For separation filtering, see section 57.3.4.1 (1) Separation Filtering.

57.2.15 Separation Filter Mask Register i (SFMi) (i = 0 or 1)

A pair of SFMi registers sets the mask value for the separation filter used by the corresponding reception queue 2 to 17.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 57.19 SFMi register contents

Bit Position	Bit Name	Function
b31 to b0	CFM[31:0]	Separation Filter Mask These bits set the mask value for the separation filter.

CFM[63:0] Separation Filter Mask Bits

These bits set the mask value for the separation filter for use with the corresponding reception queue 2 to 17 (stream 0 to 15).

SFM0.CFM[7:0] are used for bytes of Ethernet frame data specified by the separation filter offset register, while SFM1.CFM[63:56] are used for the separation filter offset register (SFO) + 7.

Writing to the bits is only possible when the current operating mode is configuration mode.

For separation filtering, see section 57.3.4.1 (1) Separation Filtering.

57.2.16 Transmit Configuration Register (TGC)

The TGC register is used to make settings related to transmission for the AVB-DMAC.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 57.20 TGC register contents (1/2)

Bit Position	Bit Name	Function
b31 to b22	—	Reserved These bits are read as 0. The write value should be 0.
b21, b20	TBD3[1:0]	Transmit FIFO Size (Stream Class A) Number of frames to be fetched from transmission queue 3 (for stream class A) CAUTION Write 2 to these bits.
b19, b18	—	Reserved These bits are read as 0. The write value should be 0.
b17, b16	TBD2[1:0]	Transmit FIFO Size (Stream Class B) Number of frames to be fetched from transmission queue 2 (for stream class B) CAUTION Write 2 to these bits.
b15, b14	—	Reserved These bits are read as 0. The write value should be 0.
b13, b12	TBD1[1:0]	Transmit FIFO Size (Network Control) Number of frames to be fetched from transmission queue 1 (for network control) CAUTION Write 2 to these bits.
b11, b10	—	Reserved These bits are read as 0. The write value should be 0.
b9, b8	TBD0[1:0]	Transmit FIFO Size (Best Effort) Number of frames to be fetched from transmission queue 0 (for best effort) CAUTION Write 2 to these bits.
b7, b6	—	Reserved These bits are read as 0. The write value should be 0.
b5, b4	TQP[1:0]	Transmit Queue Priority 00: Non-ABV mode 01: AVB mode 1 10: Setting prohibited 11: AVB mode 2

Table 57.20 TGC register contents (2/2)

Bit Position	Bit Name	Function
b3	TSM3	Transmit Synchronous Mode (Stream Class A) 0: With write-back 1: Setting prohibited
b2	TSM2	Transmit Synchronous Mode (Stream Class B) 0: With write-back 1: Setting prohibited
b1	TSM1	Transmit Synchronous Mode (Network Control) 0: With write-back 1: Setting prohibited
b0	TSM0	Transmit Synchronous Mode (Best Effort) 0: With write-back 1: Setting prohibited

TBD0 to TBD3[1:0] Transmit FIFO Size (Stream Class A/ Stream Class B/Network Control/Best Effort) Bits

These bits set the sizes of the transmission FIFO buffers for use with each of the transmission queues.

Writing to these bits is only possible when the current operating mode is configuration mode.

Set these bits to 2.

TQP[1:0] Transmit Queue Priority Bits

These bits set the priority of the transmission queues.

B’00: Non-AVB mode: Q3→Q2→Q1→Q0

B’01: AVB mode 1: Q3 (CBS)→Q2 (CBS)→Q1→Q0

B’10: Setting prohibited

B’11: AVB mode 2: Q1→Q3 (CBS)→Q2 (CBS)→Q0

For the credit-based shaping (CBS) algorithm, see Section 57.3.6, CBS (Credit-Based Shaping).

The CBS algorithm is not applied in non-AVB mode (i.e. when the value is B’00).

Writing to the bits is only possible when the current operating mode is configuration mode.

TSM0 to TSM3 Transmit Synchronous Bits

Set these bits to 0.

57.2.17 Transmit Configuration Control Register (TCCR)

The TCCR register controls transmission by the AVB-DMAC and is used to make related settings.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 57.21 TCCR register contents

Bit Position	Bit Name	Function
b31 to b10	—	Reserved These bits are read as 0. The write value should be 0.
b9	TFR	Time Stamp FIFO Release 0(W): No request to the time-stamp FIFO. 1(W): Releases the oldest entry in the time-stamp FIFO.
b8	TFEN	Time Stamp FIFO Enable 0: Recording of transmission time stamps in the time-stamp FIFO is disabled. 1: Recording of transmission time stamps in the time-stamp FIFO is enabled.
b7 to b4	—	Reserved These bits are read as 0. The write value should be 0.
b3	TSRQ3	Transmit Start Request (Queue 3 (Stream Class A)) 0(R): Transmission queue is empty or stopped. 1(W): A transmission start request is issued. 1(R): Fetching of data for transmission is pending.
b2	TSRQ2	Transmit Start Request (Queue 2 (Stream Class B)) 0(R): Transmission queue is empty or stopped. 1(W): A transmission start request is issued. 1(R): Fetching of data for transmission is pending.
b1	TSRQ1	Transmit Start Request (Queue 1 (Network Control)) 0(R): Transmission queue is empty or stopped. 1(W): A transmission start request is issued. 1(R): Fetching of data for transmission is pending.
b0	TSRQ0	Transmit Start Request (Queue 0 (Best Effort)) 0(R): Transmission queue is empty or stopped. 1(W): A transmission start request is issued. 1(R): Fetching of data for transmission is pending.

TFR Time Stamp FIFO Release Bit

This bit releases the oldest entry in the time-stamp FIFO.

When 1 is written to this bit, the TFAi register is updated by the oldest entry in the time-stamp FIFO.

For a description of how to use the time-stamp FIFO, see Section 57.3.5.4, Time Stamping in Transmission.

This bit is always read as 0.

When the time stamp FIFO count bits (TSR.TFFL) are set to B’000, 1 should not be written to this bit.

TFEN Time Stamp FIFO Enable Bit

This bit enables storage in the time-stamp FIFO.

When it is set, time-stamp information is stored for descriptors with DESCR.TSR set to 1 (for DESCR.TSR, see section 57.3.5.2 (2) Configuration of Transmission Frame Data Descriptors.

When 0 is set in this bit, no entries are made in the time-stamp FIFO.

For a description of how to use the time-stamp FIFO, see Section 57.3.5.4, Time Stamping in Transmission.

TSRQt Transmit Start Request (Queue t) (t = 0 to 3) Bit

This bit issues a request to start transmission for transmission queue t.

When read, this bit being set to 1 indicates that transmission queue t has a frame that has not yet been fetched to the transmission FIFO.

Frame transmission by the E-MAC is processed independently from fetching to the transmission FIFO. The timing of transmission from a queue depends on the priority order of transmission.

For the scheduling of transmission queues, see Section 57.3.5.1, Transmission Modes.

Writing to this bit is only possible when the current operating mode is configuration mode.

Only 1 can be written to the bit. Writing 0 to the bit has no effect.

Conditions for updating:

The bit is set to 0 when the operating mode is not operation mode, when a descriptor of type EEMPTY, FEMPTY, or LEMPTY (no usable data) is processed, when an EOS descriptor is processed, and when a descriptor with defective data is processed.

57.2.18 Transmit Status Register (TSR)

The TSR register indicates the state of transmission by the AVB-DMAC.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	TFFL[2:0]			—	—	—	—	CCS1[1:0]		CCS0[1:0]	
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 57.22 TSR register contents

Bit Position	Bit Name	Function
b31 to b11	—	Reserved These bits are read as 0. The write value should be 0.
b10 to b8	TFFL[2:0]	Time Stamp FIFO Count Number of time-stamp FIFOs
b7 to b4	—	Reserved These bits are read as 0. The write value should be 0.
b3, b2	CCS1[1:0]	CBS Counter Status 1 (Class A) B'00: The current credit value is within the limit. B'01: The current credit value is less than or equal to the lower limit. B'10: The current credit value is greater than or equal to the upper limit. B'11: (Reserved)
b1, b0	CCS0[1:0]	CBS Counter Status 0 (Class B) B'00: The current credit value is within the limit. B'01: The current credit value is less than or equal to the lower limit. B'10: The current credit value is greater than or equal to the upper limit. B'11: (Reserved)

TFFL[3:0] Time Stamp FIFO Count Bits

These bits indicate the number of time stamps in the time-stamp FIFO.

The values 0 and 2 indicate that the time-stamp FIFO is empty and full, respectively (values 3 to 7 are reserved).

Conditions for updating:

The bits are set to 0 when the operating mode is not operation mode and when the time stamp FIFO enable bit in the transmit configuration control register (TCCR.TFEN) = 0.

When the time stamp FIFO enable bit (TCCR.TFEN) is 1 and these bits are not 2, the value of these bits is incremented after a frame with DESCR.TSR set has been transmitted by the E-MAC (for DESCR.TSR, see Section 57.3.5.2 (2) Configuration of Transmission Frame Data Descriptors.

The value of these bits is decremented if it is not 0 when 1 is written to the time stamp FIFO release bit in the transmit configuration control register (TCCR.TFR).

CCS0 and CCS1[1:0] CBS Counter Status 0 and 1 Bits

These bits indicate the CBS (credit-based shaping) state of stream data transmission queues 0 and 1. If the calculated credit value is outside the range specified by CBS upper limit register c (CULc) and CBS lower limit register c (CLLc), it falls outside the range for CBS.

Conditions for updating:

The bits are set to B'00 when the operating mode is not operation mode.

The bits are set to B'00 when the credit value calculated by the CBS is within the range specified by the CBS upper limit register c (CULc) (c = 0, 1) and the CBS lower limit register c (CLLc) (c = 0, 1).

The bits are set to B'01 if the credit value calculated by the CBS is lower than the value in CBS lower limit register c (CLLc).

The bits are set to B'10 if the credit value calculated by the CBS is higher than the value in CBS upper limit register c (CULc).

57.2.19 Time Stamp FIFO Access Register 0 (TFA0)

TFA0 indicates the time stamp value.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TSV[15:0]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 57.23 TFA0 register contents

Bit Position	Bit Name	Function
b31 to b0	TSV[31:0]	Time Stamp Value Time stamp value

TSV[79:0] Time Stamp Value Bits

These 80 bits consist of TFA0.TSV[31:0], TFA1.TSV[63:32], and TFA2.TSV[79:64], which together indicate the oldest time stamp value stored in the time-stamp FIFO.

Once the time-stamp FIFO is full, no further time-stamp values are stored.

Conditions for updating:

The bits are set to H'0000 0000 when the operating mode is not operation mode.

The register is updated whenever a value is stored in the time-stamp FIFO (when the time-stamp FIFO count bit in the transmit status register (TSR.TFFL) changes from 0 to 1).

The register is updated when the oldest entry is released (when the time stamp FIFO release bit in the transmit configuration control register (TCCR.TFR) is set to 1).

57.2.20 Time Stamp FIFO Access Register 1 (TFA1)

The TFA1 register indicates the time-stamp value.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 57.25 TFA2 register contents

Bit Position	Bit Name	Function
b31 to b26	—	Reserved These bits are read as 0.
b25 to b16	TST[9:0]	Time Stamp Tag Time-stamp tag
b15 to b0	TSV[79:64]	Time Stamp Value Time-stamp value

TST[9:0] Time Stamp Tag Bits

These bits indicate the contents of the DESCR.TAG bit within the descriptor for frame transmission. These values are used to check the correlation between frames within the transmission queue and the time-stamp values (accessible through time stamp FIFO access register i (TFAi.TSV, i = 0 to 2)) which can be placed in the FIFO.

For the tagging of frames in transmission, see Section 57.3.5.4, Time Stamping in Transmission.

When the time stamp FIFO count bits (TSR.TFFL) are 0, do not refer to these bits.

Conditions for updating:

The bits are set to H'000 when the operating mode is not operation mode.

Updated when a value is stored in the time-stamp FIFO (when the value of the time stamp FIFO count bit in the transmit status register (TSR.TFFL) changes from 0 to 1).

Updated when the oldest entry has been released (1 is set in the time stamp FIFO release bit in the transmit configuration control register (TCCR.TFR)).

TSV[73:64] Time Stamp Value Bits

For details, see Section 57.2.19, Time Stamp FIFO Access Register 0 (TFA0).

57.2.22 CBS Increment Value Register c (CIVRc) (c = 0 or 1)

The CIVR0 register sets the increment in the CBS algorithm for transmission queue 2 (for stream class B).

The CIVR1 register sets the increment in the CBS algorithm for transmission queue 3 (for stream class A).

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 57.26 CIVRc register contents

Bit Position	Bit Name	Function
b31 to b0	CIV[31:0]	CBS Increment Value Setting value: 1 to 65535 (H'00000001 to H'0000FFFF)

CIV[31:0] CBS Increment Value Bits

These bits set the increment for the CBS algorithm.

Set a value in the range from 1 to 65535 (H'0000 0001 to H'0000 FFFF).

The value to be written to these bits depends on the Ethernet bit rate and Bϕ (internal bus clock). For details, see Section 57.3.6, CBS (Credit-Based Shaping).

57.2.23 CBS Decrement Value Register c (CDVRc) (c = 0 or 1)

The CDVR0 register sets the decrement in the CBS algorithm for transmission queue 2 (for stream class B).

The CDVR1 register sets the decrement in the CBS algorithm for transmission queue 3 (for stream class A).

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 57.27 CDVR0 and CDVR1 register contents

Bit Position	Bit Name	Function
b31 to b0	CDV[31:0]	CBS Decrement Value Setting value: -1 to -65536 (H'FFFF FFFF to H'FFFF 0000)

CDV[31:0] CBS Decrement Value Bits

These bits set the decrement for the CBS algorithm.

Set a negative value from -1 to -65536 (H'FFFF FFFF to H'FFFF 0000).

The value to be written to these bits depends on the Ethernet bit rate and Bϕ (internal bus clock). For details, see Section 57.3.6, CBS (Credit-Based Shaping).

57.2.24 CBS Upper Limit Register c (CULc) (c = 0 or 1)

The CUL0 register sets the upper limit for credit values calculated by using the CSB algorithm for transmission queue 2 (for stream class B).

The CUL1 register sets the upper limit for credit values calculated by using the CSB algorithm for transmission queue 3 (for stream class A).

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 57.28 CUL0 and CUL1 register contents

Bit Position	Bit Name	Function
b31?b0	ULV[31:0]	CBS Upper Limit Upper limit on CBS values

ULV[31:0] CBS Upper Limit Bits

These bits set the upper limit for credit values calculated by using the CBS algorithm.

The setting is a limiting value for error detection and does not normally affect operation of the algorithm.

Write a positive value to these bits.

For details, see Section 57.3.6, CBS (Credit-Based Shaping).

57.2.25 CBS Lower Limit Register c (CLLc) (c = 0 or 1)

The CUL0 register sets the lower limit for credit values calculated by using the CSB algorithm for transmission queue 2 (for stream class B).

The CUL1 register sets the lower limit for credit values calculated by using the CSB algorithm for transmission queue 3 (for stream class A).

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 57.29 CULc register contents

Bit Position	Bit Name	Function
b31 to b0	LLV[31:0]	CBS Lower Limit Lower limit on CBS values

LLV[31:0] CBS Lower Limit Bits

These bits set the lower limit for credit values calculated by using the CBS algorithm.

The setting is a limiting value for error detection and does not normally affect operation of the algorithm.

Write a negative value to these bits.

For details, see Section 57.3.6, CBS (Credit-Based Shaping).

57.2.26 Descriptor Interrupt Control Register (DIC)

The DIC register is used to control descriptor interrupts 1 to 15.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b1	DPE1	Descriptor Interrupt Enable 1 0: Disabled 1: Enabled
b0	—	Reserved This bit is read as 0. The write value should be 0.

RPE1 to RPE15 Descriptor Interrupt Enable Bits 1 to 15

When an interrupt source flag is set (a bit from among the DPF1 to DPF15 bits in the descriptor interrupt status register (DIS) = 1) while the interrupt is enabled, the interrupt is issued.

57.2.27 Descriptor Interrupt Status Register (DIS)

The DIS register indicates the state of descriptor interrupts.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 57.31 DIS register contents (2/2)

Bit Position	Bit Name	Function
b3	DPF3	Descriptor Interrupt Status3 0: The interrupt is not pending. 1: The interrupt is pending.
b2	DPF2	Descriptor Interrupt Status2 0: The interrupt is not pending. 1: The interrupt is pending.
b1	DPF1	Descriptor Interrupt Status1 0: The interrupt is not pending. 1: The interrupt is pending.
b0	—	Reserved This bit is read as 0. The write value should be 0.

DPF1 to DPF15 Descriptor Interrupt Status Bits

The corresponding bit indicates completion of the processing of a descriptor with DESCR.DIE set to the corresponding number from 1 to 15 within the reception or transmission queue.

When DESCR.DIE is 0, the descriptor interrupt is not generated.

Only 0 can be written to these bits.

[Conditions for Changing]

A bit is set to 0 when the operating mode is not operation mode.

A bit is set to 1 when a descriptor with DESCR.DIE set to the corresponding number from 1 to 15 is processed and a write transaction to the corresponding descriptor is issued. Note that the bit is set to 1 without waiting for response to the write transaction. Therefore confirm that the descriptor type (DESCR.DT) of the corresponding descriptor has been updated before post-processing the processed descriptor.

57.2.28 Error Interrupt Control Register (EIC)

The EIC register controls the AVB-DMAC-related error interrupts.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 57.32 EIC register contents

Bit Position	Bit Name	Function
b31 to b9	—	Reserved These bits are read as 0. The write value should be 0.
b8	TFFE	Time Stamp FIFO Full-Error Interrupt Enable 0: Disabled 1: Enabled
b7	CULE1	CBS Upper Limit Error Interrupt Enable (Class A) 0: Disabled 1: Enabled
b6	CULE0	CBS Upper Limit Error Interrupt Enable (Class B) 0: Disabled 1: Enabled
b5	CLLE1	CBS Lower Limit Error Interrupt Enable (Class A) 0: Disabled 1: Enabled
b4	CLLE0	CBS Lower Limit Error Interrupt Enable (Class B) 0: Disabled 1: Enabled
b3	SEE	Separation Filter Error Interrupt Enable 0: Disabled 1: Enabled
b2	QEE	Queue Error Interrupt Enable 0: Disabled 1: Enabled
b1, b0	—	Reserved These bits are read as 0. The write value should be 0.

TFFE Time Stamp FIFO Full-Error Interrupt Enable Bits

When the time stamp FIFO is full (TFFF in the error interrupt status register (EIS) = 1) and the interrupt is enabled, the interrupt is issued.

CULE1 CBS Upper Limit Error Interrupt Enable Bit (Class A)

When the Class A CBS reaches its upper limit (CULF1 in the error interrupt status register (EIS) = 1) and the interrupt is enabled, the interrupt is issued.

CULE0 CBS Upper Limit Error Interrupt Enable Bit (Class B)

When the Class B CBS reaches its upper limit (CULF0 in the error interrupt status register (EIS) = 1) and the interrupt is enabled, the interrupt is issued.

CLLE1 CBS Lower Limit Error Interrupt Enable Bit (Class A)

When the Class A CBS reaches its lower limit (CLLF1 in the error interrupt status register (EIS) = 1) and the interrupt is enabled, the interrupt is issued.

CLLE0 CBS Lower Limit Error Interrupt Enable Bit (Class B)

When the Class B CBS reaches its lower limit (CLLF0 in the error interrupt status register (EIS) = 1) and the interrupt is enabled, the interrupt is issued.

SEE Separation Filter Error Interrupt Enable Bit

When the separation filter error is detected (SEF in the error interrupt status register (EIS) = 1) and the interrupt is enabled, the interrupt is issued.

QEE Queue Error Interrupt Enable Bit

When the queue error is detected (QEF in the error interrupt status register (EIS) = 1) and the interrupt is enabled, the interrupt is issued.

57.2.29 Error Interrupt Status Register (EIS)

The EIS register indicates the states of AVB-DMAC-related error interrupts.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	QFS

R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Table 57.33 EIS register contents

Bit Position	Bit Name	Function
b31 to b17	—	Reserved These bits are read as 0. The write value should be 0.
b16	QFS	Queue Full Error Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b15 to b9	—	Reserved These bits are read as 0. The write value should be 0.
b8	TFFF	Time Stamp FIFO Full Error Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b7	CULF1	CBS Upper Limit Error Interrupt Status (Class A) 0: The interrupt is not pending. 1: The interrupt is pending.
b6	CULF0	CBS Upper Limit Error Interrupt Status (Class B) 0: The interrupt is not pending. 1: The interrupt is pending.
b5	CLLF1	CBS Lower Limit Error Interrupt Status (Class A) 0: The interrupt is not pending. 1: The interrupt is pending.
b4	CLLF0	CBS Lower Limit Error Interrupt Status (Class B) 0: The interrupt is not pending. 1: The interrupt is pending.
b3	SEF	Separation Filter Error Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b2	QEF	Queue Error Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b1, b0	—	Reserved These bits are read as 0. The write value should be 0.

QFS Queue Full Error Status Bit

With the interrupts enabled, this bit indicates that a queue is full (the receive queue r full interrupt status bit (QFFr) or the receive FIFO full interrupt status bit (RFFF) in receive interrupt status register 2 (RIS2) = 1).

[Conditions for Changing]

If the receive queue r full interrupt status bit (RIS2.QFFr) and the receive queue r full interrupt enable bit in the receive interrupt control register 2 (RIC2.QFEr) are updated, this bit is also updated.

If the receive FIFO full interrupt status bit (RIS2.RFFF) and the receive FIFO full interrupt enable bit (RIC2.RFFE) are updated, this bit is also updated.

TFFF Time Stamp FIFO Full-Error Interrupt Status Bit

This bit indicates that a new transmission time stamp has been discarded due to the time-stamp FIFO being full (i.e. has reached the overflow state).

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

The bit is set to 1 when a frame with DESCR.TSR set is transmitted while the time stamp FIFO enable bit in the transmit configuration control register (TCCR.TFEN) is set to 1 and the time stamp FIFO count bit in the transmit status register (TSR.TFFL) is set to 2.

CULF1 CBS Upper Limit Error Interrupt Status Bit (Class A)

This bit indicates that CBS counter 1 has exceeded the set upper limit (CUL1.ULV in the CBS upper limit register c (CULc)).

Only 0 can be written to the bit.

[Conditions for Changing]

This bit is set to 0 when the operating mode is not operation mode.

This bit is set to 1 when the value of the CBS counter status 1 (Class A) bits in the transmit status register (TSR.CCS1) change from 00 (indicating a value within the range between the limits) to 10 (indicating a value over the upper limit).

CULF0 CBS Upper Limit Error Interrupt Status Bit (Class B)

This bit indicates that CBS counter 0 has exceeded the set upper limit (CUL0.ULV in the CBS upper limit register c (CULc)).

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

The bit is set to 1 when the value of the CBS counter status 0 (Class B) bit in the transmit status register changes from 00 (indicating a value within the range between the limits) to 10 (indicating a value over the upper limit).

CULF1 CBS Lower Limit Error Interrupt Status Bit (Class A)

This bit indicates that CBS counter 1 has fallen below the set lower limit (CLL1.LLV in CBS lower limit register c (CLLc)).

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

The bit is set to 1 when the value of the CBS counter status 1 (Class A) bit in the transmit status register (TSR.CCS1) changes from 00 (indicating a value within the range between the limits) to 01 (indicating a value less than the lower limit).

CLLF0 CBS Lower Limit Error Interrupt Status Bit (Class B)

This bit indicates that CBS counter 0 has fallen below the set lower limit (CLL0.LLV in the CBS lower limit register c (CLLc)).

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

The bit is set to 1 when the value of the CBS counter status 0 (Class B) bit in the transmit status register (TSR.CCS0) changes from 00 (indicating a value within the range between the limits) to 01 (indicating a value less than the lower limit).

SEF Separation Filter Error Interrupt Status Bit

This bit indicates that a received frame has been discarded due to non-matching of the defined separation filter.

Only 0 can be written to this bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

If the stream filtering select bits in the receive configuration register (RCR.ESF) are B'10, this bit is set to 1 when the received frame is discarded because the received AVB stream data frame has not match any of the separation filters.

QEF Queue Error Interrupt Status Bit

This bit indicates that an error is detected when the transmission and reception queues are processed. For details, see Section 57.3.2.3, Checking Integrity.

Only 0 can be written to this bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

If an error in the transmission and reception queues is detected, this bit is set to 1.

57.2.30 Receive Interrupt Control Register 0 (RIC0)

The RIC0 register controls the AVB-DMAC receive interrupts.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

FRE0 to FRE17 Receive Frame Interrupt Enable Bits 0 to 17

When an interrupt source flag is set (a bit from among the receive interrupt status bits in the receive interrupt status register (RIS0.FRF0 to 17) = 1) while the interrupt is enabled, the interrupt is issued.

57.2.31 Receive Interrupt Status Register 0 (RIS0)

The RIS0 register indicates the states of the AVB-DMAC receive interrupts.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b0	FRF0	Receive Frame Interrupt Status 0 (Best Effort) 0: The interrupt is not pending. 1: The interrupt is pending.

FRF0 to FRF17 Receive Frame Interrupt Status Bits 0 to 17

Each bit indicates that a corresponding frame has been stored normally in reception queues 0 to 17 and that data are ready for CPU processing.

Only 0 can be written to the bit.

[Conditions for Changing]

A bit is set to 0 when the operating mode is not operation mode.

A bit is set to 0 when a value is written to the unread frame counter decrement register i (UFCDi) (i = 0 to 4), and this decrements the value of unread frame counter register i (UFCVi) (i = 0 to 4) to 0.

When a frame is stored in reception queue normally and a write transaction to the corresponding descriptor is issued, the corresponding bit is set to 1. Note that the bit is set to 1 without waiting for response to the write transaction. Therefore confirm that the descriptor type (DESCR.DT) of the corresponding descriptor has been updated before processing the received data.

57.2.32 Receive Interrupt Control Register 1 (RIC1)

The RIC1 register controls the AVB-DMAC receive interrupts.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b31	RFWE	Receive FIFO Warning Interrupt Enable 0: Disabled 1: Enabled
b30 to b0	—	Reserved These bits are read as 0. The write value should be 0.

RFWE Receive FIFO Warning Interrupt Enable Bit

If the reception FIFO reaches the caution level (the value set in the receive FIFO caution level bits in the receive configuration register (RCR.RFCL) with the corresponding interrupt enabled, the interrupt is issued.

57.2.33 Receive Interrupt Status Register 1 (RIS1)

The RIS1 register indicates the states of the AVB-DMAC receive interrupts.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 57.37 RIS1 register contents

Bit Position	Bit Name	Function
b31	RFWF	Receive FIFO Warning Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b30 to b0	—	Reserved These bits are read as 0. The write value should be 0.

RFWF Receive FIFO Warning Interrupt Status Bit

This bit indicates that the reception FIFO has reached the set caution level (the value set in the receive FIFO caution level bits in the receive configuration register (RCR.RFCL)).

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

The bit is set to 1 when the reception FIFO exceeds the set caution level (the value set in the receive FIFO caution level bits in the receive configuration register (RCR.RFCL)).

57.2.34 Receive Interrupt Control Register 2 (RIC2)

The RIC2 register controls the AVB-DMAC receive interrupts.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b2	QFF2	Receive Queue 2 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b1	QFF1	Receive Queue 7 (Network Control) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b0	QFF0	Receive Queue 0 (Best Effort) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.

RFFF Receive FIFO Full Interrupt Status Bit

This bit indicates that a frame was received but storing it was not possible due to the reception FIFO being full.

When receiving a frame is not possible, the frame will be discarded.

Other information regarding discarded frames is not retained. Even if the frame is not discarded, this bit may also be set to 1 if the E-MAC determines that the frame is an error frame

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

The bit is set to 1 when the reception FIFO cannot hold received data.

QFF0 to 17 Receive 0 to 17 Full Interrupt Status Bits

These bits indicate that reception queue r did not have space for storing a received frame.

A reception queue is treated as full when it has no descriptors (descriptor type (DESCR.DT) = FEMPTY, FEMPTY_IS, FEMPTY_IC, or FEMPTY_ND) available or reaches the set level for stopping.

CAUTION

If no FEMPTY descriptors or no empty space for descriptors remains in the queue during storing of a divided frame (see Section 57.3.4.3 (b) Divided Frames), an error frame is stored in the queue. Such error frames are treated as descriptor sequence errors.

[Conditions for Changing]

A bit is set to 0 when the operating mode is not operation mode.

A bit is set to 1 when reception queue r has no space available for storage.

A bit is set to 1 when the unread frame counter (unread frame counter register i (UFCVi) (i = 0 to 4)) reaches the set level for stopping.

A bit is set to 1 when the unread frame counter reaches the level for stopping before the subsequent received frame is discarded.

57.2.36 Transmit Interrupt Control Register (TIC)

The TIC register controls the AVB-DMAC transmit interrupts.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 57.40 TIC register contents

Bit Position	Bit Name	Function
b31 to b10	—	Reserved These bits are read as 0. The write value should be 0.
b9	TFWE	Time Stamp FIFO Warning Interrupt Enable 0: Disabled 1: Enabled
b8	TFUE	Time Stamp FIFO Update Interrupt Enable 0: Disabled 1: Enabled
b7 to b0	—	Reserved These bits are read as 0. The write value should be 0.

TFWE Time Stamp FIFO Warning Interrupt Enable Bit

When the time-stamp FIFO reaches the warning level while the interrupt is enabled, the interrupt is issued.

TFUE Time Stamp FIFO Update Interrupt Enable Bit

When the time-stamp FIFO is updated while the interrupt is enabled, the interrupt is issued.

57.2.37 Transmit Interrupt Status Register (TIS)

The TIS register indicates the states of the AVB-DMAC transmit interrupts.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	TFWF	TFUF	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R

Table 57.41 TIS register contents

Bit Position	Bit Name	Function
b31 to b10	—	Reserved These bits are read as 0. The write value should be 0.
b9	TFWF	Time Stamp FIFO Warning Interrupt Status 0: The interrupt is not pending. 1: The time-stamp FIFO has reached the warning level.
b8	TFUF	Time Stamp FIFO Update Interrupt Status 0: The interrupt is not pending. 1: The time-stamp FIFO has been updated.
b7 to b0	—	Reserved These bits are read as 0. The write value should be 0.

TFWF Time Stamp FIFO Warning Interrupt Status Bit

This bit indicates that the transmission time-stamp FIFO has reached the warning level.

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode and when the time stamp FIFO enable bit in the transmit configuration control register (TCCR.TFEN) is 0.

The bit is set to 1 after a frame including DESCR.TSR set has been transmitted and one entry has already been stored in the time-stamp FIFO.

TFUF Time Stamp FIFO Update Interrupt Status Bit

This bit indicates that the transmission time-stamp FIFO has been updated.

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode, when the time stamp FIFO enable bit in the transmit configuration control register (TCCR.TFEN) is 0, and when 1 is written to the time stamp FIFO release bit in the transmit configuration control register (TCCR.TFR).

The bit is set to 1 when the time stamp FIFO enable bit (TCCR.TFEN) is 1 after a frame including DESCR.TSR set has been transmitted.

57.2.38 Interrupt Summary Status Register (ISS)

The ISS register gives a summary of the states of AVB-DMAC-related interrupts.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b11 to b10	—	Reserved These bits are read as 0. The write value should be 0.
b9	TFWS	Time Stamp FIFO Warning Interrupt Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b8	TFUS	Time Stamp FIFO Update Interrupt 0: The interrupt is not pending. 1: The interrupt is pending.
b7	MS	E-MAC Interrupt Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b6	ES	Error Interrupt Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b5 to b0	—	Reserved These bits are read as 0. The write value should be 0.

DPS1 to DPS15 Descriptor Interrupt 1 to 15 Summary Bits

These bits are set to 1 when the given descriptor interrupt enable bit (DIC.DPE1 to DPE15) and descriptor interrupt status flag (DIS.DPF1 to DPF15) are both 1.

CGIS gPTP Interrupt Summary Bit

This bit is set to 1 when either interrupt-related bit in the two gPTP-related interrupt registers (GIC and GIS) is 1.

RFWS Receive FIFO Warning Interrupt Summary Bit

This bit is set to 1 when the receive FIFO warning interrupt enable bit (RIC1.RFWE) and receive FIFO warning interrupt status flag (RIS1.RFWF) are both 1.

TFWS Time Stamp FIFO Warning Interrupt Summary Bit

This bit is set to 1 when the time stamp FIFO warning interrupt enable bit (TIC.TFWE) and time stamp FIFO warning interrupt status flag (TIS.TFWF) are both 1.

TFUS Time Stamp FIFO Update Interrupt Summary Bit

This bit is set to 1 when the time stamp FIFO update interrupt enable bit (TIC.TFUE) and time stamp FIFO update interrupt status flag (TIS.TFUF) are both 1.

MS E-MAC Interrupt Summary Bit

This bit is set to 1 when an E-MAC interrupt is issued.

ES Error Interrupt Summary Bit

This bit is set to 1 when any of the valid flags in the error interrupt status register (EIS) is 1 or the queue full error interrupt status bit (EIS.QFS) in the error interrupt status register (EIS) is 1.

57.2.39 gPTP Configuration Control Register (GCCR)

The GCCR register is used to set and control the gPTP (generalized precision time protocol).

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 57.43 GCCR register contents

Bit Position	Bit Name	Function
b31 to b10	—	Reserved These bits are read as 0. The write value should be 0.
b9, b8	TCSS[1:0]	Timer Capture Source Select 00: gPTP timer value 01: Adjusted gPTP timer value 10: AVTP presentation time 11: Setting prohibited
b7, b6	—	Reserved These bits are read as 0. The write value should be 0.
b5	LMTT	Maximum Transit Time Configuration Request 0: Setting completed 1(W): Issue a configuration request. 1(R): Completion of settings is pending.
b4	LPTC	Presentation Time Compare Value Configuration Request 0: Setting completed 1(W): Issue a configuration request. 1(R): Completion of settings is pending.
b3	LTI	Timer Increment Value Configuration Request 0: Setting completed 1(W): Issue a configuration request. 1(R): Completion of settings is pending.
b2	LTO	Timer Offset Value Configuration Request 0: Setting completed 1(W): Issue a configuration request. 1(R): Completion of settings is pending.
b1, b0	TCR[1:0]	Timer Control Request 00: Timer control is not requested. 01: gPTP/AVPT presentation time reset 10: Setting prohibited 11: Captures the value set in the TCSS bit.

TCSS[1:0] Timer Capture Source Select Bits

These bits select the source used for updating the captured timer register (gPTP timer capture register (GCTi.CTV)).

These bits should still be controlled when timer control is not being requested (GCCR.TCR = B'00).

LMTT Maximum Transit Time Configuration Request Bit

This bit issues requests for configuring the gPTP maximum transit time configuration register (GMTT).

Only 1 can be written to the bit.

[Conditions for Changing]

The bit is set to 1 when the operating mode is not operation mode.

The bit is set to 0 when the value of the gPTP maximum transit time configuration register (GMTT) is reflected in the gPTP timer.

LPTC Presentation Time Compare Value Configuration Request Bit

This bit issues requests for configuring the gPTP presentation time comparison register (GPTC).

Only 1 can be written to the bit.

[Conditions for Changing]

The bit is set to 1 when the operating mode is not operation mode.

The bit is set to 0 when the value of the gPTP presentation time comparison register (GPTC) is reflected in the gPTP timer.

LTI Timer Increment Value Configuration Request Bit

This bit issues requests for configuring the gPTP timer increment configuration register (GTI).

Only 1 can be written to the bit.

[Conditions for Changing]

The bit is set to 1 when the operating mode is not operation mode.

The bit is set to 0 when the value of the gPTP timer increment configuration register (GTI) is reflected in the gPTP timer.

LTO Timer Offset Value Configuration Request Bit

This bit issues requests for configuring gPTP timer offset configuration register i (GTOi).

Only 1 can be written to the bit.

[Conditions for Changing]

The bit is set to 1 when the operating mode is not operation mode.

The bit is set to 0 when the value of gPTP timer offset configuration register i (GTOi) is reflected in the gPTP timer.

TCR[1:0] Timer Control Request Bits

These bits issue requests for controlling the gPTP timer.

Writing to the bits is only possible when the current operating mode is operation mode and the bits are B’00.

Do not write to the bit when the gPTP timer clock select bit in the AVB-DMAC mode register is B’00.

[Conditions for Changing]

The bits are set to B’00 when the operating mode is not operation mode and on completion of the requested processing.

57.2.40 gPTP Maximum Transit Time Configuration Register (GMTT)

The GMTT register sets the maximum time for transitions of the gPTP timer.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 57.44 GMTT register contents

Bit Position	Bit Name	Function
b31 to b0	MTTV[31:0]	Maximum Transit Time The maximum transition time for addition to the presentation time

MTTV[31:0] Maximum Transit Time Bits

These bits set the maximum transition time for use in calculating AVTP presentation times.

Write the desired setting to the bits, then issue the configuration request by setting the maximum transit time configuration request bit in the gPTP configuration control register (GCCR.LMTT) to 1.

CAUTION

Do not write a value to these bits when the operating mode is operation mode and the maximum transit time configuration request bit (GCCR.LMTT) is 1.

57.2.41 gPTP Presentation Time Comparison Register (GPTC)

The GPTC register sets a value for comparison with presentation times in the gPTP timer.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 57.45 GPTC register contents

Bit Position	Bit Name	Function
b31 to b0	PTCV[31:0]	Presentation Time Comparison Value Value for comparison with the gPTP presentation times

PTCV[31:0] Presentation Time Comparison Value Bits

These bits set a value for comparison with AVTP timer values to which a maximum transit time is not appended.

Write the desired setting to the bits, then issue the configuration request by setting the presentation time comparison value configuration request bit in the gPTP configuration control register (GCCR.LPTC) to 1.

CAUTION

Do not write a value to these bits when the operating mode is operation mode and the presentation time comparison value configuration request bit (GCCR.LPTC) is 1.

Do not set these bits to a value in the range from x-1 to x+1 (x is the setting value of the gPTP timer increment value bits (GTI.TIV)).

57.2.42 gPTP Timer Increment Configuration Register (GTI)

The GTI register sets the increment for the gPTP timer.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 57.46 GTI register contents

Bit Position	Bit Name	Function
b31 to b28	—	Reserved These bits are read as 0. The write value should be 0.
b27 to b0	TIV[27:0]	gPTP Timer Increment Value Increment for the gPTP timer

TIV[27:0] Bits (gPTP Timer Increment Value)

When the gPTP clock select bits in the AVB-DMAV mode register (CCC.CSEL) are selecting a clock signal, these bits set the value by which the timer is incremented each time a cycle of that clock signal elapses.

Write the desired setting to the bits, then issue the configuration request by setting the timer increment value configuration request bit in the gPTP configuration control register (GCCR.LTI) to 1.

CAUTION

Do not write a value to these bits when the operating mode is operation mode and the timer increment value configuration request bit (GCCR.LTI) is 1.

Do not write 0 to the bits.

57.2.43 gPTP Timer Offset Configuration Register i (GTOi) (i = 0 to 2)

The GTOi register sets an offset value for the gPTP timer.

The offset value is added to the combination of bits 0 to 31 in GTO0, 32 to 63 in GTO1, and 64 to 79 in GTO2, which together make up the gPTP timer.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	TOV[31+32*i:16+32*i]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TOV[15+32*i:32*i]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 57.47 GTOi register contents

Bit Position	Bit Name	Function
b31 to b0	TOV[31+32*i:32*i]	Timer Offset Value Offset value for the gPTP timer

TOV[79:0] Timer Offset Value Bits

This is an 80-bit value consisting of the settings in GTO0.TOV[31:0], GTO1.TOV[63:32], and GTO2.TOV[79:64], and is used to set an offset for adding to the value of the gPTP timer.

Write the desired setting to the bits, then issue the configuration request by setting the timer offset value configuration request bit in the gPTP configuration control register (GCCR.LTO) to 1.

CAUTION

Do not write a value to these bits when the operating mode is operation mode and the timer offset value configuration request bit (GCCR.LTO) is 1.

Write H'0000 to GTO2.TOV[95:80].

Set a value in the range from 0 to 10^9-1 (H'0000 0000 to H'3B9A C9FF) in GTO0.TOV[31:0].

57.2.44 gPTP Interrupt Control Register (GIC)

The GCI register is used to control gPTP-related interrupts.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

	—	—	—	—	—	—	—	—	—	—	—	—	—	PTME	PTOE	PTCE
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 57.48 GIC register contents

Bit Position	Bit Name	Function
b31 to b3	—	Reserved These bits are read as 0. The write value should be 0.
b2	PTME	Presentation Time Match Interrupt Enable 0: Disabled 1: Enabled
b1	PTOE	Presentation Time Overrun Interrupt Enable 0: Disabled 1: Enabled
b0	PTCE	Presentation Time Capture Interrupt Enable 0: Disabled 1: Enabled

PTME Presentation Time Match Interrupt Enable Bit

When this bit is 1, setting of the presentation time match interrupt flag in the gPTP interrupt status register (GIS.PTMF) to 1 leads to generation of that interrupt.

PTOE Presentation Time Overrun Interrupt Enable Bit

When this bit is 1, setting of the presentation time overrun interrupt flag in the gPTP interrupt status register (GIS.PTOF) to 1 leads to generation of that interrupt.

PTCE Presentation Time Capture Interrupt Enable Bit

When this bit is 1, setting of the presentation time capture interrupt flag in the gPTP interrupt status register (GIS.PTCF) to 1 leads to generation of that interrupt.

57.2.45 gPTP Interrupt Status Register (GIS)

The GIC register indicates the state of the gPTP-related interrupt.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 57.49 GIS register contents

Bit Position	Bit Name	Function
b31 to b3	—	Reserved These bits are read as 0. The write value should be 0.
b2	PTMF	Presentation Time Match Interrupt Flag 0: The interrupt is not pending. 1: The interrupt is pending.
b1	PTOF	Presentation Time Overrun Interrupt Flag 0: The interrupt is not pending. 1: The interrupt is pending.
b0	PTCF	Presentation Time Capture Interrupt Flag 0: The interrupt is not pending. 1: The interrupt is pending.

PTMF Presentation Time Match Interrupt Flag Bit

This bit indicates that the value of the AVTP timer exceeds the value of the gPTP presentation time comparison register (GPTC).

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

The bit is set to 1 when the AVTP timer value is greater than or equal to the value of the gPTP presentation time comparison register (GPTC).

PTOF Presentation Time Overrun Interrupt Flag Bit

This bit indicates that an external capture event (rising signal on the AVB_CAPTURE pin) is generated before completion of the previous capture process.

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

The bit is set to 0 when the presentation time capture interrupt flag bit (GIS.PTCF) is set to 0. The bit is set to 1 when an external capture event is generated while the value of the presentation time capture interrupt flag bit (GIS.PTCF) is 1.

PTCF Presentation Time Capture Interrupt Flag Bit

This bit indicates that an external capture event (rising signal on the AVB_CAPTURE pin) is generated.

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

The bit is set to 1 when an external capture event is generated.

CAUTION

To generate an external capture event, the AVB_CAPTURE pin should be held high for at least two cycles of the clock specified by the gPTP clock select bits (CCC.CSEL).

57.2.46 gPTP Presentation Time Capture Register (GCPT)

The GCPT register indicates the captured presentation time.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CPTV[15:0]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 57.50 GCPT register contents

Bit Position	Bit Name	Function
b31 to b0	CPTV[31:0]	Presentation Time Capture Presentation time value

CPTV[31:0] Presentation Time Capture Bits

These bits indicate the AVTP presentation time captured in response to an external capture event (rising signal on the AVB_CAPTURE pin). Read the time value from these bits and clear the presentation time capture interrupt flag bit (GIS.PTCF) before triggering a next capture.

Whether capturing a correct value was possible can be confirmed by following the procedure below.

1. Read these bits.
2. Read the presentation time overrun interrupt flag bit (GIS.PTOF).
3. Read these bits again.
4. Check whether the presentation time overrun interrupt flag bit (GIS.PTOF) is set to 1 and whether the value read from these bits has changed. If either of the two conditions is met, a correct value has not been captured.

   [Conditions for Changing]

   The bits are set to H'00000000 when the operating mode is not operation mode.

   When an external capture event occurs, the bits are updated with the AVTP presentation time value at the time of the event.

CAUTION

To generate an external capture event, the AVB_CAPTURE pin should be held high for at least two cycles of the clock specified by the gPTP clock select bits (CCC.CSEL).

57.2.47 gPTP Timer Capture Register i (GCTi) (i = 0 to 2)

The GCTi registers form an 80-bit register that captures the gPTP timer value.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	CTV[31+32*i:16+32*i]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CTV[15+32*i:32*i]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 57.51 GCTi register contents

Bit Position	Bit Name	Function
b31 to b0	CTV[31+32*i:32*i]	gPTP Timer Capture Value Captured timer value

CTV[79:0] gPTP Timer Capture Value Bits

These 80 bits consist of GCT0.CTV[31:0], GCT1.CTV[63:32] and GCT2.CTV[79:64], which together indicate captured timer values.

When B’00 (value of the gPTP timer) or B'01 (corrected gPTP timer value) is selected by the timer capture source select bits in the gPTP configuration control register (GCCR.TCSS), the corresponding 80-bit values are stored in GCT0.CTV[31:0], GCT1.CTV[63:32], and GCT2.CTV[79:64].

When B’10 (AVTP presentation time) is selected by the timer capture source select bit (GCCR.TCSS), the corresponding 32-bit values are stored in GCT0.CTV[31:0].

Actual writing of the timer value specified by the timer capture source select bits (GCCR.TCSS) proceeds when B’11 (timer capture request) is written to the timer control request bits in the gPTP configuration control register (GCCR.TCR).

Do not read the value while the value of the timer control request bits (GCCR.TCR) is B’11, because this indicates that storage is still in progress.

When operating mode is not operation mode, the bits are set to H’00000000.

57.2.48 E-MAC Mode Register (ECMR)

ECMR is used to specify the operating mode of the E-MAC. The settings in this register are normally made in the initialization process following a reset.

The operating mode settings must not be changed while transmission or reception is enabled (i.e. while the RE or TE bit in this register is 1).

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 57.52 ECMR register contents (1/2)

Bit Position	Bit Name	Function
b31 to b27	—	Reserved These bits are read as 0. The write value should be 0.
b26	TRCCM	Counter Clear Mode 0: Writing to a counter register leads to the register being cleared to 0. 1: Reading from a counter register leads to the register being cleared to 0.
b25, b24	—	Reserved These bits are read as 0. The write value should be 0.
b23	RCSC	Checksum Calculation 0: Checksums are not automatically calculated. 1: Checksums are automatically calculated.
b22	—	Reserved This bit is read as 0. The write value should be 0.
b21	DPAD	Data Padding 0: Padding to make up 60 bytes is inserted in data for transmission when fewer than 60 bytes are to be transmitted. 1: Padding is not inserted in data for transmission when fewer than 60 bytes are to be transmitted and the data are transmitted without being changed.
b20	RZPF	PAUSE Frame Reception with Time = 0 0: Reception of PAUSE frames with the TIME parameter value 0 is disabled. 1: Reception of PAUSE frames with the TIME parameter value 0 is enabled.
b19	ZPF	PAUSE Frame Usage with TIME = 0 Enable 0: Control in response to and for the sending of PAUSE frames with the TIME parameter value 0 is disabled. 1: Control in response to and for the sending of PAUSE frames with the TIME parameter value is 0 is enabled.
b18	PFR	PAUSE Frame Receive Mode 0: PAUSE frames are not transferred to the AVB-DMAC. 1: PAUSE frames are transferred to the AVB-DMAC.
b17	RXF	Operating Mode for Flow Control in Reception 0: Detection of PAUSE frames is disabled. 1: Flow control for the receiving port is enabled.
b16	TXF	Operating Mode for Flow Control in Transmission 0: Flow control for the transmitting port is disabled (PAUSE frames are not automatically transmitted). 1: Flow control for the transmitting port is enabled (PAUSE frames are automatically transmitted as required).

Table 57.52 ECMR register contents (2/2)

Bit Position	Bit Name	Function
b15 to b7	—	Reserved These bits are read as 0. The write value should be 0.
b6	RE	Reception Enable 0: Reception is disabled. 1: Reception is enabled.
b5	TE	Transmission Enable 0: Transmission is disabled. 1: Transmission is enabled.
b4 to b2	—	Reserved These bits are read as 0. The write value should be 0.
b1	DM	Full-duplex Transfer Enable 0: Disables full-duplex transfer. 1: Enables full-duplex transfer.
b0	PRM	Promiscuous Mode 0: Normal operation 1: Promiscuous mode operation

TRCCM Counter Clear Mode Bit

This bit sets the method for clearing the counter register. Refer to the descriptions of the counter registers.

RCSC Checksum Calculation Bit

Setting this bit to 1 enables automatic calculation of checksums for data in received frames.

Only the data field of an Ethernet frame is in the scope of checksum calculation. Specifically, the checksum is calculated from the data field, which follows the length/type field and is followed by the CRC field. Calculation only involves 16-bit addition; it does not involve bit inversion.

DPAD Data Padding Control Bit

This bit specifies padding or non-padding of data when less than 60 bytes are to be transmitted.

When this bit is set to 1, data are transmitted without padding; when it is set to 0, data are padded to make up 60-byte units for transmission.

RZPF (PAUSE Frame Reception with Time = 0) Bit

When the RZPF bit is set to 0, received PAUSE frames with the Timer value 0 are discarded.

When the RZPF bit is set to 1, release from the transmission wait state follows reception of a PAUSE frame with the Timer value 0.

ZPF (PAUSE Frame Usage with TIME = 0 Enable) Bit

When the ZPF bit is set to 0, the next frame to be transmitted is not transmitted until the time specified by the Timer value has elapsed.

Received PAUSE frames with the Timer value 0 are discarded.

When the ZPF bit is set to 1, if the amount of data in the reception FIFO becomes less than the setting of the receive FIFO critical level bits (RCR.RFCL) before the time specified by the Timer value elapses, a PAUSE frame with a Timer value of 0 is automatically transmitted. If the interface is in the transmission wait state, it is released from that state on receiving a PAUSE frame with a Timer value of 0.

PFR PAUSE Frame Receive Mode Bit

This bit specifies whether PAUSE frames are transferred to the AVB-DMAC.

RXF (Operating Mode for Flow Control in Reception) Bit

When the RXF bit is set to 1 and a PAUSE frame is received, a next frame to be transmitted is not transmitted until the time indicated by the Timer value in the PAUSE frame has elapsed. However, the transmission of a current frame is continued. The number of received PAUSE frames is also counted. For details, see Section 57.2.56, PAUSE Frame Receive Counter (PFRCR).

Setting this bit to 0 disables PAUSE frame detection.

TXF (Operating Mode for Flow Control in Transmission) Bit

The TXF bit enables or disables flow control in transmission by the port.

Setting this bit to 0 disables PAUSE frame detection.

RE Reception Enable Bit

If this bit is switched from reception being enabled (RE = 1) to reception being disabled (RE = 0) while a frame is being received, reception will continue until reception of that frame is completed.

TE Transmission Enable Bit

If this bit is switched from transmission being enabled (TE = 1) to transmission being disabled (TE = 0) while a frame is being transmitted, transmission will continue until transmission of that frame is completed.

DM Full-Duplex Transfer Enable Bit

This bit enables or disables full-duplex transfer.

PRM Promiscuous Mode Bit

Setting the PRM bit enables all Ethernet frames to be received. All Ethernet frames means all receivable frames, irrespective of differences or enabled/disabled status (destination address, broadcast address, multicast bit, etc.).

57.2.49 Receive Frame Length Register (RFLR)

The RFLR register specifies the maximum length (in bytes) of frames that can be received by this LSI. Settings in this register must not be changed while reception is enabled (while the RE bit in the E-MAC mode register (EMCR) is 1).

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 57.53 RFLR register contents

Bit Position	Bit Name	Function
b31 to b18	—	Reserved These bits are read as 0. The write value should be 0.
b17 to b0	RFL[17:0]	Receive Frame Length H'00000 to H'005EE: 1,518 bytes H'005EF: 1,519 bytes H'005F0: 1,520 bytes : : H'007FF: 2,047 bytes H'00800: 2,048 bytes : : H'01000: 4,096 bytes : : H'10000: 65,535 bytes : : H'20000 to H'3FFFF: 131,072 bytes

RFL[17:0] Receive Frame Length Bits

Frame data described here refers to all fields from the destination address up to the CRC data. Frame contents from the destination address up to the data are actually transferred to memory. CRC data are not included in the transfer. When more data than the specified number of bytes are received, the portion of data that exceeds the specified value is discarded.

57.2.50 E-MAC Status Register (ECSR)

The ECSR register indicates the state of the E-MAC. The CPU can be notified of the state. For bits associated with interrupts, the interrupt can be enabled or disabled by the corresponding bit in the E-MAC Interrupt Permission Register (ECSIPR) described in Section 57.2.51.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Table 57.54 ECSR register contents

Bit Position	Bit Name	Function
b31 to b5	—	Reserved These bits are read as 0. The write value should be 0.
b4	PFROI	PAUSE Frame Retransmit Retry Over 0: PAUSE frame retransmit retry count does not exceed the upper limit. 1: PAUSE frame retransmit retry count exceeds the upper limit.
b3 to b1	—	Reserved These bits are read as 0. The write value should be 0.
b0	ICD	Illegal Carrier Detection 0: PHY-LSI has not detected an illegal carrier on the line. 1: PHY-LSI has detected an illegal carrier on the line.

PFROI PAUSE Frame Retransmit Retry Over Bit

This bit indicates that retransmission count has exceeded the retransmit upper limit set in the PAUSE frame retransmission count register (TPAUSER) during PAUSE frame retransmission when the flow control is enabled.

Writing 1 to this bit clears it to 0.

ICD Illegal Carrier Detection Bit

This bit indicates that the PHY-LSI has detected an illegal carrier on the line. If a change in the signal input from the PHY-LSI occurs in a period shorter than the software recognition period, the correct information may not be obtained. Refer to the timing specification for the PHY-LSI used.

Writing 1 to this bit clears it to 0.

57.2.51 E-MAC Interrupt Permission Register (ECSIPR)

The ECSIPR register enables or disables the states indicated by the ECSR register as interrupt sources. Each effective bit disables or enables interrupts corresponding to the bits in ECSR.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 57.55 ECSIPR register contents

Bit Position	Bit Name	Function
b31 to b5	—	Reserved These bits are read as 0. The write value should be 0.
b4	PFROIP	PAUSE Frame Retransmit Interrupt Enable 0: Interrupts on setting of the PFROI bit is disabled. 1: Interrupts on setting of the PFROI bit is enabled.
b3 to b1	—	Reserved These bits are read as 0. The write value should be 0.
b0	ICDIP	Illegal Carrier Detect Interrupt Enable 0: Interrupts on setting of the ICD bit is disabled. 1: Interrupt on setting of the ICD bit is enabled.

PFROIP PAUSE Frame Retransmit Interrupt Enable Bit

Setting this bit to 1 selects interrupt generation on setting of the PAUSE frame retransmit retry over bit (ECSR.PFROI) in the E-MAC status register to 1.

ICDIP Illegal Carrier Detect Interrupt Enable Bit

Setting this bit to 1 selects interrupt generation on setting of the illegal carrier detection bit (ECSR.ICD) in the E-MAC status register to 1.

57.2.52 PHY Interface Register (PIR)

The PIR register provides a means of access to the PHY-LSI internal registers via the MII.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	MDI	MDO	MMD	MDC
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	—	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 57.56 PIR register contents

Bit Position	Bit Name	Function
b31 to b4	—	Reserved These bits are read as 0. The write value should be 0.
b3	MDI	MII Management Data-In Indicates the level of the ET_MDIO pin.
b2	MDO	MII Management Data-Out Holds data for output from the ET_MDIO pin.
b1	MMD	MII Management Mode 0: Read direction is specified. 1: Write direction is specified.
b0	MDC	MII Management Data Clock The value set in this bit is output from the ET_MDC pin, which supplies the management data clock for the MII.

MDI MII Management Data-In Bit

This bit indicates the level of the ET_MDIO pin.

MDO MII Management Data-Out Bit

This bit holds data for output from the ET_MDIO pin.

The ET_MDIO pin outputs a value set in this bit when the MMD bit is set to 1 (to specify writing as the direction). Data are not output while the MMD bit is set to 0 (to specify reading as the direction).

MMD MII Management Mode Bit

This bit specifies the direction for data through MDIO (reading or writing).

MDC MII Management Data Clock Bit

Values set in this bit are output on the ET_MDC pin to supply the MII with the management data clock. For the method of access to the MII registers, see Section 57.3.12, Connection to PHY-LSI.

57.2.53 Automatic PAUSE Frame Register (APR)

The APR register is used to set the value for the TIME parameter of automatically transmitted PAUSE frames. When a PAUSE frame is automatically transmitted, the value set in this register is used as its TIME parameter.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 57.57 APR register contents

Bit Position	Bit Name	Function
b31 to b16	—	Reserved These bits are read as 0. The write value should be 0.
b15 to b0	AP[15:0]	Automatic PAUSE These bits set the TIME parameter value of an automatic PAUSE frame.*1 H'0000: — H'0001: 512 × 1 bit-period H'0002: 512 × 2 bit-period : : H'FFFF: 512 × 65535 bit-period Note 1. A bit-period changes relative to the transfer speed as follows. 100Mbps: 1 bit-period = 10 ns 10Mbps: 1 bit-period = 100 ns

AP[15:0] Automatic PAUSE Bit

These bits set the value of the TIME parameter in automatically transmitted PAUSE frames. The unit for the setting is 512-bit periods.

Set these bits to a value other than H'0000 when the flow control in transmission (PAUSE frame transmission) is enabled (ECMR.TXF = 1).

57.2.54 Manual PAUSE Frame Register (MPR)

The MPR register is used to set the value for the TIME parameter of manually generated PAUSE frames. When a PAUSE frame is manually transmitted, the value set in this register is used as its TIME parameter.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 57.58 MPR register contents

Bit Position	Bit Name	Function
b31 to b16	—	Reserved These bits are read as 0. The write value should be 0.
b15 to b0	MP[15:0]	Manual PAUSE These bits set the TIME parameter value of a manual PAUSE frame.*1 H'0000: — H'0001: 512 × 1 bit-period H'0002: 512 × 2 bit-period : : H'FFFF: 512 × 65535 bit-period Note 1. A bit-period changes relative to the transfer speed as follows. 100Mbps: 1 bit-period = 10 ns 10Mbps: 1 bit-period = 100 ns

MP[15:0] Manual PAUSE Bits

These bits set the value of the TIME parameter in manually generated PAUSE frames.

The unit for the setting is 512 bit periods.

57.2.55 PAUSE Frame Transmit Counter (PFTCR)

The PFTCR register is a counter that indicates the number of times PAUSE frames have been transmitted.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	PFTXC[15:0]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 57.59 PFTCR register contents

Bit Position	Bit Name	Function
b31 to b16	—	Reserved These bits are read as 0.
b15 to b0	PFTXC[15:0]	PAUSE Frame Transmit Counter Counter for counting the number of transmitted PAUSE frames

PFTXC[15:0] PAUSE Frame Transmit Counter Bits

These bits indicate the total number of PAUSE frames that have been transmitted (both manually and automatically).

The bits are cleared to 0 when they are read.

If counting up and clearing of the counter coincide, clearing the counter takes priority.

57.2.56 PAUSE Frame Receive Counter (PFRCR)

The RFRCR register is a counter that indicates the number of times PAUSE frames have been received.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 57.60 RFRCR register contents

Bit Position	Bit Name	Function
b31 to b16	—	Reserved These bits are read as 0.
b15 to b0	PFRXC[15:0]	PAUSE Frame Receive Counter Counter for counting the number of received PAUSE frames

PFRXC[15:0] PAUSE Frame Receive Counter Bits

These bits indicate the number of PAUSE frames that have been received when flow control in reception is enabled (the RXF bit in ECMR = 1).

The bits are cleared to 0 when they are read.

If counting up and clearing the counter coincide, clearing the counter takes priority.

57.2.57 Automatic PAUSE Frame Retransmission Count Register (TPAUSER)

The TPAUSER register sets the upper limit of automatic PAUSE frame retransmission count.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 57.61 TPAUSER register contents

Bit Position	Bit Name	Function
b31 to b16	—	Reserved These bits are read as 0.
b15 to b0	TPAUSE[15:0]	Automatic PAUSE Frame Retransmission Count Upper Limit H'0000: No limitation H'0001: Once : : H'FFFF: 65535 times

TPAUSE[15:0] Automatic PAUSE Frame Retransmission Count Upper Limit Bits

The bits set the upper limit of automatic PAUSE frame retransmission count.

The setting in the bits must not be changed while transmission is enabled (EMCR.TE = 1).

57.2.58 MAC Address High Register (MAHR)

The MAHR register specifies the 32 higher-order bits of the 48-bit MAC address. The settings in this register are normally made in the initialization process after a reset.

The settings in this register must not be changed while transmission or reception is enabled.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	MA[47:32]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 57.62 MAHR register contents

Bit Position	Bit Name	Function
b31 to b0	MA[47:16]	MAC Address Bits 47 to 16 These bits are used to set the 32 higher-order bits of the MAC address.

MA[47:16] MAC Address Bits 47 to 16

These bits are used to set the 32 higher-order bits of the MAC address.

For example, if the MAC address is 01-23-45-67-89-AB (hexadecimal), set H'0123 4567 in the MAHR register.

57.2.59 MAC Address Low Register (MALR)

The MALR register specifies the 16 lower-order bits of the 48-bit MAC address. The settings in this register are normally made in the initialization process after a reset.

The settings in this register must not be changed while transmission or reception is enabled.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 57.63 MALR register contents

Bit Position	Bit Name	Function
b31 to b16	—	Reserved These bits are read as 0. The write value should be 0.
b15 to b0	MA[15:0]	MAC Address Bits 15 to 0 These bits are used to set the 16 lower-order bits of the MAC address.

MA[15:0] MAC Address Bits 15 to 0

These bits are used to set the 16 lower-order bits of the MAC address.

For example, if the MAC address is 01-23-45-67-89-AB (hexadecimal), set H'89AB in the MALR register.

57.2.60 CRC Error Frame Receive Counter Register (CEFCR)

The CEFCR register is a counter that indicates the number of times frames with CRC errors were received. Counting up stops when the value in this register reaches H'FFFF FFFF.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 57.64 CEFCR register contents

Bit Position	Bit Name	Function
b31 to b0	CEFC[31:0]	CRC Error Frame Counter These bits indicate the number of CRC error frames received.

CEFC[31:0] CRC Error Frame Counter Bits

These bits indicate the number of received frames having CRC errors.

The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1.

When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

57.2.61 Frame Receive Error Counter Register (FRECR)

The FRECR register is a counter that indicates the number of frames for which receive errors were generated by input on the ET_RXER pin from the PHY-LSI. Counting up stops when the value in this register reaches H'FFFF FFFF.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit Position	Bit Name	Function
b31 to 0	FREC[31:0]	Frame Receive Error Counter These bits indicate the number of errors during frame reception.

FREC[31:0] Frame Receive Error Counter Bits

These bits indicate the number of errors during frame reception.

The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1.

When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

57.2.62 Too-Short Frame Receive Counter Register (TSFRCR)

The TSFRCR register is a counter that indicates the number of received frames that were fewer than 64 bytes in length. Counting stops when the value in this register reaches H'FFFF FFFF.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b31 to b0	TSFRC[31:0]	Too-Short Frame Receive Counter These bits indicate the number of frames received with a length of less than 64 bytes.

TSFRC[31:0] Too-Short Frame Receive Counter Bits

These bits indicate the number of received frames that were fewer than 64 bytes in length.

The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1.

When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

57.2.63 Too-Long Frame Receive Counter Register (TLFRCR)

The TLFRCR register is a counter that indicates the number of received frames that were longer than the value specified in the receive frame length register (RFLR). Counting up stops when the value in the TLFRCR register reaches H'FFFF FFFF.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 57.67 TLFRCR register contents

Bit Position	Bit Name	Function
b31 to b0	TLFC[31:0]	Too-Long Frame Receive Counter These bits indicate the number of frames received with a length exceeding the value in RFLR.

TLFC[31:0] Too-Long Frame Receive Counter Bits

These bits indicate the number of received frames that were longer than the value in RFLR.

The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1.

When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

57.2.64 Residual-Bit Frame Receive Counter Register (RFCR)

The RFCR register is a counter that indicates the number of received frames containing “residual bits” (trailing bits not making up an 8-bit unit). Counting up stops when the value in this register reaches H’FFFF FFFF.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit Position	Bit Name	Function
b31 to b0	RFC[31:0]	Residual-Bit Frame Receive Counter These bits indicate the number of received frames containing residual bits.

RFC[31:0] Residual-Bit Frame Receive Counter Bits

These bits indicate the number of received frames containing residual bits.

The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1.

When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

57.2.65 Multicast Address Frame Receive Counter Register (MAFCR)

The MAFCR register is a counter that indicates the number of received frames for which a multicast address was specified. Counting up stops when the value in this register reaches H'FFFF FFFF.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

MAFC[31:0] Multicast Address Frame Counter Bits

These bits indicate the number of multicast frames that have been received.

The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1.

When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

57.3 Operation

The EthernetAVB consists of the following functional units:

- DMA transfer controller (AVB-DMAC): Handles DMA transfer between the data storage areas for reception and transmission in the on-chip RAM and the reception and transmission FIFO buffers
- MAC controller (E-MAC): Handles transfer between the reception and transmission FIFO buffers and the MII

Using its direct memory access (DMA) function, the AVB-DMAC handles DMA transfer of frame data between the destinations for storing Ethernet frame data for transmission and reception in the on-chip RAM and the FIFO buffers for reception and transmission. Data cannot be directly read from or written to the FIFO buffers.

To handle DMA transfer, the AVB-DMAC requires information that includes the addresses for storage of data for transmission and received data. These data are referred to as descriptors. The AVB-DMAC reads data for transmission from the storage area for data to be transmitted according to the information in descriptors and writes received data to the storage area for received data accompanied by information in descriptors. The descriptors are placed in the on-chip RAM. Arranging multiple descriptors in descriptor lists allows the continuous reception or transmission of multiple Ethernet frames.

The E-MAC supports an MII, which provides an interface format for the externally connected PHY-LSI. The E-MAC constructs Ethernet frames from data written to the transmission FIFO and transmits these frames to the MII. It also performs CRC checking of Ethernet frames received from the MII and writes the frames to the reception FIFO.

57.3.1 AVB-DMAC Operating Modes

Figure 57.5 illustrates the operating modes of the AVB-DMAC.

Transitions of AVB-DMAC operating mode are under the control of the items listed below.

- CPU operating mode (power-on reset)
- Configuration of the operating mode configuration bits (CCC.OPC) in the AVB-DMAC mode register

The current operating mode can be determined by reading the operating mode status bits in the AVB-DMAC status register (CSR.OPS).

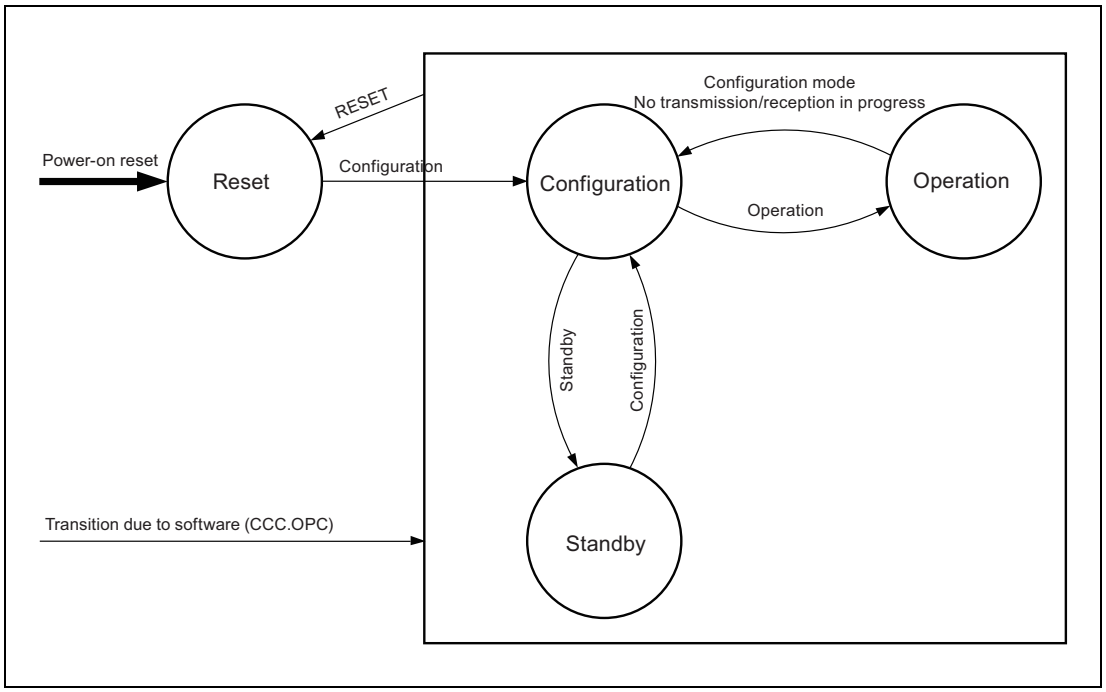

Figure 57.5 Operating Mode of AVB-DMAC

57.3.1.1 Operating Modes

(1) Reset mode

After a power-on reset, the AVB-DMAC enters reset mode.
In reset mode, only the AVB-DMAC operating mode control function is controllable and other functions are all stopped. This mode is designed for reduced power when the Ethernet function is not necessary.

(2) Configuration mode

In configuration mode, various settings for the AVB-DMAC can be made.
The operation of most functions is stopped and all status registers are initialized to their reset values.
The E-MAC functions in this mode.

(3) Operation mode

In operation mode, all functions of the AVB-DMAC can operate.
Ethernet communications can only proceed in this mode.

(4) Standby mode

In standby mode, only the operating mode control function and E-MAC can be used. Other functions cannot be used.

57.3.1.2 How to Set the Operating Mode

Set the operating mode configuration bits in the AVB-DMAC status register (CSR.OPC) to select the operating mode. Furthermore, the current operating mode can be checked by reading the operating mode status bits in the AVB-DMAC status register (CSR.OPS).

Transitions other than from operation mode to configuration mode are made after the value is written to the operating mode configuration bits (CCC.OPC) (Figure 57.6).

For transitions from operation mode to configuration mode, follow the procedure in Figure 57.7 because any transmission and reception in progress will be executed before the transition to configuration mode.

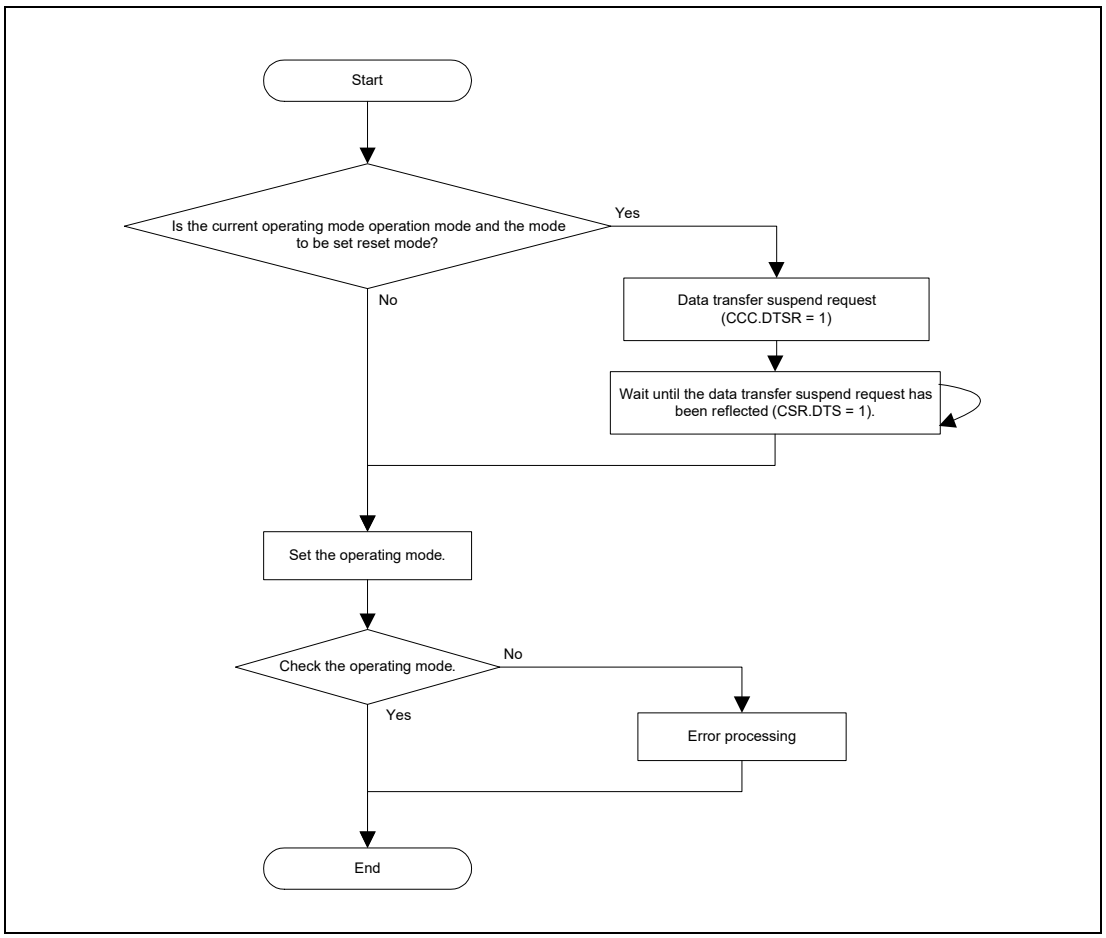

Figure 57.6 Flow for Transitions of Operating Mode (Other than from Operation Mode to Configuration Mode)

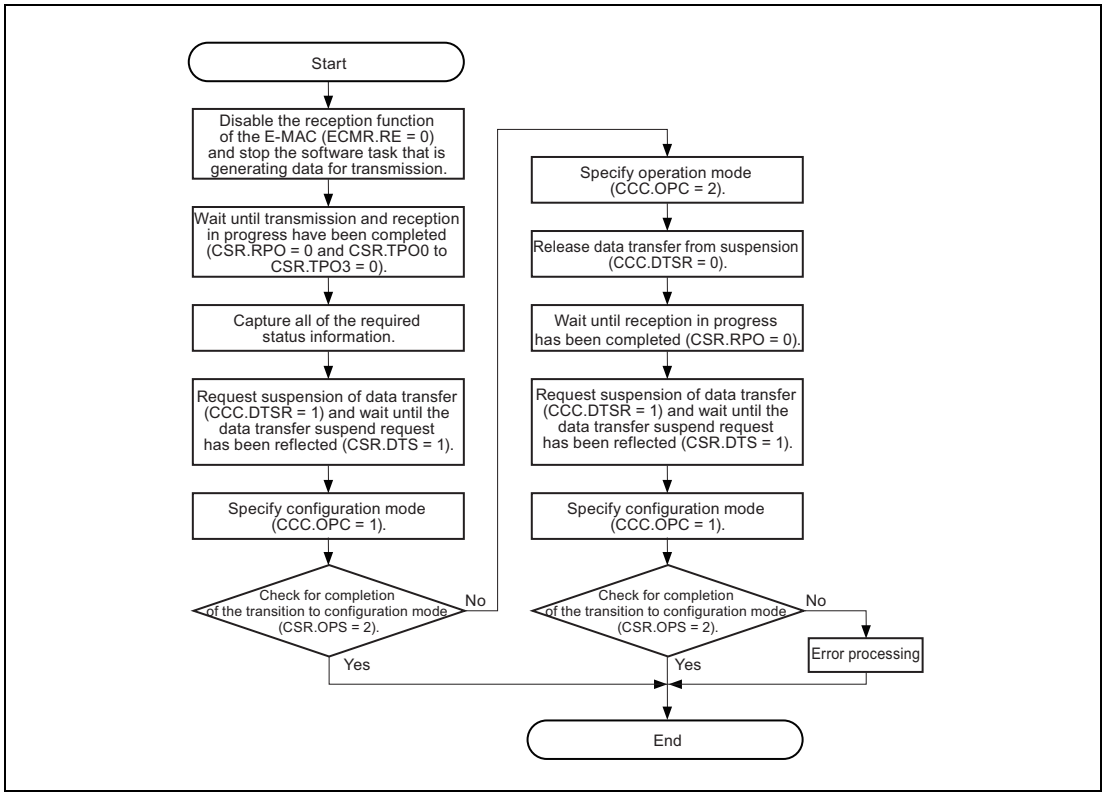

Figure 57.7 Flow for Transitions of Operating Mode (from Operation Mode to Configuration Mode)

In the transition from operation mode to configuration mode, the AVB-DMAC executes the following operations before the transition is completed. Read the operating mode status bits in the AVB-DMAC status register (CSR.OPS) to check that the transition to configuration mode has been completed.

- If the transfer of a frame between the reception FIFO and on-chip RAM is in progress, this is completed
  (other received frames remaining in the FIFO and any frames that are subsequently received by the E-MAC are discarded).
- If the transfer of a frame is in progress between the transmission FIFO and on-chip RAM, this is completed
  (frames for transmission remaining in the on-chip RAM will not be transmitted).
- All frames for transmission in the transmission FIFO are transferred to the E-MAC.

Notes:

When the operating mode shifts to configuration mode, all status registers are cleared.

We recommend following the procedure below in the case of this transition.

1. Disable reception.
2. Since reception actually stopping after being disabled requires time, wait for an interval equivalent to that for reception of a maximum length packet.
3. Stop the software task that is generating data for transmission.
4. Wait until the receive process status bit (CSR.RPO) and the transmit process status bits (CSR.TPO0 to 3) in the AVB-DMAC status register are set to 0.
5. Capture all of the required status information.

6. Set the operating mode configuration bits in the AVB-DMAC mode register (CCC.OPC) to initiate the transition to configuration mode.

57.3.1.3 Operating Mode Transitions Due to Hardware

The following hardware factors can also initiate transitions of the AVB-DMAC operating mode.

(1) Power-on reset

Resetting of the LSI chip leads to resetting of the entire EthernetAVB module. The operating mode shifts to reset mode.

57.3.2 Common Control for Transmission and Reception

57.3.2.1 Initialization Procedure

Figure 57.8 shows the overall initialization procedure in outline.

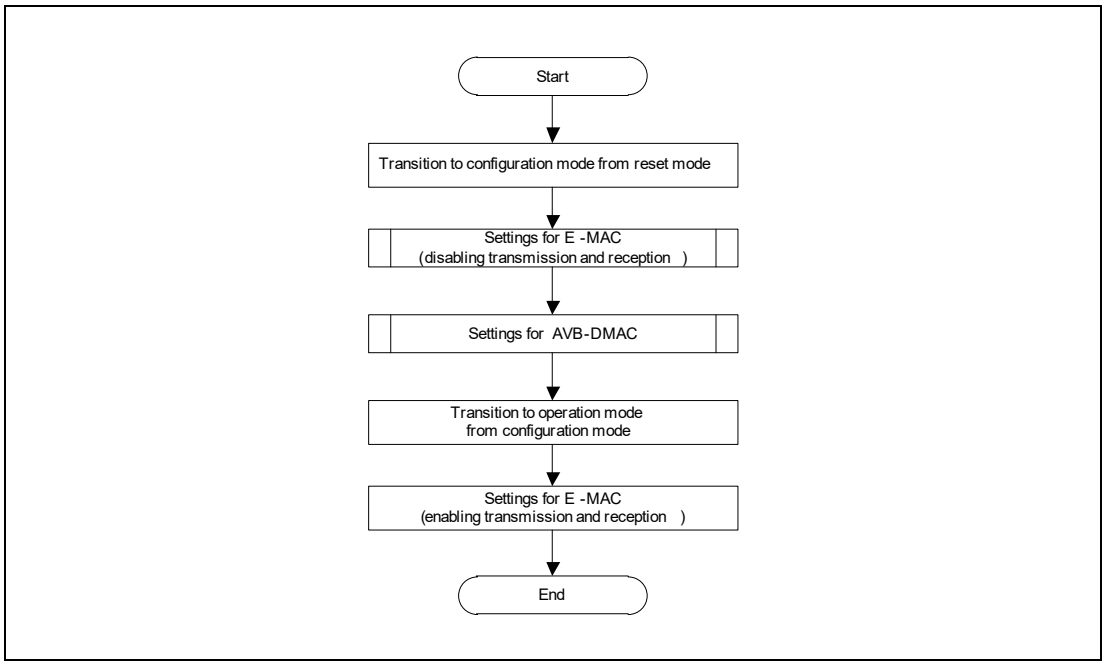

Figure 57.8 Outline of the Initialization Procedure

(1) Initializing the Receiver Section

Before starting reception, follow the procedure below.

Set the operating mode to operation mode or standby mode, and do not enable reception until the settings for the AVB-DMAC are completed.

- Set the operating mode to configuration mode.
- Set AVB filtering for network control frames and AVB stream frames to suit the specifications of the product the chip will be used in.
- Create a descriptor chain for each queue to be used.
- Set the base address for the descriptor table in the descriptor base address table register (DBAT).
- Specify the maximum frame length with the receive frame length upper limit register (RFLR).
- Specify whether padding is to be used with the receive padding configuration register (RPC).
- Set the unread frame counter for each queue with unread frame counter registers 0 to 4.

(2) Initializing the Transmitter Section

Figure 57.9 illustrates initialization of the transmitter section.

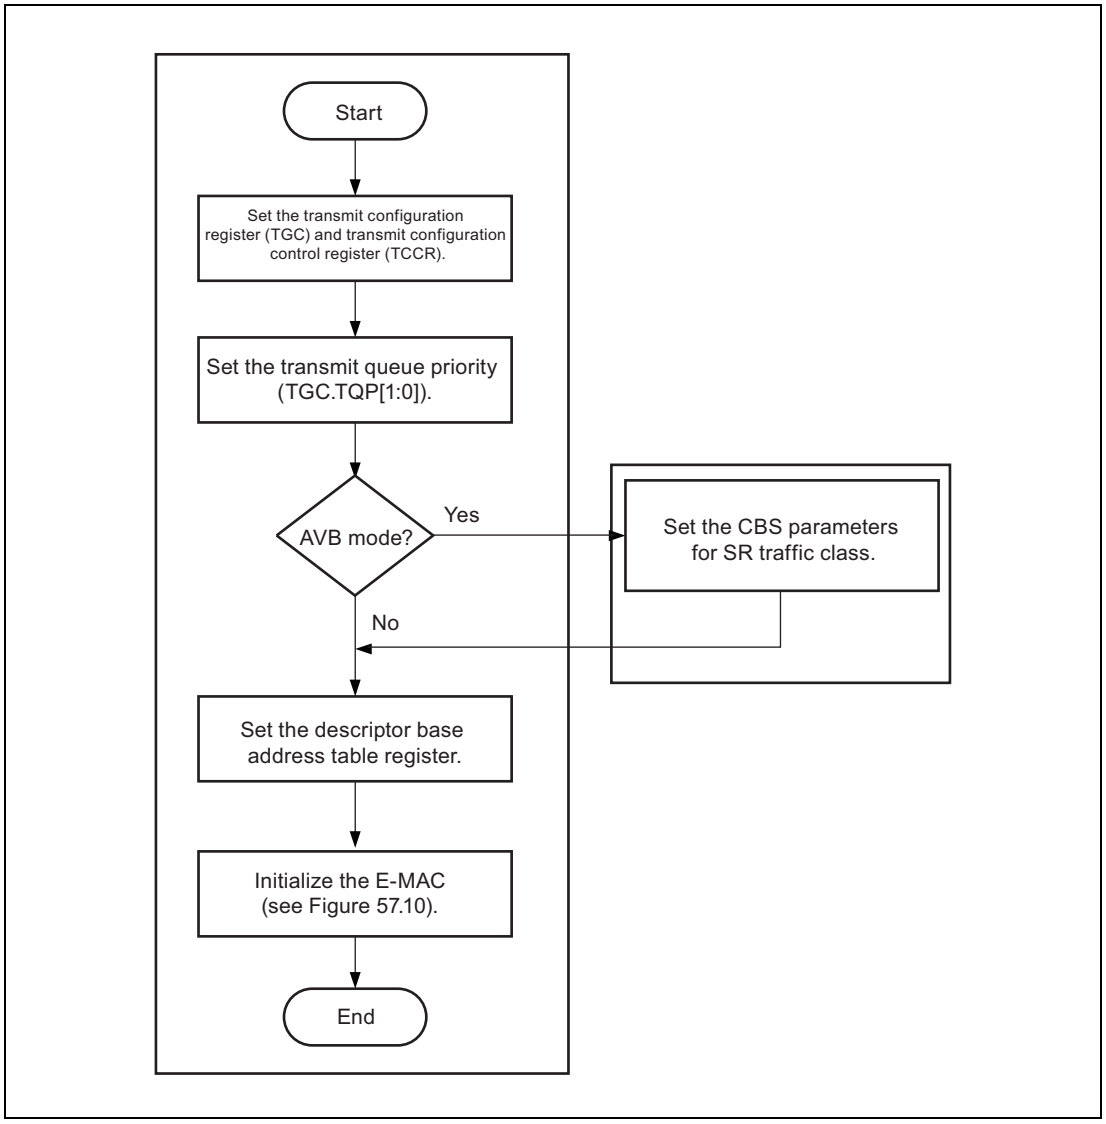

Figure 57.9 Procedure for Initializing the Transmitter Section

(3) Initializing the E-MAC Section

Figure 57.10 illustrates initialization of the E-MAC section.

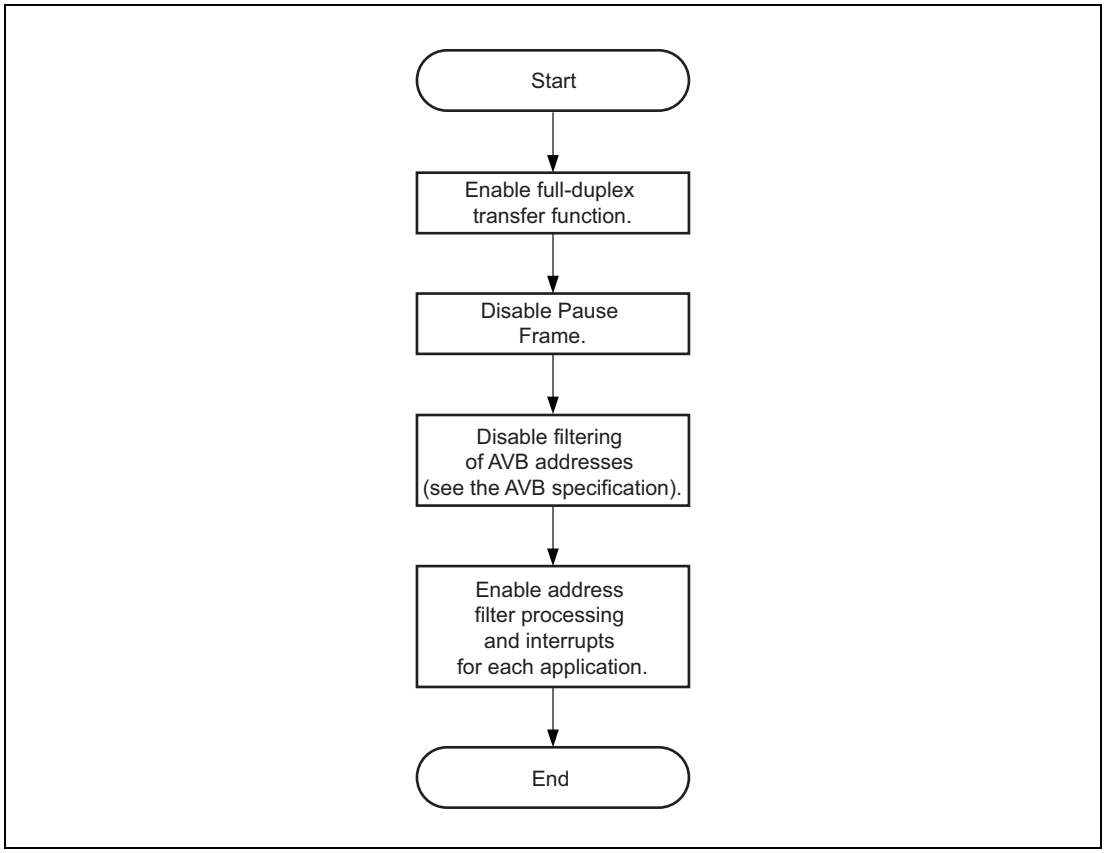

Figure 57.10 Procedure for Initializing the E-MAC Section

(4) Initialization of the AVB-DMAC Unit

Figure 57.11 illustrates initialization of the AVB-DMAC unit.

For a description of how to set up the descriptors and the CBS, see Section 57.3.3, Descriptors, and Section 57.3.6, CBS (Credit-Based Shaping).

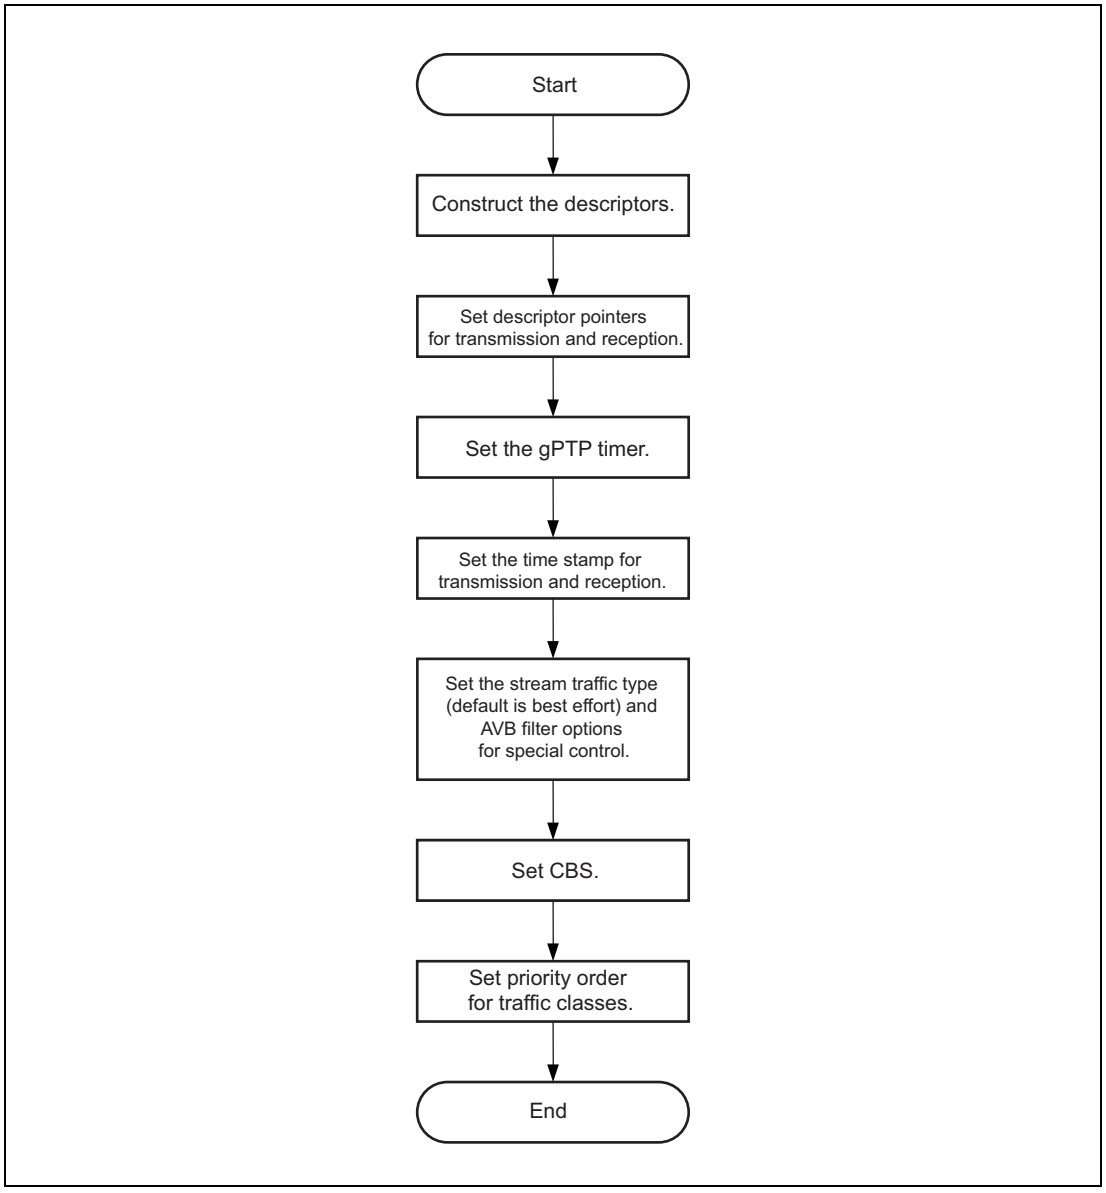

Figure 57.11 Procedure for Initializing the AVB-DMAC Unit

57.3.2.2 Scheduling Reception and Transmission

The EthernetAVB normally has independent buses for transmission and reception. Furthermore, the four processes of fetching, storing, transmission and reception are basically independent of one another. Fetching and storing, however, share the same bus master so cannot be executed simultaneously. Access to the bus master is controlled by the scheduler.

Figure 57.12 is a schematic view of EthernetAVB operations in transmission and reception.

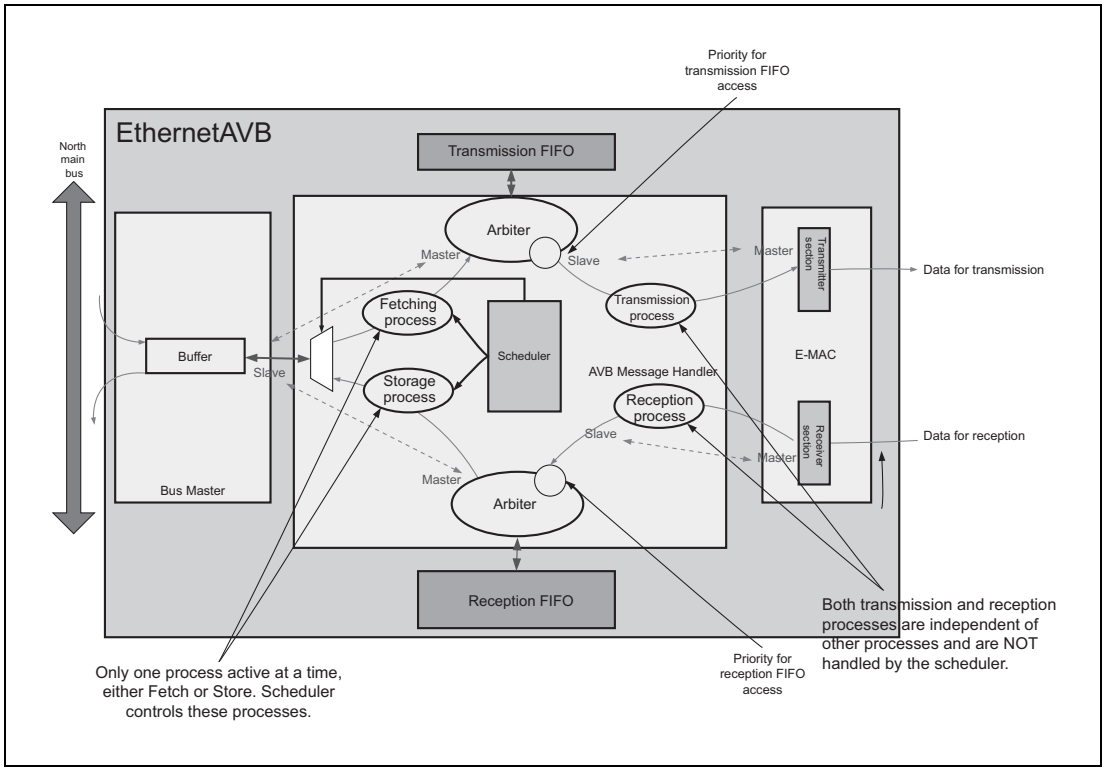

Figure 57.12 Schematic View of EthernetAVB Operations in Transmission and Reception

Storing and fetching are alternately performed. When the number of frames held by the reception FIFO reaches the warning level, storing takes precedence over fetching.

(1) Relationship between Transmission Queue Numbers and Traffic Classes

In fetching, the relationships between the transmission queues and traffic classes are fixed, so the priority specified by the transmit queue priority bits in the transmit configuration register (TGC.TQP) has no effect.

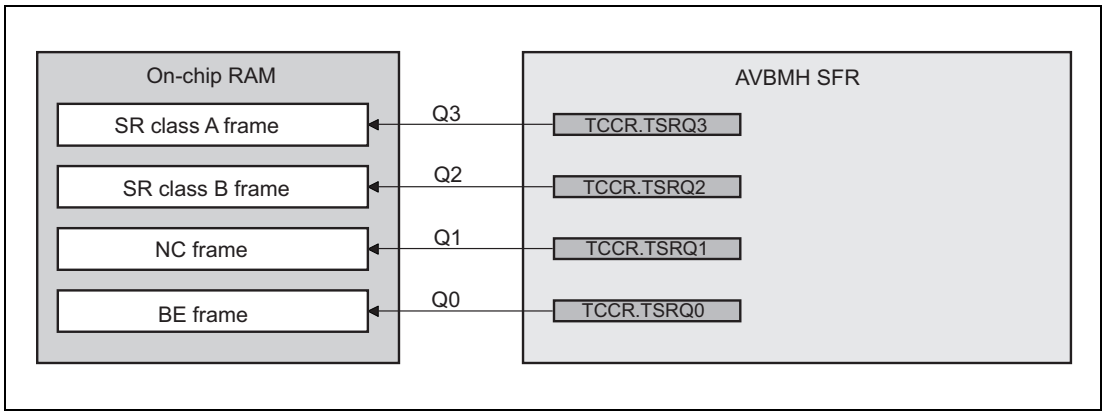

Figure 57.13 Class Associations of Queues for the Scheduler

In fetching, the credit values for stream classes A and B are not taken into account. Behavior depends on the setting of the transfer FIFO size configuration bits in the transfer configuration registers (TGC.TBDt).

When the transmit queue priority bits in the transmit configuration register (TGC.TQP) are B’00 or B'01, the priority order is Q3 → Q 2 → Q1 → Q0.

When the transmit queue priority bits in the transmit configuration register (TGC.TQP) are B’11, the priority order is Q1 → Q3 → Q2 → Q0.

57.3.2.3 Checking Integrity

The EthernetAVB is capable of detecting and identifying errors produced in the processing of Ethernet frames and in the transfer of frame data for transmission and reception.

(1) Items for Monitoring in Both Reception and Transmission

(a) Errors in access to the on-chip RAM for reading of descriptors

- The error type bits (ESR.ET) are set to B'0000, and the queue number being processed is set to the error queue number bits (ESR.EQN).
- The same descriptor may be processed again because the current descriptor address (CDARq.CDA) was not changed.
- If this problem occurs in a divided frame, the sequence may be broken.

In reception

- The received frame will be lost.
- The same problem will occur for the next frame of data received for the same queue.

In transmission

- The transmit start request bit in the transmit configuration control register (TCCR.TSRQt) is set to 0.
- The frame will be lost from the transmission FIFO.

(b) Illegal configuration of a descriptor

- The error type bits (ESR.ET) are set to B'0010, and the queue number being processed is set to the error queue number bits (ESR.EQN).
- The same descriptor may be processed again because the current descriptor address (CDARq.CDA) was not changed.
- If this problem occurs in a divided frame, the sequence may be broken.

In reception

- The received frame will be lost.
- The same problem will occur for the next frame of data received for the same queue.

In transmission

- The transmit start request bit in the transmit configuration control register (TCCR.TSRQt) is set to 0.
- The frame will be lost from the transmission FIFO.

(c) Errors in access to the on-chip RAM for writing of descriptors

- The error type bits (ESR.ET) are set to B'0001, and the queue number being processed is set to the error queue number bits (ESR.EQN).
- As in the case where no error occurs, the current descriptor address (CDARq.CDA) and the transmit start request bit in the transmit configuration control register (TCCR.TSRQt) are updated.

- As DESCR.DT was not updated, hardware and software synchronization may have been lost.

(2) Items for Monitoring in Reception

(a) Errors in access to the on-chip RAM for writing of data or time stamps

- The error type bits (ESR.ET) are set to B'0101, and the queue number being processed is set to the error queue number bits (ESR.EQN).
- As in the case where no error occurs, the current descriptor address (CDARq.CDA) is updated.
- DESCR.EI is set to 1 to indicate error detection.
- This problem occurring in a divided frame may break the descriptor sequence, making the queue unusable.

(b) Overflow of the Reception FIFO

- The reception FIFO full interrupt status bit (RIS2.RFFF) is set to 1.
- The received frames are all invalidated. The frames stored in the reception FIFO must be discarded according to the following procedure.

1. Stop reception and enter configuration mode according to the flow shown in Figure 57.7, Flow for Transitions of Operating Mode (from Operation Mode to Configuration Mode).
2. Discard all the unprocessed received data stored in the on-chip RAM.

(3) Items for Monitoring in Transmission

(a) Errors in Access for Reading Data from the on-chip RAM

- The error type bits (ESR.ET) are set to B'0100, and the queue number being processed is set to the error queue number bits (ESR.EQN).
- Data that have already been fetched are discarded from the transmission FIFO.
- When an error of this type occurs during processing of an FSINGLE or FEND descriptor:
  As in the case where no error occurs, the current descriptor address (CDARq.CDA) and the transmit start bit in the transmit configuration control register (TCCR.TSRQt) are updated. Fetching resumes after the error frame.
- When an error of this type occurs during processing of an FSTART or FMID descriptor:
  - The current descriptor address (CDARq.CDA) is not updated.
  - The transmit start bit in the transmit configuration control register (TCCR.TSRQt) is set to 0.

(b) Overflow of the Transmission FIFO

- The error type bits (ESR.ET) are set to B'1010, and the queue number being processed is set to the error queue number bits (ESR.EQN).
- As in the case where no error occurs, the current descriptor address (CDARq.CDA) and the transmit start bit in the transmit configuration control register (TCCR.TSRQt) are updated. Fetching resumes after the error frame.
- The frame will be discarded from the FIFO.

(c) Frame size error during transmission

- The error type bits (ESR.ET) are set to B'1001, and the queue number being processed is set to the error queue number bits (ESR.EQN).
- As in the case where no error occurs, the current descriptor address (CDARq.CDA) and the transmit start bit in the transmit configuration control register (TCCR.TSRQt) are updated. Fetching resumes after the error frame.

A transmit frame size error is detected when the size setting in one or more (in the case of a divided frame) descriptors for frame transmission is more than 1996 bytes. Such frames are cut out and transmitted.

57.3.3 Descriptors

57.3.3.1 Data Representation in On-chip RAM

The AVB-DMAC transfers data for transmission and received data to and from the application software via the on-chip RAM.

Control structures referred to as descriptors and the frame data referred to as descriptor data area are allocated to the on-chip RAM. Dividing into a control area and data area allows the flexible allocation of frame data to the on-chip RAM.

Figure 57.14 shows an example of the memory maps for descriptors and the descriptor data area in the on-chip RAM.

A descriptor consists of its type (DESCR.DT), which controls the descriptor functions, a descriptor pointer (DESCR.DPTR) indicating the start address for storage of the frame data in the descriptor area, and the data size field (DESCR.DS), indicating the amount of frame data. Post-processing interrupt generation can be set up for each descriptor. Enabling and disabling of the interrupt is controlled by the descriptor interrupt enable bits (DESCR.DIE).

The descriptor may also hold information related to content. This information does not affect general descriptor functions. It provides information other than the frame data proper, such as on the state of reception.

For details, see Section 57.3.4.2, Setting Up Reception Descriptors, and Section 57.3.5.2, Setting Up Transmission Descriptors.

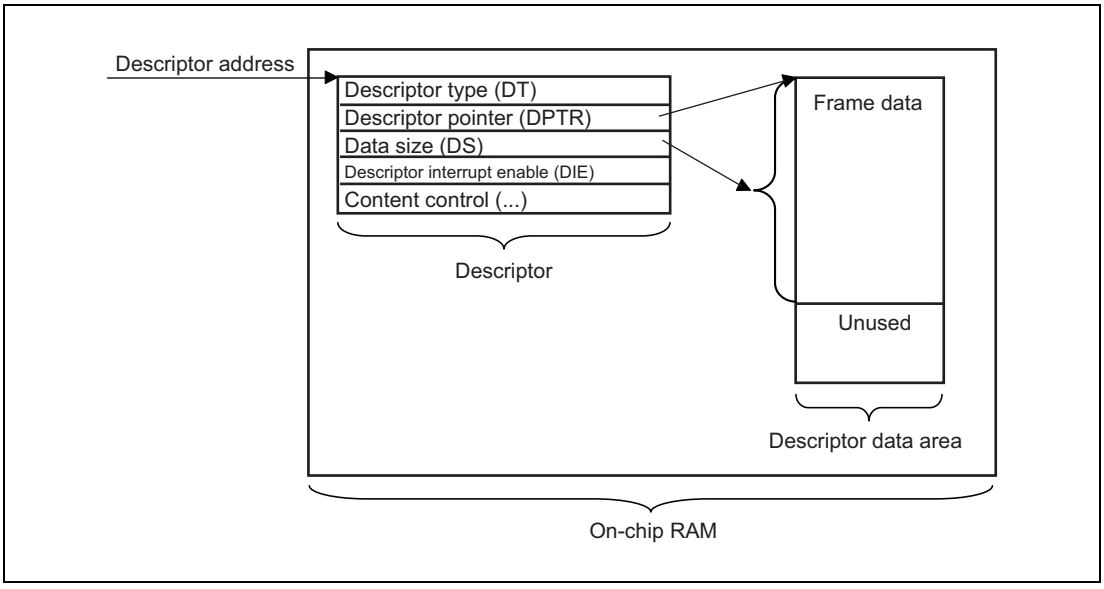

Figure 57.14 Example of On-chip RAM Memory Map

The descriptor must be aligned with a 32-bit boundary in the on-chip RAM.

Descriptors are generally configured of 64 bits, but are configured of 160 bits when reception and storage of gPTP time stamps is enabled.

The frame data must also be aligned with a 32-bit boundary in the on-chip RAM.

The amount of data in the frame is defined by the data size bits (DESCR.DS). In reception, these bits indicate the upper limit on the size of frames to be received. If the data size is not aligned with a 32-bit boundary, the bytes to the next 32-bit boundary in the data area will be an unused area.

57.3.3.2 Using Descriptor Chains in Queues

Transmission and reception descriptors in the on-chip RAM are grouped into queues. Each queue handles frames so that they are transmitted in order of priority and received separately. A queue is capable of controlling one or more frames. Accordingly, multiple descriptors can be assigned to one queue. A combination of multiple descriptors is referred to as a descriptor chain.

For a descriptor chain, the three general descriptor types listed below are defined. For details on these descriptor types, see Section 57.3.3.6, Descriptor Type.

- Descriptors that define frame data
- Descriptors that control the descriptor chain itself (e.g. LINK, EOS).
- Descriptors that arbitrate access by hardware or software

Figure 57.15 shows the two basic topologies for descriptor chains. In the simplified examples in the figure, all descriptors allocated to the chain are stored in the array.

- For a linear descriptor chain, the last descriptor in the array is a control descriptor indicating the end of the descriptors (e.g. EEMPTY).
- For a cyclic descriptor chain, the last descriptor in the array is a control descriptor that returns to the first descriptor in the array (e.g. LINK).

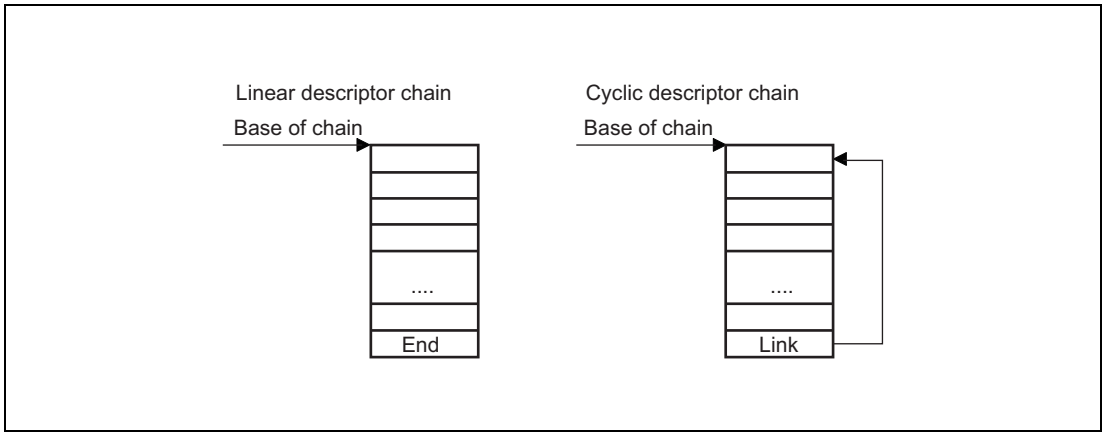

Figure 57.15 Outline of the Basic Descriptor Chains

The relationship between queues and descriptor chains is defined by the base addresses of chains. A queue is connected to one descriptor chain over one round of processing. There is also a method of switching to a different chain while in operation mode.

There are no restrictions on the number of link descriptors and their locations within the chain. The last descriptor of a designed chain determines the topology.

Which chain structure is to be used or which topology is suitable depends on the application. A description of how to design descriptor chains to suit various applications is given in Section 57.3.4.2. Procedure for Setting Reception Descriptors, and Section 57.3.5.2, Setting Up Transmission Descriptors.

57.3.3.3 Descriptor Base Address Table

The base address table in the on-chip RAM contains the address of the first descriptor of all chains to be handled by the respective queues.

Entries 0 to 3 are used to access transmission queues 0 to 3. Subsequent entries are used to access reception queues. Entry 4 thus corresponds to reception queue 0.

The configuration of entries in the base address table is the same as the configuration of link descriptors. We recommend using the descriptor type (DESCR.DT) LINKFIX. Processing of this link descriptor does not change it, so it does not require updating. The first descriptor of a chain performs hardware and software synchronization. If the application requires hardware and software synchronization for the base addresses, use the descriptor type (DESCR.DT) LINK.

The CPU is only capable of using LINKFIX and LINK as descriptor types (DESCR.DT) of descriptors in the base address table.

Set the location of the base address table in the on-chip RAM in the descriptor base address table register (DBAT).

Figure 57.16 shows an example of a base address table for controlling four transmission and three reception queues. The boxes to the right of the table represent descriptor chains with the desired topologies.

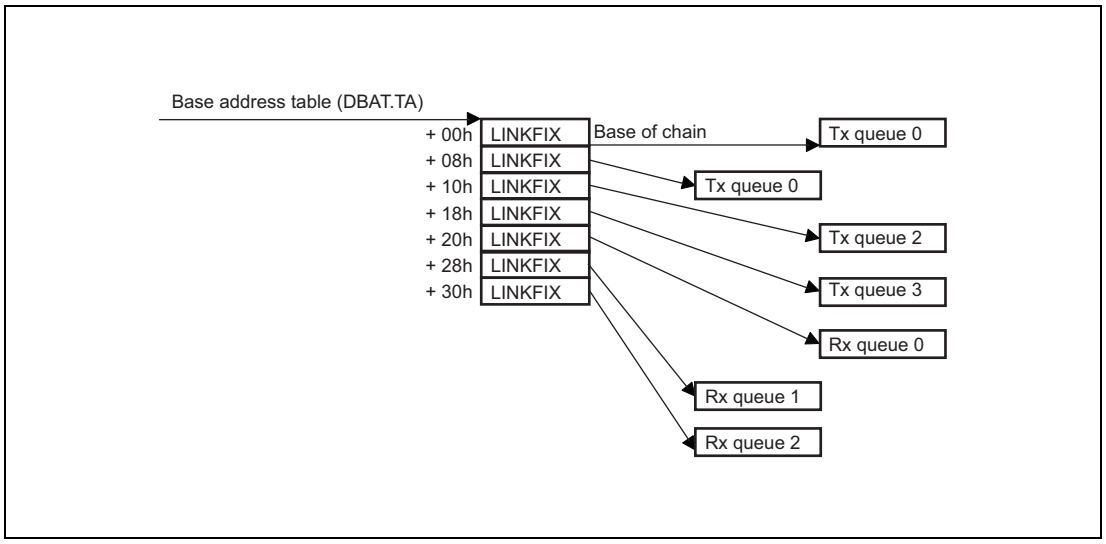

Figure 57.16 Example of a Base Address Table for Reception and Transmission Queues

CAUTION

The size of the descriptors in the base address table is always eight bytes even if the queue itself includes extended descriptors.

57.3.3.4 Descriptor Chain Processing

When a descriptor is currently being processed or the queue for a descriptor is active, the current descriptor is a descriptor to be processed. The current descriptor address for use by a queue q can be checked in the current descriptor address register q (CDARq).

Current descriptors are:

- set in the descriptor base table address bits (DBAT.TA) +8*q for all q queues when the operating mode shifts to operation mode.
- set in the descriptor base table address bits (DBAT.TA) +8*q when a base address load request is issued for a queue q by setting the corresponding bit (DLR.LBAq) in the descriptor base address load request register (DLR).
- set in DESCR.DPTR for a link descriptor (LINK, LINKFIX) to be processed.
- incremented by the size of the descriptors (8 bytes for normal descriptors and 20 bytes for extended descriptors) after a descriptor has been processed. In this case, the AVB-DMAC updates the descriptor type and informs the CPU that the descriptor has been processed.

In other cases (for illegal descriptor processing and so on), the current descriptor address register q (CDARq) is not updated.

57.3.3.5 Descriptor Interrupts

A descriptor is able to issue a descriptor interrupt on completion of its processing. The setting of the descriptor interrupt enable bits (DESCR.DIE) in each descriptor can disable the descriptor interrupts or select the specific descriptor interrupt to be generated.

The descriptor interrupt is a common resource that is shared between reception and transmission queues.

Figure 57.17 illustrates the way in which the AVB-DMAC generates descriptor interrupts (or sets bits in the descriptor interrupt status register (DIS.DPFi)). Processing of a descriptor with the value i in the descriptor interrupt enable bits (DESCR.DIE) leads to the corresponding bit in the descriptor interrupt status register (DIS.DPFi) being set.

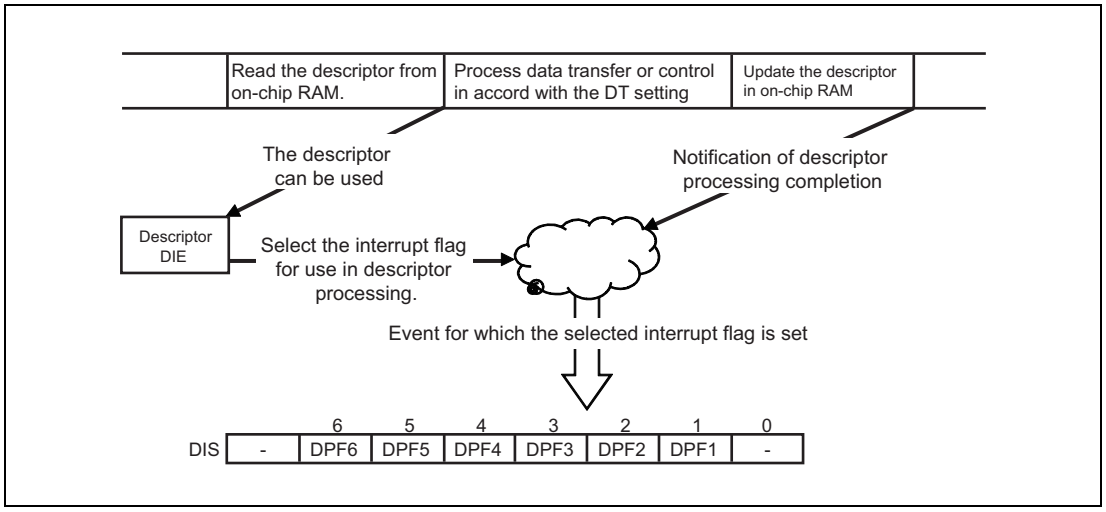

Figure 57.17 Method of Descriptor Interrupt Generation

57.3.3.6 Descriptor Type

The descriptor types (indicated by the DESCR.DT bits) supported by the AVB-DMAC fall into the following three categories.

- Definitions of frame data
- Control of descriptor chains
- Hardware and software arbitration

Table 57.70 is a summary of the descriptor types available for the AVB-DMAC. Entries under “Name” are the names of the descriptor types and the values under “DT” are the corresponding values to be set in the descriptor type field (DESCR.DT). A given descriptor may be handled differently according to whether it is in a transmission or reception queue, so the transmission and reception columns list the scopes of control and processing of the descriptor types.

The abbreviations defined below are used in the transmission and reception columns.

Definition of SW:

- The descriptor is processed by software.
- Software has access to and may modify the descriptor and descriptor data area.
- This descriptor cannot be changed by hardware (AVB-DMAC).

Definition of HW:

- The descriptor is processed by hardware (AVB-DMAC).
- Software must modify neither the descriptor nor the descriptor data area.
- Hardware (AVB-DMAC) processes this descriptor and subsequently changes the descriptor type.

Invalid:

This descriptor type is not used in transfer in the given direction (transmission or reception).

Do not write this value to the descriptor type (DESCR.DT) field for transfer in the given direction.

Hardware does not process these descriptor types in the cases listed as invalid. The current descriptor address (CDARq.CDA) will not be changed when processing of a queue for the given direction arrives at a descriptor with this type setting.

Table 57.70 Summary of Descriptor Types

Name	DT	Description	Reception	Transmission
Frame data				
FSTART	5	Frame Start The descriptor points to valid data for a frame. The frame starts with the given data and continues with that indicated by the next descriptor.	SW	HW
FMID	4	Frame Middle The descriptor points to valid data for a frame. The frame started with a previous descriptor and continues to the data indicated by the next descriptor.	SW	HW
FEND	6	Frame End The descriptor points to valid data for a frame. The frame continues from the previous descriptor and ends with the data indicated by in this descriptor.	SW	HW
FSINGLE	7	Frame Single The descriptor points to valid data for a complete frame.	SW	HW
Chain control				
LINK	8	Link Defines the descriptor in the next chain.	HW	HW
LINKFIX	9	Fixed Link Defines the descriptor in the next chain. Unlike the case of Link, it is not rewritten by hardware after descriptor processing.	SW	SW
EOS	10	End Of Set Controls division of the chain.	HW	HW
HW/SW arbitration				
FEMPTY	12	Frame Empty A descriptor related to frame data but not containing valid data for a frame	HW	SW
FEMPTY_IS	13	Frame Empty Incremental Start A descriptor related to frame data but not containing valid data for a frame DESCR.DPTR sets the base address of an "incremental data area" in the on-chip RAM.	HW	Invalid
FEMPTY_IC	14	Frame Empty Incremental Continue A descriptor related to frame data but not containing valid data for a frame Data indicated by the pointer are for storage in an incremental data area in the on-chip RAM.	HW	Invalid
FEMPTY_ND	15	Frame Empty No Data Storage A descriptor related to frame data but not containing valid data for a frame The descriptor is processed in the same way as FEMPTY but data are not stored in the on-chip RAM.	HW	Invalid
LEMPTY	2	Link Empty A link descriptor for processing by the AVB-DMAC	SW	SW
EEMPTY	3	EOS Empty An EOS descriptor for processing by the AVB-DMAC	SW	SW
DT0	0	Reserved	Invalid	Invalid
DT1	1	Reserved	Invalid	Invalid
DT11	11	Reserved	Invalid	Invalid

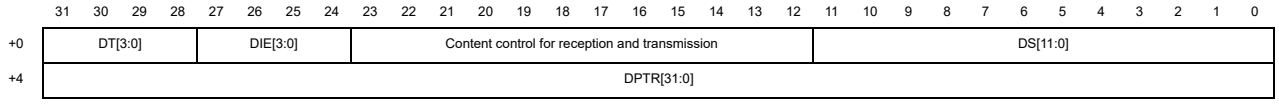
(1) Layout of General Descriptors in the On-chip RAM

The AVB-DMAC updates processed descriptors in the on-chip RAM. The field to be changed in a descriptor being updated depends upon whether the direction is transmission or reception and the queue mode. Other fields will not be changed. There are no restrictions on the values set in unused descriptor fields (indicated by "—" in the figure).

(2) Frame Data Descriptors

The allocation of bits in the frame data descriptors (FSTART, FMID, FEND, and FSINGLE) is shown below.

- Normal descriptor (usable in both reception and transmission)



- Extended descriptor (usable only in reception)

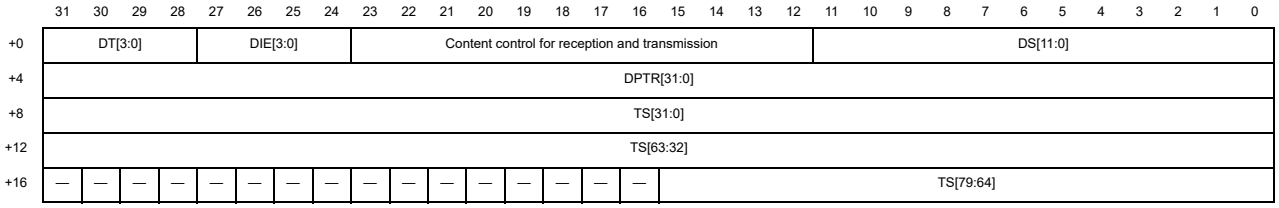


Table 57.71 Contents of Frame Data Descriptors (DESCR)

Bit Name	Function
DT[3:0]	Descriptor Type 5: FSTART 4: FMID 6: FEND 7: FSINGLE For details, see Section 57.3.4.2, Setting Up Reception Descriptors, and Section 57.3.5.2, Setting Up Transmission Descriptors.
DIE[3:0]	Descriptor Interrupt Enable B'0000: Descriptor interrupt is disabled. B'0001 to B'1111: The corresponding descriptor interrupt is generated (DIS.DPFi).
—	Content Control For details, see Section 57.3.4.2, Setting Up Reception Descriptors, and Section 57.3.5.2, Setting Up Transmission Descriptors.
DS[11:0]	Data Size Size of the data area/frame data for the descriptor (in bytes) The specifiable data lengths are as follows (when a frame is divided into parts, the total size of the frame should be within the ranges below). Transmission: 1 ≤ DS ≤ 1996 Reception: 1 ≤ DS ≤ 2000
DPTR[31:0]	Descriptor Pointer Pointer to the data area for the descriptor Register an address on a 32-bit boundary.
TS[79:0]	Time Stamp Time stamp of the received frame (only available in extended descriptors)

CAUTION

Register an address aligned with a 32-bit boundary as the descriptor pointer (DESCR.DPTR).

H'0000 is written to the reserved bits in an extended descriptor (bits 31 to 16 in DESCR) when the time stamp is stored.

(3) Hardware/Software Arbitration Descriptors (Only for Reception)

The allocation of bits in the descriptors for hardware/software arbitration (FEMPTY, FEMPTY_IS, FEMPTY_IC, and FEMPTY_ND) is shown below.

- Normal descriptor

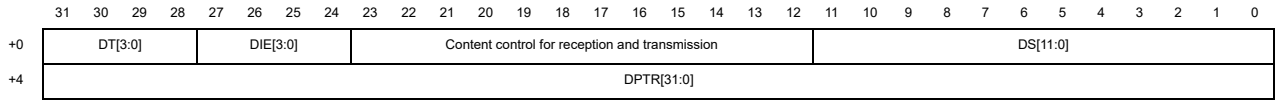

Table 57.72 Contents of Hardware/Software Arbitration Descriptors (DESCR)

Bit Name	Function
DT[3:0]	Descriptor Type 12: FEMPTY 13: FEMPTY_IS 14: FEMPTY_IC 15: FEMPTY_ND For details, see Table 57.70, Summary of Descriptor Types.
DIE[3:0]	Descriptor Interrupt Enable B'0000: Descriptor interrupt is disabled. B'0001 to B'1111: The corresponding descriptor interrupt is generated (DIS.DPFi).
—	Content Control For details, see Section 57.3.4.2, Setting Up Reception Descriptors, and Section 57.3.5.2, Setting Up Transmission Descriptors.
DS[11:0]	Data Size Size of the data area/frame data for the descriptor (in bytes)
DPTR[31:0]	Descriptor Pointer Pointer to the data area for the descriptor Register an address on a 32-bit boundary.

CAUTIONS

Register an address aligned with a 32-bit boundary as the descriptor pointer (DESCR.DPTR).

When an extended descriptor is used, a 12-byte unused area is added.

In an FEMPTY descriptor, the descriptor type (DT), descriptor interrupt enable (DIE), data size (DS), and descriptor pointer (DPTR) fields are used.

In an FEMPTY_IS descriptor, the descriptor type (DT), descriptor interrupt enable (DIE), and descriptor pointer (DPTR) fields are used.

In an FEMPTY_IC descriptor, the descriptor type (DT) and descriptor interrupt enable (DIE) are used.

In an FEMPTY_ND descriptor, the descriptor type (DT), descriptor interrupt enable (DIE), and data size (DS) are used.

(4) Link Descriptors

The allocation of bits in the link descriptors (LINK and LINKFIX) is shown below.

- Normal descriptor

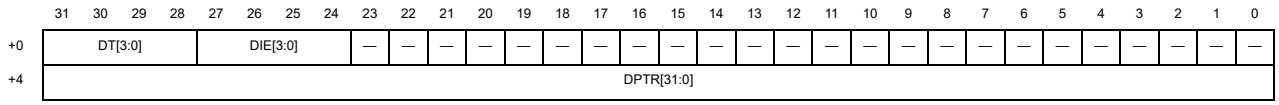

Table 57.73 Contents of Link Descriptors (DESCR)

Bit Name	Function
DT[3:0]	Descriptor Type 8: LINK 9: LINKFIX For details, see Table 57.70, Summary of Descriptor Types.
DIE[3:0]	Descriptor Interrupt Enable B'0000: Descriptor interrupt is disabled. B'0001 to B'1111: The corresponding descriptor interrupt is generated (DIS.DPFi).
—	Content Control For details, see Section 57.3.4.2, Setting Up Reception Descriptors, and Section 57.3.5.2, Setting Up Transmission Descriptors.
DPTR[31:0]	Descriptor Pointer Pointer to the data area for the next descriptor Register an address on a 32-bit boundary.

CAUTION

Register an address aligned with a 32-bit boundary as the descriptor pointer (DESCR.DPTR).

When an extended descriptor is used, a 12-byte unused area is added.

(5) Other Descriptors

The allocation of bits in the other descriptors (EOS, FEMPTY (only for transmission), LEMPTY, and EEMPTY) is shown below.

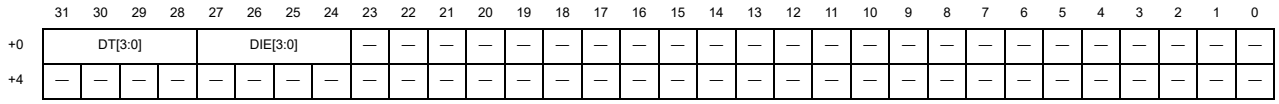

Table 57.74 Contents of Other Descriptors (DESCR)

Bit Name	Function
DT[3:0]	Descriptor Type 10: EOS 12: FEMPTY (only for transmission) 2: LEMPTY 3: EEMPTY For details, see Table 57.70, Summary of Descriptor Types.
DIE[3:0]	Descriptor Interrupt Enable B'0000: Descriptor interrupt is disabled. B'0001 to B'1111: The corresponding descriptor interrupt is generated (DIS.DPFi).

CAUTION

When an extended descriptor is used, a 12-byte unused area is added.

(6) How to Use Frame Data Descriptors

The descriptor data area size field (DESCR.DS) can specify up to 2048 bytes of Ethernet frame data per data area. Settings higher than 2048 (bytes) cannot be made.

In general, Ethernet frames are not of uniform length. The AVB-DMAC is capable of dividing frame data into multiple descriptors in order to minimize the memory capacity for frame data. This function allows processing of frames that are longer than the limit for descriptor data areas. Division can also be applied to frames on the basis of their data structures.

To handle both frames divided up into multiple data areas and descriptors for complete single frames, four types (DESCR.DT) FSTART, FEND, FMID, and FSINGLE are defined.

Figure 57.18 shows the mapping of frame data by frame data descriptors. The descriptor data areas are allocated to the on-chip RAM. For frames that require division into four or more data areas, additional FMID descriptors can be added as required.

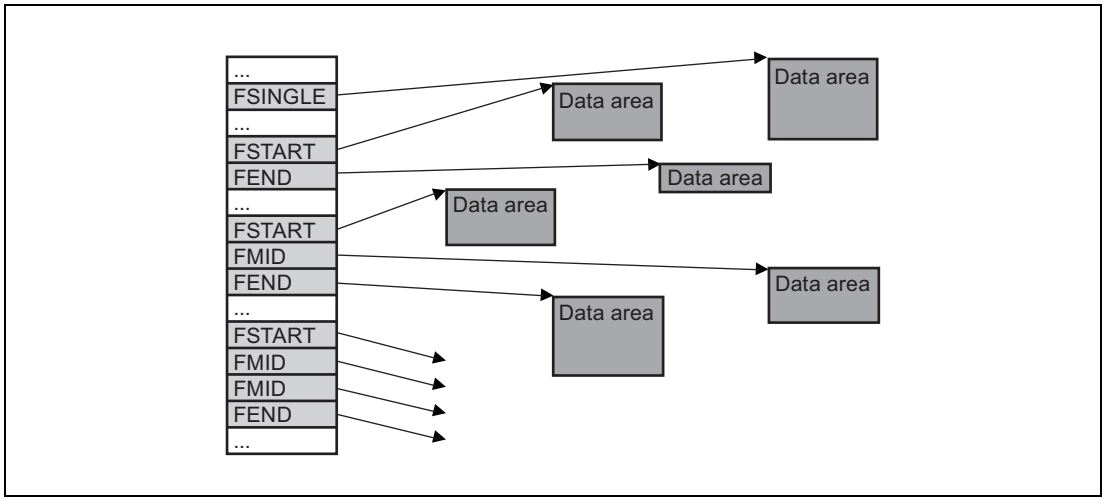

Figure 57.18 Mapping of Frame Data

For reception, set the descriptor data areas to the maximum size (i.e. give DESCR.DS its maximum value). The AVB-DMAC will store received frame data in the given area. If a received frame has more data than the maximum size, the AVB-DMAC will divide the data up.

For transmission, set the frame data size to the actual data size. The AVB-DMAC modifies the descriptor type (DESCR.DT) to FEMPTY after processing the relevant descriptor. The data size (DESCR.DS) and descriptor pointer (DESCR.PTR) fields retain their settings.

A descriptor data area including unused space produces an empty space between data areas. In reception, an "incremental data area" can be used to prevent empty spaces. For incremental data areas, see Section 57.3.4.3 (2) Incremental Data Areas.

As well as reducing the memory capacity taken up by the descriptor area in the on-chip RAM, division into frames can be used to identify different sections of data (e.g. for separating a header and data).

(7) How to Use Chain Control Descriptors

(a) Link Descriptors

The link descriptors can be used to set up cyclic descriptor chains (for details, see Section 57.3.3.2, Using Descriptor Chains in Queues).

After a LINK descriptor is processed, its descriptor type (DESCR.DT) is changed to LEMPTY. The descriptor pointer (DESCR.PTR) retains its setting.

After processing of a LINKFIX descriptor, the descriptor type (DESCR.DT) is not updated. Software can change the descriptor type (DESCR.DT), descriptor interrupt enable (DESCR.DIE), and descriptor pointer (DESCR.DPTR). Take care, however, to check the current descriptor address register (CDARq.CDA) before changing the descriptor pointer (DESCR.DPTR).

(b) EOS Descriptor

Use the EOS descriptor to divide a descriptor chain into various segments. The queue can continue even after an EOS descriptor.

In transmission, the response to an EOS descriptor is clearing of the transmit start request bit in the transmit configuration control register (TCCR.TSRQq) to 0.

In reception, the response is generation of a receive queue full interrupt (RIS2.QFFr), although if the frame currently being received is being divided for storage (received data being stored in FMID- or FEND-type frames), the data are not completely stored.

(8) How to Use Hardware and Software Arbitration Descriptors

In hardware processing of descriptors, the empty descriptor types (FEMPTY, LEMPTY, and EEMPTY) are defined to distinguish various descriptors. For software, they can be used to initiate checking for empty spaces, etc.

(a) FEMPTY, FEMPTY_IS, FEMPTY_IC, and FEMPTY_ND

These descriptor types (DESCR.DT) are used for descriptors that do not contain effective data. Of these, only FEMPTY is used in transmission.

These descriptor pointers (DESCR.DPTR) indicate the descriptor data area.

(b) LEMPTY

This descriptor type (DESCR.DT) is assigned to LINK descriptors after they have been processed.

The descriptor pointer (DESCR.DPTR) of an LEMPTY descriptor still points to the linked descriptor.

(c) EEMPTY

This descriptor type (DESCR.DT) is assigned to EOS descriptors after they have been processed.

The descriptor pointer (DESCR.DPTR) of an EEMPTY descriptor is not used, and thus points to nothing.

(9) Relationship between Descriptor Access by Hardware and Software

In the EthernetAVB, the allocation of descriptor types (DESCR.DT) to the on-chip RAM can be used. This makes it possible to minimize access to the EthernetAVB registers via the CPU, leading to higher performance.

- Each descriptor type in the set is exclusively for processing by hardware or software, depending on the direction of transfer (see Table 57.70, Summary of Descriptor Types).
- Software must not change a descriptor assigned to hardware processing (the hardware does not change descriptors assigned to software processing).

In the case of software processing, the software must process the information in the descriptor and the corresponding frame data before changing the descriptor type. If a descriptor type for hardware is set in DESCR.DT, the software should not change any part of the descriptor or of the corresponding frame data.

57.3.3.7 Optimization of Bus Performance when Using Descriptors

The following items are recommended as ways to ensure the optimal use of data structures in the on-chip RAM.

They are not requirements, but using a different approach may increase the load on the system bus within the LSI chip.

- Register descriptors with 64-bit alignment (this does not apply to extended descriptors).
- While in operation mode, use LINKFIX instead of LINK whenever a descriptor need not be changed. Hardware modifies the descriptor type (DESCR.DT) fields of LINK descriptors.
- Restrict frame data to a maximum size of 128 bytes.
- Minimize parallelism of processing to the descriptor chains.
  This helps in arranging the different segments exclusively for access by software or hardware by dividing the chains so as to be allocated to different on-chip RAM pages.
- Minimize the number of divided frames. This can reduce the overhead of descriptor handling.

57.3.4 Control in Reception

The point of the AVB-DMAC is to transfer data between the E-MAC and on-chip RAM without intervention by the CPU.

Create descriptors that define the amounts of frame data to be stored and the locations. After the E-MAC receives a frame, it stores the received frame data and the conditions of reception as the MAC state. If the descriptor is extended, the time stamp is also stored. For a description of how to set up descriptors for use in reception, see Section 57.3.4.2, Setting Up Reception Descriptors.

The AVB-DMAC filters received frames to separate them into various classifications (separation filtering). More specifically, this is done to separate received frames into the various reception queues and to set the priorities of different classes of received frames. For more on separation filtering, see Section 57.3.4.1 (1) Separation Filtering.

Figure 57.19 shows the reception data bus and the selection of queues for use in reception.

Each frame received from the E-MAC is stored in the reception FIFO; in parallel with this, the frame is analyzed to identify its type and the target queue number. After the E-MAC completes reception, the target queue number is generated and stored in the reception FIFO. A reception flag is applied to each reception queue in the on-chip RAM, and the unread frame counter (UFC) is also applied to each reception queue.

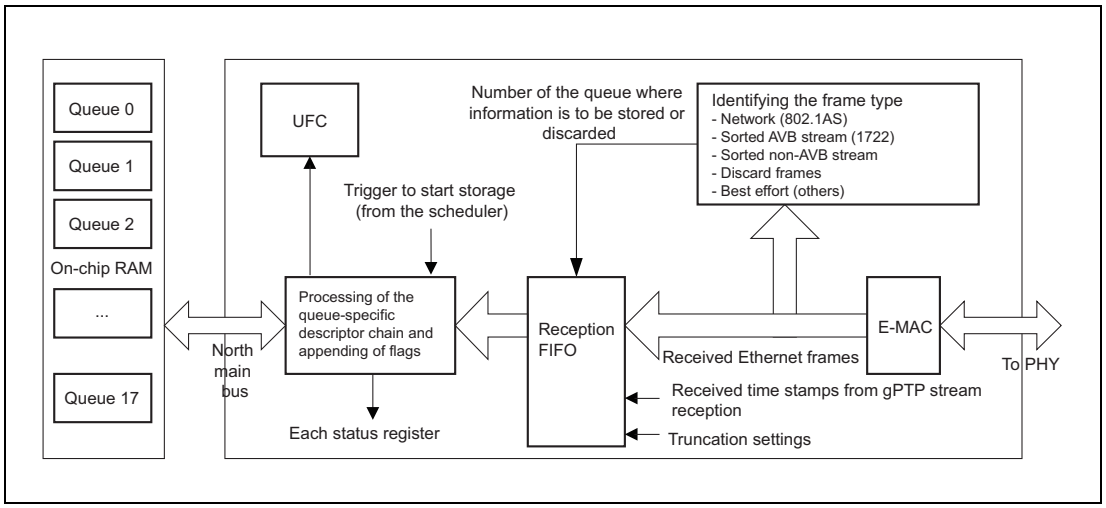

Figure 57.19 Mechanism of General Reception Queue Selection

57.3.4.1 Reception Queues

The AVB-DMAC applies its separation filtering mechanism to select the reception queue for storing a received frame. The AVB-DMAC stores all received frames in the on-chip RAM.

There are two conditions for the AVB-DMAC to discard a received frame.

- Detection of an error during reception by the E-MAC
  - Whether error frames are discarded or stored in reception queue 0 (best effort) can be set by the error frame enable bit in the receive configuration register (RCR.EFFS). If error frames are to be stored (RCR.EFFE = 1), they are always stored in queue 0 (best effort). In this case, parameters of each queue (e.g. truncation) may not match. If the storage of time stamps for reception queue 0 (best effort) is enabled (the time stamp enable bit in the receive configuration register RCR.ETS0 = 1), time stamps are stored even for error frames.
- Non-matching determination conditions of the separation filter
  - Whether non-matching frames are discarded or stored in reception queue 0 (best effort) can be set by the stream filtering select bit in the receive configuration register (RCR.ESF).

The flowchart in Figure 57.20 shows how the AVB-DMAC selects the reception queue in accord with the frame type, including judgment by the separation filter. Selection of the queue starts when the E-MAC completes frame reception. The result is storage of the frame in the proper queue or the frame being discarded.

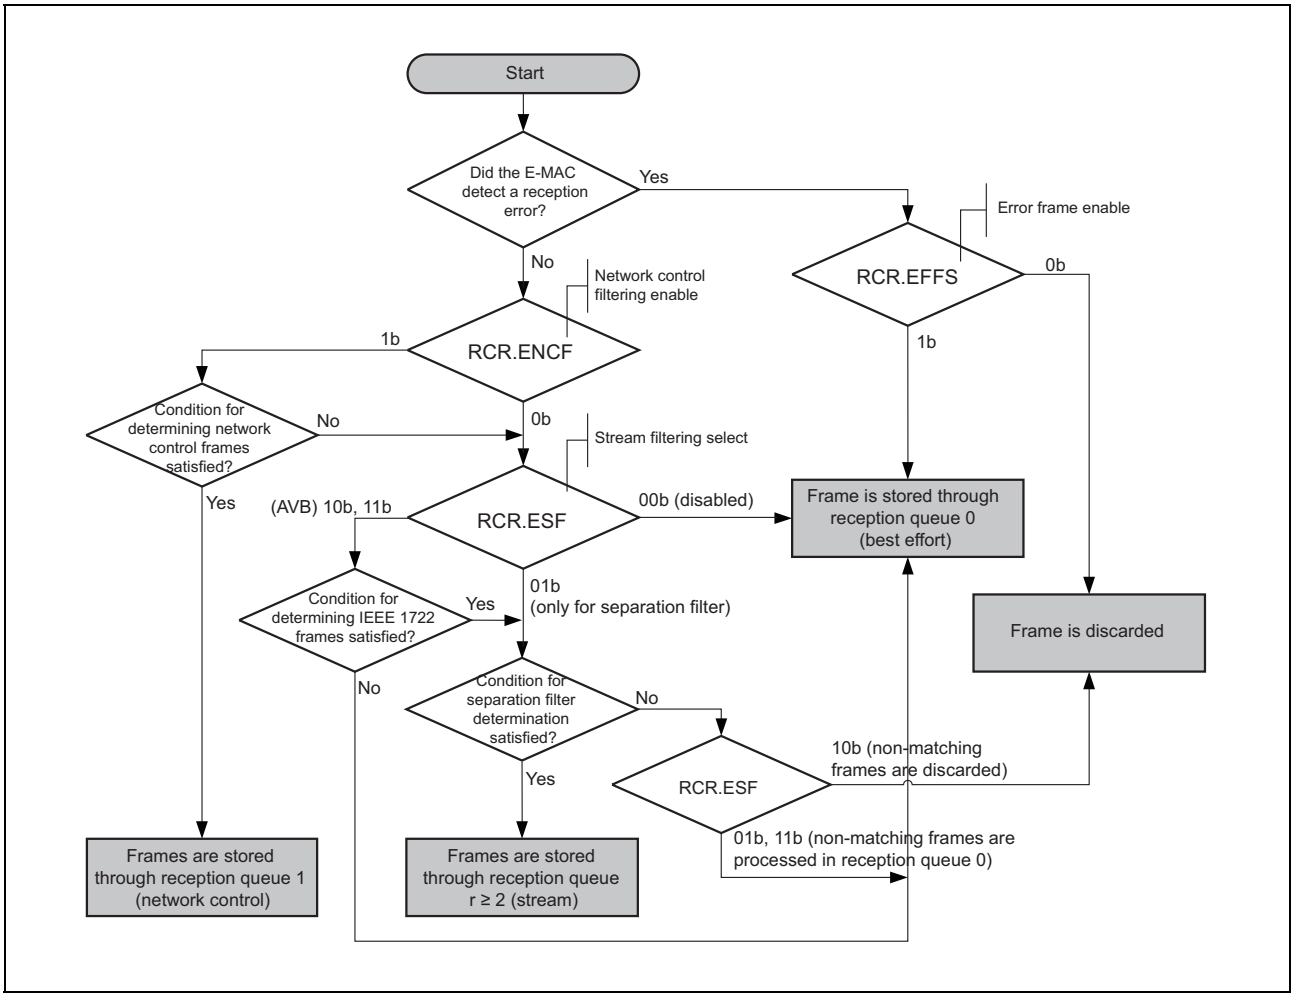

Figure 57.20 Flow of Reception Queue Selection

Notes on the description of entries in the flowchart

- “Condition for determining network control frames”
  The Ethernet destination address (DA) is 01:80:C2:00:00:0E, and
  The Ethernet type (ET) is 88:F7.
- “Condition for determining IEEE 1722 frames”
  The Ethernet destination address (DA) is in the range from 91:E0:F0:00:00:00 to 91:E0:F0:00:FE:FF,
  The VLAN tagged TPID (tag protocol identifier) field (VL) is 81:00, and
  The Ethernet type (ET) is 22:F0.
- “Condition for separation filter determination”
  See Section 57.3.4.1 (1) Separation Filtering.

Figure 57.21 shows the allocation of data in Ethernet frames used for determination of Network Control frame and IEEE1722 frame. The preambles of Ethernet frames are not taken into account.

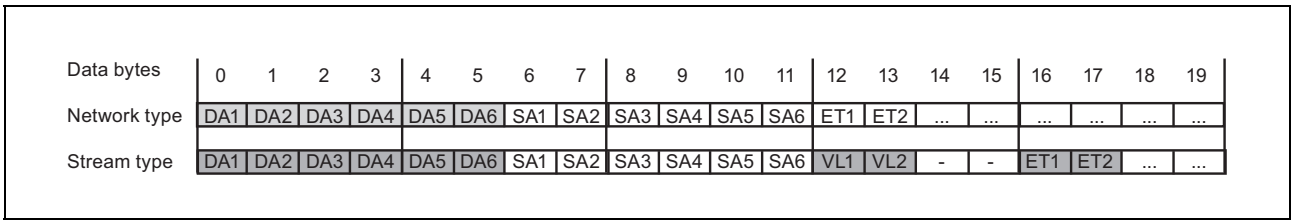

Figure 57.21 Data Allocation of Ethernet Frames Used in Frame Determination

(1) Separation Filtering

Separation filtering involves the checking of 64 bits (eight successive bytes) in received Ethernet frames. The setting for the first byte (i.e. the setting of the separation filter offset configuration register (SFO.FBP)), selects the part of frames to be used in separation filtering. There is also a common filter mask (set in the separation filter mask configuration register (SFMi.CFM)) that can filter less than the number of bytes and mask particular bits.

Examples

To use only the first byte from the top in separation filter, set separation filter mask configuration register 0 (SFM0.CFM) to H’0000 00FF and separation filter mask configuration register 1 (SFM1.CFM) to H’0000 0000.

To use seven bytes from the top in separation filter, set separation filter mask configuration register 0 (SFM0.CFM) to H’FFFF FFFF and separation filter mask configuration register 1 (SFM1.CFM) to H’00FF FFFF.

CAUTION

If bits are set to 0 in the separation filter mask, in order to match with the pattern, the bits at the corresponding positions of the pattern must also be set to 0. Only when "the received frame data & the separation filter mask register (SFMi.CFM) = the separation filter pattern register (SFPi.FPs)", it is judged that the bits match with the pattern.

Figure 57.22 shows separation filtering. The selected data from a received frame (Rx_Frame[63:0]) are masked by the common filter mask. This value is compared with all filter patterns. The AVB-DMAC selects the queue having the smallest queue number from among the matched filter patterns.

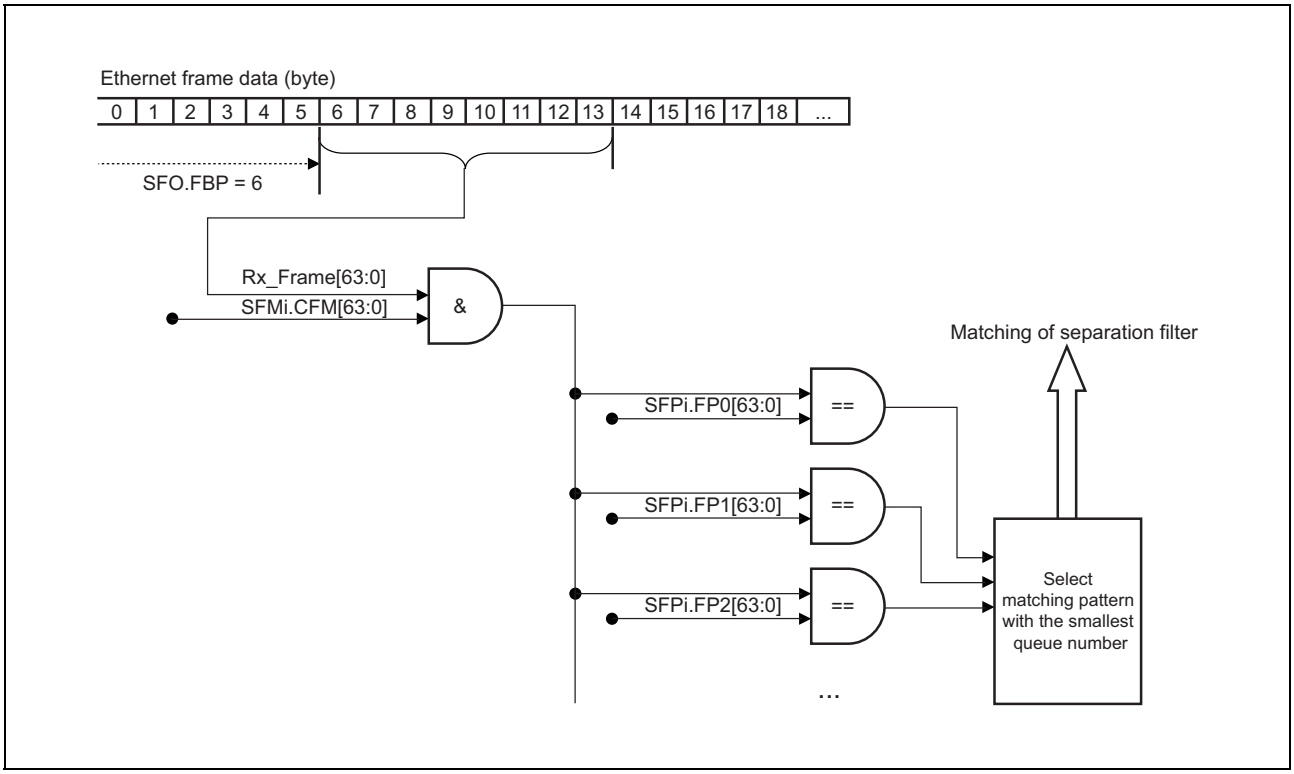

Figure 57.22 Overview of Separation Filtering (when SFO.FBP = 6)

(a) Restrictions on Number of Filters Used

The AVB-DMAC always checks all the separation filter patterns. When it is not necessary to use all the reception queues, providing a special pattern can prevent data from being stored in the unused reception queue.

Example 1:
Setting a value other than H'FFFF_FFFF_FFFF_FFFF to the separation filter mask register (SFMi.CFM) and setting H'FFFF_FFFF_FFFF_FFFF to the separation filter pattern register (SFPi.FPs) can prevent pattern matching in the unused reception queue.

Example 2:
Setting H'FFFF_FFFF_FFFF_FFFF to the separation filter mask register (SFMi.CFM) and setting the value identical to the pattern in reception queue 2 to the separation filter pattern register (SFPi.FPs) selects, upon a pattern matching, reception queue 2, which has a smaller queue number, thus preventing the unused reception queue from being used.

(2) Separating Streams

The AVB-DMAC applies separation filtering to sort frames received in streams. An AVB network has a concept of “Talker” and “Listener”. A Talker is an end station that generates one or more streams. A Listener is an end station that has the role of being a sink for at least one stream. The various A/V streams are identified by 8-byte stream IDs.

The number of end stations within an ABV network and their roles differ with the application.

The stream ID is a specific pattern of the AVB network for identifying one stream. Figure 57.23 shows the bit allocation of bits in IEEE1722 Ethernet frames and stream ID fields.

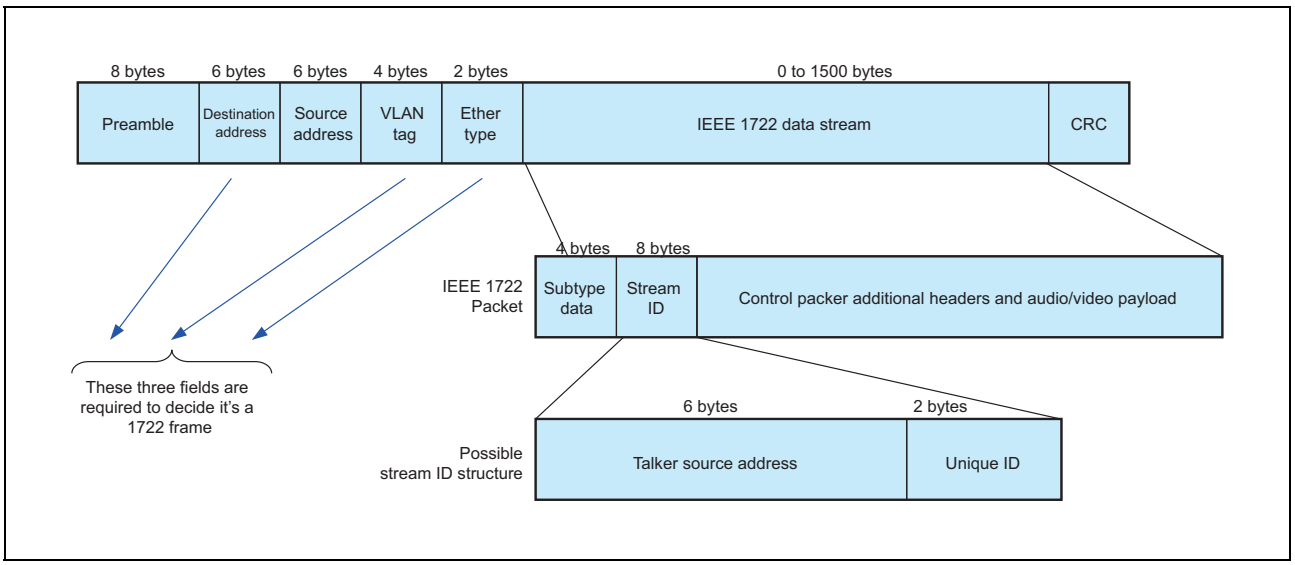

Figure 57.23 IEEE 1722 Frame Layout and Stream ID

The IEEE 1722 standard stipulates that the stream ID field starts from the 22nd byte (not counting the preamble). Accordingly, set the separation filter offset (SFO.FBP) to 22 in separations on IEEE 1722 streams. Set the separation filter mask (SFMi) and separation filter pattern (SFPi) in accord with the specification of the application in which the chip is being used.

Example: In the example of a stream ID shown in Figure 57.23, the representative application divides the field into the talker source address and the unique stream ID. The unique ID is used to differentiate between multiple streams from the same talker. Based on this, there are two settings for separation filter masking:

- To divide various streams into individual queues, set SFM0.CFM to H’FFFF FFFF and SFM1.CFM to H’FFFF FFFF.
- To divide streams for each talker into individual queues, set SFM0.CFM to H’FFFF FFFF and SFM1.CFM to H’0000 FFFF. This excludes the unique ID from the filter condition.

57.3.4.2 Setting Up Reception Descriptors

For reception, the descriptor as described in Section 57.3.3, Descriptors is used.

This section describes specific operations that are especially required in handling reception queues.

(1) Reception Descriptor Type

The type of a descriptor is defined by the descriptor type (DESCR.DT) field.

Table 57.75 shows the descriptor types used in reception. In the table, entries in the write-back column indicate how the AVB-DMAC changes the DESCR.DT field upon completion of descriptor processing.

Table 57.75 Descriptor Types in Reception

Descriptor Type (DESCR.DT)	Operation	Write-back
Frame Start (FSTART)	There is no storage space in a reception queue: The RIS2.QFFr bit indicates that queue r is full and the received frame is not stored. Descriptor processing proceeds again in response to further reception.	Not changed
Frame Middle (FMID)	Same as FSTART	Not changed
Frame End (FEND)	Same as FSTART	Not changed
Frame Single (FSINGLE)	Same as FSTART	Not changed
Link (LINK)	Processing proceeds to the descriptor specified by DESCR.DPTR.	LEMPTY
Fixed Link (LINKFIX)	Same as LINK	Not changed
End Of Set (EOS)	In the case of a divided frame (received frame being stored in FMID or FEND), storing of frames is stopped and the frame is lost. RIS2.QFFr indicates that the frame has been lost. If this happens at the start of a frame (received frame being stored in FSTART or FSINGLE), storing of frames starts from the next descriptor. In either case, processing shifts to the next descriptor in the chain.	EEMPTY
Frame Empty (FEMPTY)	Used to store received data. Up to DESCR.DS bytes are stored in the descriptor data area. For details, see Section 57.3.4.3 (1) Storing Frame Data in the Descriptor Data Area.	FSTART, FMID, FEND, or FSINGLE
Frame Empty Incremental Start (FEMPTY_IS)	Used to store received data. The remaining frame data are all stored in the descriptor's data area. DESCR.DPTR indicates the base address of the incremental data area. For details, see Section 57.3.4.3 (2) Incremental Data Areas.	FEND or FSINGLE
Frame Empty Incremental Continue (FEMPTY_IC)	Used to store received data. The remaining bytes of frame data are all stored in the descriptor's data area. DESCR.DPTR is undefined, but the address after processing of previous incremental data becomes the base address. For details, see Section 57.3.4.3 (2) Incremental Data Areas.	FEND or FSINGLE
Frame Empty No Data storage (FEMPTY_ND)	Used to store received data. DESCR.DS bytes of spaces are secured in the reception FIFO but not stored. After processing, DESCR.DS is written back as 0. For details, see Section 57.3.4.3 (2) Incremental Data Areas	FSTART, FMID, FEND or FSINGLE
Link Empty (LEMPTY)	Same as FSTART	Not changed
EOS Empty (EEMPTY)	Same as FSTART	Not changed

If a reception FIFO read error occurs when FEMPTY_ND is used, it is not reflected in DESCR.EI and queue error interrupt status bit (EIS.QEF).

Therefore, to detect a reception FIFO error also for unnecessary data, FEMPTY should be used.

(2) Configuration of Reception Frame Data Descriptors

Figure 57.24 shows the configuration of descriptors for use with reception queues. The reception-specific fields are the same whether the descriptor is normal or extended. The reception-specific fields (DESCR.MSC, DESCR.PS, DESCR.EI, and DESCR.TR) are described in Table 57.76.

For the other fields and the descriptor types, see Section 57.3.3.6, Descriptor Type.

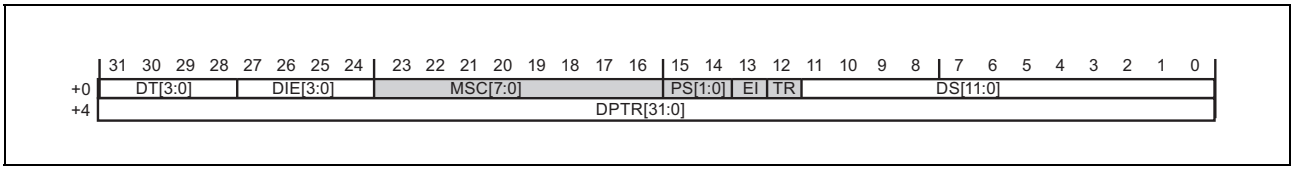

Figure 57.24 Configuration of Descriptor for a Received Frame

Table 57.76 Configuration of a Received Descriptor

Bit Name	Function
MSC	MAC Status Code These bits indicate errors in reception detected by the E-MAC. These bits are set to the same value between the frames divided by the descriptor. Details of the bits are as follows. MSC[7]: Received frame has a multicast address. MSC[6]: Reserved MSC[5]: Reserved MSC[4]: Received frame has residual bits. MSC[3]: Received frame is too long. MSC[2]: Received frame is too short MSC[1]: Error in frame reception MSC[0]: Received frame has a CRC error.
PS	Padding Selection These bits specify whether frame data are to be padded when stored in the incremental data area. Insertion of padding data is in accord with the settings in the receive padding configuration register (RPC). B’00: Padding is not to be inserted. B’01: Padding data may be inserted. This depends on the RPC settings. B'10: Setting prohibited. B'11: Setting prohibited.
EI	Error Indication This bit indicates the detection of an error in frame data while a frame was being stored. The bit is set to 1 for a descriptor in which an error has been detected. If the descriptor is for a divided frame, the frame data is discarded. 0: No error 1: Error is detected
TR	Truncation Indication This bit indicates whether frame data received from the E-MAC have been truncated before being stored in the on-chip RAM. These bits are set to the same value between the frames divided by the descriptor. 0: Data have not been truncated. 1: Data have been truncated.

CAUTION

The RCR.EFFS bit specifies whether or not frames with errors detected by the E-MAC are to be stored in the on-chip RAM. When the storing of error frames is disabled, error codes are not written to DESCR.MSC.

57.3.4.3 Reception Processing

After initialization, the AVB-DMAC is able to select the proper reception queue and store received frames in the data area in the on-chip RAM as indicated by the descriptor. The AVB-DMAC continues to store received data in the on-chip RAM as long as space is available for descriptors and data areas.

Received frames are classified and stored in the reception FIFO in accord with the algorithm described in Section 57.3.4.1 (1) Separation Filtering. A frame will already have been sorted by separation filtering, truncated, or discarded based on reception by the MAC before being stored in the reception FIFO. The following data are stored in the reception FIFO.

- MAC status of received frames
- Length of received frames
- Time stamp of received frames
- Target reception queue
- Received frame data

If the reception FIFO contains even one frame, the scheduler allocates storing in the reception queue (see Section 57.3.2.2, Scheduling Reception and Transmission).

If there is even one empty descriptor in a queue for which reception has started, the storage of frame data starts. Received frames for a queue that is already full (there is no empty frame descriptor or the unread frame counter stop level has been reached) are discarded from the reception FIFO. This ensures that one queue being full does not prevent the processing for data in the other queues.

(1) Storing Frame Data in the Descriptor Data Area

Frame data for storage are assumed to be in either of the two patterns described below.

- The data for an entire frame will fit in the descriptor data area.
  - In this case, the descriptor type (DESCR.DT) is FSINGLE.
- Frame data is bigger than the descriptor, so the frame data is divided and stored in the descriptor data area.
  - In this case, FSTART is written to the descriptor type (DESCR.DT) bits of the first of the frame data to arrive and FMID and FEND are written to the type bits of descriptors for subsequent data.

The descriptor type is updated by the AVB-DMAC in the last step of descriptor processing, so software can always access the descriptor written-back to DESCR.DT.

Software can write FEMPTYxxx directly to the descriptor type field after processing the stored frame data. Do not change the descriptor or any part of the descriptor data area after FEMPTYxxx is written to DESCR.DT.

(a) Single Frame

For a frame with an FSINGLE descriptor, all data for the frame are held at the position defined by DESCR.DPTR. DESCR.DS indicates the length of the received frame.

If DESCR.DS is bigger than the actual size of a received frame, the FEMPTY or FEMPTY_ND descriptor is stored in place of the FSINGLE descriptor.

Also, the FEMPTY_IS and FEMPTY_IC descriptors, which always hold the full frame data, are stored in place of the FSINGLE descriptor.

(b) Divided Frames

Divided frames can be processed in the same way as a single frame. A frame stored with divided descriptors must be recombined before use. DESCR.EI and DESCR.TS are only valid in the last descriptor of the sequence for a divided frame.

CAUTION

If the data area size setting in DESCR.DS is not a multiple of four bytes, only the number of bytes set in DESCR.DS is fetched from the reception FIFO and the remaining bytes are used by the next descriptor.

After a received frame is divided into different descriptors, each frame data is processed separately, and the descriptor type is assigned by software after processing. Accordingly, an error frame (FEMPTYxxx instead of FMID or FEND) may exist while a descriptor chain is being processed. In such a case, the CPU must postpone processing of the error frame until the corresponding descriptor has been processed.

(c) No Data

The application specification may lead to some types of received frames being unimportant (for example, when the application only requires stream data from the Ethernet frames). Storing frames in divided form makes separating out the unnecessary parts of Ethernet frames possible.

If part of a divided frame is not required, use the FEMPTY_ND descriptor so that unnecessary data is not stored in the on-chip RAM.

After processing an FEMPTY_ND descriptor, the AVB-DMAC sets DESCR.DS to 0. DESCR.DS = 0 is for the specific flag indicating that the FEMPTY_ND descriptor has been processed.

(2) Incremental Data Areas

Secure space for storing received data in the on-chip RAM. Even when all descriptor data areas of a chain are placed in the contiguous area of the on-chip RAM area, a received frame being shorter than the descriptor data area will lead to an empty space. Figure 57.25 shows an example of settings and the memory map.

In some cases, contiguous data arrangement may be effective (e.g. when received data are to be processed other than by hardware as the A/V codec module). When the length of frames differs for each received frame (e.g. when payloads vary between having one or two A/V packages), the use of a pointer in the descriptor produces empty spaces in the data area. This necessitates additional processing such as copying the frame data to remove the empty spaces.

Accordingly, and to prevent copying data, the AVB-DMAC supports an “incremental data area” function.

When incremental data areas are in use, different descriptors use a contiguous data area. The first descriptor (FEMPTY_IS) from the top defines the base address of the incremental data area and is used to, together with the subsequent descriptor (FEMPTY_IC) within the descriptor chain, hold received data. Figure 57.26 shows an example of settings and the memory map.

When an incremental data area is used, it is also possible to divide a frame into various descriptors in a way that reflects its structure (e.g. one descriptor for the Ethernet header and one for the data payload).

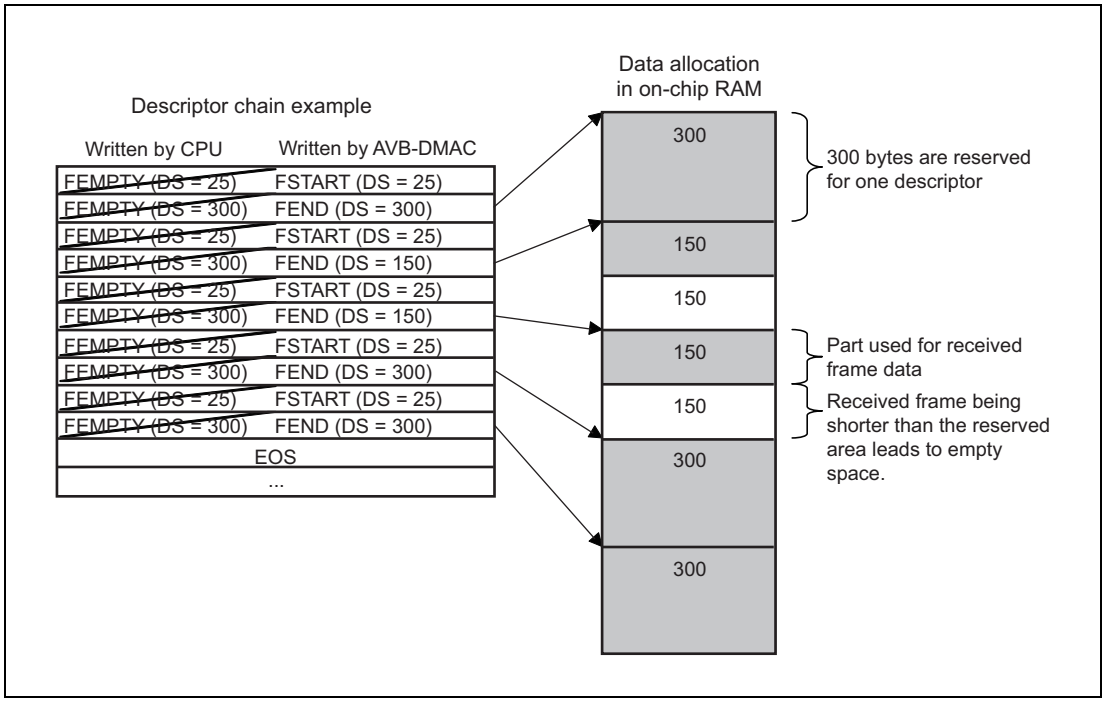

Figure 57.25 When Individual Descriptor Data Areas are Used

Figure 57.25 and Figure 57.26 show how control of the data storage areas by a descriptor chain varies according to whether incremental data areas are not in use or in use. The chains are configured for storing received frames consisting of a 25-byte header (in this example, stored in the on-chip RAM area outside the drawing range) and a 150- or 300-byte payload (whether one or two 150-byte data depending on the data source).

In Figure 57.25, an EOS descriptor is added as an example of a re-synchronization point. If a frame larger than 325 bytes is received, the frame will be divided into three descriptors, meaning that synchronization of the header and data sequences is lost. However, a frame is not divided across an EOS descriptor, so adding EOS descriptors can prevent the header and data sequences losing synchronization. While an incremental data area is in use, EOS descriptors are not required because the incremental descriptors always hold all data being processed.

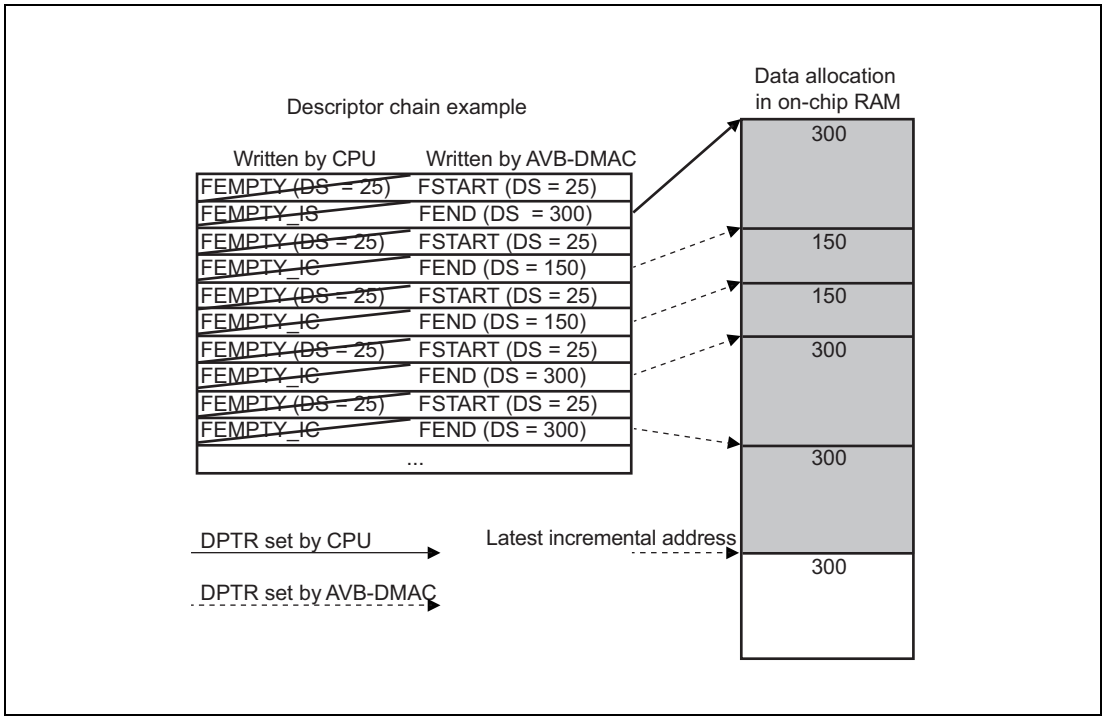

Figure 57.26 When Incremental Data Area is Used

As Figure 57.26 shows, when data are stored in an incremental data area, the descriptor pointers in the FEMPTY_IC descriptors (DESCR.DPTR) are updated. Accordingly, the FEND or FSINGLE descriptor written-back by the AVB-DMAC after processing is in the same format as the FEMPTY descriptor after processing.

Software captures contiguous received data, which has no empty spaces, from an incremental data area. The incremental data area must be aligned with a 4-byte boundary. Therefore, when the amount of received data for storage in an incremental data area is not a multiple of four bytes, from one to three bytes of empty space is placed at the end of the incremental data area. DESCR.DS can be read to check for such empty spaces.

For the normal descriptors (FEMPTY and FEMPTY_ND), controlling the amount of received data due to DESCR.DR is possible, but for the incremental descriptors (FEMPTY_IS and FEMPTY_IC), controlling the amount of received data to be stored is not possible. All received data are always stored in an incremental descriptor.

(a) Setting Up an Incremental Data Area

If a descriptor chain has N descriptors (one FEMPTY_IS and N-1 FEMPTY_IC), an area for storing N times of the maximum received data as the incremental data area must be secured.

As Figure 57.26 shows, DESCR.DPTR of an FEMPTY_IS descriptor indicates the base address of the incremental data area. The subsequent FEMPTY_IC descriptor in the chain indicates that data must be stored in the incremental data area.

(b) Processing an Incremental Data Area Based on Descriptors

Since data processing by the CPU is the same regardless of how the AVB-DMAC stores the data, data stored in an incremental data area do not require any special handling.

(c) Padding

Use padding for reception of frame data that are not aligned correctly. Padding can be set individually for each descriptor. Accordingly, in the reception of divided frames, padding can be set to only those frames that require it (e.g. A/V payload data.)

Padding can also be used to effectively use an incremental data area (e.g. to prevent inefficient access by aligning received data with 32-byte boundaries.

Padding can only be used in an incremental data area.

The value H'0000 0000 is always used in padding.

Padding is the addition of the number of words (from one to seven 32-bit words) set in the stored padding counter bit in the receive padding configuration register (RPC.PCNT). This padding is repeatedly inserted for each received data count set to the stored data counter bit (RPC.DCN) (from one to 255 32-bit words). When the stored data counter (RPC.DCNT) reaches 0, however, padding is not repeated.

The first word of padding is always inserted at the position specified by DESCR.DPTR. When divided frames are in use, a padding word can be inserted in accord with each descriptor (e.g. the first descriptor handles a 42-byte header data and the second descriptor holds padded payload data in an incremental data area).

The next figure shows a general example of how padding is inserted and an example of setting up padding. In the figure, A indicates frame data received from the E-MAC, while B indicates frame data stored in the descriptor data area (32-bit word units).

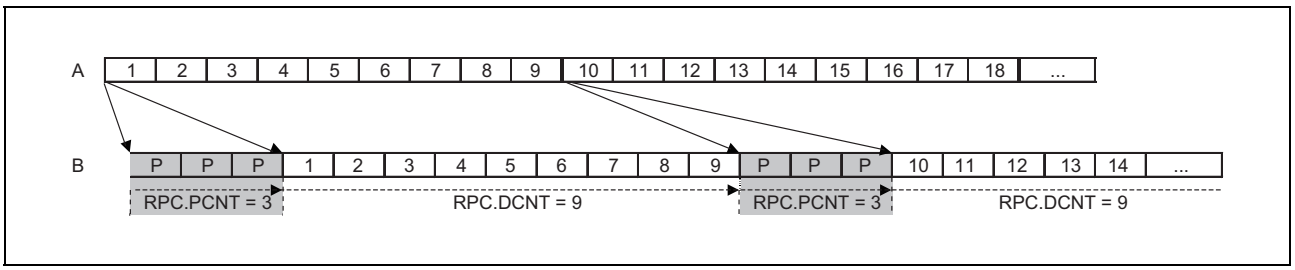

Figure 57.27 Example of a Padding Setting

Both padding and received frame data are counted in the descriptor size (DESCR.DS).

(3) Support for Reception Time Stamps

Capturing reception time stamps is essential for IEEE 802.1AS time synchronization. Other types of received frames may also require that a reception time stamp be appended; this depends on the application. The AVB-DMAC supplies reception time stamps based on the gPTP timer by storing time stamps that have been captured when the start frame delimiter (SFD) for a received frame in the last frame data descriptor (FEND or FSINGLE). For the gPTP timer, see Section 57.3.7.1, gPTP Timer.

When time stamps are to be stored, use extended descriptors for the entire reception queue. Furthermore, time stamps are always stored for reception queue 1 (network control). Time stamps for reception queue 0 (best effort) and reception queue r ($r \geq 2$; for stream data) can be selected by the time stamp enable bits in the receive configuration register (RCR.ETS0 or RCR.ETS2).

57.3.4.4 Unread Frame Counters

Each reception queue has an unread frame counter (UFCVi). Use the unread frame counter configuration bits in the receive queue configuration register (RQCi.UFCCr) to select from among the four stop levels for each unread frame counter. The 0 setting disables the stop functions. For how to set this up, see Figure 57.28.

Operations of the AVB-DMAC (hardware) and CPU (software) drive an unread frame counter (UFC) in the following ways.

- The hardware indicates that it has added a new frame to the descriptor chain for the queue (this increments the counter).
- Software indicates how many frames from the descriptor chain it has processed by writing to the corresponding bits of the unread frame counter decrement register for the queue (this decrements the register by the number written).

The unread frame counter is based on the number of frames stored in the on-chip RAM and is only incremented by one even when a received frame is divided into different descriptors. Data failure in a descriptor chain requires care because this may fail in synchronization of the unread frame counter as described in Section 57.3.4.4 (1) Loss of Unread Frame (UFC) Synchronization.

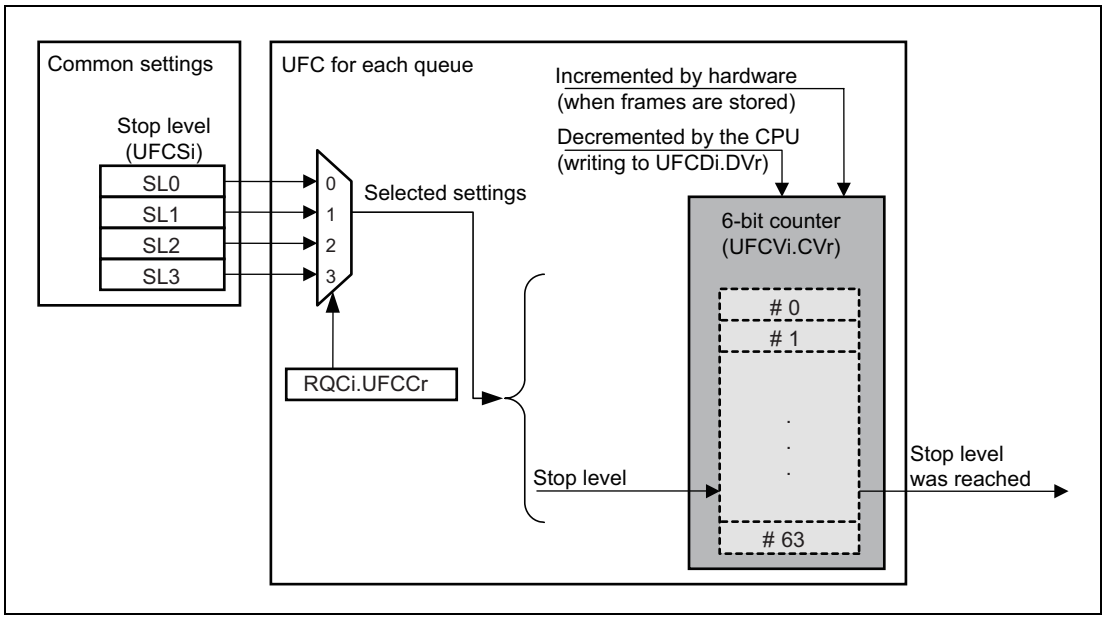

Figure 57.28 Overview of an Unread Frame Counter

Unless synchronization of hardware and software is lost, the current unread frame counter value (UFCVi.CVr) indicates the number of unread frames in the queue.

When the stop level has been reached, received frames are not stored in the descriptor chain. Setting 0 as the stop level disables the stop function. Otherwise, further received frames for the queue are discarded once its unread frame counter reaches the stop level. Activation of the unread frame counter stop function is indicating by setting of the receive queue full interrupt flag in the receive interrupt status register 2 (RIS2.QFFr).

Set the unread frame counter stop level configuration register (UFCS) for each reception queue that will use the unread frame counter function while the current operating mode is configuration mode.

(1) Loss of Unread Frame (UFC) Synchronization

The unread frame counters do not recognize failure to store a frame in the on-chip RAM. In other words, the AVB-DMAC increments the counter for a queue each time it captures a frame for that queue from the reception FIFO whether or not it succeeds in storing the frame normally in the descriptor chain.

In general, synchronization of hardware and software may be lost under the following conditions.

- An unread frame counter reaching its maximum value
  When the value of a counter in an unread frame counter register i (UFCVi) (i = 0 to 4) reaches 63, synchronization for the corresponding queue can be lost.
  It can only be judged that a loss of synchronization has not occurred when the stop level is set to 63.
- A queue not having enough space for a descriptor or the associated data
  In this case, the corresponding receive queue full interrupt flag (RIS2.QFFr) in receive interrupt status register 2 (RIS2) is set.
  If an unread frame counter reaches its stop level, the receive queue full interrupt flag (RIS2.QFFr) in the receive interrupt status register 2 (RIS2) is set.
- A problem occurring during access to memory

The result of a failure in synchronization is the unread frame counter indicating that the corresponding descriptor chain contains more available frames than it actually does. To retrieve the correct starting point for operations, use the descriptor base address load request (DLR.LBAq) for the given queue.

57.3.5 Transmission Control

Areas in the on-chip RAM for storing transmission descriptors must also be secured (for descriptors, see Section 57.3.3, Descriptors).

The AVB-DMAC fetches data from the on-chip RAM in accord with the procedure the descriptor describes. The descriptor also retains tag information once the frame has been fetched for transmission. The tag information is used to maintain the relationships between state information and time stamps for the software and the AVB-DMAC. The status and time stamp information for transmitted frames remains accessible after their transmission is completed.

57.3.5.1 Transmission Modes

The AVB-DMAC has two modes of transmission.

- AVB transmission mode
  This mode is selected by the priority level setting for the transmission queue in the transmit configuration register (setting of the TGC.TQP[1:0] bits) being B'01 or B'11.
- Non-AVB transmission mode
  This mode is selected by the priority level setting for the transmission queue in the transmit configuration register (setting of the TGC.TQP[1:0] bits) being B'00.

(1) AVB Transmission Mode

AVB transmission supports the control of traffic through the output port to implement various traffic classes.

(a) Support for Traffic Classes and Associated Priority

When transmission is in AVB transmission mode, streams of traffic are transmitted in accord with the part of the AVB specification called Forwarding and Queuing for Time Sensitive Streams (FQTSS; for details on this, see the IEEE 802.1Q standard).

In the AVB specification, at least one queue for a reserving stream under the Stream Reservation Protocol (SR stream) and at least one queue for a non-SR stream are present, and the queues for reserved traffic according to the SRP have highest priority.

The AVB-DMAC supports four traffic classes: SR class A, SR class B, network control (NC) traffic (gPTP frames), and best effort (BE) traffic. Allocating a specific queue to network control (NC) frames ensures the control of synchronization.

The AVB-DMAC realizes compliance with the AVB standards by handling queues with the following architecture (in terms of traffic classes).

- Four transmission queues (Q3, Q2, Q1, and Q0) are available.
- Q3 and Q2 are for SR streams (one each for class A and class B).
- Q1 is for low-bandwidth network control (NC) traffic (gPTP frames)
- Q0 is for other types of traffic (MSRPDU*1, MVRPDU*2, best effort (BE), etc.)

CAUTIONS

1. MSRPDU: Multiple Stream Registration Protocol Data Unit
2. MVRPDU: Multiple VLAN Registration Protocol Data Unit

Fetching from queues proceeds in order of priority of the above traffic types. Three systems of priority are available through the setting of the transmit queue priority bits in the transmit configuration register (TGC.TQP[1:0]). In the default priority scheme, which is called AVB mode 1 (selected by TGC.TQP[1:0] = B'01), operation of the AVB-DMAC is fully in accord with the AVB specification. AVB mode 2 (transmit queue priority bits (TGC.TQP[1:0] = B'11) is an alternative priority scheme and varies from the AVB specification. Using this scheme thus requires more care.

Table 57.77 Default and Alternative Priority Orders in AVB Transmission Mode

Priority Schemes (AVB Mode)	Priority Order of Queues
AVB mode 1	Q3 (SR class A) > Q2 (SR class B) > Q1 (NC) > Q0 (BE)
AVB mode 2	Q1 (NC) > Q3 (SR class A) > Q2 (SR class B) > Q0 (BE)

(b) Transmission Selecting Algorithm and CBS

The algorithm the AVB-DMAC applies to select frames for transmission is in accord with the IEEE 802.1Q standard. For AVB mode, the CBS (credit-based shaping) algorithm is applied to the class A and class B SR queues (Q3 and Q2). Use of the CBS enables correct handling of the priorities of transmission from the SR queues. For the CBS algorithm, see Section 57.3.6, CBS (Credit-Based Shaping).

When the following conditions are both satisfied, transmission from an SR queue (Q3 or Q2) proceeds at the specified time.

- The queue contains at least one frame ready for transmission.
- The queue has credit.
- Unless an SR queue satisfies the above conditions, a higher priority queue is not present (not ready for transmission).

A non-SR queue (Q1 or Q0) is selected if the conditions below both hold.

- The queue contains at least one frame ready for transmission.
- As well as the above condition, a higher priority queue is not present (not ready for transmission).

Figure 57.29 and Figure 57.30 are flowcharts of selection for transmission in AVB mode 1 and AVB mode 2.

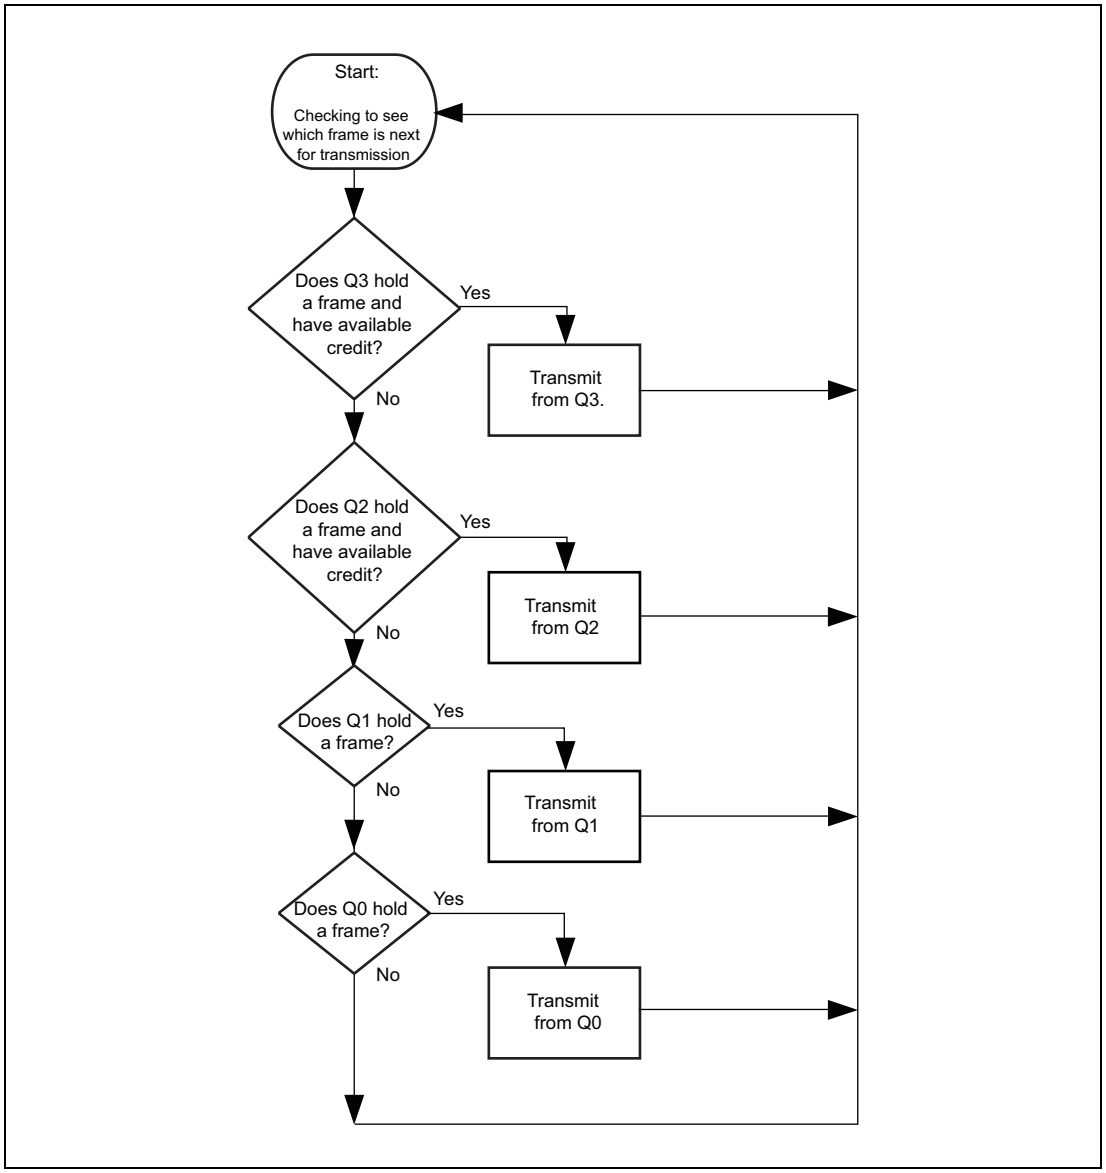

Figure 57.29 Flow of Selection for Transmission in AVB Mode 1

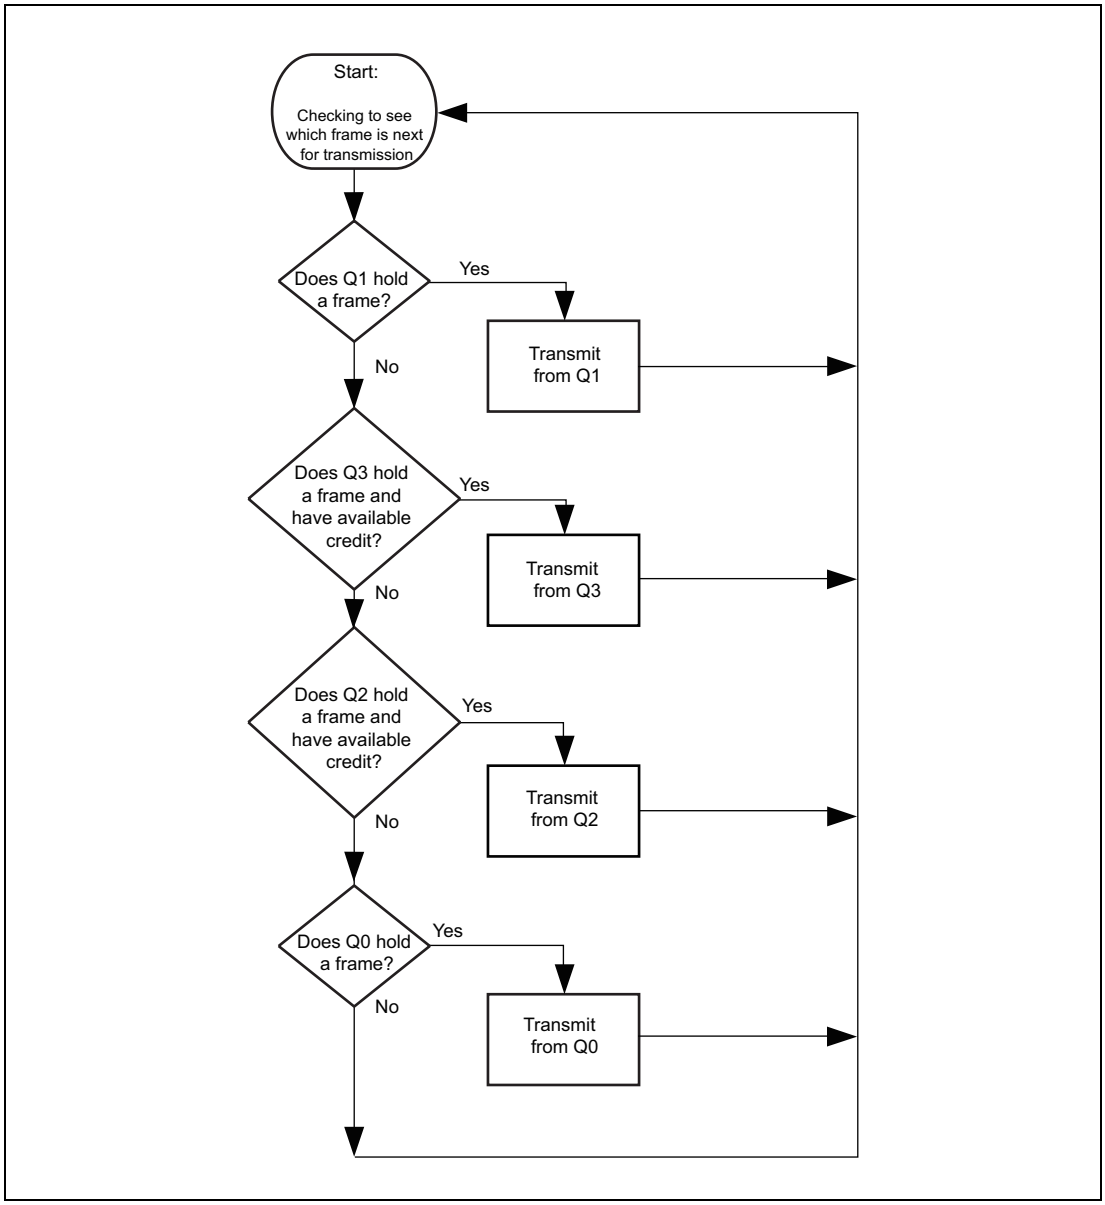

Figure 57.30 Flow of Selection for Transmission in AVB Mode 2

(2) Non-AVB Transmission Mode

In non-AVB transmission mode, an absolute priority scheme is used. The SR class is not supported and the CBS algorithm is not used.

In non-AVB transmission mode (when the transmit queue priority bits in the transmit configuration register (TGC.TQP[1:0]) are B'00), data is fetched for transmission in a strict order of priority (Q3 > Q2 > Q1 > Q0).

Figure 57.31 shows the flow of selection in non-AVB transmission mode.

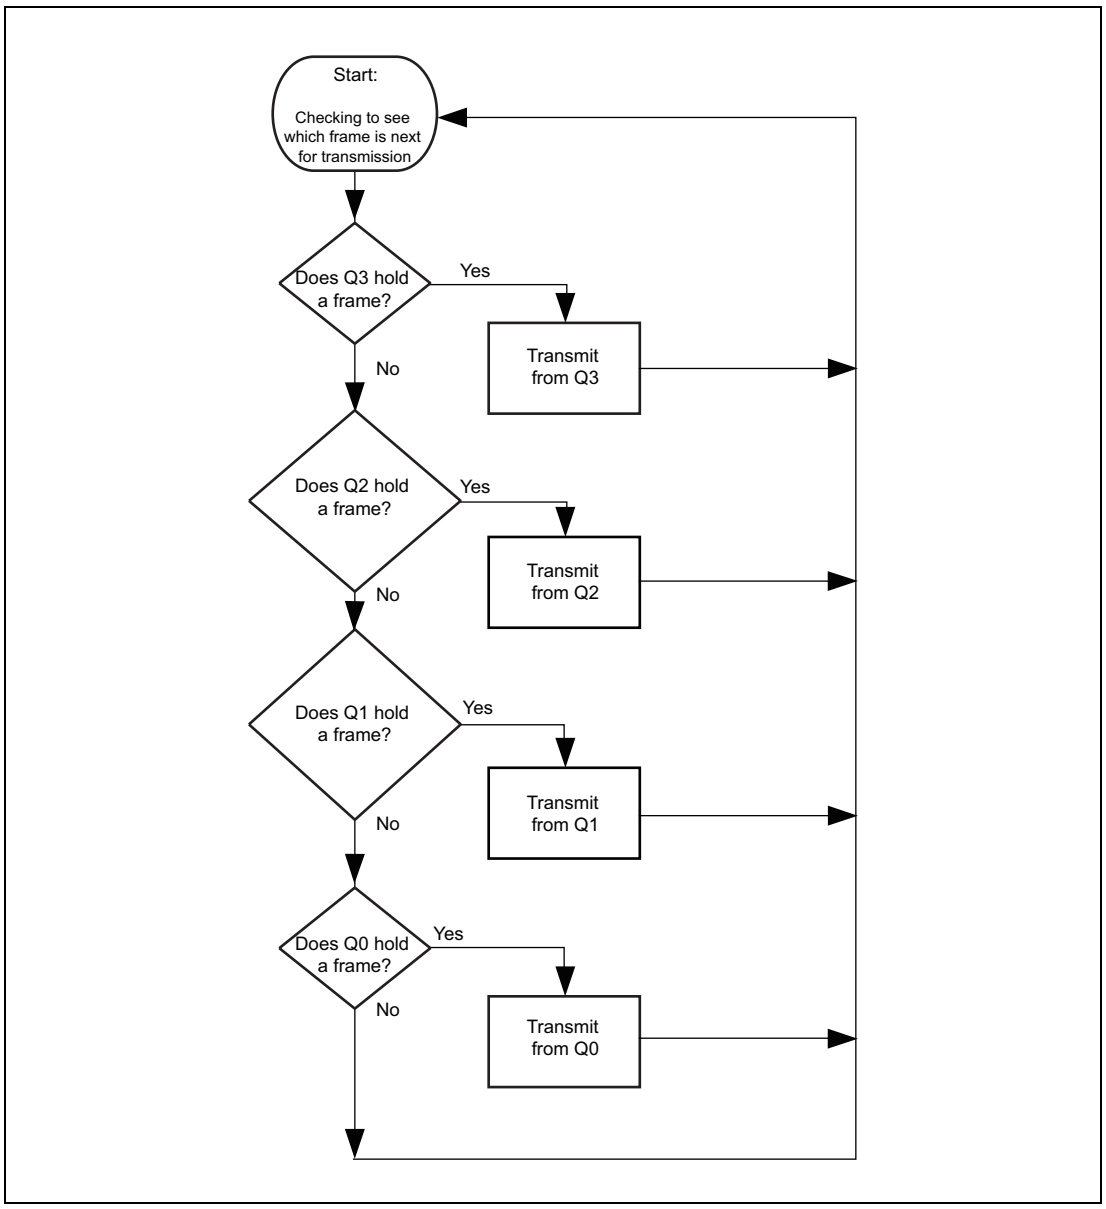

Figure 57.31 Flow of Selection for Transmission in Non-AVB Mode

(3) Setting the Size of the Transmission FIFO

The transmission FIFO is made up of 124 clusters. Each cluster can hold up to 128 bytes.

The size of the part of the transmission FIFO for use by each of the four transmission queues can be set by the corresponding transmit queue configuration q bits in the transmit control register (TGC.TBDq). The maximum number of clusters required can be determined from the maximum length of frames for transmission from the queue q.

Even if queue t already contains data of the frame size specified by TGC.TBDt, the AVB-DMAC fetches the next frame to queue t after the E-MAC starts transfer data from queue t. Therefore, a frame data area of the total of maximum frame sizes set for each transmission queue plus an area for 1 frame must be secured for a cluster.

General Usage Examples:

Q0: Frames containing up to 1500 bytes → 1500/128 = 11.7 → 12 clusters

Q1: Frames containing up to 1024 bytes → 1024/128 = 8.0 → 8 clusters

Q3: Frames containing up to 1996 bytes → 1996/128 = 15.6 → 16 clusters

Q4: Frames containing up to 1996 bytes → 1996/128 = 15.6 → 16 clusters

When the depth of all transmission queues is 2, only the following number of clusters is required.

2 * (12 + 8 + 16 + 16) + 16 = 2 * 52 + 16 = 120

Adjust the frame length of each queue so that the number of clusters to be used is no greater than 124.

57.3.5.2 Setting Up Transmission Descriptors

(1) Transmission Descriptor Type

The type of a descriptor is defined by the descriptor type (DESCR.DT) field.

Table 57.78 shows the descriptor types used in transmission. In the table, entries in the write-back column indicate how the AVB-DMAC changes the DESCR.DT field upon completion of descriptor processing.

Table 57.78 Descriptor Types in Transmission

Descriptor Type (DESCR.DT)	Operation	Write-back
Frame Start (FSTART)	The AVB-DMAC fetches the first of the data for the divided frame and proceeds to the next descriptor.	FEMPTY
Frame Middle (FMID)	The AVB-DMAC fetches the second or subsequent data for the divided frame and proceeds to the next descriptor.	FEMPTY
Frame End (FEND)	The AVB-DMAC fetches the last of the data for the divided frame. When the frame of data that has been fetched to the transmission FIFO is ready for transmission by the E-MAC, the AVB-DMAC proceeds to the next descriptor.	FEMPTY
Frame Single (FSINGLE)	The AVB-DMAC fetches the frame of data. When the frame of data that has been fetched to the transmission FIFO is ready for transmission by the E-MAC, the AVB-DMAC proceeds to the next descriptor.	FEMPTY
Link (LINK)	Processing proceeds to the descriptor specified by DESCR.DPTR.	LEMPTY
Fixed Link (LINKFIX)	Same as LINK	Not changed
End Of Set (EOS)	Clears the transmit start request bit (TCCR.TSRQt), which stops transmission queue. When the TCCR.TSRQt is again set to 1 (a new transmission start request is issued), processing proceeds to the next descriptor.	EEMPTY
Frame Empty (FEMPTY)	Clears the transmit start request bit (TCCR.TSRQt), which stops transmission queue. When the TCCR.TSRQt is again set to 1 (a new transmission start request is issued), processes this descriptor again.	Not changed
Link Empty (LEMPTY)	Same as FEMPTY	Not changed
EOS Empty (EEMPTY)	Same as FEMPTY	Not changed

(2) Configuration of Transmission Frame Data Descriptors

Figure 57.32 shows the configuration of descriptors for use with transmission queues. The transmission-specific fields (DESCR.TSR and DESCR.TAG) are described in Table 57.79.

For the other fields and the descriptor types, see Section 57.3.3.6, Descriptor Type.

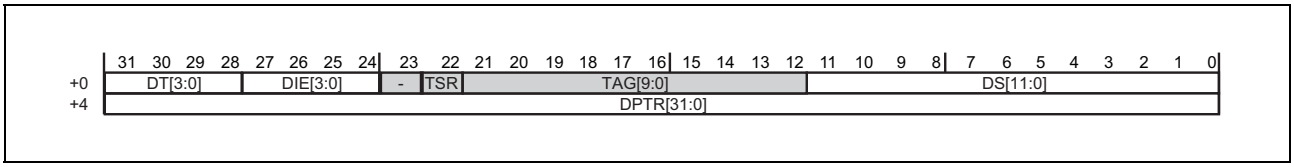

Figure 57.32 Configuration of Descriptor for a Transmitted Frame

Table 57.79 Configuration of a Transmission Descriptor

Bit Name	Function
TSR	Time Stamp Store Request This bit specifies whether the transmission time stamp together with tag information is to be stored within the EthernetAVB module. 0: The time stamp status FIFO within the EthernetAVB module does not retain a transmission time stamp. 1: The time stamp status FIFO within the EthernetAVB module retains a transmission time stamp. Only control this bit while the current DESCR.DT is FEND or FSINGLE.
TAG	Frame Tag This TAG field is used to associate each frame data status with a time stamp. Frame TAG is not required but is recommended. Only control this bit while the current DESCR.DT is FEND or FSINGLE.

For the time stamp FIFO function, see Section 57.3.5.4, Time Stamping in Transmission.

57.3.5.3 Transmission

(1) Transmitting Frames

Setting the transmit start request bit in the transmit configuration control register (TCCR.TSRQt) starts the transfer of frames from the corresponding transmission queue.

The descriptor in the current descriptor address for the queue (CDARq.CDA) is read first.

If this descriptor is a descriptor for frame transmission (FSINGLE, etc.), the AVB-DMAC fetches the frame data from the data area indicated by the descriptor, writes FEMPTY back to the descriptor type (DESCR.DT) bits to indicate completion of this processing, then proceeds to processing of the next descriptor.

If the descriptor is not for transmission, processing is as dictated by the given descriptor (for these descriptors, see the descriptions in Section 57.3.3, Descriptors).

If a base address load request is issued for a descriptor chain while it is being processed (by setting 1 in the LBAq bit for transmission queue q that is currently being processed in the descriptor base address load request register, DLR), processing proceeds to the new descriptor chain (descriptor base table address bits (DBAT.TA) + 8*q). Loading the base address does not interrupt frame fetching, but note that frames that have not been fetched from the old chain remain where they are.

Figure 57.33 shows descriptor processing during transmission. “Fxxx” in the figure indicates the frame data descriptors (FSTART, FMID, FEND, FSINGLE).

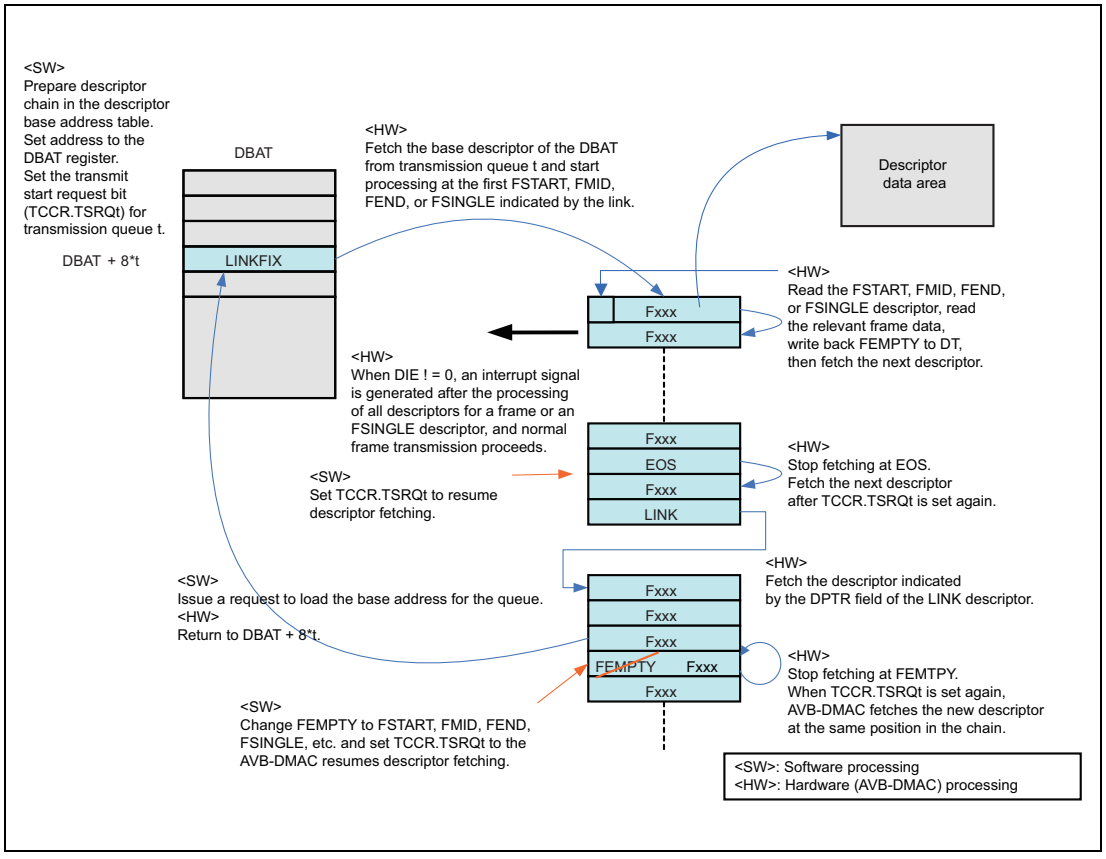

Figure 57.33 Descriptor Processing During Transmission

(2) Examples of Descriptor Usage

(a) Immediate Frame Transmission

Immediate frame transmission is a method in which fetching by the AVB-DMAC starts whenever software adds data to a queue. FEMPTY descriptors are used as stop points to keep the hardware and software in synchronization.

As preparation in transmission, software creates descriptor chains that have FEMTPY descriptors.

Figure 57.34 shows the flow for subsequent process.

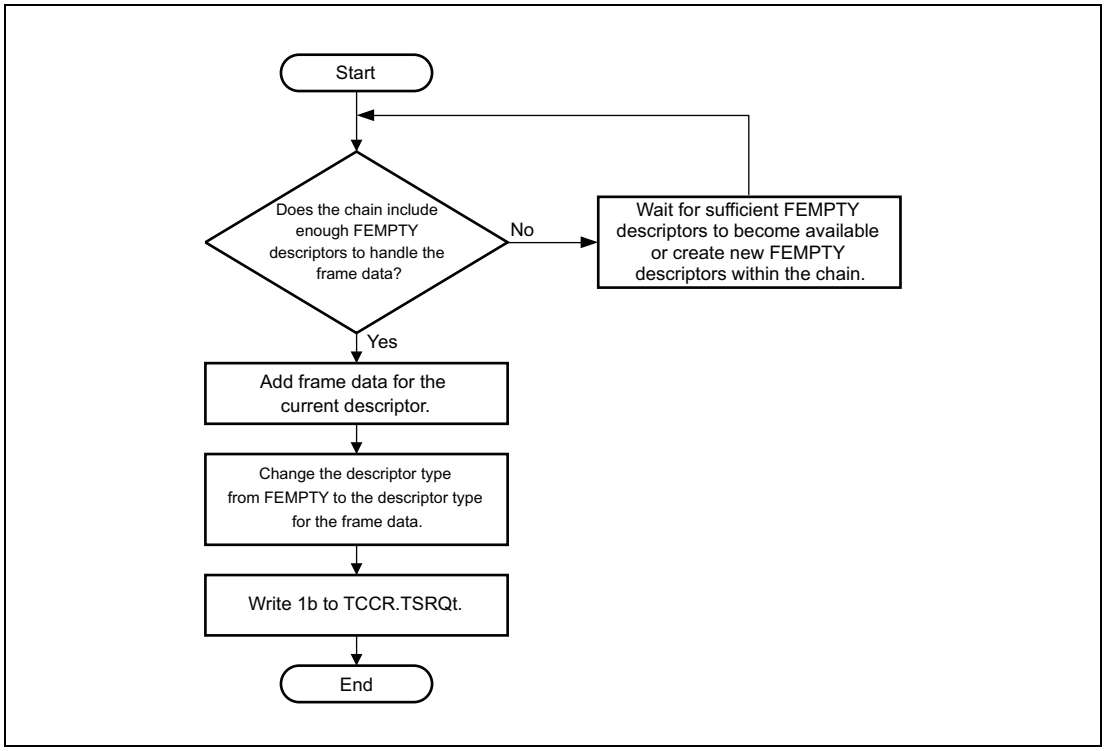

Figure 57.34 Software Flow for Immediate Frame Transmission

When processing a divided frame, change the types of descriptors in the backward direction, i.e., from FEND to FSTART. This guarantees all the descriptors including frame data to be ready when the AVB-DMAC starts fetching divided frames.

Figure 57.35 shows software and AVB-DMAC operations for divided frame transmission. In the figure, software and hardware independently perform processing. This allows software to prepare the descriptor for frame n + 1 even when the AVB-DMAC is currently fetching frame n.

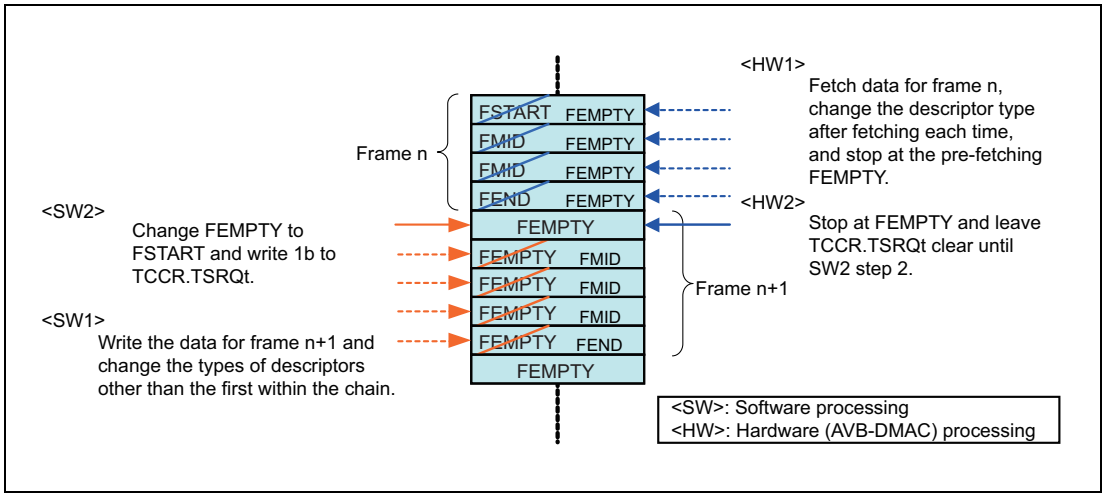

Figure 57.35 Software and AVB-DMAC Operation Examples for Immediate Frame Transmission (divided frames)

(b) Frame Set Transmission with Switching of the Active Descriptor Chain

This method is used when data are transmitted with a delay for software control to secure bandwidth or for other reasons, rather than immediately transmitted. EOS descriptors are used for the stop points.

As preparation in transmission, software creates descriptor chains that have FEMTPY descriptors.

Figure 57.36 shows the flow for subsequent process.

In the first task, software creates and adds a transmission frame to the descriptor chain, which is followed by EOS descriptor insertion.
In the second task, software processes the transmission trigger for the transmission descriptor prepared. This guarantees transmission of a frame set per trigger.
No particular operation is necessary for synchronization between two tasks. If not enough frame sets are prepared when the transmit start request bit in the transmit configuration control register (TCCR.TSRQt) is set, only the prepared frame sets are transmitted. If nothing is prepared in the queue, only clearance of a transmission request is performed.

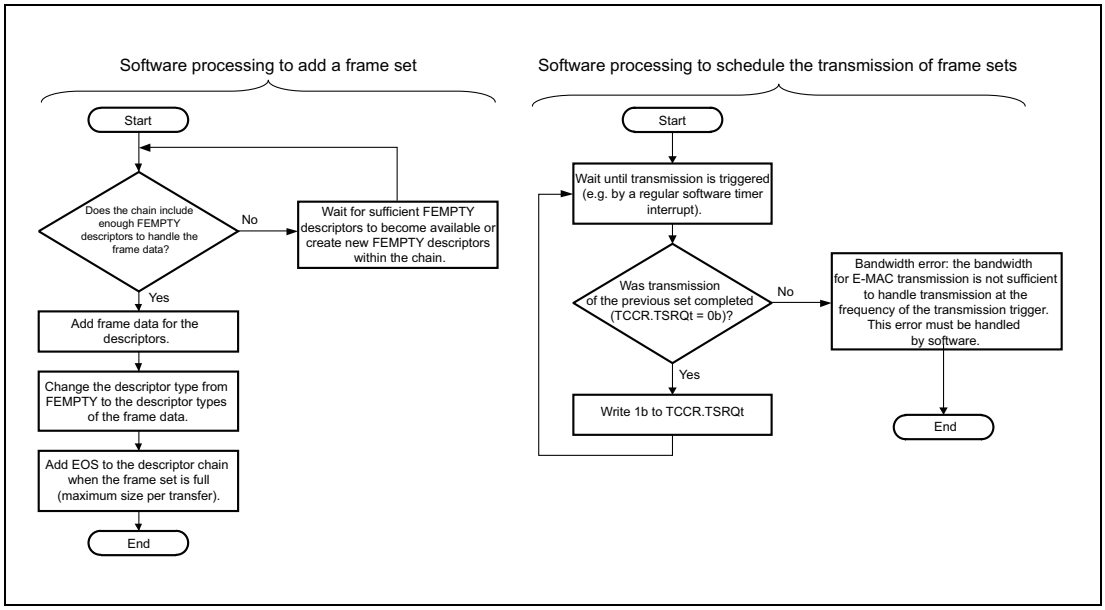

Figure 57.36 Software Flow for Frame Set Transmission with Switching of the Active Descriptor Chain

In a given time, the AVB-DMAC does not use the descriptor chain area currently being updated by software; therefore, descriptor types for a divided frame can be changed in any order.

Figure 57.37 shows software and AVB-DMAC operation examples in this method.

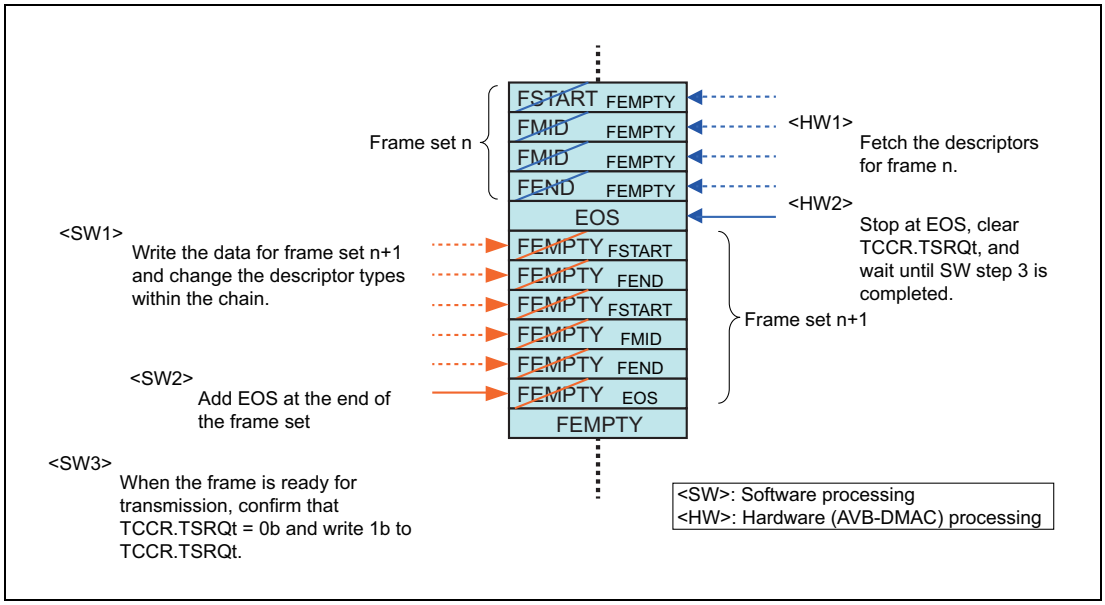

Figure 57.37 SW and AVB-DMAC Operation Examples for Frame Set Transmission with Switching of the Active Descriptor Chain

(c) Frame Set Transmission Using a Shadow Descriptor Chain

This method is used when data are transmitted with a delay for software control to secure bandwidth or for other reasons, rather than immediately transmitted. Two or more descriptor chains are used. The chains are classified as active or shadow chains. Software prepares frame data in shadow chain and descriptor while hardware processes active chain. EOS or FEMPTY descriptors are used for the stop points.

As preparation in transmission, software creates a shadow descriptor chain that has a FEMPTY descriptor, and creates a frame data descriptor in an active chain. Software then sets the transmit start request bit (TCCR.TSRQt) to start transmission of the active chain. During active chain transmission, software can prepare frame data for the shadow chain.

Figure 57.38 shows the flow for software implementing this method.

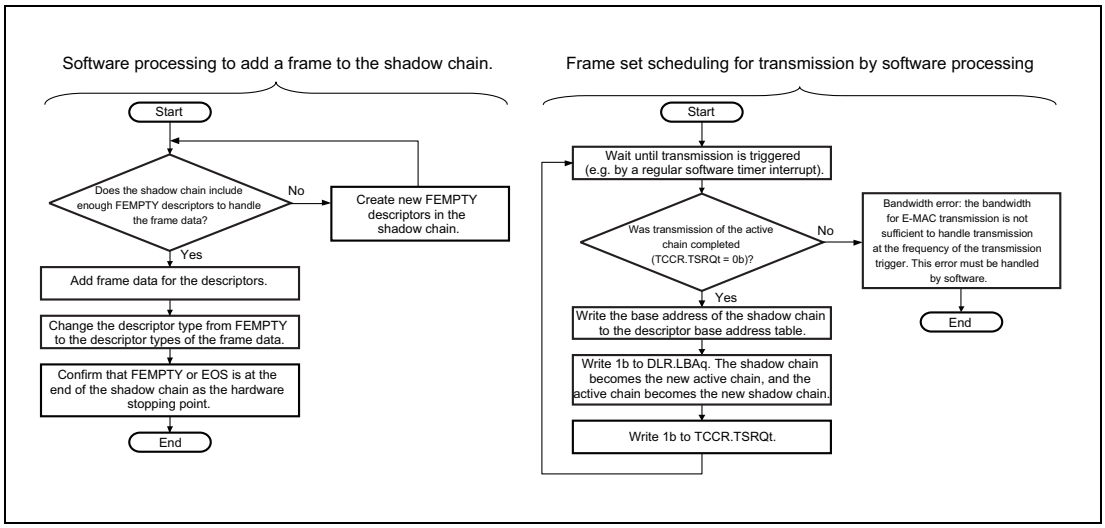

Figure 57.38 Software Flow for Frame Set Transmission Using the Shadow Descriptor Chain

Figure 57.39 shows software and AVB-DMAC operation examples in this method.

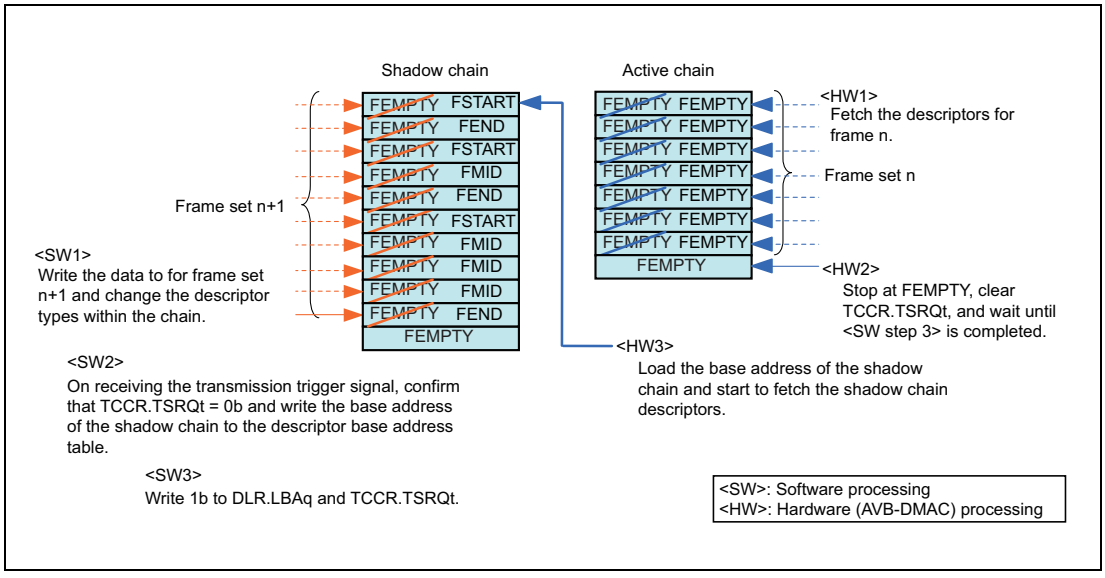

Figure 57.39 SW and AVB-DMAC Operation Examples for Frame Set Transmission Using the Shadow Descriptor Chain

57.3.5.4 Time Stamping in Transmission

Transmission time stamps are important in performing timing and synchronization processing of the IEEE 802.1AS standard. Reference to the transmission time stamps can also be useful to other applications and so on. The AVB-DMAC supplies the time-stamp values based on the gPTP timer by storing the time stamps captured at the same time as sending of the Start of Frame Delimiter (SFD) for transmitted frames.

When the time stamp storage request field (DESCR.TSR) is set to 1, selecting storage of a time stamp, the tag number defined in the tag field (DESCR.TAG) of the last descriptor in a set (FEND) or of an FSINGLE descriptor for the frame being transmitted is stored with the time stamp. This eases identification and association. The time-stamp FIFO is accessible at any time.

The method of using this function is described below:

1. Create descriptor and frame data in the on-chip RAM for the frame requiring time stamping. Write the tag number of the frame to the frame tag field (DESCR.TAG) and set the time stamp storage request field (DESCR.TSR) to 1.
2. The AVB-DMAC fetches and analyzes the descriptor. When the time stamp storage request field (DESCR.TSR) is 1, the AVB-DMAC recognizes that transmitting this frame also requires storage of the time stamp.
3. The AVB-DMAC fetches the frame data and stores the frame data in the transmission FIFO for scheduling.
4. Under the control of priority settings according to credit-based shaping (CBS) or another scheme, the transmission scheduler decides it is time to transmit frame.
5. The EthernetAVB starts transmission of frame.
6. The gPTP time stamp is captured at the start of sending the frame delimiter (SFD) for transmission and stored with the tag frame field (DESCR, TAG) in the time-stamp FIFO upon completion of the frame transmission. When the time stamp update interrupt is enabled, update of time stamp is notified by an interrupt.
7. The time stamp can now be acquired from the time-stamp FIFO.

Use the time-stamp FIFO for the timing and synchronization of frames with IEEE 802.1AS compliance.

Time stamping can also be used with other frames, but take care not to allow the time-stamp FIFO to overflow. When the time-stamp FIFO is full, further time stamps in subsequent transmissions are not stored.

Figure 57.40 shows software flow in time-stamp FIFO operation. The time stamp FIFO update interrupt status bit (TIS.TFUF) and the time stamp FIFO warning interrupt status bit (TIS.TFWF) are used for the start flag of the START block in the figure.

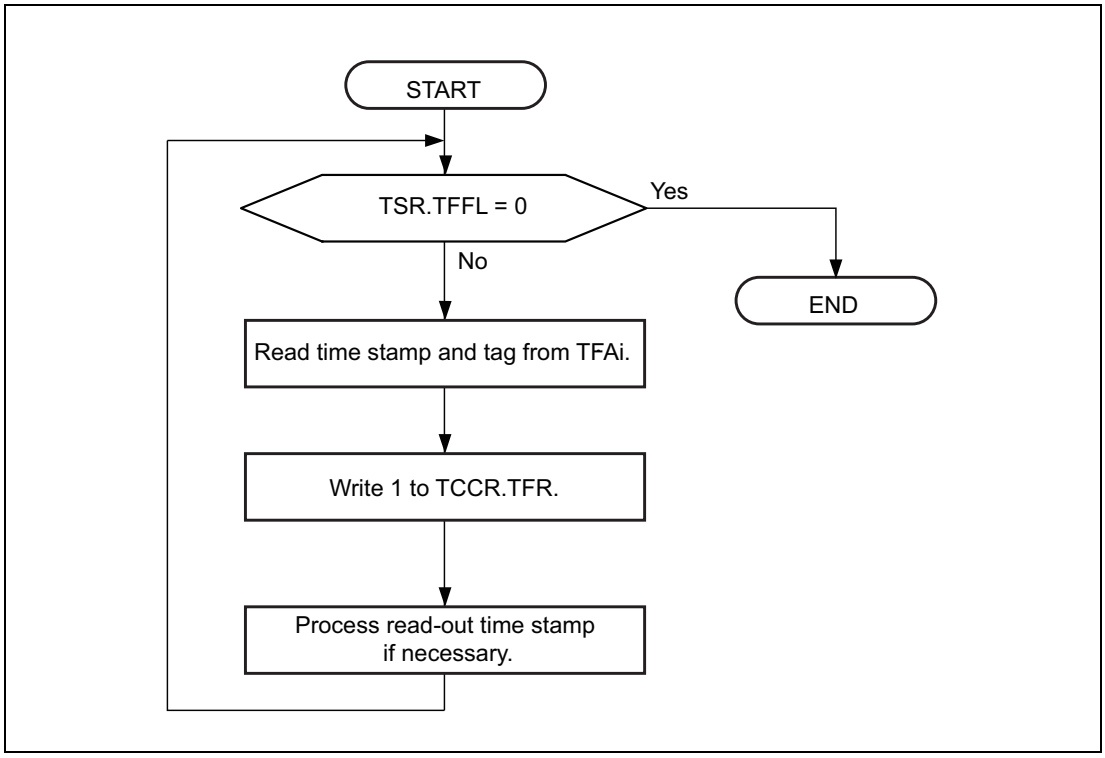

Figure 57.40 Flow of Transmission Time Stamping

When all the entries in the time-stamp FIFO are released, the time stamp FIFO update interrupt status bit (TIS.TFUF) and time stamp FIFO warning interrupt status bit (TIS.TFWF) are cleared by the AVB-DMAC. Therefore, clearing the interrupt flags is not necessary.

When multiple frames are transmitted with time stamps but from different queues, the order of storage in the time-stamp FIFO buffer depends on the order of frames in transmission.

57.3.6 CBS (Credit-Based Shaping)

In AVB transmission mode (i.e. when the transmit queue priority field in the transmit configuration register (TGC.TQP) is B'01 or B'11), transmission queues Q3 and Q2 are respectively assigned to class A and class B stream traffic and the CBS (Credit Based Shaping) algorithm is used to select the transmission queues in order to satisfy the Forwarding and Queuing for Time Sensitive Streams (FQTSS) specification (see section 8.6.8 or section 34 in IEEE 802.1Q).

The CBS algorithm is based on the concept of transmission credit for each queue. Credit can be thought of as the degree to which a queue has the "right" to transmit at a given time. In addition, in AVB transmission mode as specified in IEEE 802.1Q, queues that are subject to the CBS algorithm are able to transmit when the following conditions are met.

- At least one frame is stored in the queue.
- The credit for the queue is 0 or a positive value.

The credit for a transmission queue is incremented while one or more frames from the queue are present in the transmission FIFO but transmission of these frames is not proceeding. This state is indicated by the transmission process status bit for queue t in the AVB-DMAC status register (CSR.TPOt) being clear (0). The credit is decremented while transmission of a frame from the queue is in progress. This mechanism is used to control transmission so that the amount of data for transmission for each queue does not exceed the specified maximum bandwidths.

IEEE 802.1Q defines the following parameters for queues under the control of the CBS algorithm.

portTransmitRate: Maximum transmission data rate of an external port. The E-MAC determines this parameter.

bandwidthFraction: Maximum fraction of portTransmitRate that can be used for a queue.

idleSlope: Rate of change of credit for a queue when transmission of frames from the queue is not proceeding so the credit value (in bits per second) is increasing. idleSlope is also equal to the maximum fraction of the total bandwidth (portTransmitRate) that is available to the given queue under a specified condition (frames from the queue can be placed in a continuous stream. See Annex L of IEEE 802.Q.
idleSlope = bandwidthFraction * portTransmitRate

sendSlope: Rate of change of credit (in bits per second) for a queue while transmission of a frame from the queue is in progress so the credit value is decreasing.
The value of sendSlope is defined as follows:
sendSlope = idleSlope - portTransmitRate

Furthermore, the values below are used to define individual traffic classes (or queues for the classes) under control of the algorithm. See Annex L of IEEE 802.Q.

maxFrameSize: Maximum size of frames (in bits) of the corresponding traffic class that can be transmitted from a port

maxInterferenceSize: Maximum burst size (in bits) by which delays for the corresponding traffic class can be allowed

hiCredit: Maximum credit value (positive number). Can be calculated by using the following equation: hiCredit = maxInterferenceSize * (idleSlope / portTransmitRate)

loCredit: Minimum credit value (negative number). Can be calculated by using the following equation: loCredit = maxFrameSize * (sendSlope / portTransmitRate)

Figure 57.41 shows how the CBS algorithm works and the meaning of the above parameters. When there is no frame to be transmitted in the queue in the transmit-enabled state, the credit value is 0 (after Frame 0 transmission in the figure).

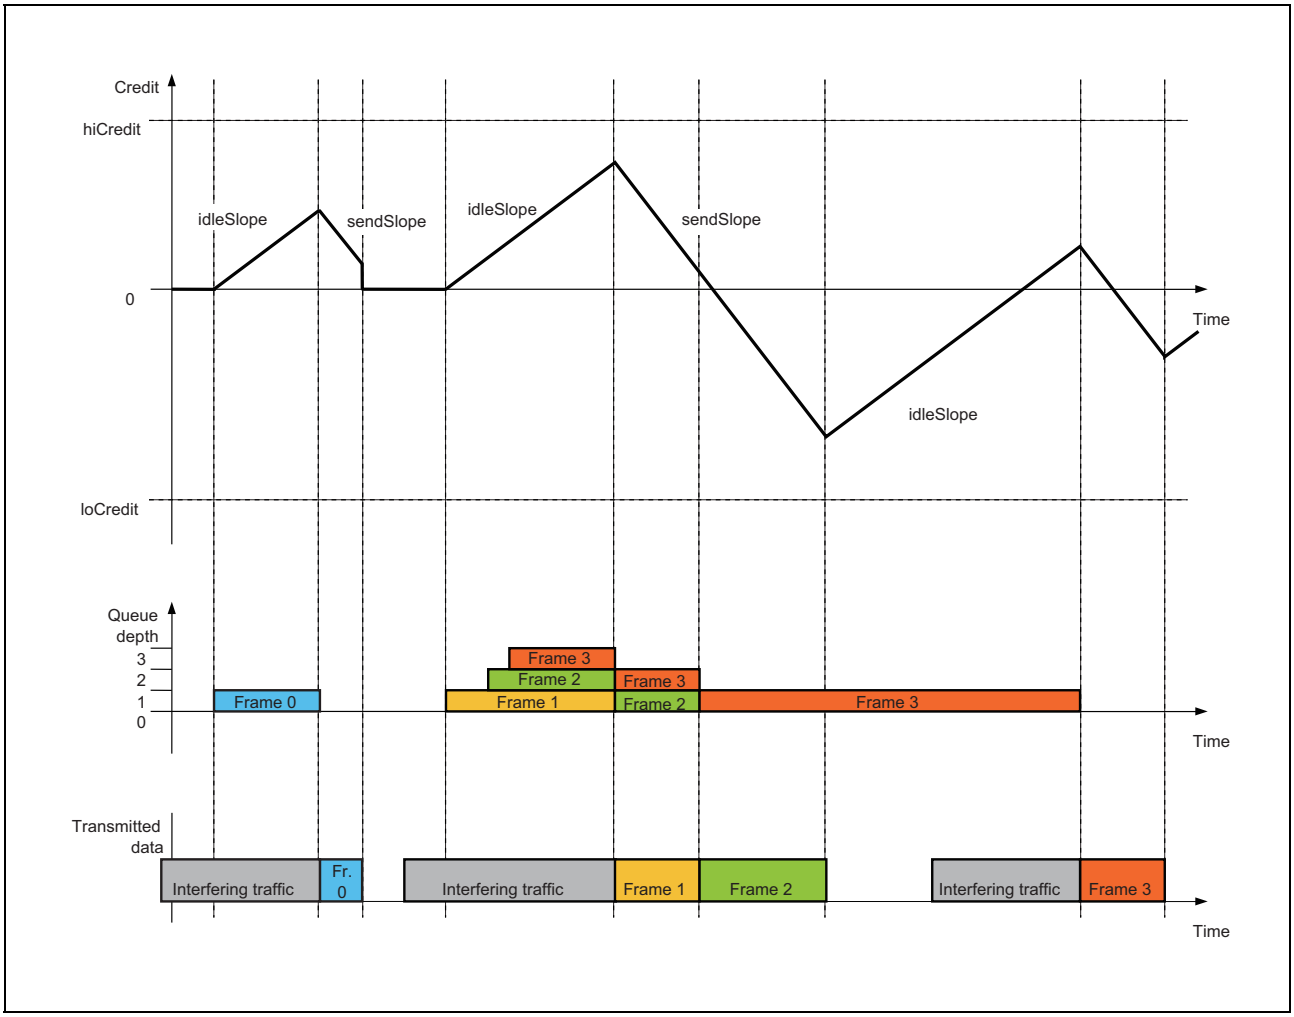

Figure 57.41 CBS (Credit-Based Shaping) Operation

Figure 57.42 shows the operation of CBS (Credit Based Shaping) in the AVB-DMAC.

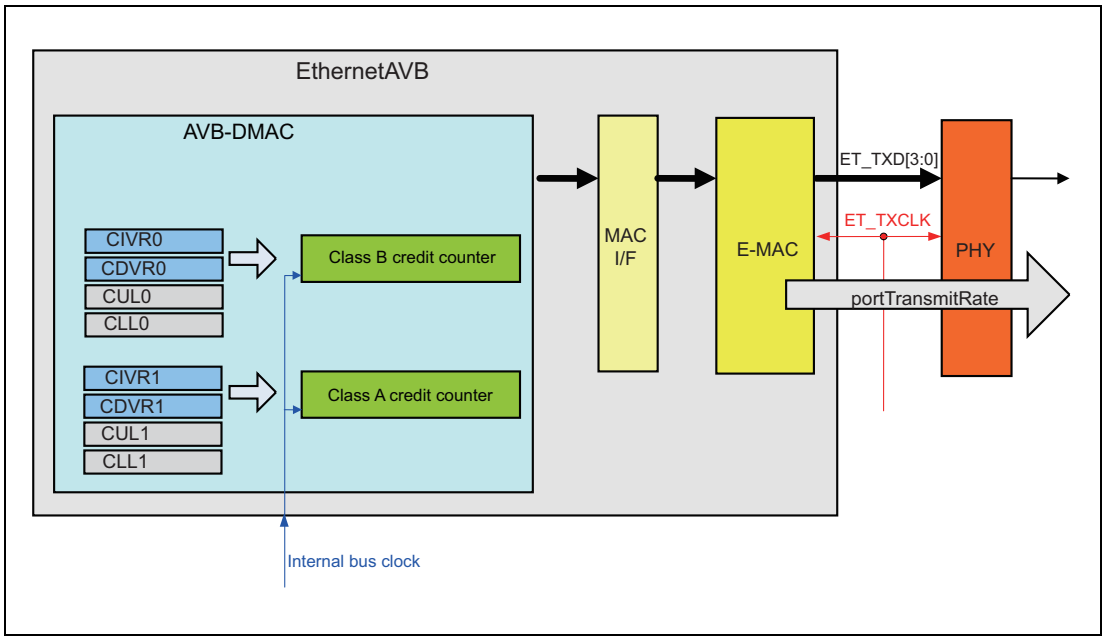

Figure 57.42 CBS (Credit-Based Shaping) Operation in the AVB-DMAC

The CBS operation in the AVB-DMAC is based on “credit counters” for the respective traffic classes (SR class A and class B). The following parameters apply for these classes.

CBS increment value (CIV): Signed positive number
The credit is incremented by this amount every internal bus clock cycle while a frame from the queue is pending but transmission has not started (idleSlope).

CBS decrement value (CDV): Signed negative number
The credit is decremented by this amount every internal bus clock cycle while transmission of a frame from the queue is proceeding (sendSlope).

The CBS increment value (CIV) and CBS decrement value (CDV) are defined as follows.

CIV = idleSlope * Mfactor

CDV = sendSlope * Mfactor

Mfactor is a multiplier factor to ensure accuracy for CIV and CDV. CIV and CDV are finally calculated by using the following equations.

CIV = (portTransmitRate/Bϕ) * bwFraction * Mfactor

CDV = (portTransmitRate/Bϕ) * (bwFraction - 1) * Mfactor

The credit counters are driven by the internal bus clock (Bϕ), so calculating the slope parameters for CBS requires (1/Bϕ).

Mfactor must be calculated for the CBS parameters. All queues for the same class must have the same CBS parameters. Mfactor for a certain class can be changed during operation, unless transmission is pending for that class (i.e. the transmit process status bit in the AVB-DMAC status register (CSR.TPOt) = 0). At that time, the credit counter values for class are 0. Note that the credit value will

not match a new incrementation or decrementation parameter if Mfactor is changed while the credit counter value is non-zero. Mfactor configuration register is not present in the AVB-DMAC.

Set the CIV and CDV parameters in the CBS increment value registers (CIVRc) and the CBS decrement value registers (CDVRc). They should be dynamically updated when streams are registered and erased in accord with IEEE 802.1Qat.

Although the credit counters operate with the internal bus clock (Bφ), a transmission clock is used in frame transmission. Therefore, time lags occur when frame transmission starts and ends.

For this reason, an extra credit is stored after a frame is transmitted. The maximum value of the credit to be stored is the credit value incremented for one cycle of the Bφ clock and equals the Tx port transmission rate in Mbps * Bφ.

Bandwidth needs to be secured by software taking this into account.

The AVB-DMAC also has CBS upper limit registers (CULc) (the upper limit registers for classes A and B) and CBS lower limit registers (CLLc) (the lower limit registers for classes A and B). Multiply the upper limit (hiCredit) and the lower limit (loCredit) by Mfactor for each class as defined above so that the resulting values agree with the credit values.

CUL = hiCredit * Mfactor = maxInterferenceSize * bwFraction * Mfactor

CLL = loCredit * Mfactor = maxFrameSize * (bwFraction - 1) * Mfactor

Example:

Assume that portTransmitRate = 100 Mbps, Bϕ = 130 MHz and bwFraction = 3%. Then idleSlope and sendSlope represented as one bit vs. cycles of the peripheral bus clock are as follows.

idleSlope = (portTransmitRate/Bϕ) * bwFraction = 100/130 (Mbps/MHz) * 3% = 0.023 (bit/Bϕ)

sendSlope = idleSlope - (portTransmitRate / Bϕ) = -0.746 (bit/Bϕ)

Let Mfactor be 100, then CIV and CDV parameters are determined as follows.

CIV = idleSlope * Mfactor = 23

CDV = sendSlope * Mfactor = -74.6

57.3.6.1 Restrictions on CIV, CDV and Mfactor

The maximum value (the minimum value for negative numbers) up to which the credit counter will not overflow determines the maximum values of CIV and CDV that can be set in the CBS registers. This maximum credit value is equivalent to the worst case of the hiCredit value, and the maximum values for class A and class B are calculated as follows.

<Conditions>

- Class A maximum value (hiCredit_max_classA)
  classA bwFraction ≅ 100%
  Maintaining the proper relations in the transmission priority order requires waiting for a period equivalent to the one maximum sized frame.
  hiCredit_max_classA ≅ maxInterferenceSize for class A = Waiting for a period equivalent to one maximum sized frame = header + maximum size payload + CRC (2000 bytes) + preamble (8 bytes) + IFG (12 bytes) + processing_delay (≅ 80 bytes) ≅ 2100 bytes
- Class B maximum value (hiCredit_max_classB)
  classB bwFraction ≅ 100%
  Maintaining the proper relations in the transmission priority order requires waiting for a period equivalent to the respective one maximum sized frame in the class A transmission queue and other transmission queues.
  hiCredit_max_classB ≅ maxInterferenceSize for class B = Waiting for a period equivalent to two maximum sized frames = 2* hiCredit_max_classA ≅ 4200 bytes

In bit units, calculated as follows:

hiCredit_max_classA = 16800

hiCredit_max_classB = 33600

The 32-bit signed counter can handle from -2^{31} to $2^{31}-1$, so the specifiable maximum values of Mfactor without overflow are:

Mfactor_max_classA = $2^{31}-1$ / hiCredit_max_classA ≅ 127826 and
Mfactor_max_classB = $2^{31}-1$ / hiCredit_max_classB ≅ 63913.

A high degree of accuracy can be achieved even with a low bandwidth. In class B, bandwidthFraction = 0.05% and the bandwidth error < 0.1%.

The maximum value of CIV is calculated from the following equation.

CIV = idleSlope x Mfactor = (portTransmitRate / Bϕ) * bandwidthFraction × Mfactor

When Mfactor is the maximum value and bandwidthFraction is the maximum value (up to 100%):

CIV_max_classA = (portTransmitRate / Bϕ) * Mfactor_max_classA and
CIV_max_classB = (portTransmitRate / Bϕ) * Mfactor_max_classB.

The maximum values when portTransmitRate = 100 Mbps and Bϕ = 130 MHz are as follows:

CIV_max_classA ≅ 98328

CIV_max_classB ≅ 49164

Table 57.80 shows examples of values for portTransmitRate and internal bus clock frequency. The values in this table are just the results of calculation, so when actually setting values, the CIV values must be limited so that the 32-bit credit counter will not overflow. In the AVB-DMAC, the CIV parameters are implemented as 16 bits + a sign bit, so CIV ≤ 65535 should be applied to both class A and class B.

Table 57.80 Example of Maximum Values for Class A and Class B CIV Parameters

portTransmitRate	Bϕ [MHz]	CIV_max_classA	CIV_max_classB
100 Mbps	100	127826	63913
100 Mbps	125	102260	51130
100 Mbps	133	96109	48054

57.3.6.2 Credit Incrementation (IFGs)

In the CBS credit counter in the AVB-DMAC, the inter-frame gap (IFG) after a frame is transmitted is not treated as part of frame transmission. During an IFG, the credit is incremented for all SR queues that have pending frames or negative credit. Figure 57.43 illustrates credit operations during IFGs.

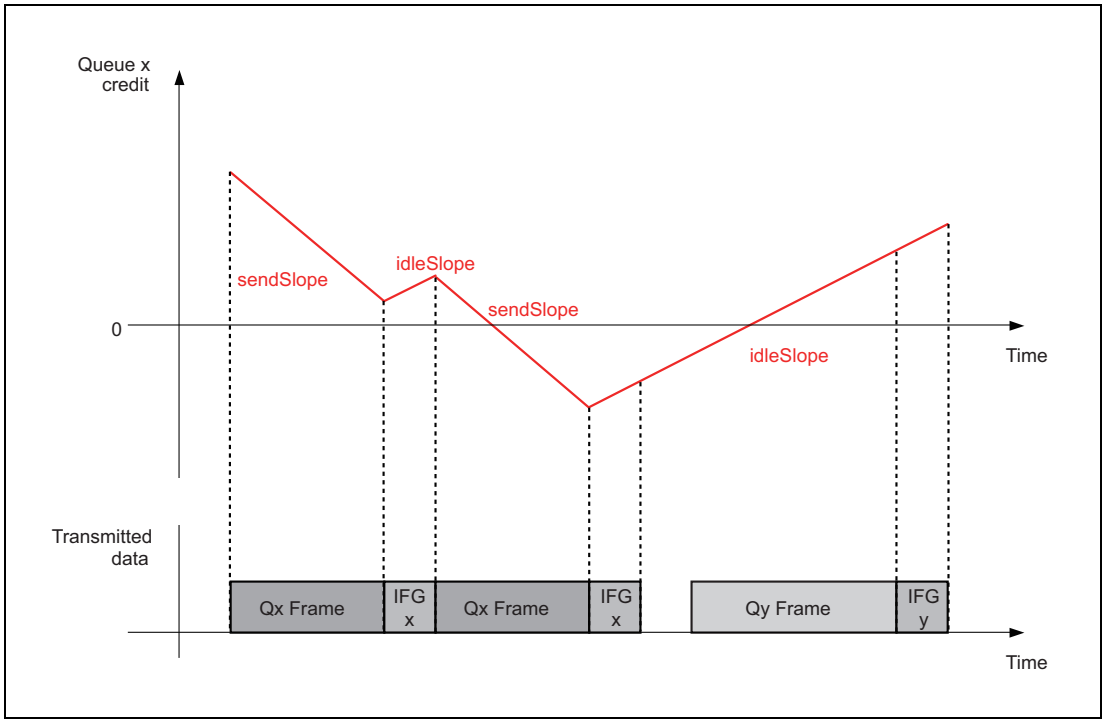

Figure 57.43 Credit Operations during IFGs

The IFG need not be included in calculation of the bandwidth for the specified SR class when deciding the idleSlope, sendSlope, and CIV and CDV parameters. However, IFG must also be included in the calculation in order to confirm that the total bandwidth allocated to all SR classes does not exceed 100% of portTransmitRate.

57.3.6.3 CBS Setting Example

The case of a class A 48-kHz stereo audio stream among Ethernet frames is described as an example.

After every class A measurement interval (125 us), 80 octets consisting of two sets of six 32-bit samples plus a 32-octet header are stored as audio data within a frame. The IEEE 802.3 also imposes a 42-octet media-specific frame overhead (an 8-octet preamble, 14-octet IEEE 802.3 header, 4-octet IEEE 802.1Q priority/VID Tag, 4-octet CRC, and 12-octet IFG) are also added. Accordingly, the total frame size is 80 + 42 = 122, and one such frame is transmitted after every class measurement interval.

This represents a total bandwidth of about 7.8 Mbits per second (122 octets × 8 bits per octet × 8000 frames per second) for this class. The E-MAC runs at 100 Mbps (portTransmitRate), so the allocation of the total bandwidth to each class A queue corresponds to 7.8%. If other traffic classes are to share the total transmission bandwidth, checking that the total allocation of bandwidth with this 7.8% allocation does not exceed 100% of portTransmitRate is required.

To obtain the CIV and CDV parameters for a given class, the IFG must not be taken into account in calculation of the frame size. For this case, therefore, we obtain the total bandwidth for the class = about 7.04 Mbps (110 octets × 8 bits per octet × 8000 frames per second) = 7.04% of portTransmitRate.

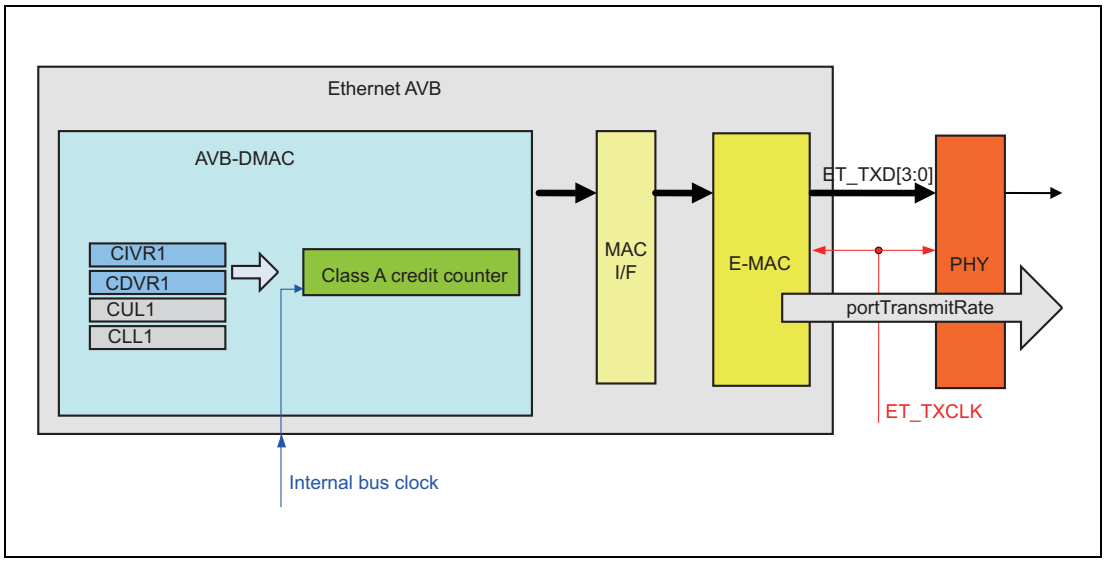

Figure 57.44 Example of CBS Settings

In this setting example, operating frequency and so on in each section are as follows:

- the E-MAC runs at 100 Mbps, so portTransmitRate = 100 Mbps and
- high-speed internal bus clock (operating clock for the credit counter) frequency = 133 MHz,

securing a bandwidth of 7.04 Mbits/sec for class A requires configuring the CBS parameters as follows.

- bandwidthFraction = 7.04%
- idleSlope = (portTransmitRate / Bϕ) * bandwidthFraction ≅ 0.05293 bits per Bϕ
- sendSlope = idleSlope – (portTransmitRate / Bϕ) ≅ -0.69895 bits per Bϕ

When Mfactor = 10000, the parameters are as follows.

- CIV = idleSlope × Mfactor = 529 bits per Bϕ

- CDV = sendSlope × Mfactor = -6989 bits per Bϕ

These are the final values for setting in the CIVR1 and CDVR1 registers.

57.3.7 IEEE802.1: gPTP

57.3.7.1 gPTP Timer

An 84-bit timer is provided to support the gPTP function. Figure 57.45 shows the overview of the timer.

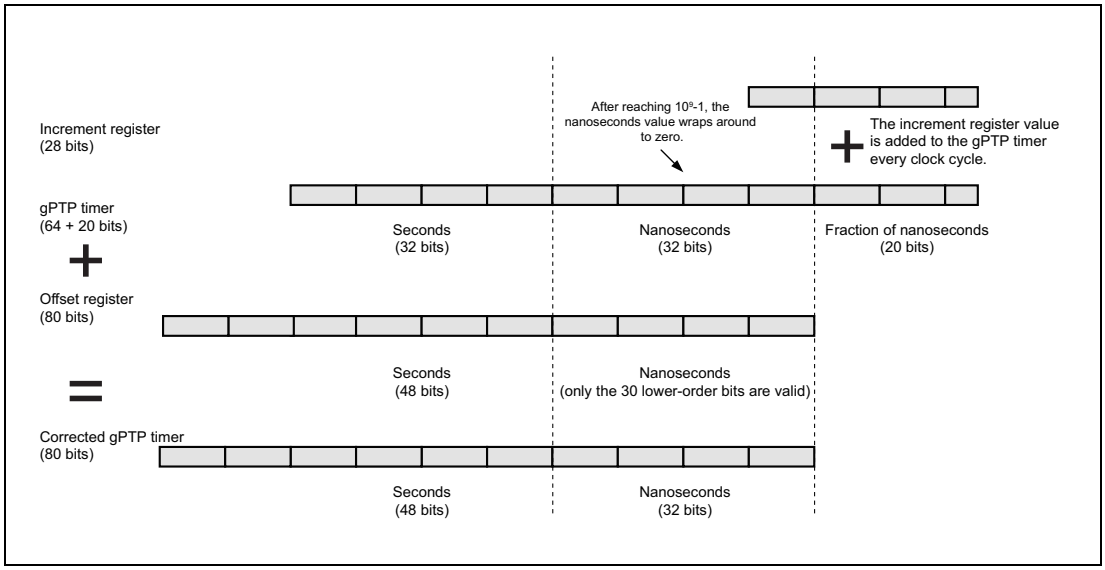

Figure 57.45 gPTP Timer

The higher-order 32 bits indicate seconds. For the next 32 bits indicate nanoseconds. The lower-order 20 bits indicate fractional nanoseconds. Software can only read the 32 higher-order bits, indicating seconds, and the subsequent 32-bits, indicating nanoseconds. The 20 lower-order 20 bits, representing less than 1 ns, are provided within the AVB-DMAC to maintain accuracy in time measurement, and cannot be referenced.

The timer can be reset by setting the timer control request bits in the gPTP configuration control register (GCCR.TCR[1:0]) to B'01. These bits are set to B'00 on completion of normal resetting of the timer.

After the timer starts, the value in the gPTP timer increment value bit (GTI.TIV) is added to the value of the gPTP timer every clock cycle. When the value of the nanosecond part reaches 10^9 - 1, it returns to 0 when the next 1 nanosecond is counted. The fractional nanosecond value is represented by 20 bits and can be adjusted in precision of $1/2^{20}$ (1/1048576) nanosecond.

Before setting a value in the gPTP timer increment value bit (GTI.TIV), set the timer increment value setting request bit in the gPTP configuration control register (GCCR.LTI) to 1. If this bit is not set to 1, new values that are written will not be reflected in the register. This bit returns to 0 after the setting is completed.

An offset to the gPTP timer is also available. If this is required, set the value in the timer offset value bit (GTO.TOV). Before setting a value in this register, set the timer offset value setting request bit in the gPTP configuration control register (GCCR.LTO) to 1. If this bit is not set to 1, new values that are written will not be reflected in the register. This bit returns to 0 after the setting is completed. Set the value from 0 to 10^9 - 1 to the timer offset value bits (GTO0.TOV[31:0]) in the nanoseconds portion. When adding an offset, take care that the calculation result with the offset added does not exceed 80 bits.

The value of the gPTP timer can be read from the gPTP timer capture value bit (GCTi.CTV) by setting the timer control request bits in the gPTP timer control register (GCCR.TCR[1:0]) to B'11. Set the timer capture source select bits in the gPTP configuration control register (TCCR.TCSS) to select the timer value for capture as the value of the gPTP timer, the corrected value of the gPTP timer (value with the offset added), or the AVTP presentation time. Setting the timer control request bits in the gPTP configuration control register (GCCR.TCR[1:0]) to B'11 initiates the capture. Once normal capture of the timer is complete, the value of the timer control request bits in the gPTP configuration control register (GCCR.TCR[1:0]) returns to B'00.

The timer for gPTP operates as a free-running timer but can be synchronized with the Grandmaster clock.

The timer clock source can be selected from the internal bus clock and Ethernet transmission clock by setting the gPTP clock select bits (CCC.CSEL[1:0]).

57.3.7.2 Free-Running Operation

The IEEE 802.1 AS standard does not prescribe the adjustment of local clocks to the Grandmaster clock. To avoid negative effects from the correction procedure, we recommend the use of a free-running timer.

As a free-running timer, the timer counts the local clock based on the local time. The gPTP timer increment value bit (GTI.TIV) is set to 1 ns (the setting value = H'0010 0000) and the timer offset value bit (GTOi.TOV) is set to 0. The ratio information captured at the time of the gPTP delay measurement and synchronization procedures is used to correct the frequency ratio to that of the Grandmaster clock. The Grandmaster clock can be calculated from the local clock by using the information collected during the gPTP measurement and synchronization procedures.

57.3.7.3 Synchronization with the Grandmaster Clock

In situations requiring physical synchronization of the local clock with the Grandmaster clock, the fractional nanoseconds value (the 20 lower-order bits of the gPTP timer) is used to make the adjustment. Specifically, the increment value is finely adjusted to correct for deviations of the clock frequency from that of the Grandmaster clock.

Use the timer offset value bit (GTOi.TOV) to correct for offsets for comparing with the absolute time and so on from start-up. The sum of the timer value and the offset register is the corrected gPTP timer value.

Set the value from 0 to 10^9 - 1 to the timer offset value bits (GTOi.TOV[31:0]) for setting the nanoseconds portion of the offset.

The following equation gives a method of calculating the increment (GTI.TIV) from the frequency of the gPTP clock and its deviation from that of the Grandmaster clock. Variable d is the deviation (d = 10^{-6} for 1 ppm).

$$GTI.TIV = round\left(\frac{2^{20}GHz}{f_{GPTP}} * (1+d)\right)$$

After adjusting for the current deviation of clock frequency, re-set the gPTP timer increment register (GTI.TIV).

After calculating the new offset value, re-set the timer offset configuration register (GTOi.TOV).

- Sample setting 1

When f_{GPTP} = 100 MHz ± 0 ppm (device used is guaranteed by the Grandmaster clock)

gPTP is updated every 10 ns.

Set the gPTP timer increment value bits (GTI.TIV) to H’00A0_0000.

- Sample setting 2

When f_{GPTP} = 100 MHz - 10 ppm

gPTP is updated every 10 ns.

Set the gPTP timer increment value bits (GTI.TIV) to H’00A0_0069 (10485864.8576 before rounded off). Rounding off the value causes a frequency error less than 1 ppm.

57.3.7.4 Support Provided by the gPTP Timer in Transmission and Reception

The timer value described above is used in the time-stamp values captured when start frame delimiters are detected in reception and generated in transmission.

Captured time stamp values for received frames are stored in the corresponding descriptors. Those for transmitted frames are stored with tag information in the time-stamp FIFO. The time stamp values are thus correlated with both transmitted and received frames.

Note that the use of corrected gPTP timer values can introduce an error due to the offset correction in the gPTP synchronization procedure.

Errors due to SFD notification and the interface between the timer modules must also be taken into account. Although SFDs for transmission and reception are detected in synchronization with the transmission and reception clocks, respectively, the gPTP operates with a gPTP clock. Therefore, an error of ± 1 GTI.TIV + 1 Bφ is generated.

57.3.8 Support for IEEE 1722

For IEEE 1722, the following two functions are supported.

- Output and capture of values in the IEEE 1722 AVTP (Audio/Video Transport Protocol) presentation time format
- Comparison of IEEE 1722 AVTP presentation time stamps

The 32-bit AVTP time stamp field of IEEE 1722 frames holds the AVTP presentation time when the AVTP time-stamp enable bit in the frame is 1. The AVTP time stamp field is generated from the pPTP timer and is given as seconds (gPTP_seconds) and nanoseconds (gPTP_nanoseconds) according to the following equation.

AVTP time stamp = (gPTP_seconds * 10^9 + gPTP_nanoseconds) modulo 2^{32}

The AVTP presentation time can be read from the gPTP timer capture value bit (GCTi.CTV). Set the timer capture source select bits in the gPTP configuration control register (TCCR.TCSS) to select the timer value for capture as the AVTP presentation time. Setting the timer control request bits in the gPTP configuration control register (GCCR.TCR[1:0]) to B’11 initiates the capture. The value stored as the capturing result is obtained by adding the maximum transit time defined in the maximum transit time bits (GMTT.MTTV) to the corrected gPTP timer value. The AVTP presentation time wraps around approximately every four seconds.

CAUTION

The AVTP presentation time captured in GCTi.CTV is only valid when the corrected gPTP timer value is in synchronization with the Grandmaster clock. That is, the timer increment and timer offset values for the corrected gPTP timer value must be adjusted by the synchronization procedure so that the corrected gPTP clock is adjusted to match the time kept by the Grandmaster clock.

57.3.9 Flow Control

The E-MAC supports flow control for full-duplex operation in compliance with the IEEE 802.3 standards. This flow control is applicable to both reception and transmission. In regard to the transmission of PAUSE frames, flow control operates in the following ways.

(1) Automatic PAUSE Frame Transmission

For the received frames, PAUSE frames are automatically transmitted when the amount of data having been written in the reception FIFO reaches the value specified by the receive FIFO caution level bits in the receive configuration register (RCR.RFCL). The TIME parameter contained in the PAUSE frame can be specified by the automatic PAUSE frame register (APR). If the maximum count of PAUSE frame retransmission times is not specified, PAUSE frames are automatically transmitted repeatedly until the data is read from the reception FIFO and the remaining data amount becomes smaller than the value specified by the RCR.RFCL. As the maximum count of PAUSE frame retransmission times, any value from 1 to 65535 can be specified by the PAUSE frame retransmission count register (TPAUSER). In this case, PAUSE frames are automatically transmitted repeatedly until the remaining data amount becomes smaller than the value specified by the RCR.RFCL or the count of retransmission times reaches the value specified by the TPAUSER. The retransmit counter is cleared to 0 when the next PAUSE frame is transmitted once the data amount in the reception FIFO becomes smaller than the value specified by the RCR.RFCL.

Automatic PAUSE frame transmission is enabled when the operating mode bit for flow control in transmission in the E-MAC mode register (ECMR.TXF) is 1.

(2) Manual PAUSE Frame Transmission

PAUSE frames can also be transmitted in response to software operations. Writing a timer value to the manual PAUSE frame register (MPR) starts the transmission of a PAUSE frame. This only causes the transmission of one PAUSE frame.

(3) PAUSE Frame Reception

After reception of a PAUSE frame, transmission of the next frame does not proceed until the time indicated by the Timer value elapses. However, transmission of a frame currently being transmitted continues. PAUSE frames are only received while the operating mode for flow control in reception bit in the E-MAC mode register (ECMR.RXF) is set to 1. The number of received PAUSE frames is counted.

(4) 0 TIME PAUSE Frame Control

The setting of the PAUSE frame usage with TIME = 0 enable bit in the E-MAC mode register (ECMR.ZPF) enables or disables the transmission of PAUSE frames with the TIME parameter value 0. The setting of the PAUSE frame reception with time = 0 bit in the E-MAC mode register (ECMR.RZPF) enables or disables the reception of PAUSE frames with the TIME parameter value 0.

- Operation for transmission
  When the 0-time PAUSE frame control is enabled, PAUSE frame with the TIME parameter value 0 is transmitted when the capacity of the reception FIFO is less than the value of the receive FIFO caution level bits in the receive configuration register (RCR.RFCR) while the time indicated by the TIME parameter value has not elapsed.
  When the 0-time PAUSE frame control is disabled, PAUSE frames with the TIME parameter value 0 are not transmitted.
- Operation for reception

When the 0-time PAUSE frame reception is enabled, frame transmission wait state is released when PAUSE frame with the TIME parameter value 0 is received.
When the 0-time PAUSE frame reception is disabled, received PAUSE frames with the TIME parameter value 0 are discarded.

57.3.10 Interrupts

The EthernetAVB module has four interrupts: three interrupts from the AVB-DMAC and one interrupt from the E-MAC. The three interrupts from the AVB-DMAC are generated when the AVB-DMAC is placed in operation mode, and the one interrupt from the E-MAC is generated when the AVB-DMAC is placed in configuration, operation, or standby mode.

Table 57.81 is a list of the interrupts.

Table 57.81 EthernetAVB Interrupts

Interrupt Source Name	Remarks
AVB_DATA	Transmit/receive data management interrupt
AVB_ERROR	Error management interrupt
AVB_MANAGE	Other management (FIFO caution level, etc.) interrupt
AVB_MAC	E-MAC interrupt

The AVB-DMAC related interrupts include descriptor interrupts (15 sources), error interrupts (5 sources), reception interrupts (37 sources), transmission interrupts (2 sources), and gPTP interrupts (3 sources). From the CPU's perspective, each appears as one of the above four interrupt sources.

The states of an AVB-DMAC-related interrupt sources can be checked in the following registers.

- Descriptor interrupt status register (DIS)
- Error interrupt status register (EIS)
- Receive interrupt status register (RISi)
- Transmit interrupt status register (TIS)
- gPTP interrupt status register (GIS)

The interrupts are controlled by the corresponding interrupt enable bits. However, the status flags operate independently of the settings of the enable bits.

The states of grouped interrupts can be checked by reading the interrupt summary status register (ISS) and the queue full error interrupt status bit in the error interrupt status register (EIS.QFS).

57.3.10.1 Transmit/Receive Data Management Interrupt

The management interrupt for transmission and reception is conveyed when the interrupt conditions corresponding to the following sources are satisfied.

- Receive frame interrupt in the receive interrupt status register 0 (RIS0.FRFr)
- Descriptor interrupt in the descriptor interrupt status register (DIS.DPFi)

57.3.10.2 Error Management Interrupt

The error management interrupt is conveyed when interrupt conditions corresponding to the following sources are satisfied.

- Time stamp FIFO full error interrupt in the error interrupt status register (EIS.TFFF)
- CBS limitation value error interrupts in the error interrupt status register (EIS.CULF1, EIS.CULF0, EIS.CLLF1, EIS.CLLF0)
- Receive FIFO full interrupt in the receive interrupt status register 2 (RIS2.RFFF)
- Receive queue full interrupt in the receive interrupt status register 2 (RIS2.QFFr)

57.3.10.3 Other Management (FIFO Warning, etc.) Interrupts

The other management (FIFO warning, etc.) interrupt is conveyed when interrupt conditions corresponding to the following sources are satisfied.

(1) Reception related interrupt

Receive FIFO warning interrupt in the receive interrupt status register 1 (RIS1.RFWF)

(2) Transmission related interrupts

Time stamp FIFO warning interrupt in the transmit interrupt status register (TIS.TSWF)

Time stamp FIFO update interrupt in the transmit interrupt status register (TIS.TSUF)

(3) gPTP related interrupts

Presentation time match interrupt in the gPTP interrupt status register (GIS.PTMF)

57.3.10.4 E-MAC Interrupt

The E-MAC interrupt is conveyed when the following E-MAC interrupt sources are generated.

- PAUSE frame retransmit retry over interrupt in the E-MAC status register (ECSR.PFROI)
- Illegal carrier detection interrupt in the E-MAC status register (ECSR.ICD)

57.3.12.2 Accessing MII Registers

MII registers in the PHY-LSI are accessed via PIR in this LSI. PIR is used as a serial interface conforming to the MII frame format specified in IEEE802.3u.

(1) MII Management Frame Format

Figure 57.64 shows the format of an MII management frame. To access an MII register, a management frame is implemented by the program in accordance with the procedures shown in MII Register Access Procedure.

Access Type	MII Management Frame							
Item	PRE	ST	OP	PHYAD	REGAD	TA	DATA	IDLE
Number of bits	32	2	2	5	5	2	16	
Read	1..1	01	10	00001	RRRRR	Z0	D..D	
Write	1..1	01	01	00001	RRRRR	10	D..D	X

[Legend]

PRE: 32 consecutive 1s
ST: Write of 01 indicating start of frame
OP: Write of code indicating access type
PHYAD: Write of 0001 if the PHY-LSI address is 1 (sequential write starting with the MSB).
This bit changes depending on the PHY-LSI address.
REGAD: Write of 000q if the register address is 1 (sequential write starting with the MSB).
This bit changes depending on the PHY-LSI register address.
TA: Time for switching data transmission source on MII interface
(a) Write: 10 written
(b) Read: Bus release (notation: Z0) performed
DATA: 16-bit data. Sequential write or read from MSB
(a) Write: 16-bit data write
(b) Read: 16-bit data read
IDLE: Wait time until next MII management format input
(a) Write: Independent bus release (notation: X) performed
(d) Read: Bus already released in TA: control unnecessary

Figure 57.64 MII Management Frame Format

(2) MII Register Access Procedure

The program accesses MII registers via PIR. Access is implemented by a combination of 1-bit-unit data write, 1-bit-unit data read, bus release, and independent bus release. Figure 57.65 to Figure 57.68 show the MII register access timing. The timing will differ depending on the PHY-LSI type.

57.3.13 Usage Notes

57.3.13.1 Checksum Calculation of Ethernet Frames

This LSI is capable of calculating the checksum data of the received frames. Only the data fields of the Ethernet frames are subject to checksum calculation. Specifically, a data field follows the length/type field and is followed by the CRC field. Figure 57.69 shows schematics indicating which parts of the Ethernet frames are calculated. Calculation involves 16-bit addition only; it does not involve bit inversion. Note that when the checksum data is valid, the CRC data (4 bytes) is not transferred as a receive frame, and the checksum data (sum data) is added automatically. Figure 57.70 shows schematics of Ethernet frames to which the checksum data has been added.

CAUTION

Also for the frames with VLANtag inserted, the 15th byte from the top and the following bytes before the CRC field are subject to calculation.

Serial communication interface with FIFO	All registers	Initialized	Initialized	Retained	Retained	Retained
Serial communications interface	All registers	Initialized	Initialized	Retained	Retained	Retained
Renesas serial peripheral interface	All registers	Initialized	Initialized	Retained	Retained	Retained
SPI multi I/O bus controller	All registers	Initialized	Initialized	Retained	Retained	Retained
I^2C bus interface	All registers	Initialized	Initialized	Retained	Retained	Retained
Serial sound interface	All registers	Initialized	Initialized	Retained	Retained	Retained
Media local bus	All registers	Initialized	Initialized	Retained	Retained	Retained
CAN interface	All registers	Initialized	Initialized	Retained	Retained	Retained
IEBus controller	All registers	Initialized	Initialized	Retained	Retained	Retained
Renesas SPDIF interface	All registers	Initialized	Initialized	Retained	Retained	Retained
CD-ROM decoder	All registers	Initialized	Initialized	Retained	Retained	Retained
LIN interface	All registers	Initialized	Initialized	Retained	Retained	Retained

Table 58.3 Register States

Module	Register Name	Power-On Reset	Deep Standby	Software Standby	Module Standby	Sleep
EthernetAVB	All registers	Initialized	Initialized	Retained	Retained	Retained
Ethernet controller	All registers	Initialized	Initialized	Retained	Retained	Retained
A/D converter	All registers	Initialized	Initialized	Initialized	Initialized	Retained
NAND flash memory controller	All registers	Initialized	Initialized	Retained	Retained	Retained
USB2.0 host/function module	All registers	Initialized	Initialized	Retained	Retained	Retained
Digital video decoder	All registers	Initialized	Initialized	Retained	Retained	Retained
Video display controller 5	All registers	Initialized	Initialized	Retained	Retained	Retained
LVDS output interface	All registers	Initialized	Initialized	Retained	Retained	Retained
Image renderer	All registers	Initialized	Initialized	Retained	Retained	Retained
Image renderer for display	All registers	Initialized	Initialized	Retained	Retained	Retained
Display out comparison unit	All registers	Initialized	Initialized	Retained	Retained	Retained
JPEG codec unit	All registers	Initialized	Initialized	Retained	Retained	Retained
Capture engine unit	All registers	Initialized	Initialized	Retained	Retained	Retained
Pixel format converter	All registers	Initialized	Initialized	Retained	Retained	Retained
SCUX	All registers	Initialized	Initialized	Retained	Retained	Retained
Sound generator	All registers	Initialized	Initialized	Retained	Retained	Retained
SD host interface	All registers	Initialized	Initialized	Retained	Retained	Retained
MMC host interface	All registers	Initialized	Initialized	Retained	Retained	Retained
Motor control PWM timer	All registers	Initialized	Initialized	Retained	Retained	Retained
Ports	All registers*10	Initialized	Initialized	Retained	-	Retained
Power-down modes	DSFR	Initialized	Retained	Retained	-	Retained
	XTALCTR	Initialized*1	Retained*6	Retained*6	-	Retained
	All registers other than above	Initialized	Initialized	Retained	-	Retained
Debugger interface	Registers in CA9 PMU*7	Initialized	Initialized	Retained	-	Retained
	All registers other than above*8	Retained	Initialized*9	Retained	Retained	Retained

Note 1. Retained on internal power-on reset by the watchdog timer.
Note 2. Flag processing continues.
Note 3. Counting up continues.
Note 4. Transfer can proceed.
Note 5. The value of RTCEN bit is retained.
Note 6. The GAIN0 bit is initialized when the realtime clock is not using the EXTAL pin. The GAIN1 bit is initialized when the realtime clock is not using the RTC_X1 or RTC_X3 pin.
Note 7. Access to these registers from the I/O area (SLV6) is not possible while $\overline{\text{TRST}}$ is asserted.
Note 8. Initialized on assertion of $\overline{\text{TRST}}$.
Note 9. Retained in FAKE debug mode.
Note 10. An internal power-on reset by the watchdog timer does not initialize PM3[7], PMC3[7], PFC3[7], PFCE3[7], and PFCAE3[7].

59. Electrical Characteristics

59.1 Absolute Maximum Ratings

Table 59.1 Absolute Maximum Ratings

Item		Symbol	Value	Unit
Power supply voltage (I/O)		PV_{CC}	–0.3 to 4.2	V
Power supply voltage (Internal)		V_{CC}	–0.3 to 1.6	V
PLL power supply voltage		$PLLV_{CC}$	–0.3 to 1.6	V
Analog power supply voltage		AV_{CC}	–0.3 to 4.2	V
Analog reference voltage		AVref	–0.3 to AV_{CC} +0.3	V
USB transceiver analog power supply voltage (I/O)		$USBAPV_{CC}$	–0.3 to 4.2	V
USB transceiver digital power supply voltage (I/O) Note: Products in BGA packages do not have this pin.		$USBDPV_{CC}$	–0.3 to 4.2	V
USB transceiver analog power supply voltage (internal)		$USBAV_{CC}$	–0.3 to 1.6	V
USB transceiver digital power supply voltage (internal) Note: Products in BGA packages do not have this pin.		$USBDV_{CC}$	–0.3 to 1.6	V
Power supply for USB 480 MHz (internal) Note: Products in BGA packages do not have this pin.		$USBUV_{CC}$	–0.3 to 1.6	V
A/D converter power supply voltage for video signal input		$VDAV_{CC}$	–0.3 to 4.2	V
LVDS analog power supply voltage		$LVDSAPV_{CC}$	–0.3 to 4.2	V
LVDS PLL power supply voltage		$LVDSPLLV_{CC}$	–0.3 to 1.6	V
Input voltage	VBUS	V_{in}	–0.3 to 5.5	V
	Other input pins	V_{in}	–0.3- to 3.3-V power supply (PV_{CC}, AV_{CC}, $USBAPV_{CC}$, $USBDPV_{CC}$, $VDAV_{CC}$, $LVDSAPV_{CC}$) +0.3	V
Operating temperature	Ambient temperature	Ta	–40 to +85	°C
	Junction temperature	Tj	–40 to +125	°C
Storage temperature		T_{stg}	–55 to +125	°C

Caution: Permanent damage to the LSI may result if absolute maximum ratings are exceeded.

59.2 Power-On/Power-Off Sequence

The 1.2-V power supply (V_{CC}, $PLLV_{CC}$, $USBAV_{CC}$, $USBDV_{CC}$, $USBUV_{CC}$, and $LVDSPLLV_{CC}$) and 3.3-V power supply (PV_{CC}, AV_{CC}, $USBAPV_{CC}$, $USBDPV_{CC}$, $VDAV_{CC}$, and $LVDSAPV_{CC}$) can be turned on and off in any order.
When turning on the power, be sure to drive both the $\overline{TRST}$ and $\overline{RES}$ pins low; otherwise, the output pins and input/output pins output undefined levels, resulting in system malfunction.
When turning off the power, drive the $\overline{TRST}$ and $\overline{RES}$ pins low if the undefined output may cause a problem.

59.3 DC Characteristics

- Conditions used to obtain DC characteristics (2) in Table 59.2 other than current consumption
  V_{CC} = USBDV_{CC}= USBUV_{CC} = 1.10 to 1.26 V, PV_{CC} = USBDPV_{CC} = 3.0 to 3.6 V, PLLV_{CC} = 1.10 to 1.26 V,
  AV_{CC} = 3.0 to 3.6 V, USBAPV_{CC} = 3.0 to 3.6 V, USBAV_{CC} = 1.10 to 1.26 V, VDAV_{CC} = 3.0 to 3.6 V,
  LVDSAPV_{CC} = 3.0 to 3.6 V, LVDSPLLV_{CC} = 1.10 to 1.26 V,
  V_{SS} = AV$_{SS}$ = USBDV_{SS} = USBAV_{SS} = USBDPV_{SS} = USBAPV_{SS} = USBUV_{SS} = VDAV_{SS} = LVDSAPV_{SS} = 0 V,
  Ta = –40 to 85 °C, Tj = –40 to 125 °C

- Conditions used to obtain DC characteristics (2) in Table 59.2 for current consumption
  V_{CC} = USBDV_{CC} = USBUV_{CC} = 1.18 V, PV_{CC} = USBDPV_{CC} = 3.3 V, PLLV_{CC} = 1.18 V, AV_{CC} = 3.3 V,
  USBAPV_{CC} = 3.3 V, USBAV_{CC} = 1.18 V, VDAV_{CC} = 3.3 V, LVDSAPV_{CC} = 3.3 V, LVDSPLLV_{CC} = 1.18 V,
  V_{SS} = AV$_{SS}$ = USBDV_{SS} = USBAV_{SS} = USBDPV_{SS} = USBAPV_{SS} = USBUV_{SS} = VDAV_{SS} = LVDSAPV_{SS} = 0 V,
  AVref = 3.3 V, VBUS = 5.0 V,
  Ta = –40 to 85 °C, Tj = –40 to 125 °C
  Iϕ = 400.00 MHz, Bϕ = 133.33 MHz, P1ϕ = 66.67 MHz, P0ϕ = 33.33 MHz

Note: Products in BGA packages do not have USBDV_{CC}, USBUV_{CC}, USBDPV_{CC}, USBDV_{SS}, USBAV_{SS}, USBDPV_{SS}, USBAPV_{SS}, USBUV_{SS}, and LVDSAPV_{SS} pins.

Table 59.2 DC Characteristics (1) [Common Items]

Item		Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Power supply voltage		PV_{CC}	3.0	3.3	3.6	V	
		V_{CC}	1.10	1.18	1.26	V	
PLL power supply voltage		PLLV_{CC}	1.10	1.18	1.26	V	
Analog power supply voltage		AV_{CC}	3.0	3.3	3.6	V	
USB power supply voltage Note: Products in BGA packages do not have USBDPVcc, USBDVcc, and USBUVcc pins.		USBAPV_{CC} USBDPV_{CC}	3.0	3.3	3.6	V	
		USBAV_{CC} USBDV_{CC} USBUV_{CC}	1.10	1.18	1.26	V	
A/D converter power supply voltage for video signal input		VDAV_{CC}	3.0	3.3	3.6	V	
LVDS analog power supply voltage		LVDSAPV_{CC}	3.0	3.3	3.6	V	
LVDS PLL power supply voltage		LVDSPLLV_{CC}	1.10	1.18	1.26	V	
Input leakage current	All input pins	$\|I_{in}\|$	—	—	1.0	µA	V_{in} = 0.5 to PV_{CC} – 0.5 V
Three-state leakage current	All input/output pins, all output pins (except P1_0 to P1_7) (off state)	$\|I_{STI}\|$	—	—	1.0	µA	V_{in} = 0.5 to PV_{CC} – 0.5 V
	P1_0 to P1_7		—	—	10	µA	
Input capacitance	all input/output pins, all input pins	Cin	—	—	10	pF	

Table 59.2 DC Characteristics (2) [Current Consumption]

Item		Power Supply	Symbol	Typ.	Max.	Unit	Test Conditions
Current consumption in normal operation		V_{CC}	I_{CC}	—	850	mA	
		$PLLV_{CC}$	$PLLI_{CC}$	—	8	mA	
		PV_{CC}	PI_{CC}	100*1	—	mA	
		AV_{CC}	AI_{CC}	—	4	mA	During A/D conversion
		AVref	AIref	—	1	mA	During A/D conversion
		$USBAV_{CC}$	UAI_{CC}	—	6	mA	When the USB host/function is in use.
		$USBDV_{CC}$ + $USBUV_{CC}$	UDI_{CC}*2	—	25	mA	In USB high-speed operation (2ch)
		$USBAPV_{CC}$	$UAPI_{CC}$	—	4	mA	When the USB host/function is in use.
		$USBDPV_{CC}$	$UDPI_{CC}$*3	70*1	—	mA	In USB high-speed operation (2ch)
		$VDAV_{CC}$	$VDAI_{CC}$	—	60	mA	
		$LVDSAPV_{CC}$	$LVDSAPI_{CC}$	—	48	mA	During LVDS transfer
		$LVDSPLLV_{CC}$	$LVDSPLLI_{CC}$	—	2.5	mA	
		VBUS	VI_{CC}	—	10	µA	
Current consumption in sleep mode		V_{CC}	Isleep	—	660	mA	
		For the other power supply, the current consumption is the same as in normal operation.					
Current consumption in software standby mode	Ta > 50 °C	V_{CC} + $PLLV_{CC}$ + $USBAV_{CC}$ + $USBDV_{CC}$ + $USBUV_{CC}$ + $LVDSPLLV_{CC}$	Isstby	72	320	mA	
		PV_{CC} + AV_{CC} + AVref + $USBAPV_{CC}$ + $USBDPV_{CC}$ + $VDAV_{CC}$ + $LVDSAPV_{CC}$	PIsstby	25	32	µA	
		VBUS	VIsstby	8	10	µA	
	Ta ≤ 50 °C	V_{CC} + $PLLV_{CC}$ + $USBAV_{CC}$ + $USBDV_{CC}$ + $USBUV_{CC}$ + $LVDSPLLV_{CC}$	Isstby	20	160	mA	
		PV_{CC} + AV_{CC} + AVref + $USBAPV_{CC}$ + $USBDPV_{CC}$ + $VDAV_{CC}$ + $LVDSAPV_{CC}$	PIsstby	18	21	µA	
		VBUS	VIsstby	8	10	µA	

Table 59.2 DC Characteristics (2) [Current Consumption]

Item		Power Supply	Symbol	Typ.	Max.	Unit	Test Conditions
Current consumption in deep standby mode	Ta > 50 °C	V_{CC} + $PLLV_{CC}$ + $USBAV_{CC}$ + $USBDV_{CC}$ + $USBUV_{CC}$ + $LVDSPLLV_{CC}$	Idstby	124	180	µA	RAM 0 Kbytes retained, RTC_X1 selected
				148	204	µA	RAM 16 Kbytes retained, RTC_X1 selected
				164	228	µA	RAM 32 Kbytes retained, RTC_X1 selected
				200	276	µA	RAM 64 Kbytes retained, RTC_X1 selected
				289	372	µA	RAM 128 Kbytes retained, RTC_X1 selected

		VBUS	VIdstby	8	10	µA	

Note 1. Reference value. The actual operating current greatly depends on the system (such as slow rising/falling edges caused by IO load and toggle frequency). Be sure to determine the value using the actual system.
Note 2. In the products in BGA packages, UDIcc is added to Icc.
Note 3. In the products in BGA packages, UDPIcc is added to PIcc.

Table 59.2 DC Characteristics (3) [Except I²C Bus Interface, and USB 2.0 Host/Function Module-Related Pins]

Item		Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Input high voltage*		V_{IH}	2.2	—	PV_{CC} + 0.3	V	
Input low voltage*		V_{IL}	–0.3	—	0.8	V	
Schmitt trigger input characteristics		VT^+	$PV_{CC} \times 0.66$	—	—	V	
		VT^-	—	—	0.8	V	
		$VT^+ – VT^-$	0.2	—	—	V	
Output high voltage		V_{OH}	PV_{CC} – 0.5	—	—	V	I_{OH} = –2.0 mA
Output low voltage		V_{OL}	—	—	0.4	V	I_{OL} = 2.0 mA
RAM standby voltage	Software standby mode (large-capacity on-chip RAM)	V_{RAMS}	0.85	—	—	V	Measured with V_{CC} as parameter
	Deep standby mode (only the on-chip RAM for data retention)	V_{RAMD}	1.10	—	—	V	

Note: * Values for the input of data for boundary scanning through pins TMS, TCK, JP0_0, JP0_1, P2_0 to P2_15, and P6_0 to P6_15.

Table 59.2 DC Characteristics (4) [I²C Bus Interface Related Pins*]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Input high voltage	V_{IH}	$PV_{CC} \times 0.7$	—	PV_{CC} + 0.3	V	
Input low voltage	V_{IL}	–0.3	—	$PV_{CC} \times 0.3$	V	
Schmitt trigger input characteristics	$V_{IH} – V_{IL}$	$PV_{CC} \times 0.05$	—	—	V	
Output low voltage	V_{OL}	—	—	0.4	V	I_{OL} = 3.0 mA

Note: * The P1_0 to P1_7 pins are open-drain pins.

Table 59.2 DC Characteristics (5) [USB 2.0 Host/Function Module-Related Pins*]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Reference resistance	R_{REF}	5.6 kΩ ± 1%	5.6 kΩ ± 1%	5.6 kΩ ± 1%		
Input high voltage (VBUS1, VBUS0)	V_{IH}	4.02	—	5.25	V	
Input low voltage (VBUS1, VBUS0)	V_{IL}	–0.3	—	0.5	V	
Input high voltage (USB_X1)	V_{IH}	PV_{CC} – 0.5	—	PV_{CC} + 0.3	V	
Input low voltage (USB_X1)	V_{IL}	–0.3	—	0.5	V	

Note: * REFRIN, VBUS1, VBUS0, USB_X1, and USB_X2 pins

Table 59.2 DC Characteristics (6) [USB 2.0 Host/Function Module-Related Pins* (Low-Speed, Full-Speed, and High-Speed Common Items)]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions
DP pull-up resistance (when function is selected)	R_{pu}	0.900	—	1.575	kΩ	In idle mode
		1.425	—	3.090	kΩ	In transmit/receive mode
DP and DM pull-down resistance (when host is selected)	R_{pd}	14.25	—	24.80	kΩ	

Note: * DP1, DP0, DM1, and DM pins

Table 59.2 DC Characteristics (7) [USB 2.0 Host/Function Module-Related Pins* (Low-Speed and Full-Speed)]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Input high voltage	V_{IH}	2.0	—	—	V	
Input low voltage	V_{IL}	—	—	0.8	V	
Differential input sensitivity	V_{DI}	0.2	—	—	V	| (DP) – (DM) |
Differential common mode range	V_{CM}	0.8	—	2.5	V	
Output high voltage	V_{OH}	2.8	—	3.6	V	I_{OH} = –200 µA
Output low voltage	V_{OL}	0.0	—	0.3	V	I_{OL} = 2 mA
Output signal crossover voltage	V_{CRS}	1.3	—	2.0	V	C_L = 50 pF (full-speed) C_L = 200 to 600 pF (low-speed)

Note: * DP1, DP0, DM1, and DM pins

Table 59.2 DC Characteristics (8) [USB 2.0 Host/Function Module-Related Pins* (High-Speed)]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Squelch detection threshold voltage (differential voltage)	V_{HSSQ}	100	—	150	mV	
Common mode voltage range	V_{HSCM}	–50	—	500	mV	
Idle state	V_{HSOI}	–10.0	—	10.0	mV	
Output high voltage	V_{HSOH}	360	—	440	mV	
Output low voltage	V_{HSOL}	–10.0	—	10.0	mV	
Chirp J output voltage (difference)	V_{CHIRPJ}	700	—	1100	mV	
Chirp K output voltage (difference)	V_{CHIRPK}	–900	—	–500	mV	

Note: * DP1, DP0, DM1, and DM pins

Table 59.2 DC Characteristics (9) [LVDS-Related Pins*]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Reference resistance	$R_{LVDSREF}$		5.6kΩ±1%			
Differential Output Voltage	VOD	250	350	450	mV	RL = 100Ω
Difference VOD between 'H' and 'L'	ΔVOD	—	—	50	mV	RL = 100Ω
Offset (Common Mode) Voltage	VOS	1.125	1.25	1.375	V	RL = 100Ω
Difference VOS between 'H' and 'L'	ΔVOS	—	—	50	mV	RL = 100Ω

Note: * LVDSREFRIN, TXCLKOUTP, TXCLKOUTM, TXOUT2P to TXOUT0P, and TXOUT2M to TXOUT0M pins

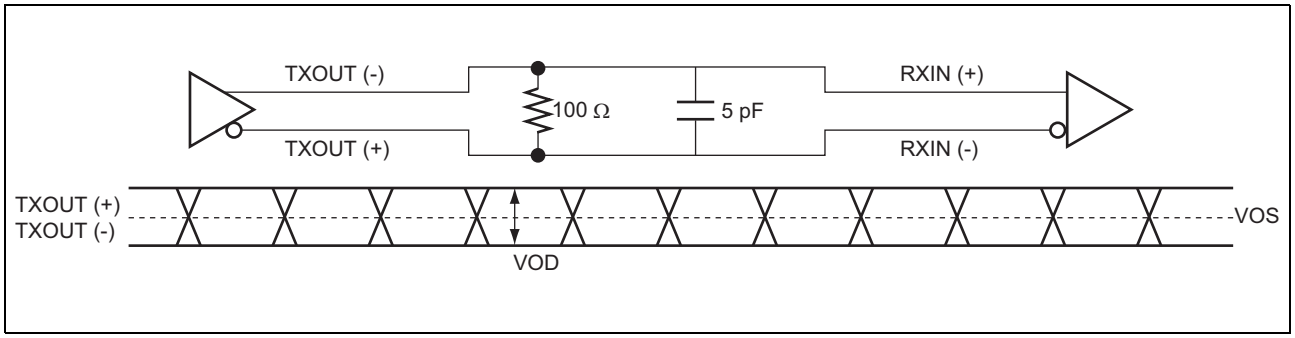

Figure 59.1 LVDS Output Waveform

Table 59.3 Permissible Output Currents

Item		Symbol	Min.	Typ.	Max.	Unit
Permissible output low current (per pin)	P1_0 to P1_7	I_{OL}	—	—	10	mA
	Output pins other than above		—		2	mA
Permissible output high current (per pin)		$-I_{OH}$	—	—	2	mA
Permissible output current (total)		ΣI_O	—	—	150	mA

Caution: To protect the LSI's reliability, do not exceed the output current values in Table 59.3.

59.4 AC Characteristics

Signals input to this LSI are basically handled as signals in synchronization with a clock. The setup and hold times for input pins must be followed.

Conditions for AC characteristics: V_{CC} = $USBDV_{CC}$ = $USBUV_{CC}$ = 1.10 to 1.26 V, PV_{CC} = $USBDPV_{CC}$ = 3.0 to 3.6 V, $PLLV_{CC}$ = 1.10 to 1.26 V, AV_{CC} = 3.0 to 3.6 V, $USBAPV_{CC}$ = 3.0 to 3.6 V, $USBAV_{CC}$ = 1.10 to 1.26 V, $VDAV_{CC}$ = 3.0 to 3.6 V, $LVDSAPV_{CC}$ = 3.0 to 3.6 V, $LVDSPLLV_{CC}$ = 1.10 to 1.26 V,
V_{SS} = AV_{SS} = $USBDV_{SS}$ = $USBAV_{SS}$ = $USBDPV_{SS}$ = $USBAPV_{SS}$ = $USBUV_{SS}$ = $VDAV_{SS}$ = $LVDSAPV_{SS}$ = 0 V,
Ta = –40 to 85 °C, Tj = –40 to 125 °C

Note: Products in BGA packages do not have $USBDV_{CC}$, $USBUV_{CC}$, $USBDPV_{CC}$, $USBDV_{SS}$, $USBAV_{SS}$, $USBDPV_{SS}$, $USBAPV_{SS}$, $USBUV_{SS}$, and $LVDSAPV_{SS}$ pins.

Table 59.4 Operating Frequency

Item		Symbol	Min.	Max.	Unit	Remarks
Operating frequency	CPU clock (Iϕ)	f	100.00	400.00	MHz	
	Image processing clock (Gϕ)		100.00	266.67	MHz	
	Internal bus clock (Bϕ)		100.00	133.33	MHz	
	Peripheral clock 1 (P1ϕ)		50.00	66.67	MHz	
	Peripheral clock 0 (P0ϕ)		25.00	33.33	MHz	

59.4.1 Clock Timing

Table 59.5 Clock Timing

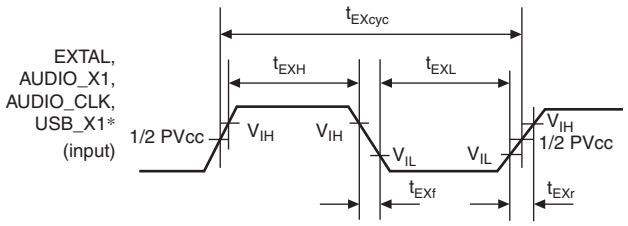
Item	Symbol	Min.	Max.	Unit	Figure
EXTAL clock input frequency (when the clock is supplied to USB 2.0 host/function module)	f_{EX}	12MHz ± 100ppm			Figure 59.2
EXTAL clock input frequency (when the clock isn't supplied to USB 2.0 host/function module)		10.00	13.33	MHz	
EXTAL clock input cycle time (when the clock isn't supplied to USB 2.0 host/function module)	t_{EXcyc}	75.00	100.00	ns	
AUDIO_X1 clock input frequency (crystal resonator connected)	f_{EX}	10.00	50.00	MHz	
AUDIO_X1 clock input cycle time (crystal resonator connected)	t_{EXcyc}	20.00	100.00	ns	
AUDIO_X1, AUDIO_CLK clock input frequency (external clock input)	f_{EX}	1.00	50.00	MHz	
AUDIO_X1, AUDIO_CLK clock input cycle time (external clock input)	t_{EXcyc}	20.00	1000.00	ns	
USB_X1 clock input frequency (when the 48-MHz clock is supplied to USB 2.0 host/function module and high-speed transfer function is used)	f_{EX}	48 MHz ±100 ppm			
USB_X1 clock input frequency (when the 48-MHz clock is supplied to USB 2.0 host/function module, high-speed transfer function is not used, and host controller function is used)		48 MHz ±500 ppm			
USB_X1 clock input frequency (when the 48-MHz clock is supplied to USB 2.0 host/function module, high-speed transfer function is not used, and host controller function is not used)		48 MHz ±2500 ppm			
VIDEO_X1 clock input frequency		27MHz ±50 ppm*1			
EXTAL, AUDIO_X1, AUDIO_CLK, USB_X1 clock input low pulse width	t_{EXL}	0.4	0.6	t_{EXcyc}	
VIDEO_X1 clock input low pulse width		0.45	0.55		
EXTAL, AUDIO_X1, AUDIO_CLK, USB_X1 clock input high pulse width	t_{EXH}	0.4	0.6	t_{EXcyc}	
VIDEO_X1 clock input high pulse width		0.45	0.55		
EXTAL, AUDIO_X1, AUDIO_CLK, USB_ X1 clock input rise time	t_{EXr}	—	4	ns	
VIDEO_X1 clock input rise time		—	3		
EXTAL, AUDIO_X1, AUDIO_CLK, USB_ X1 clock input fall time	t_{EXf}	—	4	ns	
VIDEO_X1 clock input fall time		—	3		
CKIO clock output frequency	f_{OP}	50.00	66.67	MHz	
CKIO clock output cycle time	t_{cyc}	15.00	20.00	ns	Figure 59.3 (1) and Figure 59.3 (2)
CKIO clock output low pulse width 1	t_{CKOL1}	$t_{cyc}/2 - t_{CKOr1}$	—	ns	Figure 59.3 (1)
CKIO clock output high pulse width 1	t_{CKOH1}	$t_{cyc}/2 - t_{CKOr1}$	—	ns	
CKIO clock output rise time 1	t_{CKOr1}	—	3	ns	
CKIO clock output fall time 1	t_{CKOf1}	—	3	ns	
CKIO clock output low pulse width 2	t_{CKOL2}	$t_{cyc}/2 - t_{CKOr2}$	—	ns	Figure 59.3 (2)
CKIO clock output high pulse width 2	t_{CKOH2}	$t_{cyc}/2 - t_{CKOr2}$	—	ns	
CKIO clock output rise time 2	t_{CKOr2}	—	2	ns	
CKIO clock output fall time 2	t_{CKOf2}	—	2	ns	

Table 59.5 Clock Timing

Item	Symbol	Min.	Max.	Unit	Figure
On-chip PLL circuit oscillation settling time	t_{POSC}	1	—	ms	Figure 59.4 and Figure 59.6 (1)
On-chip oscillation circuit oscillation settling time (RTC_X1)	t_{ROSC}	—	3*2	s	Figure 59.7
On-chip oscillation circuit oscillation settling time (RTC_X3)		—	10*2	ms	Figure 59.7
On-chip oscillation circuit oscillation settling time (other than above)		—	4*2	ms	Figure 59.4, Figure 59.6 (1), and Figure 59.7
Mode hold time	t_{MDH}	200	—	ns	Figure 59.4 and Figure 59.6 (1)
SSCG Stabilizing Time	tSSCG	1	—	us	Figure 59.5

Note 1. Reference value. The accuracy of the clock signal affects the quality of images output by the digital video decoder. Input clock signals that are as accurate as is possible.

Note 2. Settings for values smaller than the above specifications may be possible, as long as the values are confirmed through evaluation by the manufacturer of the oscillator.



Note: * When the clock is input on the EXTAL, AUDIO_X1, AUDIO_CLK, USB_X1, or VIDEO_X1

Figure 59.2 EXTAL, AUDIO_X1, AUDIO_CLK, USB_X1, and VIDEO_X1 Clock Input Timing

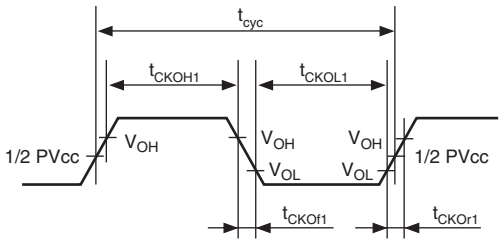


Figure 59.3 (1) CKIO Clock Output Timing 1

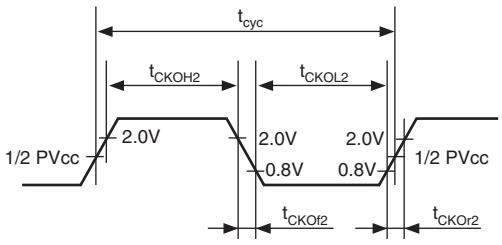

Figure 59.3 (2) CKIO Clock Output Timing 2

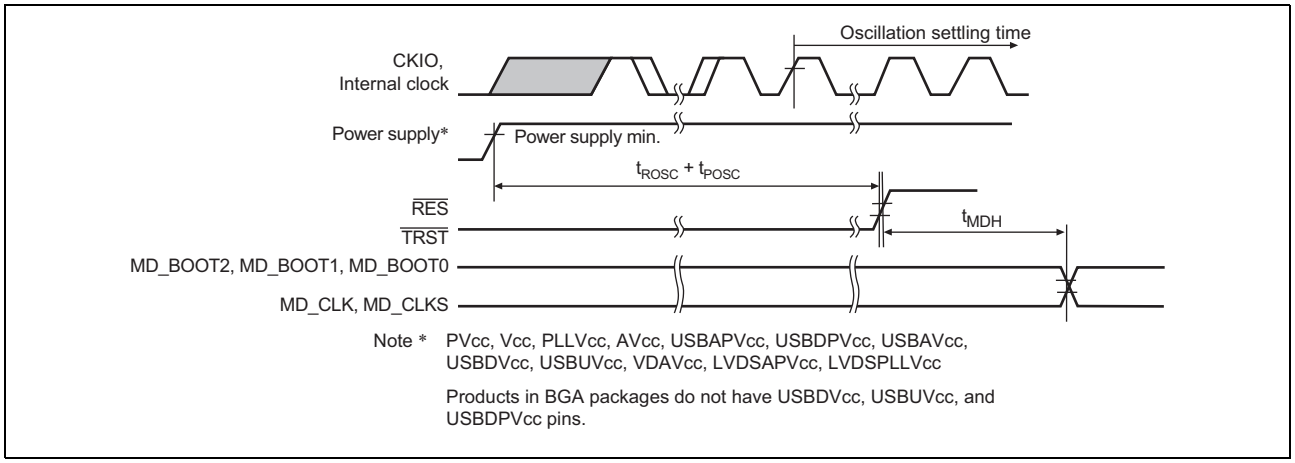

Figure 59.4 Power-On Oscillation Settling Time

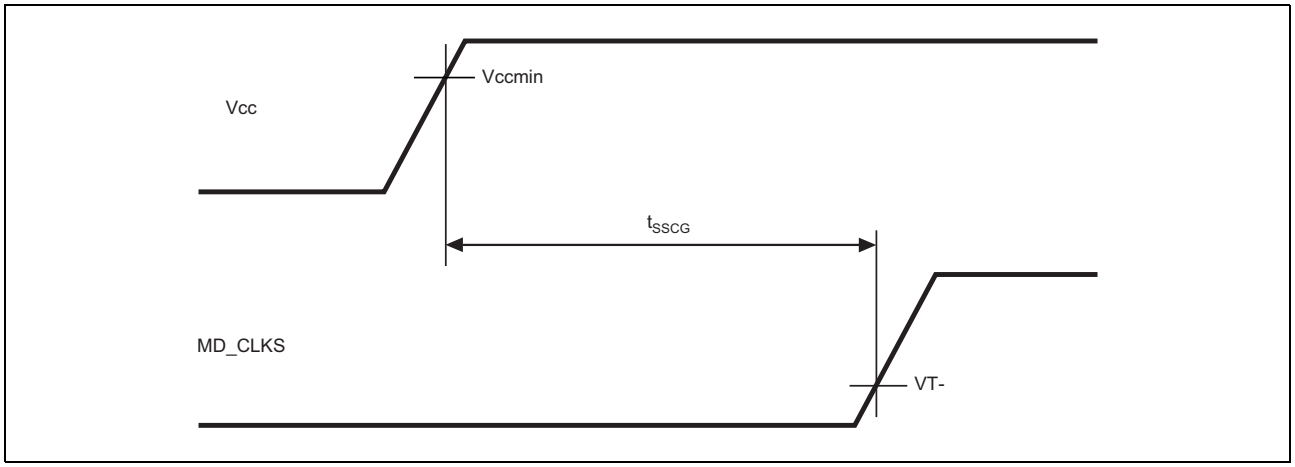

Figure 59.5 SSCG Stabilizing Time

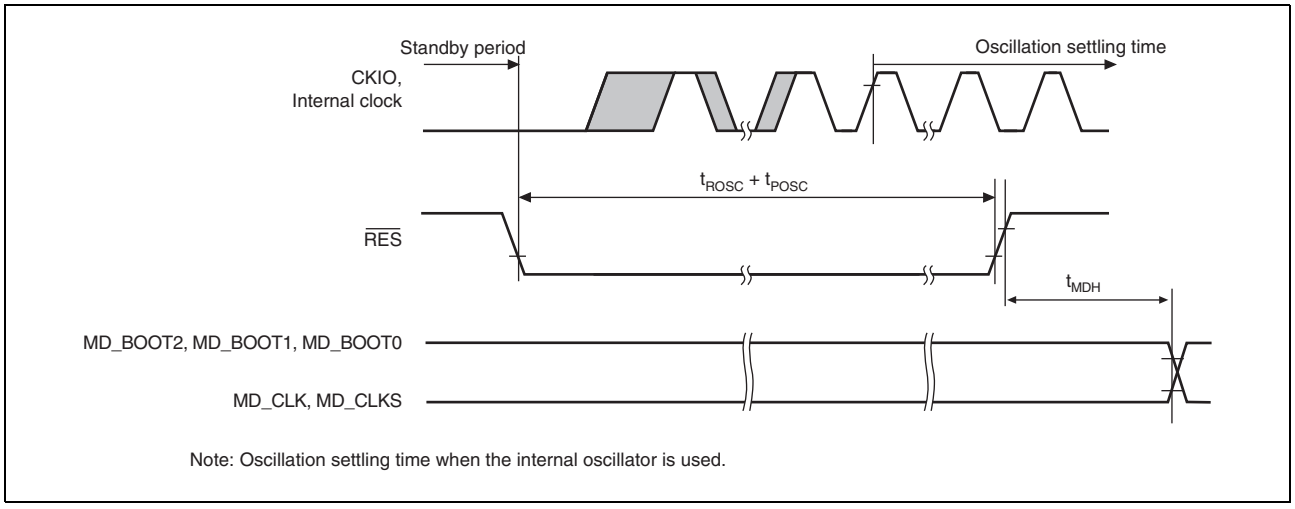

Figure 59.6 (1) Oscillation Settling Time on Return from Standby (Return by Reset)

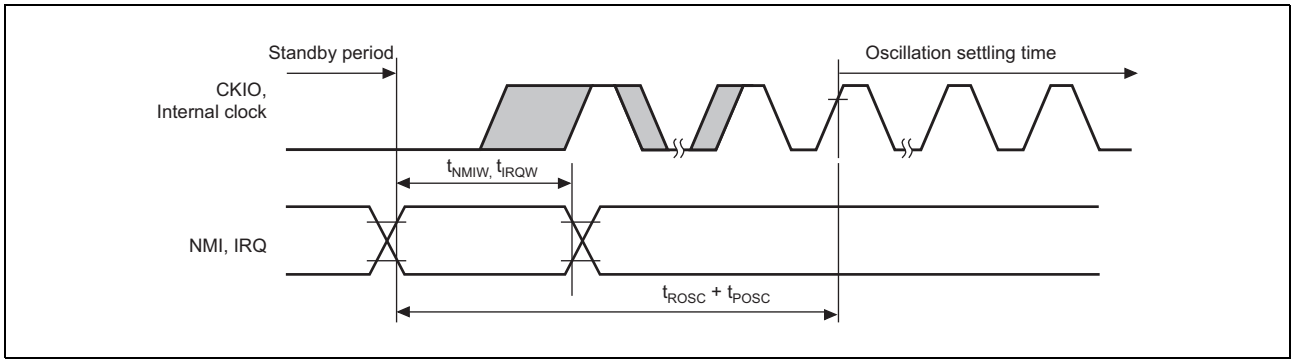

Figure 59.6 (2) Oscillation Settling Time on Return from Standby (Return by NMI or IRQ)

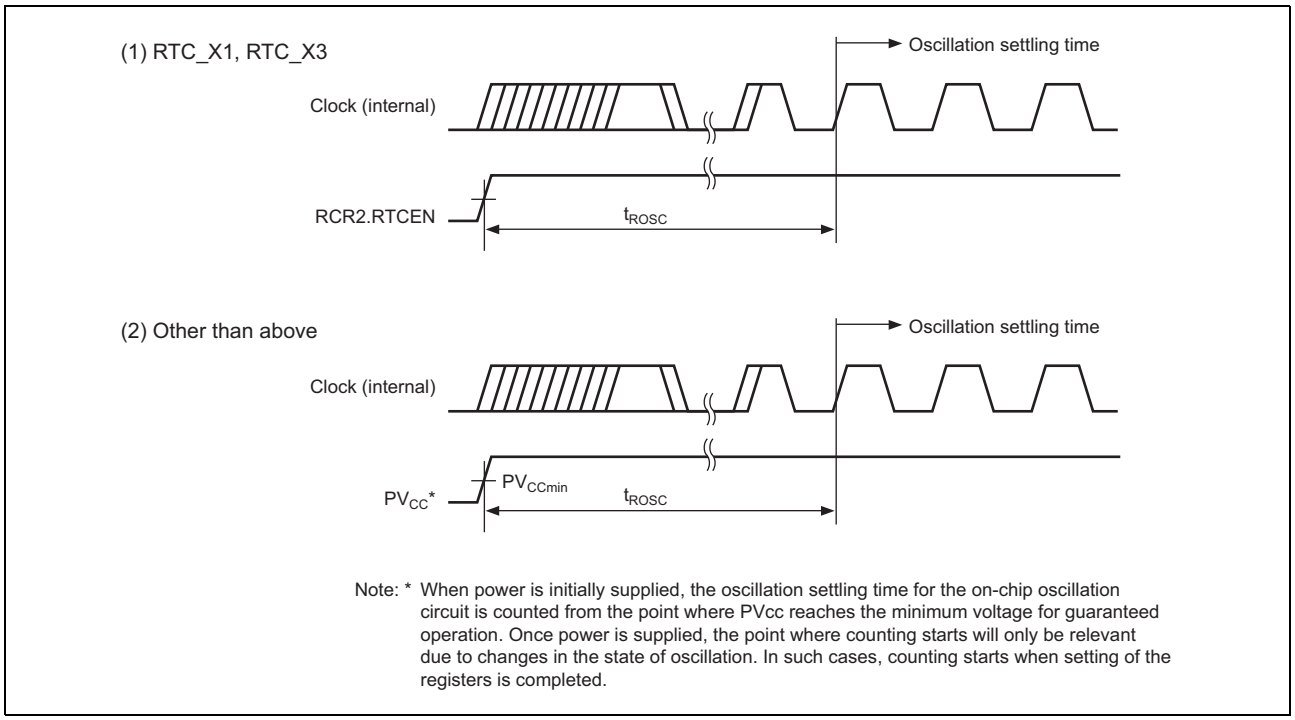

Note: * When power is initially supplied, the oscillation settling time for the on-chip oscillation circuit is counted from the point where PVcc reaches the minimum voltage for guaranteed operation. Once power is supplied, the point where counting starts will only be relevant due to changes in the state of oscillation. In such cases, counting starts when setting of the registers is completed.

Figure 59.7 On-chip Oscillation Circuit Oscillation Settling Time

59.4.2 Control Signal Timing

Table 59.6 Control Signal Timing

Item		Symbol	Min.	Max.	Unit	Figure
$\overline{RES}$ pulse width	Exit from standby mode	t_{RESW}	t_{ROSC} + t_{POSC}		ms	Figure 59.8 (1) Figure 59.6 (1)
	Other than above		20	—	t_{cyc}	
$\overline{TRST}$ pulse width		t_{TRSW}	20	—	t_{cyc}	
NMI pulse width		t_{NMIW}	20	—	t_{cyc}	Figure 59.8 (2) and Figure 59.6 (2)
IRQ pulse width		t_{IRQW}	20	—	t_{cyc}	
TINT pulse width		t_{TINTW}	20	—	t_{cyc}	
$\overline{RES}$ input rise time*1		t_{RSr}	—	500	µs	Figure 59.8 (3)
$\overline{RES}$ negating hold time*2		t_{RSNH}	0	—	ns	Figure 59.8 (4)

Note 1. Make sure that this specification is satisfied when the same signal is controlling the $\overline{TRST}$ and $\overline{RES}$ pins.
Note 2. Make sure that this specification is satisfied when different signals are controlling the $\overline{TRST}$ and $\overline{RES}$ pins.

59.4.11 I²C Bus Interface Timing

Table 59.15 I²C Bus Interface Timing

Item	Symbol	I/O	Standard mode (Sm) Min.	Standard mode (Sm) Max.	Fast mode (Fm) Min.	Fast mode (Fm) Max.	Unit
SCL clock frequency	f_{CLK}	I/O	0	100	0	400	kHz
Bus free time (between stop and start condition)	t_{BUF}	I/O	4.7	-	1.3	-	µs
Hold time*1	$t_{HD:STA}$	I/O	4.0	-	0.6	-	µs
Low period of SCL clock	t_{LOW}	I/O	4.7	-	1.3	-	µs
High period of SCL clock	t_{HIGH}	I/O	4.0	-	0.6	-	µs
Setup time for start/restart condition	$t_{SU:STA}$	I/O	4.7	-	0.6	-	µs
Data hold time (I²C bus device)	$t_{HD:DAT}$	I/O	0*2	-	0*2	-	µs
Data setup time	$t_{SU:DAT}$	I/O	250	-	100*3	-	ns
SDA and SCL signal rise time	t_R	Input	-	1000	20	300	ns
SDA and SCL signal fall time*3	t_F	Input	-	300	20 × (PV_{CC}/5.5 V)	300	ns
		Output	-	250	20 × (PV_{CC}/5.5 V)	250	ns
Setup time for STOP condition	$t_{SU:STO}$	I/O	4.0	-	0.6	-	µs
Capacitive load for each bus line	C_b	-	-	400*4	-	400*4	pF
Pulse width of spikes that must be suppressed by the input filter	t_{SP}	Input	-	-	0	50*5	ns

In the above table and subsequently, SCL and SDA refer to the RIICnSCL and RIICnSDA signals, respectively.

Note 1. The first clock pulse is generated on the SCL line after the start condition has been issued and the hold time has elapsed.

Note 2. This module requires a minimum of 300 ns hold time internally for the SDA signal to handle the period over which the falling edge of SCL has not reached a defined level (time until the CnSCL signal reaches V_{IL} (max.) from V_{IH} (min.)).

Note 3. The fast-mode I²C bus device can be used in the standard mode I²C bus system. In this case, the minimum value of the data setup time ($t_{SU:\,DAT\,(min.)}$ 250 [ns]) must be satisfied.
If the system does not extend the low period of SCL clock (t_{LOW}), this condition is automatically satisfied. If the system extends the low period of SCL clock (t_{LOW}), transmit the subsequent data bit to the SDA line before the SCL line is released ($t_{R\,(max.)}$ + $t_{SU:\,DAT\,(min.)}$ = 1000 + 250 = 1250 [ns]: (standard mode I²C bus specification)).

Note 4. Total capacitance of one bus line. The allowable maximum bus capacitance may differ from this specification, depending on the actual operating voltage and frequency of an application. For techniques to cope with a large bus capacitance, see the I²C bus specification provided by NXP Semiconductors.

Note 5. Noise is removed by the analog and digital input filters. The level of noise reduction of the digital input filter is determined by the period of internal reference clock (IICφ) and the NF[1:0] bits in RIICnMR3. For details, refer to section 18, I²C Bus Interface.

Item	Min.	Typ.	Max.	Unit	Test Conditions
Number of gain steps	—	64	—	step	
Gain step width	—	0.1	—	dB	
Minimum gain	—	0	—	dB	
Maximum gain	—	6.02	—	dB	

Table 59.37 Characteristics of A/D Converter for the Input of Video Signals (ADC)

Item	Min.	Typ.	Max.	Unit	Test Conditions
Resolution	—	10	—	bit	
A/D conversion range	—	1.6	—	Vpp	(VRP – VRM) × 2
Integral linearity error	—	—	± 5.0	LSB	ADC + PGA fs = 27 MHz
Differential linearity error	—	—	± 2.0	LSB	ADC + PGA fs = 27 MHz
S/N	—	54*	—	dB	fin = 1 MHz, fs = 27 MHz PGA_GAIN = 000000
S/(N + D)	—	51*	—	dB	fin = 1 MHz, fs = 27 MHz PGA_GAIN = 000000
Time for return from power saving mode	—	1	—	ms	

Note: * Reference value.

60. States and Handling of Pins

This section describes pin states in each operating mode and how to handle pins.

60.1 Pin States

Table 60.1 shows the pin states in each operating mode.

As for the input/output functions, input buffers are listed on the upper column and output buffers on the lower column.

Table 60.1 Pin States

Pin Function			Pin State						
			Normal State (Other than States at Right)	Power-On Reset*1	Pin State Retained*2			Power-Down State	
					EBUSKEEPE*3(Other than States at Right)		Power-On Reset*4		
Type	Pin Name				0	1		Deep Standby Mode	Software Standby Mode
Clock	EXTAL*6		I	I		I		I/Z*5	I
	XTAL*6		O	O		O		O/Z*5	O/Z*5
	CKIO	Boot mode 0, 1	O/Z*7	O	O	O/Z*7		O/Z*7	O/Z*7
		Boot mode Other than above	O/Z*7	O		O/Z*7		O/Z*7	O/Z*7

[Legend]
I: Input
O: Output
H: High-level output
L: Low-level output
Z: High-impedance
-: Condition under which the pin function is not selectable

Note 1. Indicates the power-on reset by low-level input to the $\overline{RES}$ pin. The pin states after a power-on reset by the watchdog timer overflow is the same as the initial pin states at normal operation (see section 54, Ports).
Note 2. After the chip has been released from deep standby mode by the input on pins for canceling the standby mode such as NMI or by the realtime clock alarm interrupt, the pins retain the state until the IOKEEP bit in the deep standby cancel source flag register (DSFR) is cleared (see section 55, Power-Down Modes).
Note 3. The EBUSKEEPE bit in deep standby control register (DSTCR) (see section 55, Power-Down Modes).
Note 4. This LSI enters the power-on reset state for a certain period after recovery from deep standby control mode (see section 55, Power-Down Modes).
Note 5. Depends on the setting of the RCKSEL bit in the realtime clock control register 5 (RCR5) (see section 13, Realtime Clock).
Note 6. When pins for the connection with a crystal resonator are not used, the input pins (EXTAL, RTC_X1, RTC_X3, AUDIO_X1, USB_X1, and VIDEO_X1) must be fixed (pull-up/down resistor, power supply, or ground.) and the output pins (XTAL, RTC_X2, RTC_X4, AUDIO_X2, USB_X2, and VIDEO_X2) must be open.
Note 7. Depends on the setting of the CKOEN bit in the frequency control register (FRQCR) of the clock pulse generator (see section 6, Clock Pulse Generator).
Note 8. Depends on the setting of the PIPCnm bit in the port IP control register (PIPCn) of the general I/O ports.
Note 9. Depends on the setting of the HIZ bit in the standby control register 2 (STBCR2) (see section 55, Power-Down Modes).
Note 10. Depends on the setting of the HIZMEM bit in the common control register (CMNCR) of the bus state controller (see section 8, Bus State Controller).
Note 11. Depends on the setting of the HIZCNT bit in the common control register (CMNCR) of the bus state controller (see section 8, Bus State Controller).
Note 12. Depends on the setting of the corresponding bit in the deep standby cancel source select register (DSSSR) and the RCKSEL bit in the realtime clock control register 5 (RCR5) (see section 55, Power-Down Modes).
Note 13. Depends on the setting of the RTCEN bit in the realtime clock control register 2 (RCR2) and the RCKSEL bit in the realtime clock control register 5 (RCR5) (see section 13, Realtime Clock).
Note 14. O in serial wire debug (SWD) mode. In modes other than serial wire debug (SWD), Z when the TAP controller is neither the Shift-DR nor Shift-IR state.
Note 15. When this is an output, the output is fixed to either the High or Low level. There is no oscillation.

60.2 Treatment of Unused Pins

How unused pins are to be handled is indicated below.

Table 60.2 Handling of Unused Pins (Except for Debugger Interface Pins)

Pin Name	Handling
NMI	Fix this pin at a high level (pull up or connect to a power supply).
DP1, DP0, DM1, DM0, VBUS1, VBUS0	- Connect these pins to USBDPVss (QFP package). - Connect them to Vss (BGA package).
REFRIN	Connect this pin, via a 5.6 kΩ ± 20 % resistor, to USBAPVcc.
1.18-V power dedicated to the USB (USBAVcc, USBDVcc, USBUVcc)	Supply power at 1.18 V. Note: Products in BGA packages do not have pins USBDVcc and USBUVcc.
3.3-V power dedicated to the USB (USBAPVcc, USBDPVcc)	Supply power at 3.3 V. Note: Products in BGA packages do not have the USBDPVcc pin.
Dedicated USB ground (USBAPVss, USBDPVss, USBAVss, USBDVss, USBUVss)	Connect to ground. Note: Products in BGA packages do not have the dedicated USB ground pins.
AVref	Connect this pin to AVcc.
Dedicated A/D power (AVcc)	Supply power at 3.3 V.
Dedicated A/D ground (AVss)	Connect to ground.
VIN1A, VIN2A, VIN1B, VIN2B, VRP, VRM, REXT	Open-circuit
Dedicated A/D power for input of video signals (VDAVcc)	Supply power at 3.3 V.
Dedicated A/D ground for input of video signals (VDAVss)	Connect to ground.
LVDSREFRIN	Open-circuit
LVDS analog power supply (LVDSAPVcc)	Supply power at 3.3 V.
LVDS PLL power supply (LVDSPLLVcc)	Supply power at 1.18 V.
LVDS analog ground (LVDSAPVss)	Connect to ground.
Dedicated input pins other than those listed above	Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level)*2.
Input/output pins other than those listed above	Make the input-pin settings and then fix the level (pull them up or down)*2; alternatively, make the output-pin settings and leave the pins open-circuit.
Dedicated output pins	Open-circuit

Note 1. We recommend that the values of pull-up or pull-down resistors are in the range from 4.7 kΩ to 100 kΩ.
Note 2. By setting the ports in accord with section 54, Ports, setting of a fixed level can be made unnecessary for some pins. For details, see section 54.3.12, Port Input Buffer Control Register (PIBCn/JPIBC0).

Table 60.3 Handling of Debugger Interface Pins (when Emulator is not Used)

Pin	Handling
BSCANP	Fix this pin at a low level (pull down or connect to the ground level).
$\overline{\text{TRST}}$*3	Fix this pin at a low level (pull down or connect to the ground level). Or connect to another pin which operates in the same manner as the $\overline{\text{RES}}$ pin
TCK, TMS, TDI	Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level).
TDO	Open-circuit

Note 1. When using the emulator, handle these pins as described in the manual for the emulator.
Note 2. We recommend that the values of pull-up or pull-down resistors are in the range from 4.7 kΩ to 100 kΩ.
Note 3. If the pin is not fixed to the low level, whether an emulator is or is not in use, the specifications in Table 56.12, Reset Signal Setting, or $\overline{\text{RES}}$ input rise time (t_{RSr}) or $\overline{\text{RES}}$ negating hold time (t_{RSNH}) in Table 59.6, Control Signal Timing, must be satisfied.

60.3 Handling of Pins in Deep Standby Mode

How pins are to be handled in deep standby mode is indicated below.
For the states of pins in deep standby mode, refer to the corresponding items under section 60.1, Pin States. Handling of unused pins as described under section 60.2, Treatment of Unused Pins, also applies in deep standby mode.

Table 60.4 Handling of Pins in Deep Standby Mode

Pin	Handling
1.2-V power (Vcc, USBDVcc, USBUVcc, USBAVcc, PLLVcc, LVDSPLLVcc)	Supply power at 1.2 V. Note: Products in BGA packages do not have pins USBDVcc and USBUVcc.
3.3-V power (PVcc, AVcc, USBDPVcc, USBAPVcc, VDAVcc, LVDSAPVcc)	Supply power at 3.3 V. Note: Products in BGA packages do not have the USBDPVcc pin.
Ground (Vss, USBDVss, USBUVss, USBAVss, AVss USBDPVss, USBAPVss, VDAVss, LVDSAPVss)	Connect to ground. Note: Products in BGA packages do not have the USBDVss, USBAVss, USBUVss, USBDPVss, USBAPVss, and LVDSAPVss pins.
VBUS1, VBUS0	Fix the level on this pin (pull it up or down, or connect it to the power supply or ground level) or open circuit. However, note that current as indicated in table 59.2, DC Characteristics (2) [Current Consumption] will be drawn by the pin fixed to the high level.
REFRIN	Connect this pin to USBAPVss via 5.6 kΩ ± 1% resistor (QFP package). Connect this pin to Vss via 5.6 kΩ ± 1% resistor (BGA package).
DP1, DP0, DM1, DM0	Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level) or open circuit.
AVref	Fix the level on this pin (from 3.0 V to AVcc)
REXT	Connect this pin to VDAVss via 22 kΩ ± 1% resistor.
VRP, VRM	Connect these pins to VDAVss via 0.1-μF resistor.
LVDSREFRIN	Connect this pin to LVDSAPVss via 5.6 kΩ ± 1% resistor (QFP package). Connect this pin to Vss via 5.6 kΩ ± 1% resistor (BGA package).
VIN1A, VIN1B, VIN2A, VIN2B	Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level) or open circuit.
EXTAL, RTC_X1, AUDIO_X1, USB_X1, VIDEO_X1	Connect the pins to the crystal oscillator or the clock-input signal, or to a fixed level (pull them up or down, or connect them to the power supply or ground level)
XTAL, RTC_X2, AUDIO_X2, USB_X2, VIDEO_X2	Connect the pins to the crystal oscillator or open circuit.
Dedicated input pins other than those listed above	Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level).
Input/output pins (other than those listed above) in the input state	Fix the level on the pins (pull them up or down).
Input/output pins (other than those listed above) in the high-impedance state	Fix the level on the pins (pull them up or down) or open circuit.
Input/output pins (other than those listed above) in the output state	Open-circuit
Dedicated output pins other than those listed above	Open-circuit

Note: We recommend that the values of pull-up or pull-down resistors are in the range from 4.7 kΩ to 100 kΩ.

60.4 Recommended Combination of Bypass Capacitor

Mount a multilayer ceramic capacitor between a pair of the power supply pins as a bypass capacitor. These capacitors must be placed as close as the power supply pins of the LSI. The capacitance of the capacitors should be used 0.1 µF to 0.33 µF (recommended values). For details of the capacitor related to the crystal resonator, see section 6, Clock Pulse Generator.

Figure 60.1 is an example of the externally allocated capacitor in the products in 256-pin QFP packages.

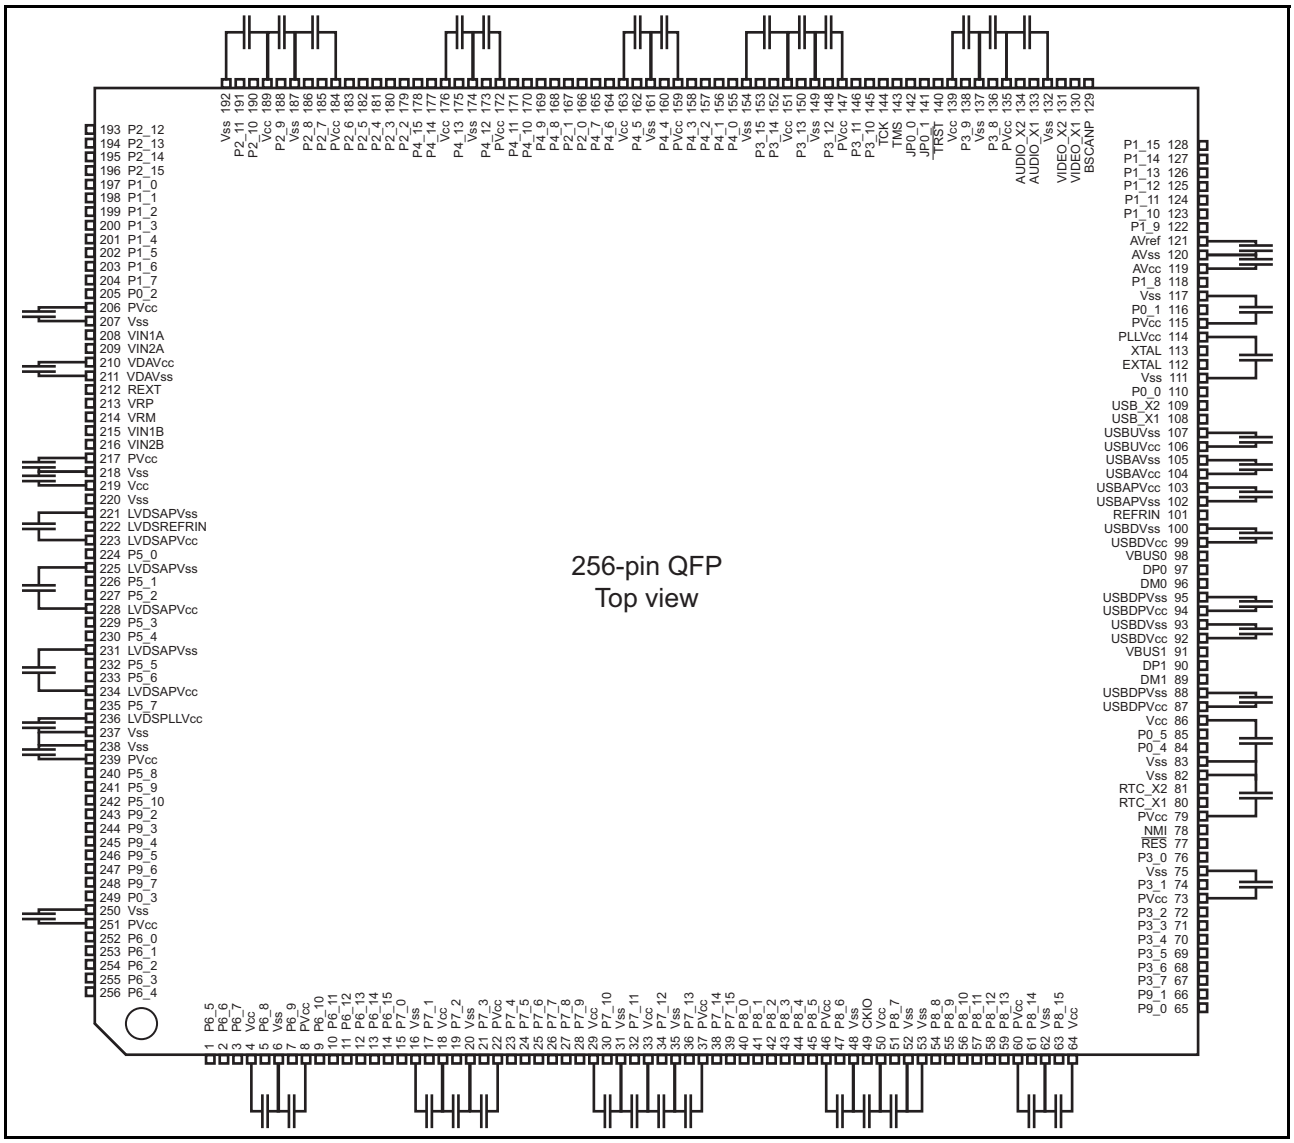

Figure 60.1 Example of Externally Allocated Capacitors in the Products in 256-Pin QFP Packages

Figure A.3 Dimensions of 324-Pin BGA Package

B. Thermal Characteristics

The junction temperature (Tj) of an average sample (typ. value) can be calculated from either of the following expressions.

Calculation by using θja
$Tj = Ta + (P_D \times \theta ja)$, where

- Tj: junction temperature;
- Ta: ambient temperature;
- P_D: power consumption of the entire LSI; and
- θja: thermal resistance between Tj and Ta.

Calculation by using Ψjt
$Tj = Tt + (P_D \times \Psi jt)$, where

- Tt: temperature at the center of the top of the package; and
- Ψjt: thermal characteristics parameter representing the difference between Tj and Tt.

Since the value of θja varies greatly with the usage environment (e.g. the board and casing), the junction temperature (Tj) calculated by using θja is less accurate. Accordingly, when calculating Tj by using θja, allow a sufficient margin in designing the system. The value of Ψjt varies little with differences in the usage environment, but pay particular attention to measuring the temperature at the center of the top of the package (Tt) if you use this approach. For the values of θja and Ψjt, contact your local sales representative.

Revision History	RZ/A1H Group, RZ/A1M Group User's Manual: Hardware

Rev.	Date	Description	
		Page	Summary
1.00	Jun 10, 2014	—	First edition, issued
2.00	May 25, 2015	All	RZ/A1M specification added, and erroneous pin names, register names, and bit names corrected
		1. Overview	
		1-2, 1-4, 1-8	Table 1.1 RZ/A1H Features: Specification of CPU, IEBus™ controller, and capture engine unit corrected
		1-18	Table 1.3 Pin Functions: Function of REFRIN corrected
		1-22 to 1-27	Table 1.4 List of Pins (256-Pin, BGA): Description corrected (BGA 256 No. → Ball Number)
		1-35 to 1-43	Table 1.6 List of Pins (324-Pin, BGA): No. deleted
		1-46	Figure 1.4 (10) Simplified Circuit Diagram (Oscillation Buffer 1) corrected
		1-46	Figure 1.4 (11) Simplified Circuit Diagram (Oscillation Buffer 2) corrected
		2. CPU	
		2-1	2.1 Features: Note 2 added
		4. Secondary Cache	
		4-1	Table 4.1 Setting Values of Configuration Signals corrected
		5. LSI Internal Bus	
		5-8, 5-9	Table 5.5 Address Map: Note 10 added
		5-10	5.5.2 Operation: Erroneous description corrected (number of digits of the addresses)
		5-12, 5-13	5.8 AXI Protocol Control Signals: Description corrected
		6. Clock Pulse Generator	
		6-5	Table 6.2 Input/Output Clock Frequency: Pin name corrected (MD_CLK0 → MD_CLK)
		6-7	6.4.1 Frequency Control Register (FRQCR): Erroneous description of CKOEN[1:0] bits corrected (Table 6.6 → Table 6.7)
		6-15	Figure 6.4 Definition of SSCG Modulation Rate and Frequency corrected
		6-16	Figure 6.5 Clock Signals for the System and Realtime Clock: Description corrected
		6-19	Figure 6.9 Clock Signals for Other Modules corrected
		6-20	Figure 6.10 Distribution of Internal Clock Signals: Description corrected
		6-21	Figure 6.11 Distribution of Internal Clock Signals (2): Erroneous description of CKOEN[1:0] bits corrected (IEBus controller → IEBus™ controller)
		7. Interrupt Controller	
		7-1	7.1 Features: Body corrected and ARM PrimeCell® generic interrupt controller (PL390) added
		7-3	7.3 Register Descriptions: Body corrected
		7-3, 7-13	Table 7.2 Register Configuration: Superscript "*3" added to the initial value of the interrupt controller type register Table 7.2 Register Configuration: Note 1 corrected and Note 3 added
		7-16	7.3.3 IRQ Interrupt Request Register (IRQRR): Description of bits IRQ7F to IRQ0F corrected
		7-17	7.4 Interrupt Sources: Body corrected
		7-17	7.4.1 NMI Interrupt: Body corrected
		7-17	7.4.2 IRQ Interrupts: Body corrected
		7-18	7.4.3 On-Chip Peripheral Module Interrupts: Body corrected
		7-19	7.4.4 Pin Interrupts: Body corrected
		7-19	7.5 Interrupt IDs: Body corrected
		7-22	Table 7.3 List of Interrupt IDs: Request source name, OIR_VSYNCERR0 corrected into OIR_VLINE0
		7-31	Table 7.3 List of Interrupt IDs: Entries under "Interrupt Request Edge/Level" for interrupt IDs 389 to 398 added
		7-37	7.6.1 Initial Settings: Body corrected
		7-39	7.6.2 Flow of Interrupt Operations: Body corrected

Rev.	Date	Description	
		Page	Summary
2.00	May 25, 2015	7-39	Figure 7.3 Flow of Interrupt Operations corrected
		7-41	7.8.3 Notes on Reading Interrupt ID Values from Interrupt Acknowledge Register (ICCIAR): Body corrected
		8. Bus State Controller	
		8-4	Table 8.2 Address Map: Reference section in note 1 corrected
		8-7	8.4.1 Common Control Register (CMNCR): Erroneous description of bits 28 and 24 corrected
		8-34	8.4.10 Timeout Enable Register (TOENR): Description of bits 5 to 0 corrected
		8-73	Table 8.15 Access Address in SDRAM Mode Register Write: Erroneous description corrected (ruled lines corrected)
		8-77	Table 8.17 Relationship between Bus Width, Access Size, and Number of Bursts: Erroneous description in note 1 corrected
		8-86	Figure 8.40 Idle Cycle Conditions corrected
		8-87	8.5.11 (3) On-Chip Peripheral Module Access: Body corrected (P0f or P1f → P0ϕ or P1ϕ)
		9. Direct Memory Access Controller	
		9-23	9.4.11 Channel Extension Register n (CHEXT_n) corrected
		9-25	9.4.14 DMA Control Register (DCTRL_0_7, DCTRL_8_15) corrected
		9-32	9.4.25 DMA Extension Resource Selectors 0 to 7 (DMARS0 to DMARS7): Bit 14 of DMARS2 corrected
		9-35	Table 9.4 On-Chip Peripheral Module Requests: Entries under "DMARS" for serial communication interface with FIFO channels 0 to 2 corrected
		9-37	Table 9.4 On-Chip Peripheral Module Requests: Entry under "AM[2:0]" for USB2.0 host/function module channel 1 corrected
		9-66	Figure 9.30 DMA Transfer Stop (Buffer Sweep Mode) corrected
		9-79	9.9.3 Atomic Access (ARLOCK[1:0] and AWLOCK[1:0]) added
		10. Multi-Function Timer Pulse Unit 2	
		10-8	Table 10.4 CCLR0 to CCLR2 (Channels 0, 3, and 4): Erroneous description corrected (Bit 6 CCLR1, Bit 5 CCLR0)
		10-12	Table 10.10 Setting of Operation Mode by Bits MD0 to MD3: Description corrected
		10-31	10.3.4 Timer Interrupt Enable Register (TIER): Description of TTGE and TTGE2 bits corrected
		10-36	10.3.6 Timer Buffer Operation Transfer Mode Register (TBTM): Description added to description of TTSE, TTSB, and TTSA bits
		10-38	10.3.8 Timer A/D Converter Start Request Control Register (TADCR): Description of ITA4VE bit corrected
		10-46	10.3.17 Timer Output Control Register 1 (TOCR1): Note 2 corrected
		10-54	10.3.23 Timer Cycle Data Register (TCDR): Body corrected
		10-55	10.3.25 Timer Interrupt Skipping Set Register (TITCR): Note corrected
		10-57	10.3.26 Timer Interrupt Skipping Counter (TITCNT): Body corrected and description of 4VCNT[2:0] bits corrected
		10-60	10.3.29 Timer Waveform Control Register (TWCR): Note corrected
		10-89	Figure 10.35 Procedure for Selecting Reset-Synchronized PWM Mode: Description of [6] and note corrected
		10-94	Figure 10.38 Example of Complementary PWM Mode Setting Procedure: Description of [9] corrected
		10-126	Figure 10.73 Example of Procedure for Specifying A/D Converter Start Request Delaying Function: Description of [2] corrected
		10-154	10.8.2 Reset Start Operation: Body corrected
		11. OS Timer	
		11-1	11.1.1 Features of OSTM: Body of Register address corrected
		11-1	Table 11.2 Register Base Addresses corrected
		11-2	11.2.1 Registers Overview: Table corrected
		11-5	Table 11.8 OSTMnTS register contents: Function of OSTMnTS bit corrected
		11-6	Table 11.9 OSTMnTT register contents: Function of OSTMnTT bit corrected
		11-7	11.3.1 Block Diagram added, and Figure 11.1 Block Diagram of OSTM added
		11-8	11.3.3 Generation of Interrupt Request: Body corrected Figure 11.2 Generating an Interrupt when Counting Starts (in Interval Timer Mode) added
		11-9	11.3.4 Starting and Stopping the Timer: Description of initialization deleted
		11-9 to 11-11	11.3.5.1 Basic Operation in Interval Timer Mode: Body corrected Figure 11.3 Timing Diagram of OSTM in Interval Timer Mode added Figure 11.4 Timing Diagram of Forced Restart in Interval Timer Mode added

Rev.	Date	Description	
		Page	Summary
2.00	May 25, 2015	11-12	11.3.5.2 Operation when OSTMnCMP = 0000 0000_H: Body corrected Figure 11.5 Timing Diagram when OSTMnCMP = 0000 0000_H in Interval Timer Mode added
		11-13, 11-14	11.3.6.1 Basic Operation in Free-Running Comparison Mode: Body corrected Figure 11.6 Timing Diagram of OSTM in Free-Run Compare Mode added Table 11.11 OSTMTINT Generation Timing added
		11-14, 11-15	11.3.6.2 Operation when OSTMnCMP = 0000 0000_H added Figure 11.7 Timing Diagram when OSTMnCMP = 0000 0000_H in Free-Run Compare Mode added
		12. Watchdog Timer	
		12-1	12.1 Features: Body corrected
		12-4	12.3.2 Watchdog Timer Control/Status Register (WTCSR): Description of bits 2 to 0 corrected
		12-5	12.3.3 Watchdog Reset Control/Status Register (WRCSR): Bit 5 corrected
		12-6	Figure 12.2 Writing to WTCNT and WTCSR: Addresses corrected
		12-6	12.3.4 (2) Writing to WRCSR: Body corrected
		12-6	Figure 12.3 Writing to WRCSR: Addresses corrected
		12-8	12.4.1 Canceling Software Standby Mode: Body corrected
		12-8	12.4.2 Using Watchdog Timer Mode: Body corrected
		15. Serial Communications Interface	
		15-1	Table 15.1 Specifications of SCI: Specifications in "Clock source" under "Asynchronous mode" corrected
		15-2	Table 15.2 Input and Output Pins of the SCIs: Note corrected
		15-46	Figure 15.24 Example of Simultaneous Serial Transmission and Reception Flowchart (Clock Synchronous Mode) corrected
		15-65	Table 15.18 Pin Configuration corrected
		17. SPI Multi I/O Bus Controller	
		17-10	Table 17.3 Relationship between SPBR[7:0] and BRDV[1:0] Settings: Description corrected
		18. I^2C Bus Interface	
		18-1	18.1.2 Register Base Addresses: Body corrected
		18-1	Table 18.3 Register Base Address corrected
		18-2	18.1.3 External I/O Signals: Title corrected
		18-2	Table 18.4 RIICn Pin Configuration corrected
		18-3	18.2.1 Functional Overview, Issuing and detecting conditions: Body corrected
		18-4	18.2.1 Functional Overview, Noise removal: Body corrected
		18-6	Figure 18.2 Connections to the External Circuit by the I/O Pins (I^2C Bus Configuration Example): Pin names (RIICnSCL and RIICnSDA) corrected
		18-7 to 18-38	Bit position of each register corrected
		18-8	18.3.1 RIICnCR1 - I^2C Bus Control Register 1: Description of IICRST Bit (I^2C Bus Interface Internal Reset) corrected
		18-9	Table 18.6 RIIC Resets corrected
		18-9	18.3.1 RIICnCR1 - I^2C Bus Control Register 1: Body of ICE Bit (I^2C Bus Interface Enable) corrected
		18-11, 18-12	18.3.2 RIICnCR2 - I^2C Bus Control Register 2: Description and caution of RS Bit (Restart Condition Issuance Request) and description of TRS Bit (Transmit/Receive Mode) corrected
		18-14	Table 18.8 RIICnMR1 register contents: Note 1 corrected
		18-17	18.3.4 RIICnMR2 - I^2C Bus Mode Register 2: Note 1 of SDDL[2:0] Bits (SDA Output Delay Setup Counter) corrected ([Fm])
		18-19	18.3.5 RIICnMR3 - I^2C Bus Mode Register 3: Description of NF[1:0] Bits (Noise Filter Stage Selection) and ACKBT Bit (Transmit Acknowledge) corrected
		18-20	18.3.5 RIICnMR3 - I^2C Bus Mode Register 3: Name and body of SMBE Bit (SMBus Select) corrected
		18-29	18.3.9 RIICnSR1 - I^2C Bus Status Register 1: Description of DID Flag (Device-ID Address Detection) and HOA Flag (Host Address Detection) corrected
		18-31	18.3.10 RIICnSR2 - I^2C Bus Status Register 2: Description of TMOF Flag (Timeout) and AL Flag (Arbitration-Lost) corrected
		18-35	Table 18.17 RIICnSARy register contents: Function of SVA[9:1] bits corrected
		18-36	18.3.11 RIICnSARy - I^2C Slave Address Register y (y = 0 to 2): Name of SVA[9:1] Bits corrected (Lower → Upper)
		18-40	Table 18.21 Examples of RIICnBRH/RIICnBRL Settings for Transfer Rate (when RIICnFER.SCLE = 1 and RIICnFER.NFE = 0) corrected

Rev.	Date	Description	
		Page	Summary
2.00	May 25, 2015	18-40	Table 18.22 Examples of RIICnBRH/RIICnBRL Settings for Transfer Rate (when RIICnFER.SCLE = 1, RIICnFER.NFE= 1, and Number of NF Stages = 4) corrected
		18-41	18.3.14 RIICnDRT - I2C Bus Transmit Data Register: Body corrected
		18-45	Figure 18.3 I2C Bus Format corrected
		18-45	18.5.1 Communication Data Format: Body corrected
		18-47, 18-48	18.5.3 Master Transmit Operation: Description of (3), (5), and (7) corrected, and caution added
		18-52	18.5.4 Master Receive Operation: Body corrected
		18-54	Figure 18.10 Example Flowchart for the Master Reception of 3 or More Bytes (7-Bit Address Format): Title corrected
		18-56	Figure 18.13 Master Receive Operation Timing (3) (when RDRFS = 0): Level of TRS and TDRE corrected
		18-58	18.5.5 Slave Transmit Operation: Description of (7) corrected and caution added
		18-59	Figure 18.15 Example of Slave Transmission Flowchart corrected
		18-64	18.6 SCL Synchronization Circuit: Body corrected
		18-65	Figure 18.22 SDA Output Delay Facility corrected
		18-66	18.8 Digital Noise-Filter Circuits: Body corrected
		18-69	18.9.2 Detection of the General Call Address: Body corrected
		18-70	18.9.3 Device-ID Address Detection: Body corrected
		18-71	Figure 18.28 AASy/DID Flag Set/Clear Timing during Reception of Device-ID corrected
		18-74	Figure 18.31 Suspension of Data Transfer when NACK is Received (NACKE = 1) corrected
		18-79	18.11.2 Function to Detect Loss of Arbitration during NACK Transmission (NALE Bit): Body corrected
		18-80	18.11.3 Slave Arbitration-Lost Detection (SALE Bit): Body corrected
		18-82	Figure 18.37 Start Condition/Restart Condition Issue Timing (ST and RS Bits) corrected
		18-83	Figure 18.38 Stop Condition Issue Timing (SP Bit): Erroneous description corrected (IICϕ)
		18-84	18.13.1 Timeout Function: Description corrected
		18-87	18.13.3 RIIC Reset and Internal Reset: Reference section corrected
		18-90	18.15 Reset Function of RIIC: Title corrected
		18-90, 18-91	Table 18.24 RIIC Reset Functions: Title of the table and description corrected
		21. CAN Interface	
		21-2	21.1.2 Register addresses: Body corrected
		21-2	Table 21.4 Register base address corrected
		21-10	Table 21.10 List of RS-CAN Module Registers (3/25): Register name of Transmit/receive FIFO buffer receive interrupt flag status register and Transmit/receive FIFO buffer transmit interrupt flag status register corrected
		21-32	Table 21.11 Transmit Buffer p Allocated to Each Channel: CANn corrected to CANm
		21-32	Table 21.12 Transmit/Receive FIFO Buffer k Allocated to Each Channel: CANn corrected to CANm
		21-38	21.3.2 RSCAN0CmCTR - Channel Control Register (m = 0 to 4): Erroneous description of OLIE bit corrected
		21-43	21.3.4 RSCAN0CmERFL - Channel Error Flag Register (m = 0 to 4): Name of CRCREG[14:0] flag corrected
		21-69	21.3.18 RSCAN0GAFLP1j - Receive Rule Pointer 1 Register (j = 0 to 15): Name of GAFLFDP [22:0] bits corrected
		21-71	21.3.20 RSCAN0RMNDy - Receive Buffer New Data Register y (y = 0 to 2): Description of RMNSq flags (q = 0 to 79) corrected
		21-72	21.3.21 RSCAN0RMIDq - Receive Buffer ID Register (q = 0 to 79): Name of RMIDE bit corrected
		21-109	21.3.45 RSCAN0TMCp - Transmit Buffer Control Register (p = 0 to 79): Body corrected
		21-139	21.3.63 RSCAN0GTSTCFG - Global Test Configuration Register: Function of C4ICBCE, C3ICBCE, and C2ICBCE bits corrected
		21-145	Figure 21.2 CAN Global Interrupt Block Diagram corrected
		21-151	21.5.2.1 Channel Stop Mode: Erroneous description corrected
		21-171	Figure 21.16 CAN Setting Procedure after the this LSI is Reset corrected
		21-193	21.11 Notes on the RS-CAN Module: Description corrected
		22. IEBus Controller	
		22-3	22.2.1 Function overview: Description of effective transmission speed corrected
		22-50	Table 22-29 Received control data and data written to the IEBBnDR register: Function of 5H corrected

Rev.	Date	Description	
		Page	Summary
2.00	May 25, 2015	22-76	Note 1 corrected
		22-92	(c) Slave status transmission request processing flow example: Title corrected
		22-100	Figure 22-45 Master transmission (FIFO mode): Description corrected
		22-102	Figure 22-47 Master reception (FIFO mode): Description corrected
		22-106	Figure 22-51 Slave transmission (FIFO mode): When the control bit 3H or 7H is received: Description corrected
		22-111	22.7.1 (3) Effective transmission speed: Description corrected
		22-112	Table 22-56 Transfer rate and maximum number of transfer bytes in each communication mode: Effective transfer rate corrected
		22-119	Table 22-60 Control field $\overline{\text{ACK}}$ signal response conditions (when the received control data is 0H, 3H, 4H, 5H, 6H, or 7H): Title corrected (H → 0H)
		22-123	22.7.6 (9) (b) Last acknowledge bit of the control field: Body corrected
		22-125	Note b) in Figure 22-62 corrected
		25. LIN Interface	
		25-1	25. LIN Interface: Body corrected
		25-1	25.1 Features: Title corrected
		25-1	25.1.2 Register Addresses: Body corrected
		25-1	Table 25.2 Register Base Addresses corrected
		25-1	Table 25.3 RLIN3n Clock Supply: Title corrected
		25-2	Table 25.4 RLIN3n Interrupt and DMA Requests corrected
		25-3	25.2 Function: Body corrected
		25-4	Table 25.6 LIN Interface Specifications corrected
		25-4	Table 25.6 LIN Interface Specifications corrected (prohibition of the frame separated mode setting added)
		25-5	Figure 25.1 LIN Interface Block Diagram: n = 0, 1 deleted
		25-7 to 25-32	25.3.1 LIN Master Related Registers: Address and bit position of each register corrected
		25-7	Table 25.8 RLN3nLWBR register contents: Function of LWBR0 bit corrected
		25-7	25.3.1.1 RLN3nLWBR - LIN Wake-up Baud Rate Select Register: Description of NSPB[3:0] bits (bit sampling count select bits) and LWBR0 bit (wake-up baud rate select bit) corrected
		25-8	Table 25.9 RLN3nLBRP0 register contents: Function corrected (setting range corrected)
		25-8	Table 25.10 RLN3nLBRP1 register contents: Function corrected (setting range corrected)
		25-9	Table 25.11 RLN3nLSTC register contents: Function of reserved bits corrected
		25-9	25.3.1.4 RLN3nLSTC - LIN Self-Test Control Register: Body corrected
		25-10	25.3.1.5 RLN3nLMD - LIN Mode Register: Description of LCKS[1:0] bits (LIN system clock select bits) corrected
		25-14	25.3.1.8 RLN3nLWUP - LIN Wake-up Configuration Register: Description of WUTL[3:0] bits (wake-up transmission low level width select bits) corrected
		25-15	Table 25.16 RLN3nLIE register contents: Function of SHIE, ERRIE, FRCIE, and FTCIE bits corrected
		25-15, 25-16	25.3.1.9 RLN3nLIE - LIN Interrupt Enable Register: Description of SHIE bit (successful header transmission interrupt enable bit), ERRIE bit (error detection interrupt request enable bit), FRCIE bit (successful frame/wake-up reception interrupt request enable bit), and FTCIE bit (successful frame/wake-up transmission interrupt request enable bit) corrected
		25-17	25.3.1.10 RLN3nLEDE -LIN Error Detection Enable Register: Description of PBERE bit (physical bus error detection enable bit) corrected
		25-19	25.3.1.11 RLN3nLCUC - LIN Control Register: Description of OM1 bit (LIN mode select bit) corrected
		25-20	25.3.1.12 RLN3nLTRC - LIN Transmission Control Register: Description of RTS bit (response transmission/ reception start bit) and FTS bit (frame transmission/wake-up transmission/reception start bit) corrected
		25-20	Table 25.19 RLN3nLTRC register contents: Note added (prohibition of the frame separated mode setting) in the RTS bit function
		25-22, 25-23	25.3.1.14 RLN3nLST - LIN Status Register: Body and description of HTRC flag (successful header transmission flag), D1RC flag (successful data 1 reception flag), ERR flag (error detection flag), FRC flag (successful frame/ wake-up reception flag) and FTC flag (successful frame/wake-up transmission flag) corrected
		25-24, 25-25	25.3.1.15 RLN3nLEST - LIN Error Status Register: Body and description of RPER flag (response preparation error flag), CSER flag (checksum error flag), FER flag (framing error flag), FTER flag (timeout error flag), PBER flag (physical bus error flag), and BER flag (bit error flag) corrected
		25-26 to 25-28	25.3.1.16 RLN3nLDFC - LIN Data Field Configuration Register: Description of LSS bit (transmission/reception continuation select bit), FSM bit (frame separate mode select bit), RFT bit (response field communication direction select bit), and RFDL[3:0] bits (response field length select bits) corrected

Rev.	Date	Description	
		Page	Summary
2.00	May 25, 2015	25-26	Table 25.23 RLN3nLDFC register contents: Note added (prohibition of the frame separated mode setting) in the FSM bit function
		25-30	25.3.1.18 RLN3nLCBR - LIN Checksum Buffer Register: Access and body corrected
		25-32	25.3.1.19 RLN3nLDBRm - LIN Data Buffer m Register (m = 1 to 8): Description of For transmission of response data of 9 bytes or more corrected
		25-34	Table 25.28 Transition Condition of Each Mode corrected
		25-38	Table 25.30 Transition Conditions of Operation Modes corrected
		25-40	Table 25.32 Processing in Response Transmission corrected
		25-41	Table 25.33 Processing in Response Reception corrected

		25-43	Figure 25.8 Example of Data Reception Timing corrected
		25-46	25.7.3.3 Multi-Byte Response Transmission/Reception Function: Body corrected
		25-47	25.7.4.1 Wake-up Transmission: Body corrected
		25-48	25.7.4.2 Wake-up Reception: Body corrected
		25-48	25.7.4.3 Wakeup Collision added
		25-49	Table 25.34 Types of Statuses in LIN Master Mode corrected
		25-50, 25-51	Table 25.35 Types of Error Statuses in LIN Master Mode corrected
		25-50, 25-51	25.7.6.1 LIN Master Mode (1) Types of Error Statuses: Body corrected
		25-53	Figure 25.14 Connection in LIN Reset Mode and LIN Mode and Figure 25.15 Connection in LIN Self-Test Mode: n = 0, 1 deleted
		25-54	25.8.1 Change to LIN Self-Test Mode: Description corrected
		25-55, 25-56	25.8.2 Transmission in LIN Master Self-Test Mode: Description corrected
		25-56, 25-57	25.8.3 Reception in LIN Master Self-Test Mode: Description corrected
		25-58	25.9 Baud Rate Generator: Body corrected
		25-58, 25-59	25.9.1 LIN Master Mode: Title and body corrected
		25-58	Figure 25.16 Block Diagram of Baud Rate Generation in LIN Master Mode corrected
		—	Table 25.36 Examples of Baud Rate (19200, 10417, 9600, and 2400 bps) Generation in LIN Master Mode deleted
		25-59	25.9.2 Noise Filter: Body corrected
		25-59	Figure 25.17 Configuration of Noise Filter corrected
		25-59	Figure 25.18 Example of Noise Filter Circuit corrected
		25-60	Figure 25.19 Determination of Received Data when Noise Filter is Used corrected
		26. Ethernet Controller	
		26-15	26.3.9 CRC Error Frame Receive Counter Register (CEFCR) corrected
		26-15	26.3.10 Frame Receive Error Counter Register (FRECR) corrected
		26-16	26.3.11 Too-Short Frame Receive Counter Register (TSFRCR) corrected
		26-16	26.3.12 Too-Long Frame Receive Counter Register (TLFRCR) corrected
		26-17	26.3.13 Residual-Bit Frame Receive Counter Register (RFCR) corrected
		26-17	26.3.14 Multicast Address Frame Receive Counter Register (MAFCR) corrected
		27. A/D Converter	
		27-22	27.6 Definitions of A/D Conversion Accuracy: Body corrected
		29. USB2.0 Host/Function Module	
		All	Erroneous description corrected: DxFIFO → DnFIFO, DEVADDx → DEVADDn, PIPExCTR → PIPEnCTR, PIPExTRE → PIPEnTRE, PIPExTRN → PIPEnTRN, PIPExCFG → PIPECFG
		29-3	Table 29.1 Pin Configuration: Function of REFRIN corrected
		29-20	29.3.7 FIFO Port Registers (CFIFO, D0FIFO, D1FIFO): Description of FIFOPORT[31:0] bits corrected
		29-22	29.3.8 (1) CFIFOSEL: Description of MBW[1:0], BIGEND, ISEL, and CURPIPE[3:0] bits corrected

Rev.	Date	Description	
		Page	Summary
2.00	May 25, 2015	29-23	29.3.8 (2) D0FIFOSEL, D1FIFOSEL: Description of DREQE bit corrected
		29-38	29.3.19 NRDY Interrupt Status Register (NRDYSTS): Bit of PIPENRDY corrected (15 to 10 → 15 to 0)
		29-52	29.3.32 Pipe Configuration Register (PIPECFG): Description of TYPE[1:0] bits corrected
		29-96	Table 29.21 FIFO Port Function Settings: Function of DREQE corrected
		29-97	Figure 29.6 Procedure for Pipe Switching during Access to the FIFO Port corrected
		30. Digital Video Decoder	
		30-13	Figure 30.6 Example of Vertical Active Image Period (59.94 Hz (525i)) corrected
		30-16	30.4.5 (3) Reference Level Operation Speed Control for Sync Separation: Body corrected
		30-21	Table 30.10 Recommended Threshold and Serration Pulse Width (for reference): VSYNCSLICE[4:0] corrected
		30-22	30.4.10 (1) Horizontal AFC Loop Gain Control: Body corrected
		30-35	30.4.23 (5) Default Color System during Chroma Decoding: Title and body corrected
		30-35	Table 30.15 Default Color System corrected
		30-37	30.4.24 Burst Gate Pulse Control Register (BTGPCR): Description of BGPWIDTH[6:0] and BGPSTART [7:0] corrected
		30-40	30.4.25 ACC Control Register 1 (ACCCR1): Description of ACCLEVEL[8:0] corrected
		30-42	Figure 30.21 Example of R-Y Axis Correction corrected
		30-42	Figure 30.22 Example of Hue Adjustment (TINT) Correction corrected
		30-45	30.4.30 (2) AGC Response Speed Control: Body corrected
		30-80	Figure 30.28 A/D Conversion Image corrected
		30-80, 30-81	30.5.2 (2) Sync Tip Clamp Block and (3) Programmable Gain Amplifier (PGA): Body corrected
		30-84	30.5.3 (9) Automatic Gain Control (AGC) Block with Peak Limiter: Description added
		30-99	Table 30.41 Recommended Setting Common to Various Color Formats: Recommended value (decimal) of RADJ_O_LEVEL0, RADJ_U_LEVEL0, RADJ_O_LEVEL2, and RADJ_U_LEVEL2 bits corrected
		30-101	Table 30.42 Recommended Setting for Each Color Format: PAL-4.43 of ACCLEVEL bit corrected
		32. Video Display Controller 5 (2): Input Controller	
		32-17	Table 32.14 Timing of Delay for Output of Vertical Synchronization Signal corrected
		33. Video Display Controller 5 (3): Scaler	
		33-27	Table 33.25 Frame Buffer Writing Mode Setting corrected
		33-37	Table 33.38 Frame Buffer Control: Description of GR_FLM_SEL bit corrected
		33-82	33.2.49 Frame Buffer Control Register 1 (Graphics 0) (GR0_FLM1): Description of GR0_FLM_SEL[1:0] bits corrected
		36. Video Display Controller 5 (6): Output Image Generator	
		36-2	Figure 36.1 Functional Block Diagram of Output Image Generator corrected
		36-13	Figure 36.5 Data Arrangement in Frame Buffer corrected
		36-43	36.2.28 Frame Buffer Control Register 1 (Graphics (OIR)) (GR_OIR_FLM1): Description of GR_OIR_FLM_SEL[1:0] bits corrected
		37. Video Display Controller 5 (7): Output Controller	
		37-6, 37-7	Table 37.5 Gamma Correction corrected
		37-38 to 37-45	37.2.4 Area Setting Register G1 in Gamma Correction Block (GAM_G_AREA1) to 37.2.11 Area Setting Register G8 in Gamma Correction Block (GAM_G_AREA8): Description corrected
		37-49 to 37-56	37.2.14 Area Setting Register B1 in Gamma Correction Block (GAM_B_AREA1) to 37.2.21 Area Setting Register B8 in Gamma Correction Block (GAM_B_AREA8): Description corrected
		37-60 to 37-67	37.2.24 Area Setting Register R1 in Gamma Correction Block (GAM_R_AREA1) to 37.2.31 Area Setting Register R8 in Gamma Correction Block (GAM_R_AREA8): Description corrected
		40. LVDS Output Interface	
		40-1	Figure 40.1 Block Diagram of LVDS Output Interface Configuration corrected
		40-8	Figure 40.3 Block Diagram of LVDS PLL and Peripheral Circuits corrected
		40-11	Table 40.3 Setting Example of LVDS Output Format corrected

Rev.	Date	Description	
		Page	Summary
2.00	May 25, 2015	46. Capture Engine Unit	
		46-2	Table 46.1 Functional Overview of CEU corrected
		46-7	46.4.1 Capture Start Register (CAPSR): Note added
		46-13	46.4.3 Capture Interface Control Register (CAMCR): Description of JPG[1:0] bits corrected
		46-14	46.4.3 Capture Interface Control Register (CAMCR): Note added
		46-19	46.4.6 Capture Interface Width Register (CAPWR): Description of VWDTH[11:0] and HWDTH[12:0] bits corrected
		46-37	46.4.17 Capture Bundle Destination Size Register (CBDSR): Description of CBVS[22:0] bits corrected
		46-37	(a) Image capture and data synchronous fetch: Body corrected
		46-50	Figure 46.47 Operating Status during Capturing: Erroneous description corrected
		46-59	Table 46.11 Restrictions on CEU Input/Output Functions corrected
		48. SCUX	
		48-101 to 48-103	Table 48.18 Input/Output Timing Setting (1), Table 48.19 Input/Output Timing Setting (2), and Table 48.20 Input/ Output Timing Setting (3) corrected
		48-112	Figure 48.20 Volume Ramp Operation for 4-System Data corrected
		49. Sound Generator	
		49-3	49.3.1 Sound Generator Control Register 1 (SGCR1): Erroneous description in the table corrected (R/W added)
		51. MMC Host Interface	
		51-19	51.3.15 DMA Mode Setting Register (CE_DMA_MODE): Description of the DMASEL bit corrected
		52. Motor Control PWM Timer	
		52-7	52.3.5 PWM Duty Registers_nA, nC, nE, nG (PWDTR_nA, PWDTR_nC, PWDTR_nE, PWDTR_nG) (n = 1, 2): Body corrected
		53. On-Chip RAM	
		53-2	Table 53.1 Address Spaces of On-Chip Large-Capacity RAM corrected
		53-2	Table 53.2 Address Spaces of On-Chip Data Retention RAM corrected
		54. Ports	
		54-5	54.3.2 Port Set and Reset Register (PSRn): Body corrected
		54-7	Table 54.6 Alternative Mode Selection: Description corrected (Pn.PMnm → PMn.PMnm)
		54-9	54.3.9 Port Mode Set and Reset Register (PMSRn): Body corrected
		54-10	54.3.10 Port Mode Control Set and Reset Register (PMCSRn/JPMCSR0): Body corrected
		54-11	54.3.12 Port Input Buffer Control Register (PIBCn/JPIBC0): Title corrected, body corrected, and description added to note
		54-11	54.3.13 Port Bidirection Control Register (PBDCn): Title corrected and note deleted
		54-12	Table 54.7 Alternative Functions that PIPCn.PIPCnm Bit Should be Set to 0: Description of watchdog timer added
		54-19	Table 54.18 Control Registers (P3) corrected
		55. Power-Down Modes	
		55-1	Figure 55.1 Transitions between Processing States corrected
		55-2	Table 55.1 States of Power-Down Modes: Transition Conditions corrected and note 6 added
		55-3	55.2.1 Standby Control Register 1 (STBCR1): Description of STBY and DEEP bits corrected
		55-10	55.2.7 Standby Control Register 7 (STBCR7): Description of MSTP76, MSTP74, and MSTP73 bits corrected
		55-11	55.2.8 Standby Control Register 8 (STBCR8): Note 1 added to description of Module Stop 86
		55-12	55.2.9 Standby Control Register 9 (STBCR9): Description of MSTP93 bit corrected
		55-25	55.2.23 Standby Acknowledge Register 1 (STBACK1): Title corrected and note 1 corrected
		55-26	55.2.24 Standby Acknowledge Register 2 (STBACK2): Note 1 corrected
		55-32	55.2.29 Deep Standby Cancel Source Flag Register (DSFR): Body corrected
		55-34	55.3.1 Sleep Mode, (1) Transition to Sleep Mode and (2) Canceling Sleep Mode: Description corrected
		55-36	55.3.3 Software Standby Mode Application Example: A noted added
		55-38	55.3.4 Deep Standby Mode, (1) Transition to Deep Standby Mode: Description corrected
		55-39	Figure 55.3 Flowchart of Transition to Deep Standby Mode corrected
		55-40	55.3.4 Deep Standby Mode, (2) Canceling Deep Standby Mode: Body corrected

Rev.	Date	Description	
		Page	Summary
2.00	May 25, 2015	55-40	Figure 55.4 Flowchart of Canceling Deep Standby Mode: Description corrected
		55-41	Table 55.4 External Memory Control Pins in Different Modes corrected
		55-42	55.3.5 Module Standby Function, (1) Transition to Module Standby Function: Body and reference corrected
		55-43	55.3.6 Software Reset: Configuration and description corrected
		56. Debugger Interface	
		56-7 to 56-12	Table 56.10 Correspondence between Pins of this LSI and Bits of Boundary Scan Registers corrected
		56-14	56.4 ICE Registers: Body corrected
		57. EthernetAVB	
		All	Newly created
		58. List of Registers	
		58-31, 58-86	Table 58.1 Register Addresses: Registers of CAN interface and debugger interface corrected
		58-106, 58-116, 58-128, 58-129, 58-158, 58-159, 58-166, 58-257, 58-298, 58-324	Table 58.2 Register Bits: Registers of direct memory access controller, I2C bus interface, Ethernet controller, LVDS output interface, power-down modes, and debugger interface corrected, and registers of LIN interface channel 0 LIN slave, LIN interface channel 1 LIN slave, LIN interface channel 0 UART, and LIN interface channel 1 UART deleted
		58-325	Table 58.3 Register States: Power-On Reset and Deep Standby of RCR3 corrected (Initialized → Retained)
		58-326	Table 58.3 Register States: Note 11 added to register name of ports, and description of note 11 added
		59. Electrical Characteristics	
		59-3	Table 59.2 DC Characteristics (2) [Current Consumption]: Typical and maximum value of LVDSAPIcc corrected
		59-5	Table 59.2 DC Characteristics (3) [Except I2C Bus Interface, and USB 2.0 Host/Function Module-Related Pins] corrected
		59-48	Table 59.14 SPI Multi I/O Bus Controller Timing: A unit and a note for the SPBCLK clock cycle corrected
		59-70	Table 59.26 LVDS Timing: Panel clock for LVDS output (LSI internal signal) added and erroneous description (a ruled line) corrected
		59-72	Figure 59.87 Capture Engine Unit Module Signal Timing corrected
		59-72	Table 59.27 Capture Engine Unit Module Signal Timing: Description of Item corrected
		Appendix (section title of "Package" corrected)	
		Appen-dix-3	Figure A.3 Dimensions of 324-Pin BGA Package corrected
3.00	Nov 30, 2016	1. Overview	
		1-2	Table 1.1 Features of RZ/A1H and RZ/A1M: Title corrected
		1-16, 1-20	Table 1.3 Pin Functions: Symbol within the classification of "Renesas serial peripheral interface" and function of LVDSREFRIN within the classification of "LVDS output interface" corrected
		2. CPU	
		2-2	Table 2.1 Cortex-A9 Configuration Signal Settings: Error corrected
		3. Boot Mode	
		3-4	Figure 3.1 Control Signals Output to the Serial Flash Memory Through SPI Communication Conversion corrected
		3-9	3.6.3 Notes on Serial Flash Booting (Boot Mode 3) after This LSI is Reset added
		5. LSI Internal Bus	
		5-4	Table 5.2 List of Peripheral Buses: EthernetAVB added to peripheral bus 6
		5-12	5.8.1 (3) Protection unit information (ARPROT[2:0], AWPROT[2:0]): Note added
		5-13	5.8.5 (4) Atomic access (ARLOCK[1:0], AWLOCK[1:0]): Note added
		6. Clock Pulse Generator	
		6-3	6.1 (7) SSCG Circuit: Body corrected
		6-5	6.3 Clock Mode: Body corrected
		6-13	6.7.1 Oscillation Stabilizing Time of the On-chip Crystal Oscillator: Body corrected
		6-13	6.7.2 Oscillation Stabilizing Time of the PLL circuit: Body corrected

Rev.	Date	Description	
		Page	Summary
3.00	Nov 30, 2016	6-17	Figure 6.6 Audio and USB Clock Signals corrected
		6-18	Figure 6.7 Video Image Clock Signals (Channel 0) corrected
		6-19	Figure 6.8 Video Image Clock Signals (Channel 1) corrected
		6-19	Figure 6.9 Clock Signals for Other Modules corrected
		8. Bus State Controller	
		8-5	Table 8.3 Initial States by Areas in Boot Modes 0, 1, and 2 to 5: Note 1 corrected
		8-87	8.5.11 (3) On-Chip Peripheral Module Access: Body corrected
		10. Multi-Function Timer Pulse Unit 2	
		10-44, 10-68, 10-88, 10-95, 10-104, 10-105, 10-111, 10-147, 10-149, 10-152, 10-153	TCNT0, TCNT1, TCNT2, TCNT3, and TCNT4 have been respectively changed to TCNT_0, TCNT_1, TCNT_2, TCNT_3, and TCNT_4.
		12. Watchdog Timer	
		12-8	12.4.1 Canceling Software Standby Mode: Body corrected
		13. Realtime Clock	
		13-16	13.4.1 Initial Settings of Registers after Power-On and Oscillation Stabilization Time: Body corrected
		14. Serial Communication Interface with FIFO	
		14-14	14.3.7 Serial Status Register (SCFSR): Description of bit 1 (RDF) corrected
		14-20	14.3.9 FIFO Control Register (SCFCR): Description of bits 10 to 8 (RSTRG[2:0]), bits 7 and 6 (RTRG[1:0]), and bits 5 and 4 (TTRG[1:0]) corrected
		14-34, 14-39	14.4.2 (3) Transmitting and Receiving Data: Body corrected
		15. Serial Communications Interface	
		15-4	15.2.2 Receive Data Register (RDR): Body corrected
		16. Renesas Serial Peripheral Interface	
		16-11	16.3.5 Data Register (SPDR): Body corrected
		16-13	16.3.9 Data Control Register (SPDCR): Description of bits 6 and 5 (SPLW1, SPLW0) corrected, and Note added
		17. SPI Multi I/O Bus Controller	
		17-6	17.4.1 Common Control Register (CMNCR): Description of bits 23 and 22 (MOIIO3[1:0]), bits 21 and 20 (MOIIO2[1:0]), bits 19 and 18 (MOIIO1[1:0]), bits 17 and 16 (MOIIO0[1:0]), bits 15 and 14 (IO3FV[1:0]), bits 13 and 12 (IO2FV[1:0]), and bits 9 and 8 (IO0FV[1:0]) corrected
		17-22	17.4.14 SPI Mode Read Data Register 0 (SMRDR0): Description of bits 31 to 0 (RDATA0[31:0]) corrected
		17-22	17.4.15 SPI Mode Read Data Register 1 (SMRDR1): Description of bits 31 to 0 (RDATA1[31:0]) corrected
		17-23	17.4.16 SPI Mode Write Data Register 0 (SMWDR0): Description of bits 31 to 0 (WDATA0[31:0]) corrected
		17-23	17.4.17 SPI Mode Write Data Register 1 (SMWDR1): Description of bits 31 to 0 (WDATA1[31:0]) corrected
		17-25	17.4.19 SPI AC Input Characteristics Adjustment Register (CKDLY): R/W and description of bits 15 to 8 (GB[7:0]) corrected
		17-30	17.4.24 SPI AC Output Characteristics Adjustment Register (SPODLY): R/W and description of bits 31 to 24 (GB[7:0]) corrected
		17-33	17.5.3 32-bit Serial Flash Addresses: Error in note corrected (RBE bit in DRCR = 1)
		17-43	Table 17.5 Data Registers: Register name for Dummy cycle (1 to 8 cycles) corrected
		17-48	Table 17.7 Pin Status (2) corrected
		17-49	Table 17.8 Pin Status (3) corrected
		18. I^2C Bus Interface	
		18-37	18.3.12 RIICnBRL - I^2C Bus Bit Rate Low-Level Register: Body corrected
		18-38, 18-39	18.3.13 RIICnBRH - I^2C Bus Bit Rate High-Level Register: Calculation formulae of frequency and duty cycle corrected, and note 1 added
		18-46	Figure 18.5 Example of RIIC Initialization Flowchart: Note 1 corrected
		18-67	18.9.1 Slave-Address Match Detection: Error corrected

Rev.	Date	Description	
		Page	Summary
3.00	Nov 30, 2016	18-68	Figure 18.25 AASy Flag Set Timing with 10-Bit Address Format Selected: Error of SDAn signal corrected
		18-72	18.9.4 Host Address Detection: Body corrected
		18-74	18.10.2 NACK Reception Transfer Suspension Function: Body corrected
		18-74	Figure 18.31 Suspension of Data Transfer when NACK is Received (NACKE = 1) corrected
		18-88	18.14 SMBus Operation: Body corrected
		19. Serial Sound Interface	
		19-21	19.3.12 FC Status Register (SSIFCSR): Error in the table corrected
		21. CAN Interface	
		21-7	Figure 21.1 RS-CAN Module Block Diagram corrected
		22. IEBus Controller	
		22-1	22.1 IEBB Features: Body corrected
		22-5	22.3.1 IEBBn register overview: Body corrected
		22-30	22.3.2 (14) IEBBnTMS - IEBBn transfer mode setting register: Body corrected
		24. CD-ROM Decoder	
		24-46	24.6.8 Note on Software Reset added
		25. LIN Interface	
		25-12	Table 25.13 RLN3nLBFC register contents: Error in the function column of bits 5 and 4 (BDT[1:0]) corrected
		25-13	Table 25.14 RLN3nLSC register contents: Error of the function column of bits 5 and 4 (IBS[1:0]) corrected
		25-36	25.6 LIN Reset Mode: Body corrected
		26. Ethernet Controller	
		26-2	Figure 26.1 Configuration of ETHER corrected
		26-57	26.4.1 (2) Receive Descriptor, (a) Receive Descriptor 0 (RD0): Description of bits 29 and 28 (RFP[1:0]) and bits 25 to 16 (RFS[9:0]) corrected
		26-59	26.4.1 (2) Receive Descriptor, (b) Receive Descriptor 1 (RD1): Description of bits 31 to 16 (RBL[15:0]) corrected
		26-61	26.4.1 (3) Descriptor and Transmit/Receive Buffer, (b) Reception: Body corrected
		26-61	Figure 26.6 Relationship between Receive Descriptor and Receive Buffer corrected
		26-69	Figure 26.11 Sample Reception Flowchart (Single-Frame/Single-Descriptor): Title and figure corrected
		26-70	26.4.3 (2) Reception Error Processing, (b) Receive FIFO Overflow: Body corrected
		26-74	Table 26.5 List of ETHER Interrupts: Error in “Register and Bit” corrected (EESR0.TC)
		26-84	26.6.3 Software Reset added
		27. A/D Converter	
		27-1	27.1 Features: Description for minimum conversion time corrected from 5.0 ms to 5.0 µs
		27-25	Figure 27.9 Example of Analog Input Circuit: Note deleted
		27-25	Table 27.8 Analog Input Pin Ratings: Note added
		30. Digital Video Decoder	
		30-32	Figure 30.16 Digital Clamp Timing (Horizontal): Error corrected (µs → usec)
		30-39	30.4.25 (4) ACC Level Control: Body corrected
		30-85	30.5.3 (10) Timing Adjustment and Signal Detection Block: Body corrected
		30-87	Figure 30.32 Block Diagram of Y/C Separator Circuit corrected
		30-98	Table 30.41 Recommended Setting Common to Various Color Formats: Recommended Value of DCPEND in DCPCR5 corrected
		32. Video Display Controller 5 (2): Input Controller	
		32-23	Table 32.19 YCbCr/RGB Signal Reception Timing corrected
		33. Video Display Controller 5 (3): Scaler	
		33-1	Figure 33.1 Functional Block Diagram of Scaler 0 corrected
		33-2	Figure 33.2 Functional Block Diagram of Scaler 1 corrected
		33-10	33.1.4 (2) Generating a Full-Screen Enable Signal: Body corrected
		33-28	Table 33.29 Frame Buffer Transfer Mode: Description corrected
		33-69	33.2.29 Writing Mode Register (SC0_SCL1_WR1): Description of bit 0 (SC0_RES_BST_MD) corrected

Rev.	Date	Description	
		Page	Summary
3.00	Nov 30, 2016	33-103	33.2.77 Vertical Capture Size Register (SC1_SCL0_DS2): Description of bits 26 to 16 (SC1_RES_VS[10:0]) corrected
		33-115	33.2.93 Writing Mode Register (SC1_SCL1_WR1): Description of bit 0 (SC1_RES_BST_MD) corrected
		35. Video Display Controller 5 (5): Image Synthesizer	
		35-23	35.1.14 Alpha Blending Calculation: Body corrected
		35-28	Table 35.29 CLUT Table Configuration (Channel 0): Abbreviation corrected
		35-33	Table 35.33 CLUT Table Configuration (Channel 1): Abbreviation corrected
		36. Video Display Controller 5 (6): Output Image Generator	
		36-7	36.1.5 (2) Generating a Full-Screen Enable Signal: Body corrected
		36-11	Table 36.15 Frame Buffer Transfer Mode: Description corrected
		36-36	36.2.19 Writing Mode Register (OIR_SCL1_WR1): Description of bit 0 (SC0_RES_BST_MD) corrected
		37. Video Display Controller 5 (7): Output Controller	
		37-4	37.1.6 (2) Offset calculation formulas for each area: Calculation formula corrected
		37-38	37.2.4 Area Setting Register G1 in Gamma Correction Block (GAM_G_AREA1): Error corrected
		37-39	37.2.5 Area Setting Register G2 in Gamma Correction Block (GAM_G_AREA2): Error corrected
		37-49	37.2.14 Area Setting Register B1 in Gamma Correction Block (GAM_B_AREA1): Error corrected
		37-50	37.2.15 Area Setting Register B2 in Gamma Correction Block (GAM_B_AREA2): Error corrected
		37-60	37.2.24 Area Setting Register R1 in Gamma Correction Block (GAM_R_AREA1): Error corrected
		37-61	37.2.25 Area Setting Register R2 in Gamma Correction Block (GAM_R_AREA2): Error corrected
		40. LVDS Output Interface	
		40-1	Figure 40.1 Block Diagram of LVDS Output Interface Configuration corrected
		40-2	Table 40.1 Pin Configuration: Function of LVDS resistor connection pin corrected
		40-5	40.4.3 LVDS Clock Select Register (LCLKSELR): Description of bits 26 to 24 (LVDS_IN_CLK_SEL[2:0]) corrected
		40-8	Figure 40.3 Block Diagram of LVDS PLL and Peripheral Circuits corrected
		40-8	40.5.1 (1) Clock Input to LVDS PLL: Body corrected
		40-10	Figure 40.5 Data Map of LVDS Output Format corrected
		46. Capture Engine Unit	
		46-5	Figure 46.2 Register Plane Switching Timing (VD Polarity is High-Active in Data Enable Fetch Mode): Title corrected
		46-13, 46-14, 46-15	46.4.3 Capture Interface Control Register (CAMCR): Description of bit 1 (VDPOL) corrected, and body corrected
		46-15	Figure 46.14 Relationship between VIO_VD and VD Interrupt when VD is High-Active (In Data Enable Fetch Mode): Title corrected
		46-15	Figure 46.15 Relationship between the VIO_VD and VIO_HD signals and the VD Interrupt when VD and HD are High-Active (in Image Capture Mode or Data Synchronous Fetch Mode) added
		46-47	46.4.22 Capture Event Flag Clear Register (CETCR): Description of bit 9 (VD) corrected
		46-58	46.5.1 (1) Clock Frequency: Body corrected
		46-59	46.5.4 Software Reset added
		48. SCUX	
		48-69	48.3.68 FFD0_n Timing Select Register (FDTSELn_CIM) (n = 0, 1, 2, 3): Description of bits 3 to 0 (SCKSEL) corrected
		48-70	Figure 48.4 Configuration Diagram of Input Timing Signal Selector corrected
		48-71	48.3.69 FFU0_n Timing Select Register (FDTSELn_CIM) (n = 0, 1, 2, 3): Description of bits 3 to 0 (SCKSEL) corrected
		48-72	Figure 48.5 Configuration Diagram of Output Timing Signal Selector corrected
		48-113	48.5 Usage Note added
		50. SD Host Interface	
		50-1 to 50-56	Some specifications that don't require an NDA have been disclosed.
		51. MMC Host Interface	
		51-42	51.8.3 Software Reset added

Rev.	Date	Description	
		Page	Summary
3.00	Nov 30, 2016	54. Ports	
		54-12	Table 41.7 Alternative Functions for Which the PIPCn.PIPCnm Bit Should be Set to 0: Pin name within the classification of "Serial sound interface" corrected
		54-13	54.3.15 Serial Sound Interface Noise Canceler Control Register (SNCR): Body corrected
		54-30	Figure 54.2 Example of Port Settings (in Port Mode) (1/3) corrected
		55. Power-Down Modes	
		55-15	55.2.12 Standby Control Register 12 (STBCR12): Note added
		55-35	55.3.2 (1) Transition to Software Standby Mode: Body corrected
		55-38	55.3.4 (1) Transition to Deep Standby Mode: Body corrected
		55-40	55.3.4 (2) Canceling Deep Standby Mode: Body corrected
		55-42	55.3.5 (1) Transition to Module Standby Function: Body corrected
		55-43	55.3.6 Software Reset: Body corrected
		55-44	55.3.7 Adjustment of XTAL Crystal Oscillator Gain: Body corrected
		55-45	55.4.3 Usage Notes Applying when the USB_X1 Pin is not to be Used added
		56. Debugger Interface	
		56-5	Table 56.7 Pin Configuration: Function of the test data output (pin name: TDO) corrected, and note corrected
		56-17	Table 43.12 Reset Signal Setting: Note 2 corrected, and note 3 added
		57. EthernetAVB	
		57-1 to 57-196	Specifications of the EthernetAVB have been disclosed.
		58. List of Registers	
		58-74, 58-75	Table 58.1 Register Addresses: Register addresses of SD host interface added
		58-86 to 58-89	Table 58.1 Register Addresses: Register addresses of EthernetAVB added
		58-129, 58-131	Table 58.2 Register Bits: Bit 0 of SMDRENR_0 and SMDRENR_1 registers in SPI multi I/O bus controller corrected
		58-292 to 58-294	Table 58.2 Register Bits: Bits of SD host interface added
		58-329 to 58-338	Table 58.2 Register Bits: Bits of EthernetAVB added
		58-340	Table 58.3 Register States: Register states of SD host interface added
		59. Electrical Characteristics	
		59-9, 59-10	Table 59.5 Clock Timing: Table corrected, and note 2 added
		59-11	Figure 59.4 Power-On Oscillation Settling Time corrected
		59-11	Figure 59.5 Oscillation Settling Time on Return from Standby (Return by Reset) corrected
		59-11	Figure 59.6 Oscillation Settling Time on Return from Standby (Return by NMI or IRQ) corrected
		59-12	Figure 59.7 On-chip Oscillation Circuit Oscillation Settling Time corrected
		59-13	Table 59.6 Control Signal Timing: Table corrected, and notes 1 and 2 added
		59-13	Figure 59.7 (1) Reset Input Timing 1: Title corrected
		59-13	Figure 59.7 (3) Reset Input Timing 2 added
		59-14	Figure 59.7 (4) Reset Input Timing 3 added
		59-49	Table 59.14 SPI Multi I/O Bus Controller Timing corrected
		59-50	Figure 59.48 SDR Transfer Format Transmission and Reception Timing (CPHAT = 0, CPHAR = 0) corrected
		59-51	Figure 59.49 SDR Transfer Format Transmission and Reception Timing (CPHAT = 1, CPHAR = 1) corrected
		59-51	Figure 59.50 DDR Transfer Format Transmission and Reception Timing (CPHAT = 0, CPHAR = 0) corrected
		59-52	Figure 59.51 DDR Transfer Format Transmission and Reception Timing (CPHAT = 1, CPHAR = 1) corrected
		59-52	Figure 59.52 Timing for Switching the Buffers on and off (CPHAT = 0, CPHAR = 0) corrected
		59-52	Figure 59.53 Timing for Switching the Buffers on and off (CPHAT = 1, CPHAR = 1) corrected
		59-69	Table 59.25 Video Display Controller 5 Timing: Table corrected, and notes 1 and 2 added
		59-77	59.4.25 AC Characteristics Measurement Conditions: Body corrected

Rev.	Date	Description	
		Page	Summary
3.00	Nov 30, 2016	60. States and Handling of Pins	
		60-4	Table 60.1 Pin States: EthernetAVB added, [Legend] corrected, and notes 2 and 14 corrected
		60-8	Table 60.2 Handling of Unused Pins (Except for Debugger Interface Pins): Note 2 added
		60-8	Table 60.3 Handling of Debugger Interface Pins (when Emulator is not Used): Note 3 added
4.00	Jun 11, 2018	All	Trademarks of Arm changed
		1. Overview	
		1-3	Table 1.1 Features of RZ/A1H and RZ/A1M: Specification of SPI multi I/O bus controller corrected
		1-4	Table 1.1 Features of RZ/A1H and RZ/A1M: Specification of Media local bus corrected
		1-16	Table 1.3 Pin Functions: I/O of “$\overline{\text{RTS7}}$, $\overline{\text{RTS5}}$, $\overline{\text{RTS1}}$” within the classification of “Serial communication interface with FIFO” corrected
		1-16	Table 1.3 Pin Functions: I/O of “$\overline{\text{CTS7}}$, $\overline{\text{CTS5}}$, $\overline{\text{CTS1}}$” within the classification of “Serial communication interface with FIFO” corrected
		1-23	Table 1.4 List of Pins (256-Pin, BGA): I/O of DV0_DATA23 (Function 8, Ball Number E2) corrected to I(s)
		1-24	Table 1.4 List of Pins (256-Pin, BGA): I/O of DV0_DATA21 (Function 8, Ball Number G4) corrected to I(s)
		1-24	Table 1.4 List of Pins (256-Pin, BGA): I/O of DV0_DATA22 (Function 8, Ball Number H4) corrected to I(s)
		1-28	Table 1.5 List of Pins (256-Pin, QFP): I/O of DV0_DATA21 to DV0_DATA23 (Function 8, No. 1 to No. 3) respectively corrected to I(s)
		2. CPU	
		2-2	Table 2.1 Cortex-A9 Configuration Signal Settings: Setting Values of CLUSTERID corrected
		6. Clock Pulse Generator	
		6-21	6.11 Usage Note added
		7. Interrupt Controller	
		7-37	Figure 7.2 Flow of Initial Settings corrected
		7-41	7.8.2 Notes on Selecting IRQ Interrupt Pin Functions: Body corrected
		7-42	7.8.4 Notes on Using IRQ Pins as Triggers for Release from Standby when Software Standby is in Use added
		8. Bus State Controller	
		8-27	8.4.4 SDRAM Control Register (SDCR): Description of Bit 10 (RMODE) corrected
		16. Renesas Serial Peripheral Interface	
		16-13	Table 16.3 Relationship between SPBR and BRDV1 and BRDV0 Settings: Note 1 added
		18. I^2C Bus Interface	
		18-40	Table 18.21 Examples of RIICnBRH/RIICnBRL Settings for Transfer Rate (when RIICnFER.SCLE = 1 and RIICnFER.NFE = 0): RIICnMR1, RIICnBRH, and RIICnBRL settings for Transfer Rate 400 [kbps] corrected
		18-40	Table 18.22 Examples of RIICnBRH/RIICnBRL Settings for Transfer Rate (when RIICnFER.SCLE = 1, RIICnFER.NFE= 1, and Number of NF Stages = 4): RIICnMR1, RIICnBRH, and RIICnBRL settings for Transfer Rate 400 [kbps] corrected
		20. Media Local Bus	
		20-1	20.1 Features: Body corrected
		20-2	20.3 Register Description: Body corrected
		20-2	Table 20.2 Register Configuration: Note 1 corrected
		25. LIN Interface	
		25-31	25.3.1.19 RLN3nLDBRm — LIN Data Buffer m Register (m = 1 to 8): Description under “For response reception” corrected
		26. Ethernet Controller	
		26-4	Table 26.2 Register Configuration: CAM entry table specification enable register (common) added
		26-4	Table 26.2 Register Configuration: CAM entry table POST 1 register added
		26-4	Table 26.2 Register Configuration: CAM entry table POST 2 register added
		26-4	Table 26.2 Register Configuration: CAM entry table POST 3 register added
		26-4	Table 26.2 Register Configuration: CAM entry table POST 4 register added
		26-22	26.3.21 CAM Entry Table Specification Enable Register (Common) (TSU_FWSLC) added
		26-27	26.3.25 CAM Entry Table POST 1 Register (TSU_POST1) added
		26-28	26.3.26 CAM Entry Table POST 2 Register (TSU_POST2) added
		26-29	26.3.27 CAM Entry Table POST 3 Register (TSU_POST3) added

Rev.	Date	Description	
		Page	Summary
4.00	Jun 11, 2018	26-30	26.3.28 CAM Entry Table POST 4 Register (TSU_POST4) added
		26-65	26.4.1 (2) (b) Receive Descriptor 1 (RD1): Description of bits 31 to 16 (RBL[15:0]) corrected
		26-65	26.4.1 (2) (b) Receive Descriptor 1 (RD1): Description of bits 15 to 0 (RDL[15:0]) corrected
		26-89	Figure 26.20 Data Subject to Checksum Calculation corrected
		26-89	Figure 26.21 Data after Checksum Data Addition corrected
		29. USB2.0 Host/Function Module	
		29-11	29.3.1 System Configuration Control Register (SYSCFG0): Description of bit 2 (UCKSEL) corrected
		31. Video Display Controller 5 (1): Overview	
		31-1	Table 31.1 Features of Video Display Controller 5: Function of Input video image specification corrected
		32. Video Display Controller 5 (2): Input Controller	
		32-3	32.1.4 Controlling Externally Input Video Signals: Body corrected
		33. Video Display Controller 5 (3): Scaler	
		33-10	Table 33.8 Full-Screen Enable Control: Description of the SC_RES_F_HW[10:0] bits corrected
		33-24	Table 33.22 Control of Interrupt on Specified Image Line before Scaling-down, and Reading of Current Image line before Scaling-down: Description of the SC_RES_LINE[10:0] bits corrected
		33-52	33.2.8 Full-Screen Horizontal Size Register (SC0_SCL0_FRC7): Description of bits 10 to 0 (SC0_RES_F_HW[10:0]) corrected
		33-54	33.2.11 Interrupt Control Register (SC0_SCL0_INT): Description of bits 10 to 0 (SC0_RES_LINE[10:0]) corrected
		33-101	33.2.72 Full-Screen Horizontal Size Register (SC1_SCL0_FRC7): Description of bits 10 to 0 (SC1_RES_F_HW[10:0]) corrected
		33-102	33.2.75 Interrupt Control Register (SC1_SCL0_INT): Description of bits 10 to 0 (SC1_RES_LINE[10:0]) corrected
		35. Video Display Controller 5 (5): Image Synthesizer	
		35-24	35.1.15 CLUT Table: Body corrected
		35-24	35.1.16 Multiplication Processing with Current Alpha at Alpha Blending in Rectangular Area: Body corrected
		36. Video Display Controller 5 (6): Output Image Generator	
		36-7	Table 36.9 Full-Screen Enable Control: Description of the OIR_RES_F_HW[10:0] bits corrected
		36-25	36.2.8 Full-Screen Horizontal Size Register (OIR_SCL0_FRC7): Description of bits 10 to 0 (OIR_RES_F_HW[10:0]) corrected
		38. Video Display Controller 5 (8):System Controller	
		38-1	Table 38.1 Interrupt Signals: Function of the INT_STA9 bit of the S0_WLINE request source corrected
		38-1	Table 38.1 Interrupt Signals: Function of the INT_STA16 bit of the S1_WLINE request source corrected
		38-2	Table 38.2 Interrupt Clear/Hold Settings: Description of the INT_STA9 bit of the SYSCNT_INT2 register corrected
		38-3	Table 38.2 Interrupt Clear/Hold Settings: Description of the INT_STA16 bit of the SYSCNT_INT3 register corrected
		38-4	Table 38.3 Interrupt Output On/Off Settings: Description of the INT_OUT9_ON bit of the SYSCNT_INT5 register corrected
		38-4	Table 38.3 Interrupt Output On/Off Settings: Description of the INT_OUT16_ON bit of the SYSCNT_INT6 register corrected
		38-11	38.2.2 Interrupt Control Register 2 (SYSCNT_INT2): Description of bit 4 (INT_STA9) corrected
		38-13	38.2.3 Interrupt Control Register 3 (SYSCNT_INT3): Description of bit 0 (INT_STA16) corrected
		38-15	38.2.5 Interrupt Control Register 5 (SYSCNT_INT5): Description of bit 4 (INT_OUT9_ON) corrected
		38-16	38.2.6 Interrupt Control Register 6 (SYSCNT_INT6): Description of bit 0 (INT_OUT16_ON) corrected
		48. SCUX	
		48-64	48.3.65 DMA Transfer Register for FFD0_n (DMATDn_CIM) (n = 0, 1, 2, 3): Body corrected
		48-65	48.3.66 DMA Transfer Register for FFU0_n (DMATUn_CIM) (n = 0, 1, 2, 3): Body corrected
		50. SD Host Interface	
		—	50.6 Electrical Characteristics deleted
		54. Ports	
		54-14	Table 54.10 Control Registers (JP0): Location of Valid Bit within the JPMCSR0 register corrected
		54-18	Table 54.15 Pin Function (P2): Port Mode of LCD0_DATA16 to LCD0_DATA23 (8th Alternative, P2_0 to P2_7) corrected
		55. Power-Down Modes	
		55-22	55.2.20 CPU Status Register (CPUSTS): Description of bits 7 to 5 corrected

Rev.	Date	Description	
		Page	Summary
4.00	Jun 11, 2018	55-22	55.2.20 CPU Status Register (CPUSTS): Description of bits 3 to 0 corrected
		55-25	55.2.23 Standby Acknowledge Register 1 (STBACK1): Description of bits 7, 6 corrected
		55-25	55.2.23 Standby Acknowledge Register 1 (STBACK1): Description of bit 4 corrected
		55-25	55.2.23 Standby Acknowledge Register 1 (STBACK1): Description of bit 1 corrected
		55-35	55.3.2 (1) Transition to Software Standby Mode: Body corrected
		55-45	55.4.4 Notes on Using IRQ Pins as Triggers for Release from Standby when Software Standby is in Use added
		56. Debugger Interface	
		56-14	Table 56.11 Configuration of ICE Registers: Initial value of Mode reset control register (ICEREGMDRSTCTL) corrected
		56-14	56.4.1 Mode Reset Control Register (ICEREGMDRSTCTL): Initial value and description of bits 15 to 13 corrected
		56-14	56.4.1 Mode Reset Control Register (ICEREGMDRSTCTL): Initial value and description of bits 11 to 9 corrected
		57. EthernetAVB	
		57-196	Figure 57.69 Data Subject to Checksum Calculation corrected
		57-196	Figure 57.70 Data after Checksum Data Addition corrected
		58. List of Registers	
		58-11	Table 58.1 Register Addresses: Address of CPU interface implementer identification register (ICCIIDR) corrected
		58-36	Table 58.1 Register Addresses: CAM entry table specification enable register (common) (TSU_FWSLC) added
		58-36	Table 58.1 Register Addresses: CAM entry table POST 1 register (TSU_POST1) added
		58-36	Table 58.1 Register Addresses: CAM entry table POST 2 register (TSU_POST2) added
		58-36	Table 58.1 Register Addresses: CAM entry table POST 3 register (TSU_POST3) added
		58-36	Table 58.1 Register Addresses: CAM entry table POST 4 register (TSU_POST4) added
		58-162	Table 58.2 Register Bits: Bits of TSU_FWSLC added
		58-162	Table 58.2 Register Bits: Bits of TSU_POST1 added
		58-162	Table 58.2 Register Bits: Bits of TSU_POST2 added
		58-162	Table 58.2 Register Bits: Bits of TSU_POST3 added
		58-162	Table 58.2 Register Bits: Bits of TSU_POST4 added
		58-340	Table 58.3 Register States: SDIR*7 register of the debugger interface module and note 7 deleted
		59. Electrical Characteristics	
		59-2	Table 59.2 DC Characteristics (1) [Common Items]: Item of Three-state leakage current corrected
		59-5	Table 59.2 DC Characteristics (4) [I^2C Bus Interface Related Pins*]: Note corrected
		59-7	Table 59.3 Permissible Output Currents: Item of Permissible output low current (per pin) corrected
		59-10	Table 59.5 Clock Timing: Figures for reference of on-chip PLL circuit oscillation settling time, on-chip oscillation circuit oscillation settling time (other than above), and mode hold time corrected
		59-10	Table 59.5 Clock Timing: SSCG Stabilizing Time added
		59-11	Figure 59.5 SSCG Stabilizing Time added
		59-11	Figure 59.6 (1) Oscillation Settling Time on Return from Standby (Return by Reset): Figure number corrected
		59-12	Figure 59.6 (2) Oscillation Settling Time on Return from Standby (Return by NMI or IRQ): Figure number corrected
		59-13	Table 59.6 Control Signal Timing: Figures for reference of $\overline{\text{RES}}$ pulse width and $\overline{\text{TRST}}$ pulse width corrected
		59-13	Table 59.6 Control Signal Timing: Figures for reference of NMI pulse width, IRQ pulse width, and TINT pulse width corrected
		59-74	59.4.22 SD Host Interface Timing added
		60. States and Handling of Pins	
		60-5	Table 60.1 Pin States: Pin State corrected (Software Standby Mode of LVDS output interface)
		Appendix	
		Appendix -1	Figure A.1 Dimensions of 256-Pin QFP Package corrected
		Appendix -2	Figure A.2 Dimensions of 256-Pin BGA Package corrected
		Appendix -3	Figure A.3 Dimensions of 324-Pin BGA Package corrected

Rev.	Date	Description	
		Page	Summary
5.00	Mar 19, 2020	3. Boot Mode	
		3-4	Figure 3.1 Control Signals Output to the Serial Flash Memory Through SPI Communication Conversion: Corrected
		9. Direct Memory Access Controller	
		9-57	Table 9.18 Setting for Detection of External Pin Request: LVL, HIEN, and LOEN in the header were corrected.
		9-59	Table 9.19 DACK0 Output Timing Setting: AM[2], AM[1:0], and REQD in the header were corrected.
		11. OS Timer	
		11-10	Figure 11.3 Timing Diagram of OSTM in Interval Timer Mode: Corrected
		11-13	Figure 11.6 Timing Diagram of OSTM in Free-Run Compare Mode: Corrected
		16. Renesas Serial Peripheral Interface	
		16-2	Figure 16.1 Block Diagram (for One Channel): A typo in the register name for SPCKD was corrected.
		18. I^2C Bus Interface	
		18-3	18.2.1 Functional Overview: The description for the SCL clock was corrected.
		18-22	18.3.6 RIICnFER — I^2C Bus Function Enable Register: The description for the NACKE bit was corrected.
		18-23, 18-24	18.3.7 RIICnSER — I^2C Bus Status Enable Register: SAR0E, SAR1E, SAR2E, and SARyE were corrected.
		18-28	18.3.9 RIICnSR1 — I^2C Bus Status Register 1: Corrections for SARyE
		18-35, 18-36	18.3.11 RIICnSARy — I^2C Slave Address Register y: Corrections for SARyE
		18-66	Figure 18.23 Block Diagram of Digital Noise Filter Circuit: Corrected
		18-67	18.9.1 Slave-Address Match Detection: Corrections for SARyE
		18-86	18.13.2 Extra SCL Clock Cycle Output Function: Body corrected
		18-86	Figure 18.40 Extra SCL Clock Cycle Output Function (CLO Bit): Corrected
		25. LIN Interface	
		25-52	25.8 LIN Self-Test Mode: Body corrected
		25-55	25.8.2 Transmission in LIN Master Self-Test Mode Settings for the baud rate, noise filter, and interrupt output related registers: The setting of the RLN3nLWBR register was corrected and *1 was deleted.
		25-55	25.8.2 Transmission in LIN Master Self-Test Mode Settings for the interrupt enable and error enable related registers: *2 was added to the setting of the RLN3nLIE register.
		25-55	25.8.2 Transmission in LIN Master Self-Test Mode: Note 1 was corrected.
		25-56	25.8.3 Reception in LIN Master Self-Test Mode Settings for the baud rate, noise filter, and interrupt output related registers: The setting of the RLN3nLWBR register was corrected and *1 was deleted.
		25-56	25.8.3 Reception in LIN Master Self-Test Mode Settings for the interrupt enable and error enable related registers: *2 was added to the setting of the RLN3nLIE register.
		25-56	25.8.3 Reception in LIN Master Self-Test Mode: Note 1 was corrected.
		31. Video Display Controller 5 (1): Overview	
		31-3	Figure 31.1 Video Display Controller 5 Former Stage Block Diagram: Note (*) was added.
		31-3	Figure 31.2 Video Display Controller 5 Middle Stage Block Diagram: Note (*) was added.
		33. Video Display Controller 5 (3): Scaler	
		33-20	Table 33.16 Horizontal Scale Up Control: The description for the SC_SCL0_US4 register was corrected.
		33-21	Table 33.17 Vertical Scale Up Control: The description for the SC_SCL0_US4 register was corrected.
		33-64	33.2.22 Scaling-Up Control Block Input Size Register (SC0_SCL0_US4) Bit function table: The descriptions for the SC0_RES_IN_VW[10:0] and SC0_RES_IN_HW[10:0] bits were corrected.
		33-109	33.2.86 Scaling-Up Control Block Input Size Register (SC1_SCL0_US4) Bit function table: The descriptions for the SC1_RES_IN_VW[10:0] and SC1_RES_IN_HW[10:0] bits were corrected.
		48. SCUX	
		48-95	Table 48.12 Data Transfer Routes (1) Route SSIF→SRC→FFU: The module names from No. 5 through 8 were corrected.
		50. SD Host Interface	
		50-1	The description regarding non-disclosure agreement was deleted.

Rev.	Date	Description	
		Page	Summary
5.00	Mar 19, 2020	(Rev.4.00)	50.1.4 SD Card Hardware Interface: Deleted
		50-7	50.2.3 Data STOP Register (SD_STOP) Bit function table: The description for the STP bit was corrected.
		50-20	50.2.16 SDIO Mode Control Register (SDIO_MODE) Bit function table: The description for the IOABT bit was corrected.
		50-27	Figure 50.5 The figure title was corrected to Reading from SD_BUF0.
		(Rev.4.00)	50.3.1 SD I/F, (2) Command Issue Timing within the Command Sequence: Deleted
		(Rev.4.00)	50.3.1 SD I/F, (3) SDIO Interrupt: Deleted
		(Rev.4.00)	50.4.1 Card Detect: Deleted
		50-34	50.4.1 Command without Data Transfer, (2) Operation Example: Deleted
		50-36	50.4.2 Single Block Read, (2) Operation Example: Deleted
		50-38	50.4.3 Single Block Write, (2) Operation Example: Deleted
		50-40	50.4.4 Multiple Block Read, (2) Operation Example: Deleted
		50-42	50.4.5 Multiple Block Write, (2) Operation Example: Deleted
		50-44	50.4.6 IO_RW_DIRECT Command (CMD52), (2) Operation Example: Deleted
		50-46	50.4.7 IO_RW_EXTENDED Command (CMD53/Multiple Block Read), (2) Operation Example: Deleted
		50-48	50.4.8 IO_RW_EXTENDED Command (CMD53/Multiple Block Write), (2) Operation Example: Deleted
		58. List of Registers	
		58-131, 58-132	Table 58.2 Register Bits: I^2C bus interface RIIC0SER, RIIC1SER, RIIC2SER, and RIIC3SER registers: The names of bits 2 to 0 were corrected.
		59. Electrical Characteristics	
		59-3	Table 59.2 DC Characteristics (2) [Current Consumption]: The typical values of Current consumption in normal operation were corrected.
		59-62	Table 59.21 NAND Type Flash Memory Interface Timing: $\overline{FCE}$ output setup time (t_{NCES}) was added.
6.00	Jan 29, 2021	3. Boot Mode	
		3-1	3. Boot Mode: Body corrected and note 1 added
		6. Clock Pulse Generator	
		6-16	Figure 6.5 Clock Signals for the System and Realtime Clock: Description of peripheral clocks 0C and 1C added
		9. Direct Memory Access Controller	
		9-37	Table 9.4 On-Chip Peripheral Module Requests: Setting of the TM bit in the CHCFG_n register for the A/D converter corrected
		9-40	Table 9.4 On-Chip Peripheral Module Requests: DMA transfer request signals of I^2C bus interface channels 0 to 3 corrected
		26. Ethernet Controller	
		26-63	26.4.1 Descriptors and Descriptor List, (a) Receive Descriptor 0 (RD0): Description of bit 27 (RFE) corrected
		27. A/D Converter	
		27-21	27.5 Interrupt Sources and DMA Transfer Request, (a) ADI Interrupt: Body corrected
