

# SGM8531/2/4

## 500kHz, 18µA, Rail-to-Rail I/O

## CMOS Operational Amplifiers

### PRODUCT DESCRIPTION

The SGM8531 (single), SGM8532 (dual) and SGM8534 (quad) are low cost, rail-to-rail input and output voltage feedback amplifiers. They have a wide input common mode voltage range and output voltage swing, and take the minimum operating supply voltage down to 2.1V. The maximum recommended supply voltage is 5.5V. All are specified over the extended -40°C to +125°C temperature range.

The SGM8531/2/4 provide 500kHz bandwidth at a low current consumption of 18µA per amplifier. Very low input bias currents of 0.5pA enable the SGM8531/2/4 to be used for integrators, photodiode amplifiers, and piezoelectric sensors. Rail-to-rail input and output are useful to designers for buffering ASIC in single-supply systems.

Applications for these amplifiers include safety monitoring, portable equipment, battery and power supply control, and signal conditioning and interfacing for transducers in very low power systems.

The SGM8531 single is available in the Green SOT-23-5 and SOIC-8 packages. The SGM8532 dual comes in Green SOIC-8 and MSOP-8 packages. The SGM8534 quad is offered in Green SOIC-14 and TSSOP-14 packages.

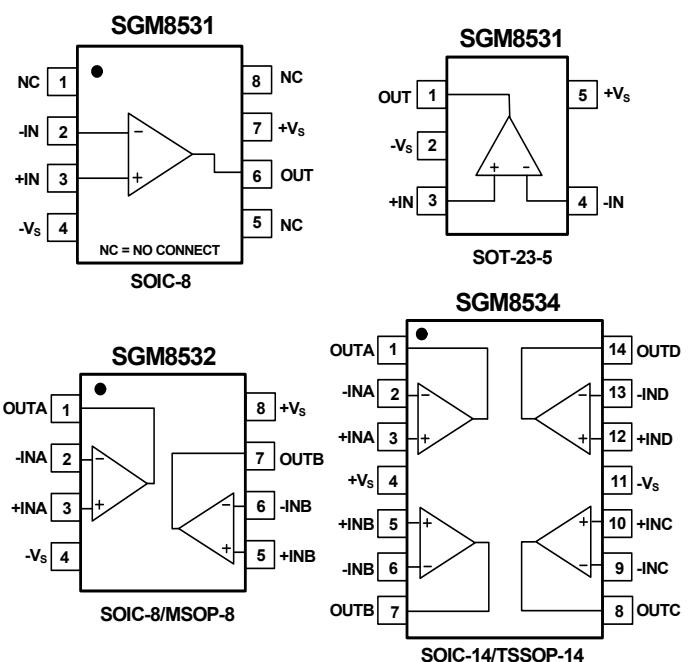

### APPLICATIONS

ASIC Input or Output Amplifier  
Sensor Interface  
Piezoelectric Transducer Amplifier  
Medical Instrumentation  
Mobile Communication  
Audio Output  
Portable Systems  
Smoke Detectors  
Mobile Telephone  
Notebook PC  
PCMCIA Cards  
Battery-Powered Equipment

### FEATURES

- Low Cost
- Rail-to-Rail Input and Output  
    0.8mV Typical  $V_{os}$
- Unity Gain Stable
- Gain-Bandwidth Product: 500kHz
- Very Low Input Bias Current: 0.5pA
- Supply Voltage Range: 2.1V to 5.5V
- Input Voltage Range:  
    -0.1V to +5.6V with  $V_s = 5.5V$
- Low Supply Current: 18µA/Amplifier
- Small Packaging  
    SGM8531 Available in SOIC-8 and SOT-23-5  
    SGM8532 Available in SOIC-8 and MSOP-8  
    SGM8534 Available in SOIC-14 and TSSOP-14

### PIN CONFIGURATIONS (TOP VIEW)

## PACKAGE/ORDERING INFORMATION

MODEL	ORDER NUMBER	PACKAGE DESCRIPTION	PACKAGE OPTION	MARKING INFORMATION
SGM8531	SGM8531XN5/TR	SOT-23-5	Tape and Reel, 3000	8531
	SGM8531XS/TR	SOIC-8	Tape and Reel, 2500	SGM8531XS
SGM8532	SGM8532XS/TR	SOIC-8	Tape and Reel, 2500	SGM8532XS
	SGM8532XMS/TR	MSOP-8	Tape and Reel, 3000	SGM8532XMS
SGM8534	SGM8534XS14/TR	SOIC-14	Tape and Reel, 2500	SGM8534XS14
	SGM8534XTS14/TR	TSSOP-14	Tape and Reel, 3000	SGM8534XTS14

## ABSOLUTE MAXIMUM RATINGS

Supply Voltage, $+V_S$ to $-V_S$ .....	6V	SOIC-8, $\theta_{JA}$ .....	125°C/W
Common Mode Input Voltage..... ( $-V_S$ ) - 0.3V to ( $+V_S$ ) + 0.3V		MSOP-8, $\theta_{JA}$ .....	216°C/W
Storage Temperature Range.....	-65°C to +150°C	Lead Temperature (Soldering 10sec).....	260°C
Junction Temperature .....	150°C	ESD Susceptibility	
Operating Temperature Range .....	-40°C to +125°C	HBM.....	4000V
Package Thermal Resistance @ $T_A = +25^\circ C$		MM.....	400V
SOT-23-5, $\theta_{JA}$ .....	190°C/W		

## NOTE:

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

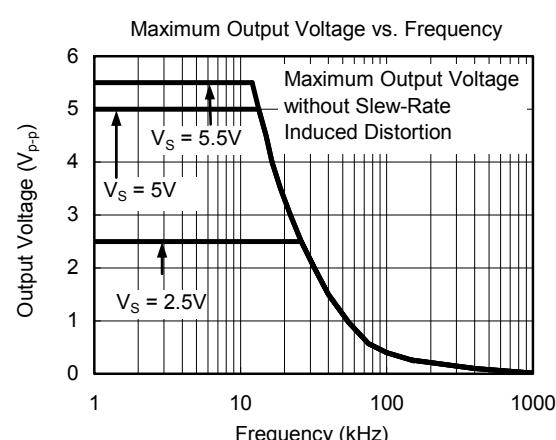

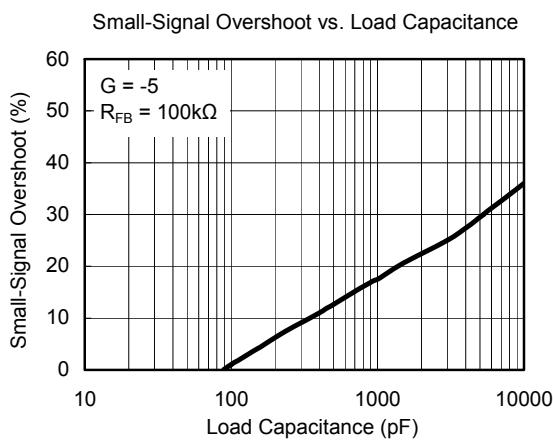

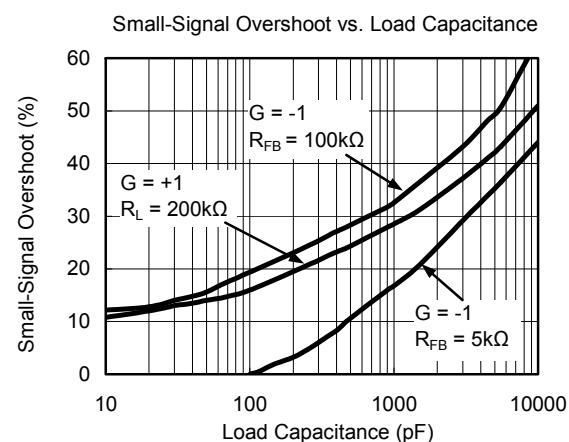

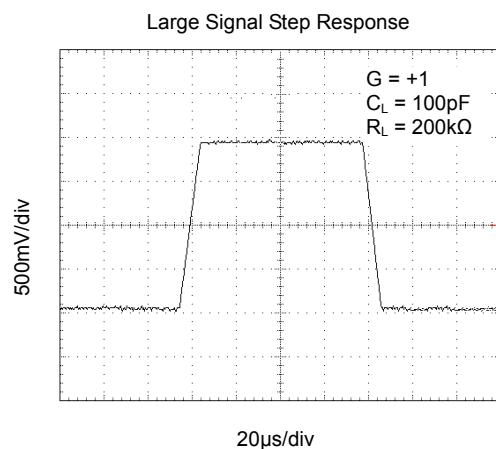

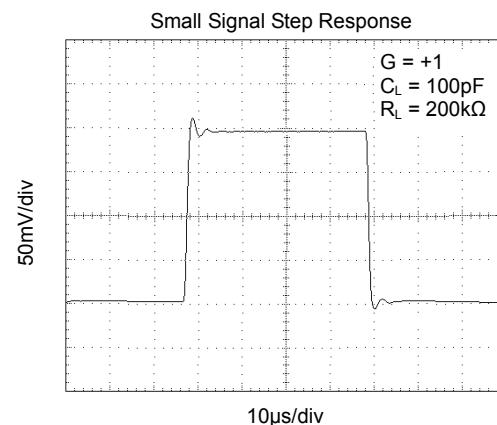

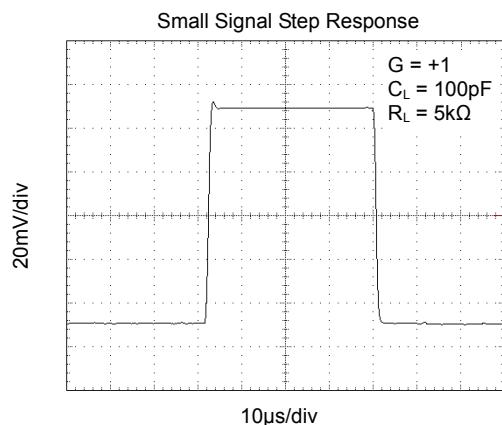

## CAUTION

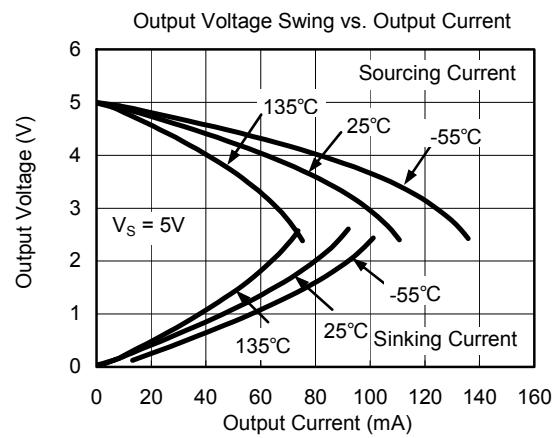

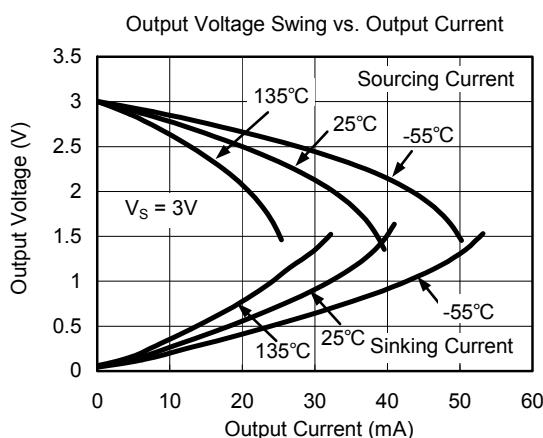

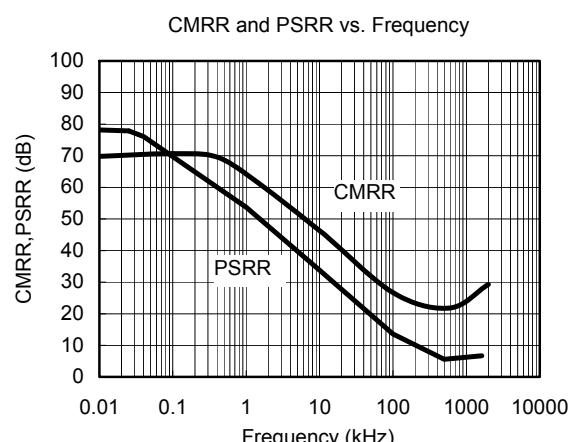

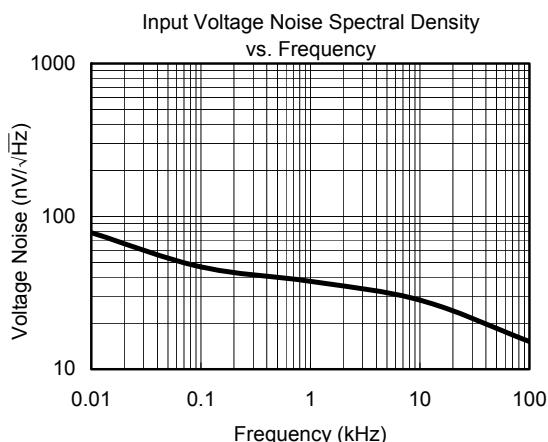

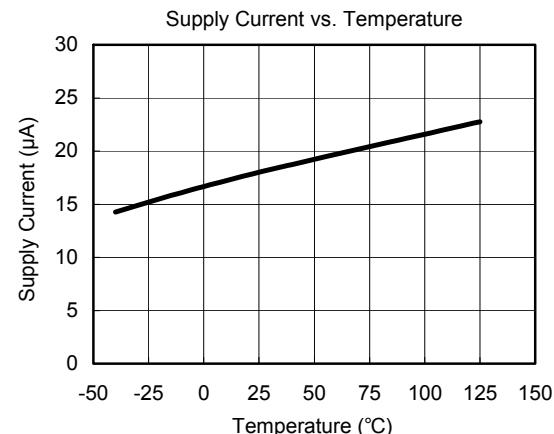

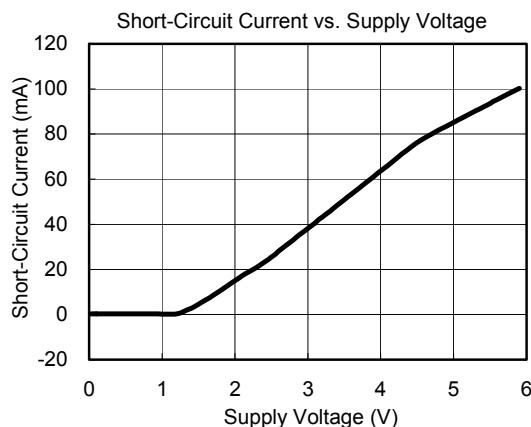

This integrated circuit can be damaged by ESD if you don't pay attention to ESD protection. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

SGMICRO reserves the right to make any change in circuit design, specification or other related things if necessary without notice at any time. Please contact SGMICRO sales office to get the latest datasheet.

**ELECTRICAL CHARACTERISTICS**(At  $V_S = +5V$ ,  $R_L = 200k\Omega$  connected to  $V_S/2$  and  $V_{OUT} = V_S/2$ , unless otherwise noted.)

**APPLICATION NOTES****Driving Capacitive Loads**

The SGM8531/2/4 can directly drive 250pF in unity-gain without oscillation. The unity-gain follower (buffer) is the most sensitive configuration to capacitive loading. Direct capacitive loading reduces the phase margin of amplifiers and this results in ringing or even oscillation. Applications that require greater capacitive driving capability should use an isolation resistor between the output and the capacitive load like the circuit in Figure 1. The isolation resistor  $R_{ISO}$  and the load capacitor  $C_L$  form a zero to increase stability. The bigger the  $R_{ISO}$  resistor value, the more stable  $V_{OUT}$  will be. Note that this method results in a loss of gain accuracy because  $R_{ISO}$  forms a voltage divider with the  $R_{LOAD}$ .

**Figure 1. Indirectly Driving Heavy Capacitive Load**

An improved circuit is shown in Figure 2. It provides DC accuracy as well as AC stability.  $R_F$  provides the DC accuracy by connecting the inverting signal with the output.  $C_F$  and  $R_{ISO}$  serve to counteract the loss of phase margin by feeding the high frequency component of the output signal back to the amplifier's inverting input, thereby preserving phase margin in the overall feedback loop.

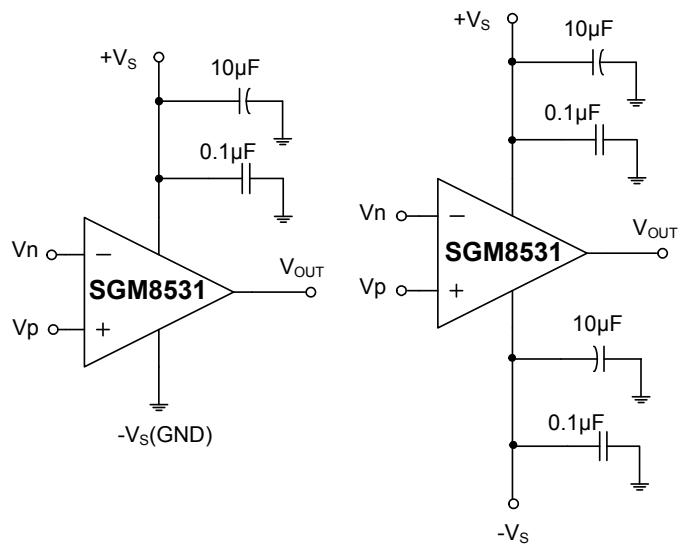

**Figure 2. Indirectly Driving Heavy Capacitive Load with DC Accuracy**

For non-buffer configuration, there are two other ways to increase the phase margin: (a) by increasing the amplifier's gain or (b) by placing a capacitor in parallel with the feedback resistor to counteract the parasitic capacitance associated with inverting node.

**Power-Supply Bypassing and Layout**

The SGM8531/2/4 family operates from either a single +2.1V to +5.5V supply or dual  $\pm 1.05V$  to  $\pm 2.75V$  supplies. For single-supply operation, bypass the power supply  $+V_S$  with a  $0.1\mu F$  ceramic capacitor which should be placed close to the  $+V_S$  pin. For dual-supply operation, both the  $+V_S$  and the  $-V_S$  supplies should be bypassed to ground with separate  $0.1\mu F$  ceramic capacitors.  $2.2\mu F$  tantalum capacitor can be added for better performance.

**Figure 3. Amplifier with Bypass Capacitors**

## TYPICAL APPLICATION CIRCUITS

### Differential Amplifier

The circuit shown in Figure 4 performs the difference function. If the resistor ratios are equal to ( $R_4 / R_3 = R_2 / R_1$ ), then  $V_{OUT} = (V_p - V_n) \times R_2 / R_1 + V_{REF}$ .

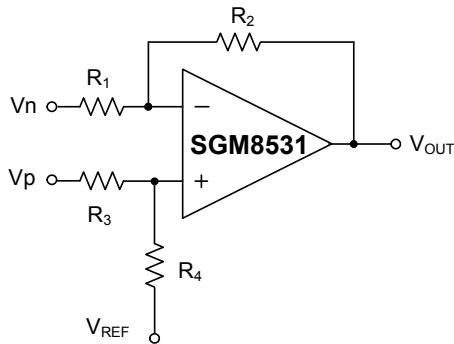

Figure 4. Differential Amplifier

### Instrumentation Amplifier

The circuit in Figure 5 performs the same function as that in Figure 4 but with a high input impedance.

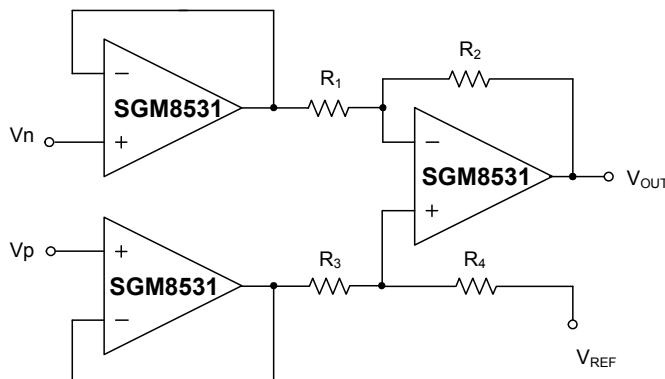

Figure 5. Instrumentation Amplifier

### Low Pass Active Filter

The low pass filter shown in Figure 6 has a DC gain of  $(-R_2 / R_1)$  and the -3dB corner frequency is  $1/2\pi R_2 C$ . Make sure the filter bandwidth is within the bandwidth of the amplifier. The large values of feedback resistors can couple with parasitic capacitance and cause undesired effects such as ringing or oscillation in high-speed amplifiers. Keep resistor values as low as possible and consistent with output loading consideration.

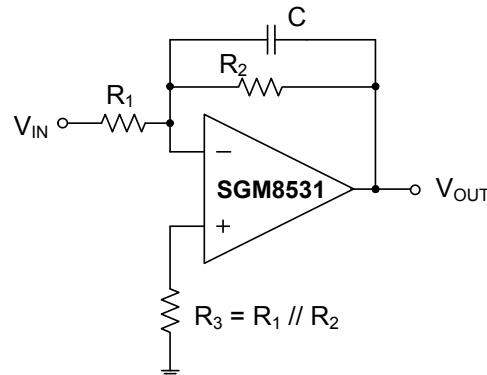

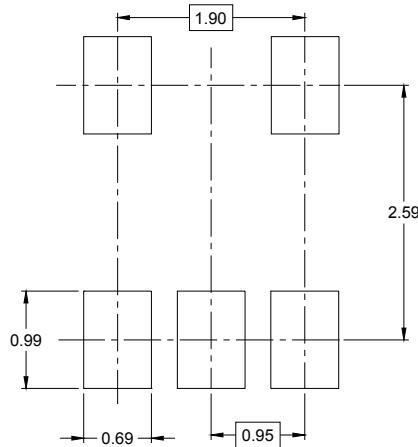

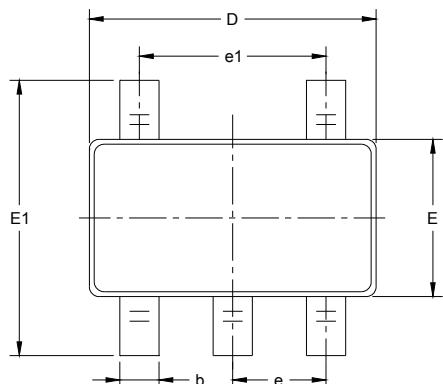

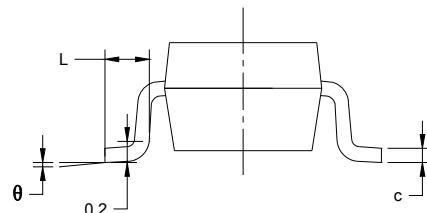

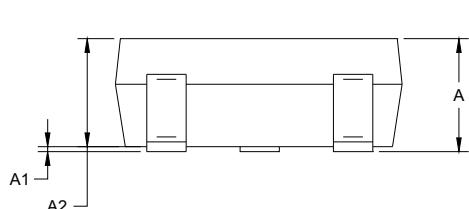

Figure 6. Low Pass Active Filter
